Do the Naiads who protect my mineral spring in your woods, resign their charge to Jack Frost? I presume you hardly frequent their rustic temple at this season. If when you revisit the woods, you should, perchance, descry the sylvan spirit peeping over her urn, you must present my poetical devotions to the red water lady, and promise my return to the same. I have just seen my tall cousin from your halls who promises to take my letter. He carries likewise a new "Christian Disciple." I know two or three of the authors. After this number, it passes into other hands. Please to read the first article and I will tell you who the writer is. I learn that Dr. Bigelow reviews Nuttall in the N. A. Review, and Mr. Hale (Editor of the D. Advertiser) reviewed Morse's Geography. I am in haste and cannot wait to finish my page.

Respectfully your friend and classmate,
R. Waldo Emerson.

He to whom these letters address their frank admiration, and their shy appeal for sympathy, lived most of his life in the obscurity of country parsonages. April 27, 1882, sixty years from the day the first letter was written, he who called himself "a desponding schoolmaster," "weary of myself," lay dying—his pillow watched and wept and blest by reverent thousands.

Mary S. Withington.

WASHINGTON ON THE EVE OF THE WAR.

During the summer and autumn of 1860, I was in Washington, supervising the preparation of maps of the reconnaissances which had been made by the Scientific Commission under my orders during the years 1857–58–59; and at the same time preparing my report on the operations of the Commission. It was my desire to preface the report by a history of all previous surveys and explorations of the western coast of North America. I had access to the large and valuable library of the late General Peter Force, probably the most complete collection of rare works on American history that then existed. General Force was a sergeant of volunteers for the defense of the capital at the time of its invasion by the British in 1813. He had been from that time forward attached to the militia organization of the District of Columbia, and had passed through every grade from sergeant to major-general, thus arriving at the highest grade known in the corps in which he had been enrolled fifty years before. He showed me a copy of a bill which the Secretary of War had prepared, abolishing all existing laws regarding the District of Columbia militia and volunteers and providing for a new organization. He said that the bill would no doubt pass the two houses of Congress, and that meantime all the old organizations had been abandoned excepting a few companies, and these were awaiting the advantages of the new law to reorganize on the new basis. He then requested me to aid him in organizing his new division. I willingly consented, and began to study the matter with reference to the distribution of the volunteer organizations between the two divisions, the arrangement of the rolls of the militiamen, etc. The country at this time (Dec. 1860) was in a curious and alarming condition: one State (South Carolina) had already passed an ordinance of secession from the Union and other States were preparing to follow her lead.

The only regular troops near the capital of the country were three hundred or four hundred marines at the marine barracks, and perhaps a hundred enlisted men of ordnance at the Washington arsenal. The old militia system had been abandoned (without being legally abolished), and Congress had passed no law establishing a new one. The only armed volunteer organizations in the District of Columbia were: One company of riflemen at Georgetown (the Potomac Light Infantry), one company of riflemen in Washington (the National Rifles), a skeleton battalion of in-

fantry (the Washington Light Infantry) of about one hundred and sixty men, and another small organization called the National Guard Battalion.

It was evident that, on its assembling in December, Congress would have far different work to consider than the organization of the District of Columbia militia; and also that it would not be the policy of the President, at the very outset of the session, in the delicate position of affairs, to propose the military organization of the federal district. It was also evident that, should he be so disposed, the Senators and Representatives of the Southern States would oppose and denounce the project.

What force, then, would the Government have at its disposal in the federal district for the simple maintenance of order in case of need? Evidently but a handful; and as to calling thither promptly any regular troops, that was out of the question, since they had already all been distributed by the Southern sympathizers to the distant frontiers of the Indian country,—Texas, Utah, New Mexico, Oregon, and Washington Territory,—and winter was rapidly approaching. It must be remembered that in those days there were no railways reaching out into those distant regions, and months would have been necessary to concentrate at Washington, in that season, a force of three thousand regular troops. Even had President Buchanan been desirous of bringing troops to the capital, the feverish condition of the public mind would, as the executive believed, have been badly affected by any movement of the kind, and the approaching crisis might have been precipitated.

I saw at once that the only force which could be readily made of service was a volunteer force raised from among the well disposed men of the District, and that this must be organized, if at all, under the old law of 1799.

By careful consultation with gentlemen well acquainted with the various classes of Washington society, I canvassed the District to learn what proportion of the able-bodied population could be counted on to sustain the Government should it need support from armed and organized citizens.

All who knew Washington in the days of December, 1860, know what thoughts reigned in the minds of all thinking men. Whatever their daily occupations, they went about them with their thoughts always bent on the possible disasters of the near future: some wishing to see the Union destroyed, and laboring night and day to that end; others straining their minds to discover how it might be saved and the civil war, which seemed imminent, might be averted.

On the 31st of December, 1860, Lieutenant-General Scott, commander-in-chief of the army (who had his head-quarters in New York), was in Washington. The President, at last thoroughly alarmed at the results of continued concessions to secession, had called him for consultation on the situation.

On the evening of that day I went to pay my respects to my old commander, and was received by him at Wormley's hotel. I found the General alone at the dinner-table, just finishing his evening meal. He chatted pleasantly with me for a few minutes, recalling past service in the Mexican war, etc.; and when the occasion presented itself, I remarked that I was glad to see him in good spirits, for that proved to me that he took a more cheerful view of the state of public affairs than he had on his arrival — more cheerful than those who resided in Washington had dared to take during the past few days.

"Yes, my young friend," said the General, "I feel more cheerful about the affairs of the country than I did this morning; for I believe that a safer policy than has hitherto been followed will now be adopted. The policy of entire conciliation, which has so far been pursued, would soon have led to ruin. We are now in such a state that a policy of pure force would precipitate a crisis for which we are not prepared. A mixed policy of force and conciliation is now necessary, and I believe it will be adopted and carried out." He then looked at his watch, rose, and said: "I must be with the President in a quarter of an hour," and ordered his carriage. He walked up and down the dining-room, but suddenly stopped and faced me, saying: "How is the feeling in the District of Columbia? What proportion of the population would sustain the Government by force, if necessary?"

I replied:

"General, it is my belief that two-thirds of the fighting stock of this population would sustain the Government in defending itself, if called upon. But they are uncertain as to what can be done or what the Government desires to have done, and they have no rallying point."

The General walked the room again in silence. The carriage came to the door, and I accompanied him toward it. As he was leaving the room, he turned suddenly, looked me in the face, placed his hand on my shoulder, and said:

"These people have no rallying point. Make yourself that rallying point!"

The next day I was commissioned by the President colonel in the staff and Inspector-General of the District of Columbia. I was mustered into the service of the United States from the 2d day of January, 1861, on the

special requisition of the General-in-Chief, and thus became the first one of the million citizens called into the military service of the Government to defend it against secession.

I immediately entered upon my duties, commencing by inspections in detail of the existing organizations of volunteers. The Potomac Light Infantry company, of Georgetown, I found fairly drilled, well armed, and, from careful information, it seemed to me certain that the majority of its members could be depended upon in case of need, but not all of them.

On the 2d of January, I met, at the entrance of the Metropolitan Hotel, Captain Schaeffer, of the "National Rifles" of Washington, and I spoke to him about his company, which was remarkable for its accurate and rapid drill and full ranks. Schaeffer had been a lieutenant in the First Regiment of United States Artillery, and was an excellent drill-master.

He had evidently not yet heard of my appointment as Inspector-General, and he replied to my complimentary remarks on his company:

"Yes, it is a good company, and I suppose I shall soon have to lead it to the banks of the Susquehanna!"

"Why so?" I asked.

"Why! To guard the frontier of Maryland and help to keep the Yankees from coming down to coerce the South!"

I said to him quietly that I thought it very imprudent in him, an employé of the Department of the Interior and captain of a company of District of Columbia volunteers, to use such expressions. He replied that most of his men were Marylanders, and would have to defend Maryland. I told him that he would soon learn that he had been imprudent, and advised him to think more seriously of his position, but did not inform him of my appointment, which he would be certain to learn the following morning from the newspapers.

It must be admitted that this was not a very cheerful beginning.

On inspecting the "National Rifles," I found that Schaeffer had more than one hundred men on his rolls, and was almost daily adding to the number, and that he had a full supply of rifles with two hundred rounds of ball cartridges, two mountain howitzers with harness and carriages, a supply of sabers and of revolvers and ammunition, all drawn from the United States arsenal. I went to the Chief of Ordnance, to learn how it was that this company of riflemen happened to be so unusually armed; and I found at the Ordnance office that an order had been given by the late Secretary of War (Floyd) directing the Chief of Ordnance to cause to be issued to Captain Schaeffer "all the ordnance and ordnance stores that he might require for his company!" I ascertained also that Floyd had nominated Captain Schaeffer to the President for the commission of Major in the District of Columbia militia, and that the commission had already been sent to the President for his signature.

I immediately presented the matter to the new Secretary of War (Holt), and procured from him two orders: One, an order to the Chief of Ordnance to issue no arms to any militia or volunteers in the District of Columbia unless the requisition should be countersigned by the Inspector-General; the other, an order that all commissions issued to officers of the District of Columbia should be sent to the Inspector-General for delivery.

An office was assigned me in the War Department, convenient to the army-registers and near the Secretary of War, who kindly gave orders that I should at all times be admitted to his cabinet without waiting, and room was made for me in the office of Major-General Weightman, the senior major-general of the District, where each day I passed several hours to confer with him, and to be able promptly to obtain his authority for any necessary order to the District forces.

The Washington Light Infantry organization and the National Guard were old volunteers composed of Washington people, and were almost to a man faithful to the Government. Of their officers, Major-General Weightman, though aged, and Major-General Force, aged and infirm, were active, and true as steel; Brigadier-Generals Bacon and Carrington were young, active, and true. Brigadier-General Ould, who took no part in the preparations of the winter, joined the Confederates as soon as Virginia passed her ordinance of secession, and his known sentiments precluded consultation with him.

Having thus studied the ground, and taken the first necessary steps toward security, I commenced the work of providing a force of volunteers. I addressed individual letters to some forty well-known and esteemed gentlemen of the District, informing each one that it would be agreeable to the Government should he in his neighborhood raise and organize a company of volunteers for the preservation of order in the District. To some of these letters I received no replies. To some I received replies courteously declining the service. To some I received letters sarcastically declining. But to many I received replies enthusiastically accepting the service and promising to raise companies of good men.

Each week thenceforth, until the middle of February, brought to my office the rolls of several new companies formed, so that in about six weeks thirty-three companies of infantry and riflemen and two troops of cavalry were on the lists of the District volunteer force; and all had been uniformed, equipped, and put under frequent drill.

The Northern Liberties fire companies brought their quota; the Lafayette Hose Company was prompt to enrol; the masons, the carpenters, the stone-cutters, and the painters, the German turners responded: each corporation formed its companies, and drilled industriously. Petty rivalries disappeared, and each company strove to excel the others in drill and discipline. While the newly organized companies thus strove to perfect themselves, the older organizations resumed their drills and filled their ranks with good recruits.

The National Rifles company (Captain Schaeffer's) was carefully observed, and it was found that its ranks received constant accessions, including the most openly declared secessionists and even members of Congress from the States proposing to secede. This company was very frequently drilled in its armory, and its recruits were drilled nearly every night.

Having, as Inspector-General, a secret service force at my disposition, I placed a detective in the company, and had regular reports of the proceedings of its captain. He was evidently pushing for an independent command of infantry, artillery and cavalry, having his rifles, cannon, sabers, and revolvers stored in his armory. He also began to prepare for action, ordering his men to take their rifles and equipments home with them, with a supply of ammunition, so that even should his armory be occupied, they could assemble on short notice, ready for action. Meantime, his commission as major was signed by the President and sent to me.

I reported these matters to General Scott, who ordered me to watch these proceedings carefully, and to be ready to suppress any attempt at violence; but to avoid, if possible, any shock, for, said he, "We are now in such a state that a dog-fight might cause the gutters of the capital to run with blood."

While the volunteer force for the support of the Government was organizing, another force with exactly the opposite purpose was in course of formation. I learned that the great hall over Beach's livery stable was nightly filled with men, who were actively drilled. Doctor B——, of well known secession tendencies, was the moving spirit of these men, and he was assisted by other citizens of high standing, among whom was a connection of the Governor of Virginia. The numbers of these occupants of Beach's hall increased rapidly, and I found it well to have a skillful New York detective officer, who had been placed at my disposition, enrolled among them. These men called themselves "National Volunteers," and openly discussed, in their meetings, the seizure of the national capital at the proper moment. They drilled industriously, and had regular business meetings, full reports of which were regularly laid before me every following morning by "the New York member." In the meeting at which the uniform to be adopted was discussed, the vote was for gray Kentucky jeans, with the Maryland button. A cautious member suggested that they must remember that, in order to procure arms, it would be "necessary to get the requisition signed by 'Old Stone,' and if he saw that they had adopted the Maryland button, and not that of the United States, he might suspect them and refuse the issue of arms!" Doctor B—— supported the idea of the Maryland button, and said that, if Stone refused the arms, his connection, the Governor of Virginia, would see them furnished, etc. These gentlemen probably little thought that a full report of their remarks would be read the next morning by "Old Stone" to the General-in-Chief.

The procuring of arms was a difficult matter for them, for it required the election of officers, the regular enrolling of the men, the certificate of elections, and the muster-rolls, all to be reported to the Inspector-General. The matter was long discussed by them, and it was finally arranged that, out of the three hundred and sixty men in their midst, a pretended company should be organized, officers elected, and the demand for arms made. This project was carried out, and *my* member brought to me early the next morning the report of the proceedings, informing me that Doctor B—— had been elected captain, and would call on the Inspector-General for arms. Sure enough, Doctor B—— presented himself in my office and informed me that he had raised a company of volunteers, and desired an order for arms. He produced a certificate of election in due form. I received him courteously, and informed him that I could not give an order for arms without having a muster-roll of his men, proving that a full one hundred had signed the rolls. It was, of course, very desirable to have the names of men holding their known sentiments and nursing such projects as were known to be theirs.

He returned, I think, on the following day,

with a muster-roll in due form, containing the names of one hundred men. This was all that I wanted. I looked him full in the face, smiled, and locked the muster-roll in a drawer of my desk, saying:

"Doctor B——, I am very happy to have obtained this list, and I wish you good morning."

The gallant doctor evidently understood me. He smiled, bowed, and left the office, to which he never returned. He subsequently proved the sincerity of his principles by abandoning his pleasant home in Washington, his large and valuable property, and giving his earnest service to the Confederate cause. The "National Volunteer" organization broke up without further trouble.

Next came the turn of Captain Schaeffer. He entered my office one day with the air of an injured man, holding in his hand a requisition for arms and ammunition, and saying, that, on presenting it at the Ordnance office, he had been informed that no arms could be issued to him without my approval. I informed him that that was certainly so, and that the order of the Secretary of War was general. I told him that he had already in his possession more rifles than were required for a company and that he could have no more. He then said, sulkily, that he could easily, with his company, *take* the arms he wanted.

I asked him, Where? and he replied:

"You have only four soldiers guarding the Columbian armory, where there are plenty of arms, and those four men could not prevent my taking them."

"Ah!" I replied, "In what part of the armory are those arms kept?" He said they were on the upper floor, which was true.

"Well," said I, "you seem to be well informed. If you think it best, just try taking the arms by force. I assure you that if you do you shall be fired on by one hundred and fifty soldiers as you come out of the armory."

The fact was, that only two enlisted men of ordnance were on duty at the Columbian armory, so feeble was the military force at the time. But Barry's battery had just arrived at the Washington arsenal, and on my application General Scott had ordered the company of sappers and miners at West Point to come to Washington to guard the Columbian armory; but they had not yet arrived. The precautions taken in ordering them were thus clearly proved advisable.

The time had evidently come to disarm Captain Schaeffer; and when he reached his office after leaving mine, he found there an order directing him to deposit in the Columbian armory, before sunset on that day, the two howitzers with their carriages which he had in his possession, as well as the sabers and revolvers, as these weapons formed no part of the proper armament of a company of riflemen. He was taken by surprise, and had not time to call together men enough to resist; so that nothing was left to him but to comply with the order. He obeyed it, well knowing that if he did not I was prepared to take the guns from his armory by means of other troops.

Having obeyed, he presented himself again in my office, and before he had time to speak I informed him that I had a commission of major for his name. He was much pleased, and said: "Yes, I heard that I had been appointed." I then handed him a slip of paper on which I had written out the form of oath which the old law required to be taken by officers, that law never having been repealed, and said to him:

"Here is the form of oath you are to take. You will find a justice of the peace on the next floor. Please qualify, sign the form in duplicate, and bring both to me. One will be filed with your letter of acceptance, the other will be filed in the clerk's office of the Circuit Court of the District."

He took the paper with a sober look, and stood near my table several minutes looking at the form of oath and turning the paper in his hand, while I, apparently very busy with my papers, was observing him closely. I then said:

"Ah, Schaeffer, have you already taken the oath?"

"No," said he.

"Well, please be quick about it, as I have no time to spare."

He hesitated, and said slowly:

"In ordinary times I would not mind taking it, but in these times ——"

"Ah!" said I, "you decline to accept your commission of major. Very well!" and I returned his commission to the drawer and locked it in.

"Oh, no," said Schaeffer, "I want the commission."

"But, sir, you cannot have it. Do you suppose that, in these times, which are not, as you say, 'ordinary times,' I would think of delivering a commission of field-officer to a man who hesitates about taking the oath of office? Do you think that the Government of the United States is stupid enough to allow a man to march armed men about the federal district under its authority, when that man hesitates to take the simple oath of office? No, sir, you cannot have this commission; and more than that, I now inform you that you hold no office in the District of Columbia volunteers."

"Yes, I do; I am captain, and have my commission as such, signed by the President and delivered to me by the Major-General."

"I am aware that such a paper was delivered to you, but you failed legally to accept it."

"I wrote a letter of acceptance to the Adjutant-General, and forwarded it through the Major-General."

"Yes, I am aware that you did; but I know also that you failed to inclose in that letter, according to law, the form of oath required to accompany all letters of acceptance, and on the register of the War Department, while the issuance of your commission is recorded, the acceptance is not recorded. You have never legally accepted your commission, and it is now too late. The oath of a man who hesitates to take it will not now be accepted."

So Captain Schaeffer left the "National Rifles," and with him left the secession members of the company. I induced quite a number of true men to join its ranks; a new election was ordered, and a strong, loyal man (Lieutenant Smead of the U. S. artillery) was elected its captain. Smead was then on duty in the office of the Coast Survey, and I easily procured from the War Department permission for him to accept the position.

If my information was correct, the plan had been formed for seizing the public departments at the proper moment and obtaining possession of the seals of the Government. Schaeffer's part, with the battalion he was to form, was to take possession of the Treasury Department for the benefit of the new provisional government. Whatever may have been the project, it was effectually foiled. With the breaking up of the "National Volunteers"; with the transformation of the secession company of "National Rifles" into a thoroughly faithful and admirably drilled company ready for the service of the Government; with the arrival from West Point of the company of sappers and miners, and, later, the arrival of the Military Academy battery under Griffin; and with the formation in the district of thirty new companies of infantry and riflemen from among the good citizens of Washington and Georgetown the face of things in the national capital had much changed before the fourth of March, 1861.

I must now go back a little in time, to mention one fact which will show in how weak and dangerous a condition our Government was in the latter part of January and the early part of February, 1861. The invitations which I had issued for the raising of companies of volunteers had, as already stated, been enthusiastically responded to, and companies were rapidly organized. The preparatory drills were carried on every night, and I soon found that the men were sufficiently advanced to receive their arms. I began to approve the requisitions for arms; but to my great astonishment, the captains who first received the orders came back to me, stating that the Ordnance Department refused to issue any arms! On referring to the Ordnance office, I was informed by the Chief of Ordnance that he had received, the day before, an order not to issue any arms to the District of Columbia troops, and that this order had come from the President!

I went immediately to the Secretary of War (Mr. Holt) and informed him of the state of affairs, telling him at the same time that I did not feel disposed to be employed in child's play, organizing troops which could not be armed, and that unless the order in question should be immediately revoked there was no use for me in my place and that I must at once resign. Mr. Holt told me that I was perfectly right; that unless the order should be revoked there was no use in my holding my place, and he added, with a smile, "and I will also say, Colonel, there will be no use in my holding my place any longer. Go to the President, Colonel, and talk to him as you have talked to me."

I went to the White House, and was received by Mr. Buchanan. I found him sitting at his writing-table, in his dressing-gown, looking wearied and worried.

I opened at once the subject of arms, and stated the necessity of immediate issue, as the refusal of arms would not only stop the instruction of the volunteers, which they needed sadly, but would make them lose all confidence in the Government and break up the organizations. I closed by saying that, while I begged his pardon for saying it, in case he declined to revoke his order I must ask him to accept my resignation at once.

Mr. Buchanan was evidently in distress of mind, and said:

"Colonel, I gave that order acting on the advice of the District Attorney, Mr. Robert Ould."

I replied:

"Then, Mr. President, the District Attorney has advised your Excellency very badly."

"But, Colonel, the District Attorney is an old resident of Washington, and he knows all the little jealousies which exist here. He tells me that you have organized a company from the Northern Liberties fire company."

"Not only one, but two excellent companies in the Northern Liberties, your Excellency."

"And then, the District Attorney tells me

you have organized another company from among the members of the Lafayette Hose Company."

"Yes, your Excellency, another excellent company."

"And the District Attorney tells me, Colonel, that there is a strong feeling of enmity between those fire companies and, if arms are put in their hands, there will be danger of bloodshed in the city."

"Will your Excellency excuse me if I say that the District Attorney talks nonsense or worse to you? If the Northern Liberties and the Lafayette Hose men wish to fight, can they not procure hundreds of arms in the shops along the avenue? Be assured, Mr. President, that the people of this District are thinking now of other things than old ward feuds. They are thinking whether or not the Government of the United States is to allow itself to crumble out of existence by its own weakness. And I believe that the District Attorney knows that as well as I do. If the companies of volunteers are not armed, they will disband, and the Government will have nothing to protect it in case of even a little disturbance. Is it not better for the public peace, your Excellency, even if the bloody feud exists (which I believe is forgotten in a greater question),—is it not better to have these men organized and under the discipline of the Government?"

The President hesitated a moment, and then said:

"I don't know that you are not right, Colonel; but you must take the responsibility on you that no bloodshed results from arming these men."

I willingly accepted this responsibility. The prohibitory order was revoked. My companies received their arms. They made good use of them learning the manual of arms in a surprisingly short time. Later, they made good use of them in sustaining the Government which had furnished them against the faction which soon became the public enemy, including Mr. Robert Ould, who, following his convictions, no doubt as honestly as I was following mine, gave his earnest services to his State against the federal Government.

I think that the country has never properly appreciated the services of those District of Columbia volunteers. It certainly has not appreciated the difficulties surmounted in their organization. Those volunteers were citizens of the federal District, and therefore had not at the time, nor have they ever since had, the powerful stimulant of a State feeling, nor the powerful support of a State government, a State's pride, a State press to set forth and make much of their services. They did their duty quietly, and they did it well and faithfully. Although not mustered into the service and placed on pay until after the fatal day when the flag was fired upon, for the first time, at Sumter, yet they rendered great service before that time in giving confidence to those citizens of the District who were faithful to the Government, in giving confidence to members of the national legislature, and in giving confidence also to the President in the knowledge that there was at least a small force at its disposition ready to respond at any moment to his call. It should also be remembered of them, that the first troops mustered into the service were sixteen companies of these volunteers; and that, during the dark days when Washington was cut off from communication with the North, when railway bridges were burned and tracks torn up, when the Potomac was blockaded, these troops were the only reliance of the Government for guarding the public departments, for preserving order and for holding the bridges and other outposts; that these were the troops which recovered possession of the railway from Washington to Annapolis Junction and made practicable the re-opening of communications. They also formed the advance guard of the force which first crossed the Potomac into Virginia, and captured the city of Alexandria.

These were the troops which insured the regular inauguration on the steps of the capitol of the constitutionally elected President. I firmly believe that without them Mr. Lincoln would never have been inaugurated. I believe that tumults would have been created, during which he would have been killed, and that we should have found ourselves engaged in a struggle, without preparation, and without a recognized head at the capital. In this I may be mistaken, of course, as any other man may be mistaken; but it was then my opinion, when I had many sources of information at my command, and it remains my opinion now, when, after the lapse of twenty years and a somewhat large experience, I look back in cool blood upon those days of political madness.

One day, after the official declaration of the election of Mr. Lincoln, my duties called me to the House of Representatives; and while standing in the lobby waiting for the member with whom I had business, I conversed with a distinguished officer from New York. We were leaning against the sill of a window which overlooked the steps of the capitol, where the President-elect usually stands to take the oath of office. The gentleman grew excited as we discussed the elec-

tion of Mr. Lincoln, and pointing to the portico he exclaimed:

"He shall never be inaugurated on those steps!"

"Mr. Lincoln," I replied, "has been constitutionally elected President of the United States. You may be sure that, if he lives until the 4th day of March, he will be inaugurated on those steps."

As I spoke, I noticed for the first time how perfectly the wings of the capitol flanked the steps in question; and on the morning of the 4th of March I saw to it that each window of the two wings was occupied by two riflemen.

I received daily numerous communications from various parts of the country, informing me of plots to prevent the arrival of the President-elect at the capital. These warnings came from St. Louis, from Chicago, from Cincinnati, from Pittsburg, from New York, from Philadelphia, and, especially, from Baltimore. Every morning I reported to General Scott on the occurrences of the night and the information received by the morning's mail; and every evening I rendered an account of the day's work and received instructions for the night. General Scott also received numerous warnings of danger to the President-elect, which he would give me to study and compare. Many of the communications were anonymous and vague. But on the other hand many were from calm and wise men, one of whom became, shortly afterward, a cabinet minister; one was a railway president, another a distinguished ex-Governor of a State, etc., etc. In every case where the indications were distinct, they were followed up to learn if real danger existed.

So many clear indications pointed to Baltimore, that three good detectives of the New New York police force were constantly employed there. These men reported frequently to me, and their statements were constantly compared with the information received from independent sources.

Doubtless, Mr. Lincoln, at his home in Springfield, received many and contradictory reports from the capital, for he took his own way of obtaining information. One night, between eleven o'clock and midnight, while I was busy in my study over the papers of the day and evening, a card was brought me, bearing the name "Mr. Leonard Swett," and upon it was written, in the well-known hand of General Scott, "Colonel Stone, Inspector-General, may converse freely with Mr. Swett." I gave orders for his admission, and a tall gentleman of marked features entered my room. At first I thought that Mr. Lincoln himself was present, so much, at first glance, did Mr. Swett's face resemble the portraits I had seen of Mr. Lincoln, and so nearly did his height correspond with that attributed to the President-elect. But I quickly found that the gentleman's card bore his true name, and that Mr. Swett had come directly from Mr. Lincoln, having his full confidence, to see for him the state of affairs in Washington, and report back to him in person.

Mr. Swett remained several days in the capital, had frequent and long conversations with General Scott and myself (and I suppose also with many others), and with me visited the armories of some of the volunteer companies. As he drove with me to the railway station on the evening of his departure, Mr. Swett said:

"Mr. Lincoln, and in fact everybody almost, is ignorant of the vast amount of careful work which has been done here this winter, by General Scott and yourself, to insure the existence of the Government and to render certain and safe the inauguration of Mr. Lincoln. He will be very grateful to both."

I replied, with more sincerity than tact:

"Mr. Lincoln has no cause to be grateful to me. I was opposed to his election, and believed in advance that it would bring on what is evidently coming, a fearful war. The work which I have done has not been done for him, and he need feel under no obligations to me. I have done my best toward saving the Government of the country and to insure the regular inauguration of the constitutionally elected President, on the 4th of next month."

As President Lincoln approached the capital, it became certain that desperate attempts would be made to prevent his arriving there. To be thoroughly informed as to what might be expected in Baltimore, I directed a detective to be constantly near the chief of police and to keep up relations with him; while two others were instructed to watch independent and without the knowledge of the chief of police. The officer who was near the chief of police reported regularly, until near the last, that there was no danger in Baltimore; but the others discovered a band of desperate men plotting for the destruction of Mr. Lincoln during his passage through the city, and by affiliating with them, these detectives got at the details of the plot.

Mr. Lincoln passed through Baltimore in advance of the time announced for the journey (in accordance with advice given by me to Mr. Seward and which was carried by Mr. Frederick Seward to Mr. Lincoln), and arrived safely at Washington on the morning of the day he was to have passed through Baltimore. But the plotting to prevent his inauguration continued; and there was only

too good reason to fear that an attempt would be made against his life during the passage of the inaugural procession from Willard's hotel, where Mr. Lincoln lodged, to the capitol.

On the afternoon of the 3rd of March, General Scott held a conference at his headquarters, there being present his staff, General Sumner, and myself, and then was arranged the programme of the procession. President Buchanan was to drive to Willard's hotel, and call upon the President-elect. The two were to ride in the same carriage, between double files of a squadron of the District of Columbia cavalry. The company of sappers and miners were to march in front of the Presidential carriage, and the infantry and riflemen of the District of Columbia were to follow it. Riflemen in squads were to be placed on the roofs of certain commanding houses which I had selected, along Pennsylvania avenue, with orders to watch the windows on the opposite side and to fire upon them in case any attempt should be made to fire from those windows on the Presidential carriage. The small force of regular cavalry which had arrived was to guard the side-street crossings of Pennsylvania avenue, and to move from one to another during the passage of the procession. A battalion of District of Columbia troops were to be placed near the steps of the Capitol, and riflemen in the windows of the wings of the Capitol. On the arrival of the Presidential party at the Capitol, the troops were to be stationed so as to return in the same order after the ceremony.

To illustrate the state of uncertainty in which we were at that time concerning men, I may here state that the Lieutenant-Colonel, military secretary of the General-in-chief, who that afternoon recorded the conclusions of the General in conference, and who afterward wrote out for me the instructions regarding the disposition of troops, resigned his commission that very night, and departed for the South, where he joined the Confederate army.

During the night of the 3d of March, notice was brought me that an attempt would be made to blow up the platform on which the President would stand to take the oath of office. I immediately placed men under the steps, and at daybreak a trusted battalion of District troops (if I remember rightly, it was the National Guard, under Colonel Tait) formed in a semicircle at the foot of the great stairway, and prevented all entrance from without. When the crowd began to assemble in front of the portico, a large number of policemen in plain clothes were scattered through the mass to observe closely, to place themselves near any individual who might act suspiciously, and to strike down any hand which might raise a weapon.

At the appointed hour, Mr. Buchanan was escorted to Willard's hotel, which he entered. There I found a number of mounted "marshals of the day," and posted them around the carriage, within the cavalry guard. The two Presidents were saluted by the troops as they came out of the hotel and took their places in the carriage. The procession started. During the march to the Capitol I rode near the carriage, and by an apparently clumsy use of my spurs managed to keep the horses of the cavalry in an uneasy state, so that it would have been very difficult for even a very good rifle shot to get an aim at one of the inmates of the carriage between the dancing horses.

After the inaugural ceremony, the President and the ex-President were escorted in the same order to the White House. Arrived there, Mr. Buchanan walked to the door with Mr. Lincoln, and there bade him welcome to the House and good morning. The infantry escort formed in line from the gate of the White House to the house of Mr. Ould, whither Mr. Buchanan drove, and the cavalry escorted his carriage. The infantry line presented arms to the ex-President as he passed, and the cavalry escort saluted as he left the carriage and entered the house. Mr. Buchanan turned on the steps, gracefully acknowledged the salute, and disappeared. The District of Columbia volunteers had given to President Lincoln his first military salute and to Mr. Buchanan his last.

Charles P. Stone.

TOPICS OF THE TIME.

College Presidents and the Power of Appointment.

A COLLEGE president is a purely American institution; no officer having the same name or functions is found in European universities. In Germany, a *rector magnificus*, who is the presiding officer in the faculty and the official representative of the university on all public occasions, is elected annually by his colleagues in the academical senate; but he has no control over the latter, nor, in fact, any recognized powers which do not also belong to every other full professor. He is therefore not a president in the American sense, having more limited functions and responsibility. A nearer equivalent to our presidential office is that of the curator of the German university—a resident Government officer, who looks after the financial affairs of the institution, and has a general supervision over all its departments. He has, however, in reality small power, but reports all cases requiring interference to the minister of public instruction and worship (*cultusminister*), who governs the university through his agency. The curator is, moreover, not a member of the faculty, and has nothing to do with any kind of teaching. He is purely an administrative officer, and exerts his power by means of his influence with the Government, to which he stands approximately in the same relation as an American college president does to the board of trustees. In other respects, however, the differences of the two systems are more striking than their points of resemblance.

Nominally, a college president is usually the representative of the governing body of the institution, and holds office only so long as his administration and general policy are acceptable to the board of trustees. As a matter of fact, however, the president, if he be an able and energetic man, governs the board, which, as a rule, registers his will, appoints his candidates for professorships, and in all except the financial management leaves his hands free. A man with a definite purpose, and the power to defend it, has always an advantage over thirty or forty men with mere general impressions on the subject of education, but with no previous training which enables them to form sound and definite conclusions. In the matter of appointments, the president has again the advantage, in being better able to judge of the standing and scholarly reputation of every applicant in the special departments, and, if he distrusts his own judgment, he knows better where to turn to obtain reliable information; while among the lawyers, merchants, and clergymen constituting the board of trustees, the number is small of those capable of forming an opinion as to the merit of a chemist, physicist, or philologist. It therefore follows that, whenever the trustees undertake to consult their own preferences, disregarding the president's recommendation, they usually make a mistake; and, as every one knows, mistakes in appointments are the most serious ones that the governing boards of educational institutions can make, and are, moreover, very hard to remedy. It is such a common thing, for men who have no special claim to scholarship themselves, to undervalue the difficulties of acquiring it; and in consequence, a very lax notion is apt to prevail that, if the candidate for this or that professorship has hitherto devoted his time to something else, he can easily "catch up" and make himself proficient in a new department, if he only sets earnestly about it. It is this baneful idea which produces so many bad appointments in the faculties of many colleges, and which makes the scholarship of the average college graduate so unsatisfactory as it generally is. The tendency toward specialization in modern life is so great that no man (unless he be a genius of rare caliber) can make himself really prominent in any science or department of knowledge for which he has not trained himself from a comparatively early age by long and serious study; and even a relative proficiency, which would enable him to give elementary instruction, is not acquired by a year of "cramming" or unsystematic preparation, such as a man is forced to adopt who accepts a professorship the requirements of which are beyond his actual attainments at the time of appointment.

We have said that the president of a college is, as a rule, better qualified for the task of selecting a faculty than the trustees in whom the right of appointment is actually vested. But even a president is far from possessing the intellectual equipment necessary for so difficult a task. No one man, however able and learned, can possibly have a sufficient insight into all the branches of knowledge which have to be represented in a college faculty to determine the relative proficiency of the many applicants who present themselves for any vacancy in the body of instructors. If he has made a specialty of philosophy, or philology, or history, he is apt to have but the vaguest notions about the sciences, and is scarcely competent to judge concerning the acquirements of competing scientists. It is in order to supplement this inevitable limitation in the judgment of any individual, however learned, that the German Government, although reserving for itself the final decision, practically vests the power of appointment in the academic senate, of which all the full or ordinary professors of the university are members. When a vacancy occurs, the names of the various candidates are discussed, and specialists in the same department are invited to express their opinions freely. If the decision rested with these specialists,—who may be rivals in the same field and not above a little professional jealousy,—the wisdom of this method might well be questioned; but, in the first place, every branch of knowledge is so numerously represented at a German university, that the jealousy of any one man would have but small influence; and secondly, the faculty at large, and especially the professors of kindred sciences, exercise a wholesome restraint upon any one who would allow personal

feelings to bias his judgment. The generous rivalry between the various German universities makes every academic senate anxious to strengthen itself by the acquisition of the most distinguished names in every science, because the reputation of the university, by which alone students are attracted, depends solely upon this one consideration—the strength of its faculty. It is a very frequent occurrence that a single man of great repute brings a sudden rush of students to a comparatively obscure university; and as these students must pursue several studies, and pay direct fees to the professors whose lectures they attend, it is obvious that all are benefited by the distinction of a new colleague. It may therefore be asserted that the general sense of any considerable body of scholars in a question of appointment, after a free discussion, is apt to be as near an approximation toward the absolute right as we can ever hope to arrive at. The German Government, at all events, recognizes this fact, first, in its consultation of the academical senate; and secondly, in its acceptance of its preference. The custom is for the senate to send to the minister of public instruction three names, accompanying each with a recommendation specifying the qualifications of each nominee for the office. The rector also, in behalf of the senate, respectfully indicates who is its first choice, and as a rule the Government acts upon this advice. There is no law binding the minister in this matter, but practically a well-established precedent is as good as a law.

In France, where much more laxness and favoritism prevail in state appointments, a similar system is now in vogue. If a vacancy occurs in the Collége de France, the Government refers the names of all the candidates to the class in L'Institut de France comprising the specialists in this or that particular science. A graduated list is also prepared by the faculty of the college, and if its recommendation coincides with that of the Institute, the appointment is forthwith made; in case of a divergence of views, tradition limits the minister to a choice between the two or three candidates who have been placed among the first upon the lists of the two learned bodies. This method has resulted in bringing together in the faculty of the Collége de France unquestionably the most eminent scientists and scholars whom the country possesses; and it is the general opinion, among men who are competent to judge, that the classes in the Institute as well as the faculty of the college have fulfilled their function admirably, and have usually named the worthiest candidate.

The conclusion deducible from the experience both of Germany and France thus points in the same direction, viz.: nomination of professors, not by a board of business men, but by a board of scholars. This plan was long ago adopted at Yale, but, so far as we know, has not had a fair trial in any other American university. And yet the faculties of the larger American colleges comprise many distinguished scholars, whose vote for a new colleague would certainly be more weighty and more intelligent than that of an equal number of clergymen, lawyers, and retired millionaires. Would any one contend that the collective faculty of Harvard College would not be more competent to judge of the relative qualifications of a dozen candidates for a professorship than the corporation, assisted by President Eliot? What the corporation, in nine cases out of ten, would probably do, would be to register its approval of the president's choice; and that a president, be he never so able, cannot in every instance be equally competent to choose, we have already shown. The experiment is therefore worthy of a more general trial, to give the faculty the right of nomination, while the board of trustees might still retain the right of appointment. As matters now stand, there may be good reason to fear that the latter (priding themselves on their practical sense and crediting the faculty with a slight deficiency in this direction) would not duly heed the recommendations of the former. But some weight the faculty's nomination would certainly carry, especially when accompanied by explicit reasons for its choice; and, in the course of time, the proposed innovation could not fail to have a marked effect in doing away with much unworthy favoritism, and elevating the standard of scholarship in our institutions of learning.

It might be urged, as an objection to our plan, that American colleges are not intended to foster independent scientific research, like the German universities, but are merely training-schools for young men in the ordinary branches of knowledge. "We have no need of professors," it might be said, "such as Draper, Marsh, and Whitney, who lead the vanguard of knowledge, each in his own specialty; and the kind of men we do need,—men who are fairly well-versed in various sciences and languages, and are capable of imparting what they know,—a president and a board of trustees are fully capable of selecting without the aid of any learned body." It is of course difficult to answer those who take this position; but we are very confident that, among the friends of our great universities, there is scarcely one who would avow such an opinion. It is a generally admitted fact that we have outgrown, or are daily outgrowing, the old English college system, in conformity to which our older universities were modeled. Harvard to-day resembles Berlin more than it does Oxford; Cornell and Johns Hopkins are fashioned rather after German prototypes; and Yale every year makes generous concessions to the scientific spirit of the age. If this evolution toward higher and more useful forms is to continue, the demand for eminent specialists in professors' chairs will be increased rather than diminished; and the professor of the old-fashioned type, who took to teaching as a *pis aller*, because he saw small chance of success in the law or the ministry, will have to limit his aspirations to grammar-schools and seminaries. It is as a means of facilitating this development that we have recommended giving the faculties a consultative voice in appointments. We are far from expecting, from the adoption of the measure, any sudden and radical change in the character of the teaching body in our institutions of learning. That, however, in the great majority of cases it would exert a gradual and wholesome influence in the right direction seems scarcely to admit of doubt.

The experience of the medical schools that have tried the experiment with questionable success need not discourage any one. Professional jealousies are apt to influence medical men to an extent which is rarely observed among scholars, and their continual rivalries frequently vitiate their judgments of each other, and

make them more willing to recognize the merits of an inferior than those of an equal. Under such circumstances, it is scarcely strange that their selection of colleagues should, in many instances, have been an unfortunate one. College professors are rarely placed in such direct antagonism to each other, and there are good reasons for believing that they would show themselves capable of a comparatively unbiased choice.

The Real Basis of Party Harmony.

A GREAT deal has been said of late about the importance of harmonizing the Republican party. The party was defeated last year in several States where it had been accustomed to win, and disastrously so in the State of New York; and this defeat was undoubtedly due to the dissensions in the party ranks. Meanwhile, the near approach of a Presidential election renders it of vital importance to the party leaders and those who live by politics to have their party in a condition to win, and this is impossible unless the differences that exist within it can be in some way removed. These differences are in part of a factional character, and it seems to be the factional quarrels alone that the politicians are concerned about. The remarks that have appeared on the subject in the newspapers, and the various plans that have been proposed for securing the harmony desired, all have reference to these factional differences, and it seems to be thought that if these can be removed, the union of the party will be effectually secured.

It has been proposed, therefore, that here in New York, where the dissensions in the party have been most bitter and their effects most disastrous, the party committees and associations shall be re-organized so as to admit the leaders of both factions, and that a convention of leading Republicans shall be held in the early summer to devise all necessary means for bringing the factional contest to an end. This plan for securing harmony seems to satisfy the organs of both the opposing groups, and it may be put in practice before this reaches our readers; and if it results as its authors believe it will, we may expect ere long to see Stalwarts and Half-breeds, Grant men and Blaine men, and all the other factions into which the party is now divided sitting together in harmony around the council table.

But meanwhile, the party leaders, amid all their efforts for harmony, have neglected to present any system of principles for their party to support. We beg, therefore, to remind them that, without such a system of principles to serve as a bond of union and a motive to action, no real harmony can be secured or would be desirable if it could be secured. The only use of a party is to be the exponent of some principle; and if a party cannot agree as to what principles it will advocate, it has no sufficient reason to exist, and must inevitably dissolve as soon as important questions arise and demand solution. A party, in the proper sense of the term, is a body of men who do agree in their political principles, and who combine in order the more effectually to carry them into practice. Unless, therefore, the Republican leaders can present a system of principles on which their followers will unite, their party will go to pieces at last, in spite of all efforts to save it; while, on the other hand, if harmony of views can be secured, mere factional differences will give little trouble.

Now it is notorious that, at the present time, the party has no principles at all, and it is hard to see what principle or what policy can be found on which its members can agree. The questions of most immediate importance in our public affairs to-day are those relating to the tariff, the civil service, and the government of corporations; and on all these questions the most diverse opinions prevail within the party ranks. On the subject of the tariff, the disagreement is as wide as it can be; for the party contains men of all grades of opinion, from extreme protectionists to extreme free-traders, so that it cannot take a decisive stand upon this question without alienating a large portion of its members. In regard to civil service reform, there is not much disagreement among the rank and file; and if the party leaders would take up this reform in earnest and make it a party measure, it would serve, for a time at least, as a real bond of union. But, unfortunately, on this question the leaders themselves are in disagreement with their followers; and even if they should suddenly change their attitude and become advocates of reform, most people, we fear, would doubt the genuineness of their conversion. These considerations show how difficult is the task of harmonizing the Republican party, and how futile is the attempt to do so by merely healing factional discords.

It must be remarked also that the Democratic party is in much the same predicament as its rival, and for the same reason — disagreement on matters of principle. Last year (rather prematurely, as it would appear from late events) it was announced amid general jollification that all differences in the Democratic ranks had been healed, and that Tammanyites and Tildenites, who had so long been at variance, would hereafter work together in harmony. But now the party has struck a rock in the shape of the tariff question, and is in imminent danger of shipwreck; the divergence of views that has been developed being quite as great as that existing among the Republicans. This experience of the Democrats ought to serve as a warning to the Republican leaders and to politicians generally, that the only sufficient bond of union in political affairs is devotion to a common principle, and that if they wish to win success they must get their principles first and their party afterwards.

Meanwhile, the people do not care whether either party is harmonized; they care only to have their government well conducted and its abuses reformed; and if neither of the existing parties will do this work, they will readily provide a new one that will. What we specially need in our public affairs is a party of progress and reform — a party that will not sit lazily down, content with its past achievements, as the Republicans have of late been doing, nor resist important reforms, as the Democrats have too often done; but which will be ready at all times, wherever abuses exist or injustice is committed, to act with energy in the work of reform. The Republican party has done good work of this sort in years past, and if it will continue to do so the people will sustain it; if not, it must soon pass away to make room for some other organization which will better serve the interests of a progressive civilization.

The Greatest Need of the Working Class.

It would seem that the working classes, in their endeavor to improve their lot in life, have largely misdirected their efforts, by seeking too exclusively to increase their income instead of trying to get more happiness out of the income they now receive. For a generation past, the workingmen of all civilized countries have striven by every means they could devise to raise their wages, in the evident belief that wages could be raised even in opposition to economic forces and natural laws, and in the further belief that a sufficient increase in their income was the one thing needful to make them happy. In these endeavors, too, they have had the sympathy, and, so far as possible, the assistance of their friends in the higher ranks of society; and so exclusively have the efforts of both been turned in this direction that the "labor question" has come to be almost synonymous with the question of raising wages.

Now it is certainly desirable that the incomes of the mass of men should be increased wherever an increase is possible, and it is specially desirable in the case of manual laborers, whose present incomes are so small. But it is clear to all instructed minds that the machinery of trades-unions and strikes, and schemes for state aid to industry, and all the other devices that have been proposed to increase the laborer's earnings can do comparatively little toward accomplishing their purpose, and the history of the past thirty years shows very clearly that they have done but little.

The trades-unions, indeed, by organizing the workingmen and enabling them to act in concert, have made the class more influential and more respected by other classes; and this result is worth something in times like these, when associated action is becoming essential in all departments of affairs, and when isolated effort is in general of little avail. But if we ask ourselves what the unions have done toward raising the rate of wages, we must acknowledge that, if they had accomplished nothing except in this direction, they would hardly be able to justify their existence.

Some friends of the workingmen, especially professed economists, seeing that any considerable increase in their wages was not to be looked for, save as a result of the general advance in civilization and their own self-improvement, have urged their adoption of the coöperative system as the best means of increasing their income and improving their condition. Unfortunately, however, the result of most of the experiments in productive coöperation has not been such as to raise high hopes of accomplishing much during the present generation in this direction, for only a few of them have been markedly successful.

But still it is urged that the way to increase the laborer's happiness is to increase his pecuniary means, and some persons even talk as if the increase of means was in itself the chief happiness to be desired. So the laborers are told that they must save as much as possible of their earnings and thus obtain an addition to their income from invested capital. Now every man ought to save something for unprosperous seasons and for old age; but the amount that a workingman can save is small, and the interest it will yield is but a trifle, and unless he has the mercantile talent, so as to engage in business for himself, there is no good reason why he should deny himself all the comforts of life in order to accumulate this little capital. Capital is only a means to an end; and if a man is to spend his whole life in accumulating the means without ever enjoying the end, what is the good of the means?

It seems to us that what the workingmen most need, for the present at least, is to learn better how to use the income they now receive. Of course, if a man only earns enough to furnish himself and family with the bare necessaries of life, he can do little toward improving his lot till he has more pecuniary means. But many workingmen earn more than enough for the necessaries of life, and are able to procure some of the comforts and even luxuries also. But in choosing the kind of comforts and luxuries they will enjoy, the mass of workingmen are apt to show little wisdom; and it is here that the greatest improvement in their affairs is to be looked for. They are apt, especially the more ignorant of them, to prefer the coarser pleasures to the more refined, and the transient to the enduring; and it seems to us that by the choice of higher and more enduring pleasures, and by greater wisdom in using the means they have to secure such pleasures, their happiness can be best promoted.

What are the purposes to which workingmen apply their surplus means? Many of them, it is true, save something for investment, and many also in this country purchase a cottage to be their home, and to secure such a home is one of the best uses to which their money can be put. But if we consider the pleasures that workingmen generally choose, when they have the means to procure them and the time to enjoy them, we shall find few among them that any person of refinement would enjoy, while we shall find some that are positively hurtful and pernicious. In the first place, we know what enormous sums many of them spend for liquors and tobacco, things which, even when moderately used, yield but a transient pleasure and no real benefit at all. Not that all workingmen are addicted to dram-drinking, as has sometimes been charged; on the contrary, most of our native American laborers are temperate in this respect, and the ranks of the total abstainers have been mainly recruited from this class. But among the foreigners who have settled in this country the habit of drinking, even to excess, is widely prevalent; and we cannot see that men who indulge in this habit are entitled to much sympathy in case they find their income insufficient, after supplying them with grog, to purchase the ordinary comforts of life.

Again, the amusements of the working classes are often of a low and even vulgar kind; and one of the greatest improvements in their life would be the adoption of some more refined enjoyments in place of the vulgar shows, the trifling sports, and the insipid reading in which they now indulge. It is true that, in this respect, the whole American people need refining and elevating, and not the working classes alone, for many of our richest men show little more ability to amuse themselves in a refined and sensible way than the workingmen do. But the rich can, in a pecuniary sense, better afford to throw away money on unrefined amusements and vulgar display than workingmen can, for their means are sufficient to admit of some waste; whereas the workingmen, if they are to get the greatest possible happiness out of the means they have, must studiously avoid all expenditure for things

of no value, or they will have nothing to spend for those finer pleasures which are so much better and more enduring. There has been of late years, we are glad to say, a considerable advance in this respect among the workingmen, as seen especially in their increased attention to music, art, and to the cultivation of flowers; but a vast deal more remains to be done to raise the amusements and recreations of the laboring class to the standard required by a cultivated taste.

But the most important source of happiness of a cheap yet elevated kind is to be found in reading, affording as it does both amusement and instruction; and whoever can lead workingmen to a better practice in this regard will render them an inestimable service. A taste for reading, indeed, is even now rapidly spreading among the better portion of the working class, and this is in itself an encouraging sign; but the reading is often so low in quality, so little able to amuse or to instruct, that the benefit obtained from it is but trifling in comparison with what it ought to be. Workingmen read the newspapers, and thus become familiar, to a certain extent, with the course of affairs throughout the world; but the quality of the newspapers they often read shows at once the poorness of their literary taste and the meagerness of their information. Besides the newspapers, their principal reading is fiction, and this rarely of the best; while of the vast stores of information, historical, biographical, scientific, and other kinds, which English literature contains, their knowledge is in general of the most meager sort. Yet the majority of working people have abundant time and energy for the prosecution of such reading, and only need to form a taste for it in order to obtain a pleasure of the noblest kind.

Finally, the working classes can secure a great addition to their present enjoyments by cultivating among themselves a more refined society and gentler manners. There has been already a noticeable improvement in this respect among our native workingmen especially, and the manners of many of them will now compare favorably with those of the business classes; though it must be added that the manners of the business classes themselves admit of no little improvement. But among a certain portion of the working class, very abundant in the city of New York, manners seem to be an unknown art, while society, in any proper sense of the term, would appear to be an impossibility. Yet there is no good reason why the manners of working people should not be refined and agreeable; and with better manners and the wider information and quickened intelligence that would come by better and more extended reading, the working people might do much to improve their social surroundings.

We have thus noted some of the ways in which working people can, if they will, obtain a far higher order of happiness than they now enjoy, with little or no increase of expense. Some of the pleasures which the rich man enjoys are and must remain beyond their reach; the spacious halls, the costly furnishings, the expensive journeys and other pleasures which only wealth can afford, can never be theirs, and it is vain to sigh for the unattainable. But the pleasure and improvement that come from reading can be cheaply obtained by means of circulating libraries; many refined amusements cost little more than vulgar ones do, while the pleasure that comes from good manners and good society can be had without any expense at all. When we compare the life of an ordinary mechanic with that of a country clergyman who earns but little more; when we see the latter with his books, his universal interests, and his refined society; the former with few books, and those not of the best, with his vulgar amusements, and his unsatisfying society, it seems too obvious to need pointing out that what the working classes most need is not to get more money, but to learn how to get more happiness by means of the money they now have.

OPEN LETTERS.

A Study of Sea-sickness.

When a landsman perambulates the hurricane deck during his first few days at sea, his feet come down upon the deck with a force and emphasis quite in contrast with the quiet glide of an experienced seaman. This stamping upon the deck means that, in addition to the five senses commonly known, there is also a muscular sense, which is one of the most important of them all. Through the influence of this sense, as one walks under accustomed conditions, he directs the muscles engaged in walking in a manner almost automatic, and the nervous supply to the muscles engaged in the act of locomotion is quite exactly proportioned to the amount of muscular force demanded. But if the conditions are unfamiliar; if, for instance, the surface beneath the feet rises and falls in an irregular and quite unexpected manner, there is too much nervous stimulus applied to one group of muscles and too little to another, and hence the muscular contractions are too great in one direction and too little in another. First, then, one foot comes down with an excessive muscular impulse, against a rising deck; then, the muscular sense giving alarm, an insufficient impulse is given to the other, which is now approaching a receding surface, and it fails to reach the deck by the muscular action of stepping, and the weight of the body coming upon that side, forces the foot down by gravitation; hence, one step is a stamp and the other a fall. All this is perplexing and disappointing to the nerves engaged in the act of locomotion, and the nervous centers which control the muscular impulses are irritated and exhausted.

Every one remembers having in the darkness made muscular preparation to step up or down where no step existed, and how this disappointed muscular action was accompanied by both mental and physical perturbation; how the face was flushed, the heart palpitated, and the breath came rapidly. This, on a different scale, is what happens at almost every step to the novice on the steamer's deck. It is not remarkable that such a series of little nervous shocks should react upon the nervous centers, and induce disturbance of circulation or revulsion of the digestive organs.

While the function of locomotion is by no means the

most important one in inducing the nervous disturbance of sea-sickness, it is an important element, especially during the first few days of ship life. This fact may be verified by any one susceptible to sea-sickness who will leave the deck or saloon, where walking or sitting may be accompanied with little inconvenience, and pass along one of the narrow passages leading between the rows of state-rooms. One who can traverse the deck with courageous defiance of sea-sickness, will, in the narrow passage, often turn pale, and experience a most unpleasant weakening of the knees. The reason is that, in making one's way along the narrow passage, there is an earnest endeavor to keep the body in uniform relation to the sides of the passage. On deck, however, the steps are directed in devious ways, and the body sways freely from side to side. Hence, on deck there is much less restraint and tension, and therefore fewer muscular disappointments.

But it is known that one may sit quietly in a steamer chair or lie in a state-room and still experience all the horrors of *nausea marina*. Another source of nervous perplexity, then, of no small consequence, will be found in the inclination to breathe synchronously with the swing of the vessel. We are all familiar with the instinctive act of making long and full inspirations and expirations as one rises and falls in a swing. If the ship's motions were only in one direction, and if they were uniform in time, they would produce in one sitting on the deck, or reclining in a berth, the same agreeable effect as the swinging of a hammock on shore; but unfortunately there are too many elements of disturbance in the rhythm of the ship's movements to react in such an agreeable manner.

It is not during the storm, when mountain waves lift the prow of the vessel now high in the air, and now plunge it as though it were steered for the ocean's bed, that sea-sickness most prevails. It is the chopping sea after the storm that conquers the stomach of even the weather-worn sea-farer. One may look across the deck of a ship from side to side, and beyond to the horizon, in such a way as to mark the motion of the vessel as it rolls. Perhaps it will be found that with each roll the ship's side rises and falls through a space of ten or more feet, yet the motion is so agreeable that no one on board is sick, and none but those who are watching even think that there is a roll. But if, an hour later, the ship has entered a chop sea, caused by a change of wind or a current, the ship's roll may be less than half what it was before, but more than half the people on board are thinking of their stomachs. The unenviable notoriety of the English Channel, as a region where the stoutest knees tremble and the ruddiest faces grow pale, arises not from any superiority in the height of waves, but from their unequal character. When the ship rolls regularly, once in so many seconds, the people breathe regularly; but when the ship's motions lose uniformity, the irregularity in performing the function would be a sufficient cause for general nervous disturbance.

Many years ago, Dr. Darwin, in stating his views of sea-sickness, declared that disturbance of the visual function was the cause of the trouble. His opponents, however, met him with the statement that a blind person could be sea-sick, and as Dr. Darwin could not gainsay the fact, his theory was not considered sound, and it practically dropped out of sight. There was, nevertheless, more truth in Darwin's view than his opponents were willing to concede. He was correct in his opinion that visual disturbance could produce sea-sickness. But as comparatively little attention had at that time been directed to the muscular adjustments of the eyes, it did not occur to him that muscular confusion in adjusting the eyes, or other organs, would bring about the nervous reactions which he was considering.

When the eyes are directed to an object they are automatically adjusted, not only in their focus individually, but in their relations to each other, so that the most perfect image may be obtained, not only in each eye, but in corresponding parts of the retinæ of the two eyes; thus not only is each eye adjusted to the object, but a stereoscopic effect is produced. These various adjustments are performed through the instrumentality of a series of muscular contractions, and hence the act of looking at an object is an exceedingly complicated one, bringing into play many muscles and nerves. When one is upon the solid land and changes his gaze from one object to another, the adjustment is completed in harmony with the movements of all the other muscles of the body, and with the experience of the individual. The adjustments are, in an emphatic degree, automatic; and if the changes are not too sudden or unusual, the sensation is agreeable. On shipboard, however, the relation of objects to the eyes is constantly changing. If the changes were uniform, the ocular muscles and nerves would soon accustom themselves to the new state of things, and act regularly and with ease. Owing, however, to the constantly varying relations of things at sea, this complicated system of muscles is in an unceasing state of perplexity. Many persons will experience a sensation of discomfort, and even nausea, when looking at a curtain or scenic fixture at a theater if a current of air causes either to fluctuate in an unsteady or unexpected way.

It is this perplexity of ocular muscles which renders the state-room the most unpleasant part of the ship to the sea-sick subject. On deck or in the large saloons, the eyes, being directed to distant objects, are adjusted with comparative ease. In the state-room, however, all objects are seen at close range, and the acts of accommodation, and of corresponding movements of the eyes, must be sharply and quickly performed. Hence, in the act of dressing, when one looks at articles of wardrobe, at buttons and other small things, and especially when one looks in the little state-room mirror, the head swims, the face loses color, and nausea quickly supervenes.

No other examples need be adduced to show that sea-sickness is a direct result of muscular disappointments and nervous perplexities, arising from the unaccustomed efforts to regulate certain functions with respect to the novel and extremely unsettled state of things on the ship.

Accepting this proposition, we are in position to inquire what can be done to mitigate or prevent the evil. Sea-sickness, probably, can never be abolished; but it is not unreasonable to expect that its effect and duration can be greatly modified. In considering preventives, attention should be first directed to general conditions and precautions. From what has already been said, it is evident that sea travelers are subjected to very unusual demands upon their nervous energies. Hence, advantage should be taken of every circum-

stance calculated to increase the nervous power, and everything tending to depress it should be strictly avoided. Abundance of oxygen in the lungs, a cheerful state of mind, and sufficient physical exercise, all tend to an increase of nervous power; while a vitiated atmosphere, a despondent state of mind, and the use of improper foods or the improper use of drugs, tend to depress the nervous forces. No drug will prevent sea-sickness, except so far as it acts by blunting or destroying nervous susceptibilities. Most people who cross the ocean do it in the hope of renewing and increasing their store of nervous energies. Nothing could be more illogical than to commence this process by depressing the nervous functions by the use of stupefying drugs. It may, under extreme circumstances, be better to use a medicine for temporary relief than to suffer from excessive nausea, or from those other forms of sea-sickness, headache, dyspepsia, or diarrhea; and it is proper that one should be provided with a small quantity of bromide of ammonium, which is the most effectual means of temporary relief to nausea or headache, and with such medicine as may be needed to arrest serious disturbance of the digestive organs. These should be used only as occasion absolutely demands, and not as preventives.

Again, the diet on shipboard should correspond as nearly as possible with what the individual has been accustomed to at home. Many persons take wine on shipboard as a preventive of sea-sickness. If one is accustomed to wine at dinner when on shore, the fact of being on the ship is not a reason for changing the habit; but if one is at home an abstainer, he would be much better off without wine on the voyage than with it. Champagne is extremely liable to induce dyspepsia at sea, and is often mischievous in its influence. The same may be said of lemons and of other acids which are sometimes recommended.

Another precept which should be earnestly impressed upon every person who goes to sea is, that no one, merely on account of sea-sickness, should keep the state-room during the day. No matter how severe the illness induced by the vessel, the traveler should leave the stifling air of the state-room, and inhale the fresh breeze upon the deck, if the weather permits; or, at least, in bad weather, enjoy such freedom of breathing and of movement as may be obtained in the saloons.

In regard to the function of locomotion, the sooner the muscular sense of the feet and legs is educated the better. The mental and muscular exhilaration incidental to walking, running, or dancing upon the deck, will more than compensate for the disturbance caused by the difficulties of locomotion at first experienced. The most deplorably sea-sick individual can leave the steamer chair long enough to take a run from one end of the ship to the other, and the excursion will repay the effort, which should be renewed at least every hour or two of the most disconsolate day of the voyage. But in short trips, as in crossing the English Channel, the more completely the locomotive faculties are suspended, the less disagreeable will it be for the individual.

Strict attention should be directed to the state of the respiration. Many a threatened sickness may be averted by drawing a few deep, full inspirations at regular and rather rapid intervals. One who is overtaken by sea-sickness, while lying quietly in the berth in the darkness of night, may be quite sure that he or she is breathing in the same unsteady manner in which the ship is moved upon the water. If the sufferer, at the first premonition of sickness, would rouse sufficiently to attend properly and earnestly to the breathing process, it is probable that the nausea would pass away as suddenly as it came. Under all circumstances, then, the breathing should be strictly dissociated from the motions of the ship. By attention to this precept for a short time, varying from one to three or four days in different individuals, the respiratory acts will become quite independent of external influences, and will be carried on in the accustomed and regular manner, without further thought on the part of the traveler.

It would seem less easy to regulate the function of vision at sea, yet much may be accomplished in this direction, and as in the case of breathing, after some attention during the early part of a voyage, the function will be managed without an effort of will. When on deck, the view should be directed to the distant sea. When reclining in the steamer chair, one should look at the clouds, or the horizon, and in walking the gaze should not be fixed upon the objects passed. In conversation, the eyes should not be directed to the face of the person conversed with. In the state-room, the eyes may be directed indifferently about the place, and while dressing and undressing they may be closed, except when it is necessary to find an article wanted. The greatest difficulty will be experienced at the tables in the dining saloon. The popular idea that the almost universal desertion of the tables during two or three of the early days of the voyage is owing to the odor of food, is largely a mistake. The great source of trouble is, that at the table one looks at plates and dishes intently, and for a considerable time, at very short range. The act of seeing, under the circumstances, demands, for perfect vision, that all the muscles of the eyes shall be on the alert, and at this short range the greatest tension is demanded. The perpetual changing of relative distances from the eyes of the articles upon the table, renders each new adjustment unsatisfactory as soon as it is made. But the function of adjustment may be so suspended that objects will be seen only in the most vague and indistinct manner. By thus suspending the faculty of accommodation at table, one may go through a meal scarcely seeing any object with greater clearness of vision than is absolutely necessary for finding the articles needed.

It is supposed that young children are less susceptible than grown persons to nausea at sea. An explanation is found in the fact that there exists in them a much higher degree of muscular adaptability and flexibility of tissues. Especially in children is the function of accommodation of the eyes accomplished with far greater ease than in adults. On the other hand, aged persons enjoy comparative immunity from sea-sickness, though in this respect they are less fortunate than children. In the old, the function of accommodation of the eyes is usually so completely suspended that they make less effort in that direction, and hence experience fewer disappointments from that cause. Those persons who have weak or disproportioned ocular muscles may find greater trouble in managing the accommodation of the eyes than others, and in those

cases the susceptibility to sea-sickness may be greater than usual, and may continue even after considerable experience at sea. On the contrary, if the muscular insufficiencies are so great that it is impossible for the eyes to act together, there may be little irritation arising from the visual function.

Sea-sickness, then, is the result of reflex irritations arising from little surprises to the muscles, and shocks to the nerves engaged in performing certain important functions,—notably of locomotion, respiration, and vision,—and when the groups of muscles thus engaged are once educated to the surrounding circumstances, the nervous revulsions are not experienced. Proper attention to the exercise of these functions may so far mitigate the trouble as to make it rather an inconvenience than a distressing illness. Let it be distinctly understood that medicines can only prevent sea-sickness by inducing nervous insensibility, and that such a stupefying process is directly opposed to the object of the voyage when this is undertaken for the promotion of health. Every article of diet likely to disturb the digestive organs should be avoided, and an abundant supply of oxygen should be inhaled. The feet should be educated, the respiration regulated, and the vision restricted. If close attention is given to these directions, little fear of serious sickness need be apprehended; and a voyage which might otherwise be remembered with the most disagreeable associations may be rendered a season of almost uninterrupted enjoyment

George T. Stevens.

Free Trade with Canada.

It seems to me strange that the question of an American zollverein was not brought prominently before the Tariff Commission. The people of the United States have been so educated to a belief in protection that it would be folly for any political party to work seriously for free trade or a tariff for revenue only, but a change might, perhaps, be made which, while seemingly a concession to the free-traders, would in reality strengthen the protective character of the tariff. A protective tariff should be a discriminating tariff, so arranged as to shut off the competition of strong manufacturing nations, while encouraging trade with countries likely to afford a market for manufactured products. The United States have nothing to fear from the competition of Canada or Mexico, and free trade with them would give American manufactures a greatly extended field. American capitalists are now interesting themselves in the development of Mexico, and a great deal of attention has been paid, of late, to the resources of that country; but the prevailing feeling with regard to Canada is one of indifference, occasioned by ignorance of its resources.

To the average American, the name of Canada calls to mind a narrow strip of inhospitable country lying to the north-east of the United States, and inhabited by an unprogressive people. It is now, in fact, the name for the whole of British North America, extending from the Atlantic to the Pacific,—a territory almost as large as the whole of Europe, rich in minerals, and possessing the finest fisheries and the largest area of land adapted to the production of first-class wheat in the world. The most fertile part of Canada lies in the north-west, although the crop reports for 1882 show a higher yield of wheat per acre in Ontario than in any of the American states. Over the whole of the Canadian north-west territory, formerly known as the Hudson Bay territory, from the American boundary, line forty-nine, to latitude sixty degrees, the same flora prevails, and there is little difference in the climate, although it becomes warmer toward the west on account of the Chinook breezes which come through the passes of the Rockies and cause a rise of sixty degrees in the temperature in a few hours. The valley of the Peace river, twelve hundred miles north-west of Winnipeg, is said to have a finer climate than Manitoba. In explanation of this uniformity of temperature in such a wide range of latitude, Professor Macoun says: "It was long ago asserted as a principle by geologists, that land in quantity situated to the southward of latitude forty degrees north, very materially raises the temperature of lands lying to the north of such parallel." He gives meteorological tables showing that there is almost no variation in the temperature between forty-nine and sixty degrees, and that the climate compares favorably with that of European countries in the same latitudes.

Almost the whole of this vast territory will yield from twenty-eight to forty bushels of wheat per acre. United States Consul Taylor, who has made a study of the Canadian north-west for years, has gained for himself the nickname of Saskatchewan Taylor, on account of his praises of the section of country bordering on the Saskatchewan river. He says three-fourths of the wheat producing area of North America lies within the Dominion of Canada. The Canadian Pacific Railway is being pushed through to British Columbia with an energy almost unparalleled in railway construction; and during the last three years, Manitoba has been filling up with settlers almost as rapidly as the Western States did in their most progressive days. Already a prosperous trade has grown up between this part of Canada and the cities of the eastern provinces, Winnipeg alone purchasing $12,000,000 worth of goods from them last year. As Manitoba and the north-west territory become thickly settled, and the wonderful resources of Canada's most western province, British Columbia, are developed, this trade will grow to enormous proportions. At present, most of the settlers are Canadians and Europeans, but the time will come when the stream of migrants from the Eastern States will be diverted to this region, and then, unless free trade prevails, the United States will experience what Canada did during the rapid development of the Western States,—a loss of population without any compensating advantages in the way of trade, while eastern Canada will be built up by the trade of the north-west.

But remove the tariff wall between the two countries, and the bulk of this trade may be secured by the United States, for settled Ontario is separated from Manitoba by a stretch of one thousand miles of rocky country, enormously rich in minerals and timber, but almost useless for agricultural purposes, while the territory of the United States is well settled to the borders of Manitoba. Chicago is many miles nearer to Winnipeg than Toronto, and St. Paul and Minneapolis are nearer still. These cities could control most

of the north-west trade, if the tariff were abolished, and the cities of the Eastern States could compete on equal terms with those of eastern Canada.

Of course, this would not prove advantageous to eastern Canada, whose growth would be greatly retarded. The effect it would have upon the north-west is not so apparent, but it would certainly strike a blow at the future greatness of Winnipeg, Manitoba's chief city, which has in four years grown from a straggling village to a flourishing modern city with a population of about 30,000. So long as the protective tariff is maintained, and the Canadian Pacific Railway does the carrying trade for the north-west, Winnipeg will be the gate-way of western Canada, and, controlling the trade of the largest wheat producing area in the world, will become a second Chicago. Already some of the manufacturers of Ontario, to save the expense of carriage, have started factories there, and others will doubtless follow suit. With free trade between the two countries, Winnipeg would have few if any advantages over St. Paul and Minneapolis as the distributing center of the north-west, and would be exposed to competition not only with them but with Chicago.

Appearances would indicate that Canadians are strongly imbued with the protection idea, as at the last two elections, when it was made the issue, the conservatives favoring and the reformers opposing it, a large majority of the former were elected. But many of those who voted for protection did so merely with a view to forcing the United States, by retaliation, to entertain the idea of reciprocity. Americans could rely upon the full support of the reformers, with a liberal sprinkling of conservatives, in negotiations for free trade; and, as many of the conservative members were elected by small majorities, a slight change in public sentiment might make a great change in parliamentary representation. The conservatives themselves could consistently favor an American zollverein, for many of their leaders and newspapers expressed themselves in favor of actual free trade, but opposed the one-sided policy that would confer upon Americans favors which they refused to Canadians. But that was before the north-west trade had developed; and as the policy of the present Government is to build up trade between the provinces, they might with reason object to a measure that would divert trade to the United States. The Canadian customs act of 1879, now in force, provides for the admission of natural products free of duty whenever the United States are willing to reciprocate; and the people of Montreal favor the abolition of the duty on grain in any event, as a great part of the grain export trade of the Western States is lost to the city, it is claimed, on account of the bonding system.

Watson Griffin.

A Novel Suggestion Concerning Prisoners.

A PLAN which is believed to be new, and which appears to have great merit, has been proposed for the reformation of prison discipline. It has been proposed * that prisoners shall be paid for the labor which they perform; that, so far as may be, there shall be no restriction of the industries or honest occupations which prisoners may follow; that they shall be allowed to engage in trades and industries on their own account, and that they shall even be permitted to traffic with the outside world so far as may be compatible with insurance against escape and the commission of frauds or other unlawful practices, and that all prisoners shall be entirely dependent upon their industry for their living and comfort except in cases of sickness or other disability; that they shall support themselves by their labor, be entitled to the savings of their labor, and grow rich or remain poor by their labor; in fine, that true individual liberty be not only taught but enforced when the State by the sequestration of criminals has put it out of their power to be a present danger to society. It is proposed to teach criminals, by experience, the true meaning of liberty; to impress upon the past enemies of order the habits of thought and action which it is desired they shall acquire, by giving them a practical experience of the value to the individual of harmonious society.

Whenever society undertakes to punish offenders, it acts purely and simply for its protection. The idea of offense has its origin in the idea of danger, and even in the days when punishments were most cruel and brutal, protection was, as it ever must be, the ultimate purpose—else why have supposed offenders always been selected for punishment? Short of killing, sequestration is the most sure and obvious means society has of protecting itself from offenders, and as the humanizing influence of civilization extends itself, it is not unlikely that the mildest method of producing any desired result will always be the one employed. For our present purpose we may say that, with few possible exceptions, sequestration is so far as it is necessary and therefore so far as it is right or desirable for society to go in its dealing with individuals. Liberty, however, is so highly prized that society condemns the securement in all cases of perpetual protection by means of perpetual imprisonment, and hopes by the application of other measures to induce criminals to change their ways. The question, then, is, How shall the State deal with the criminal during the term of sequestration which it sees fit to impose, in order that the effects of that sequestration shall be as good and permanent as possible? How shall society treat those whom it has imprisoned for acting in a way it thinks injurious to its interests, so that they may come to think as society thinks upon the matter? What is the most efficacious way of making the bad see that it is for their interest to be good, of counteracting the effect of the first downward step of those who have yielded to temptation, of raising from wretchedness those who are more unfortunate than vicious; who are criminals, because, perhaps, they were almost born criminals and into whose hearts the warm light of sympathy and human affection has never entered, or may only have been seen at the most, with the agony of despair, beyond their reach?

Is the mind enlarged or the nature softened by the deep brand of social stigma? Does the constant reminder given by the surroundings and the treatment of a condition of alienation from the world, without any evidence of kindness, sympathy, or human love from the world, tend to make the imprisoned criminal love the world? Where criminals are kept together in

* See two articles on Prison Reform in the Newport (R. I.) "Daily News," April 18 and April 20, 1883.

large numbers, each bearing the same iniquitous stigma, all being constantly made to feel that they and the world are at odds, is it natural that the sympathy among them in their common degradation should grow less; that the fraternity of wrong should be diminished, or that they should learn to love the power which holds them? Does unrewarding, undiscriminating, repressive and absolute slavery, upon a herding system, prepare the individual for a proper use of freedom? Is the habit of temperance in thought and action, and of regard for the rights of others, to be learned amid surroundings which are violent in their manifestations, and in which the natural rights of man are disregarded? In fine, is not experience alone the means of producing conviction upon the minds of the great majority of men? Must not the presentation of a theory be enforced by the demonstration of its truth before men will accept it, and does not the history of the world show that moral truth, which, in this case at least, means expediency, is only to be discovered and accepted as such by the demonstration of experience? Is not, then, that plan of conversion for criminals the best which will give to them a practical experience, which most of them have never had, of the ways in which men may live honestly and happily? If the exercise of true liberty be that which society wishes the criminal to learn, is it unreasonable to propose that he shall be taught the value of liberty by enforcing upon him an experience thereof? Or is a proper understanding of liberty more likely to be learned by adding to imprisonment all the incidents of slavery!

Let criminals learn the value of social order by giving them interests in prison, which will demonstrate to them the value of social order. If they may earn money they will probably be no slower than other mortals in discovering that the best way of keeping money is not by encouraging theft, robbery, and social confusion. If those criminals who, for great crimes, have been given long terms of imprisonment, have the opportunity, they will not be unlikely to avail themselves of it to make the lack of total freedom as bearable as possible by increasing their worldly possessions. They, then, the greater criminals, may become the strongest converts to social order, and may use their influence for its encouragement with those whose terms of imprisonment are shorter, and who will perhaps be a part of the world into which they themselves will one day go with their accumulated property. It seems hardly too much to hope that the ranks of crime may thus be attacked from within, and the axe laid at the root of the tree.

Charles Acton Ives.

A Piece of History Worth Writing.

If ever an author can be criticised for not making a different book from that which he professes the intention to make, Mr. Lewis Rosenthal may be suspected of having laid himself open to such a criticism in the second edition of his thorough and readable volume, "America and France," recently published by Messrs. Henry Holt & Co. He has proposed to himself to exhibit the influence which the revolt of the British colonies of America in 1776, and the popular government which they founded, exerted upon France during the remaining years of that century. His volume consists of a very exhaustive citation of facts and opinions drawn from the literature of that period. By stopping at this point he, unfortunately, not only fails to achieve the result at which, from the title of the book, we infer that he aimed, but he achieves exactly the opposite result. We infer that he wished to show, what undoubtedly can be shown, that France owns a large share of whatever liberalizing and popularizing influence her political institutions have experienced, since the accession of Louis XVI., to the establishment of popular sovereignty in America, and to her own part in bringing that result about. By stopping, however, as he does, at the downfall of Robespierre, Mr. Rosenthal establishes, if anything, precisely the contrary result. Balancing our accounts with France at the close of the eighteenth century, it would appear that all France got from us as the fruit of French contributions to our independence, was not popular sovereignty, not constitutional liberty, not peace, power, and prosperity, but fifteen years of Bonapartist ruffianism, terminating in a restoration of Bourbonism with seven other spirits of despotism worse than the first. What reflecting man who saw Louis XVIII. escorted through the streets of Paris by the allied armies, in 1814, if he had been compelled to judge by the events that were passed or passing, and had been forbidden to forecast the future, would not have been forced to the conclusion that, so far as France was concerned, the influence of American independence "was evil, and for evil only good!"

But I take it for granted that that is not Mr. Rosenthal's theory of American influence upon France. But if it is not, his book is incomplete. To judge the influence of the political experiment made in the United States in the eighteenth century upon France, by what it developed in France within that century, would be as illogical as to measure the influence of Christianity upon the world in the fifteenth century by the accession of the Borgias to the pontifical throne, or in the sixteenth century by the incorporation of the Society of Jesus. In fact, the influence of American political operations in the eighteenth century upon France have only become palpable and well defined since the War for the Union of 1861–5. Till then, our republic was generally regarded by Europeans as an experiment which would be soon overtaken by the disasters which had in turn overtaken all the so-called republics of antiquity.

The result of that struggle completely changed the opinions of thinking men of all parties upon that point, and it would be no exaggeration to say that no constitution in Europe was, at the close, what it was when the war commenced. Since then the prejudices of the privileged classes, and of the disciples of the doctrines of Divine Right and of Passive Obedience, have been constantly weakening, while the faith of the people of Europe in man's right to share in the government which he pays for with his treasure, and is expected to defend with his blood, has been constantly and rapidly strengthening. The extinction of Bonapartism and the formation of a government of the people, by the people, for the people, in France within five years after the triumph of the Constitution in the United States, in 1865, was more directly the fruit or logical consequence of American Independence than the French Revolution of '89 was; while the latter and

its disastrous sequence were more directly the outcome of an inevitable reaction against despotism in church and state, the credit of which is usually ascribed to the encyclopedists or the *philosophes*, as it is the fashion to call them in France.

Hence we say, with the highest appreciation of what Mr. Rosenthal has already done, that his work is incomplete. He has not yet achieved what the title of his book justified us in expecting of him. However, "a work well begun is half done," and this is well begun. He evidently is fond of his subject; he is not afraid of labor; and he knows how such work should be done. We therefore call upon him to prosecute his theme. Let him show how the death of Lincoln produced an emotion in France never manifested at the decease of any European sovereign. Let him show how promptly, after the news of General Lee's surrender, in 1865, the French Army moved precipitately out of Mexico, deserting the "chromo" emperor it had planted there; how the blow thus given to Napoleon's prestige in France compelled him to a transaction with the opposition, and to concede to their importunities a free press and parliamentary government; how this concession compelled him, in order to divert the attention of the press and the tribune from the past and to prevent too close a scrutiny of his own title to the crown he wore, to plunge headlong into a war with the first military power in Europe, and within a twelvemonth to exchange his palace for a prison; how, during that war, the diplomatic concerns of her powerful antagonist were confided to the Minister of the United States in Paris, as the only one of the nations whose authority was sure to be respected; how, upon the downfall of the empire, a popular government was organized in France upon the Jeffersonian model, which has lasted already longer than the average governments of France for the last two hundred years, and which has to-day as good a prospect of longevity as any government in the world.

With these facts, and others like them, of scarcely less critical significance which abound, Mr. Rosenthal, with his thoroughness of research, his judgment in selection, and skill in presentation, will demonstrate as he claims to have already but has not yet demonstrated, "that the people of the United States may feel justified in the belief that they have fulfilled the great law of compensation, and have amply repaid the debt of gratitude which they owed the French nation for services rendered in the War of Independence."

Woodman's Portrait of John Brown.*

NORTH TOPEKA, KANSAS, October 30, 1882.

EDITOR CENTURY MAGAZINE.

MY DEAR SIR: I have just received yours of the 24th ultimo. My portrait of John Brown was painted at the suggestion of Colonel A. G. Hawes, of San Francisco, who was with Brown in the Ossawatomie fight. Colonel Hawes told me that no good portrait of Brown existed; that the ones with the beard did not look like him, and that those without were characterless. On my way east from California, I visited the Historical Society Rooms here in search of information relating to likenesses of Brown, and the Secretary, Judge Adams, showed me the pictures of Brown in his possession; but they made no impression upon me until he finally produced from a long neglected drawer an old photograph which had been sent, among other effects of Governor Thayer, to the society from Boston. Using this as a basis upon which to build, I added to it every essential point of likeness in the others, and produced the portrait from which the photograph was taken which you now have in your possession,—aided by my memory of Brown, with whom I once held a very animated conversation in the hallway of Cooper Institute years ago, when I was not much more than a boy. * * * * *

Truly yours,

Selden J. Woodman.

KANSAS HISTORICAL SOCIETY,

TOPEKA, KANSAS, October 31, 1882.

EDITOR CENTURY MAGAZINE.

DEAR SIR: The photograph which Mr. Woodman used as the principal basis for his portrait of John Brown was procured by the Kansas Historical Society with the collection of the materials of Kansas History made up by Dr. Thomas H. Webb, of Boston, who was the Secretary of the Kansas Emigrant Aid Company, which was organized through the action of Hon. Eli Thayer, of Worcester. That company was very influential in promoting emigration to Kansas throughout the Territorial period. Captain John Brown, Jr., when visiting the rooms of the State Historical Society three years ago, remarked to me that the photograph was an excellent likeness of his father. I saw Captain Brown in 1856, when he was shaven, and this picture is the only one of many which I have seen that recalls his features to my memory. I regard Mr. Woodman's portrait as an excellent and characteristic likeness of Captain John Brown as I saw him.

F. G. Adams,
Secretary.

DANVERS, 8 mo., 16, 1882.

MY DEAR FRIEND: Thy portrait of John Brown is by far the best I have ever seen. It is the *man* — not only the physical man, but his inner self also. It is him at his best and truest.

Thanking thee for the picture, I am

Very truly thy friend,

John G. Whittier.

To Selden J. Woodman.

I have seen Mr. Woodman's portrait of my husband. I think it a very good likeness of him, and the more I see it, the more I like it.

Mrs. John Brown.

TOPEKA, KANSAS, November 15, 1882.

DU MAURIER'S DRAWINGS. We wish to state that while we were indebted to the publishers of "Punch" for the right to reproduce certain drawings by Mr. du Maurier in our May number, the drawings themselves are the property of the artist, and were by him kindly lent to us for reëngraving.— ED.

* See frontispiece.

BRIC-À-BRAC.

To John Burroughs.

(After reading "Signs and Seasons" in the March CENTURY.)

THE genial John Burroughs is racking his brain
For a token that spring-time is coming again.
"*Quod primum?*" he queries; and I am the man, sir,
Can give him an incontrovertible answer.
The very first thing in the coming of spring,
Ere crows or musquitoes are out on the wing:
My little white mare
Is shedding her hair.

Ere *Alnus incana* hath opened a scale
Of her staminate catkins' impervious mail;
Ere sweetness doth trickle from *Acer saccharinum*,
My whiskers are grisly with pony's white hair in 'em.
My coat-sleeve will show it; my beaver also;
And neighbors and patrons will each of them know
My little white mare
Is shedding her hair.

Take notice this season, O genial John B.,
You'll find, as I tell you, as sure as can be,
That, ere the *Hepatica* opens a calyx,—
Ere *Populus*, *Corylus*, *Betula*, *Salix*,
Or *Carex* has blossomed, or grasshopper thawed,
Or button-ball bursted, or *Corvus* has cawed,
Your little white mare
Will be shedding her hair.

F. Blanchard.

Picking Berries.

'TWAS in the season of the year
When clustering fruit bedecks the bramble
That gallant Paul and Laura fair
Set out upon a pleasant ramble.

They went in search of berries red,
And Paul seemed somewhat melancholy,
But dainty Laura tossed her head,
With lightsome laughter blithe and jolly.

At last they reached the destined place
Where brambles grew in wild profusion,
And lo! Paul's melancholy face
Put on a look of deep confusion;

But Laura laughed in roguish glee,
With lips that rivaled ripest cherries,
And, while Paul loitered doubtfully,
She calmly went on picking berries.

At last Paul, dawdling at his task,
With face as grave as prebendary's,
Said, "Laura, dear, I'd like to ask"—
But Laura went on picking berries.

Poor Paul stood still and twirled his hat,
His stammering tongue played queer vagaries,
Then said, "I'd like to tell you that——"
But Laura went on picking berries.

"I long have loved you," murmured he,
"With love that never, never varies."
"In that case, don't you think," said she,
"You'd better help me pick the berries?"

Stanley Wood.

Caught.

OVER the lattice there clambered a vine,
Its tendrils in arabesques tenderly clung
To the cool slender bars in the shade of the pine,
That sheltered us there where the song-sparrows sung.

As sweet as a rose in the pale pink and blue
Of her thin fleecy robe, with a bud in her hair,
As fair as a tropic bloom fresh with the dew,
She mused by my side in the cool morning air.

How did it happen? I really don't know,
Her lips were like rosebuds—sore tempted, I fell;—
"*Oh, nobody saw us!*"—I started to go,
When a wee voice,—"*I seen 'oo, an' I'm doin' to tell!*"

Harold Van Santvoord.

Culture.

THE village maid, whose gentle heart
I won, those golden summer days,
Brought up in simple country ways
With store of all housewifely art,
Had little learning else to boast:
A year or two of school at most.

I knew it. Yet within her eyes,
Up-raised in loving trust to mine,
What wealth of promise seemed to shine!
What glorious possibilities!
"When my sweet girl and I are wed,
I'll cultivate her mind," I said.

We tried it in the honeymoon.
I planned a "course" of history,
Art, literature, and poetry
Combined; and every afternoon
I read to her, and gave her "talks"
On science in our evening walks.

And she—ah! when can I forget
Her look of measureless content,
Her love-lit eyes so gravely bent
Upon my face! And yet—and yet—
I sometimes felt a haunting doubt
If she knew what 'twas all about.

For oftentimes, in lightsome mood,
She'd murmur something sweet and low
That was not always *à propos:*
Her judgments, too, were often crude,
And her remarks on Locke and Kant
Were painfully irrelevant.

Somehow I can't escape a sense
Of failure: though to-day her face
Still keeps its tender, listening grace,
Its subtile, fine intelligence
(She'd look the same were I to speak
In Sanskrit or Homeric Greek!)—

I think I'll have to give it up.
I'll have to bear it, that is all!—
The first, the only drop of gall
In joy's divine, o'erflowing cup,
The one grand failure of my life!—
I cannot "cultivate" my wife!

Robertson Trowbridge.

Bits of Midsummer Metaphysics.

THESE suggestions as to the essence of a few metaphysical units are believed to be very suitable for members of summer schools of philosophy, and for all searchers after truth. They depend for their significancy on the words themselves as related to the appreciative intuitivism of the reader:

Art is the joyous externalizing of inwardness.
Beauty is the joyful internalization of outwardness.
Poetry is the hampered soul leaping at verity.
Truth is the so-ness of the as-it-were.
Right is the awful yes-ness of the over-soul meditating on the how-ness of the thing.
Society is the heterogeneous, buying peace with homogeneity.
A *Thing* is simply an is-ness. *Matter* is is-ness possessed of somewhat-ness. *Mind* is am-ness.
Philosophy is the mind trying to find out its own little game.

G. F. S.

"Too Too."

THE phrase "Too too," as an intensified adverb, is common in old literature. Witness Hamlet's "too, too solid flesh," and Dekker uses it perhaps a hundred times. But I never saw "too too" standing by itself without an adjective except in one place. That phrase, which sounds so new to us, occurs in one of the oldest English plays, "A new Enterlude called Thersytes," 1537—black-letter quarto—thus:

"It is too too, mother, the pastime and good cheer,
That we shall see and have when that we come there."
(Dodsley's Old Plays. Vol. I., p. 423.)

Our modern slang crops up unexpectedly in my old reading. In Dekker's Sabromastix (1603), I find "We'd let all slide."

A. A. Adee.

At Last.

SHE tips to-and-fro in the old rocking-chair,
Her forehead is wrinkled, and white is her hair,
While her grandchildren romp in a turbulent throng
She reads the fond words of a tender love-song.

That love-song was writ her one sunshiny day
When her heart was as light as the breezes in May,
When her figure was graceful, her cheek like a rose,
And never were spectacles perched on her nose.

The lover that wrote her that sonnet, alas,
Has peacefully slept 'neath the long tangled grass
For years—and the words of his eloquent lay
"Miss Violet" reads for the first time to-day.

You ask why that poem thus lingered unseen?
He had sent it that time to a great magazine,
And the publishing man let the musical waif
Unprinted remain fifty years in the safe.

R. K. Munkittrick.

Little Tee-Hee.

IT was over the sea, in the land of tea,
By the beautiful river they call Yang Tse,
To which an additional name they hang
Making the river Yang Tse Kiang,
A baby was born in a Chinese town;
But a look of scorn and a terrible frown

O'er the face of the father was seen to curl,
When he learned that his baby was only a girl.

Now the father, whose name was Hang U. High,
Was the last of the race of the great I. Ligh,
The father of Chinese history.
He was very proud of his pedigree,
And even declared that his lineage ran
In a line direct to the very first man.
His greatest ambition was now to see
Another limb on his family tree,
A boy who could finally step in his place,
Down the race-course of time to continue his race;

But alas for his hopes! "Chug um whirl! Chug um whirl!"
He muttered, which means "It's a girl! It's a girl!"
And he angrily hissed: "Clack whang bog lound!"
Which means in their language "It must be drowned!"

Though the mother, in words that sound imprudent,
Insipidly pleaded: "Oh, Hang U. *I* wouldn't!"
He sternly answered, "Clack whang bo quid!"
Which means in their language "It must be did!"
So he called his servant and said: "Ar Chang,
Go drown that thing in the river Kiang."
Then turned away, with an angry glare,
To smoke his pipe in the open air.

But the good Ar Chang had a tender heart.
He saw it was hard for the mother to part
From her little girl, yet, strange to tell,
The sorrow that on his heart-strings fell
Affected the strings of his purse as well.
Still he couldn't think what in the world to do,
And he stood in agony clutching his queue

And pulling it downward until he drew
His eyes clear up to the top of his head,
Till they looked like long diagonal gashes
Stretched over his forehead and fringed with lashes,
Then, letting them down — "I have it!" he said.
But the rest that he said I will tell to thee
In the very words it was told to me
By that honest, efficient, and noble Chinee
Who charged me two prices for my "washee":
He said: "I got girl-ee same old like this,
Got too much-ee girl-ee; my wife-ee no miss
One girl-ee. Ar Chang save-ee yo' girl-ee life,
I take-ee *yo'* girl-ee light home to my wife,
I dlown-ee *my* girl-ee in liver Kiang!
You give-ee much money to poo' Ar Chang!"
Then gratitude stole down the beautiful slants
Of the mother's long eyes, and she gave such a glance
Of approval, he cried, "I would rather be Chang,
And serve such a generous mistress, than Hang!"

He carried Tee-Hee to his own little hut,
Where the floors were of dirt and the frescoes of soot,
And he said to his wife: "I have swapped for Tee-Hee.
We must dlown-ee our girl-ee in liver Yang Tse,—
And our mistless she give-ee much money to we!"
"I will go," answered she, "and wrap Minnee Ting Loo
In Tee-Hee's little mantle and bring her to you,"
And then, with a smile of approval, withdrew.

Now it chanced Mrs. Chang had the masculine art
Of "playing it low" and concealing her heart,
In short, of enacting a duplicate part.
For, expecting the time when her husband would say: —
"We are poor; we'll put Minnee Ting out of the way,"
She had built a rag baby with marvelous skill,
Placed a spring here and there for the sake of the wriggle,
Supplied its small chest with a bladder and quill,
So that touch it who would the rag baby would giggle;
Just the size of Ting Loo, — she had measured and weighed it, —
And now, with the skill she had learned when she made it,
She pinned on the cloak past all hope of undoing,
And, bearing it so as to start it to cooing,
Right into the arms of her husband she laid it.
Thus Chang bore it down toward the river Kiang,
But happened, in passing the vigilant Hang,
To stumble, which caused it to kick and to coo,
Till Hang cried: "Away! I'll accompany you.
I never can rest till it's safe in the water,
Lest the mother has bribed you to rescue my daughter."
Then quick in the pitiless river they threw
What to Hang was Tee-Hee and to Chang was Ting Loo.

Each day, while the notable Hang U. High
Was reading the books of the great I. Ligh,
His wife stole away to the hut of Ar Chang,
While Chang acted spy o'er the motions of Hang.

But Chang never dreamed as he watched by the wall
To give warning if Hang at his hovel should call,
That *his* dear little wife from its hiding-place drew
The only original Minnee Ting Loo,
Nor supposed, as he stretched to its limit each limb
To peep at his master, that out of the dim
Of his hovel two mothers kept watch upon *him*.
And it never occurred to Hang U. High,
As he studied the books of the great I. Ligh,
That, instead of retrenching on Little Tee-Hee
By drowning the child in the river Yang Tse,
His lucre provided provisions for three.

MIDSUMMER HOLIDAY NUMBER.

THE CENTURY MAGAZINE.

VOL. XXVI. AUGUST, 1883. No. 4.

BOB WHITE, THE GAME BIRD OF AMERICA.

OF all the game birds of America, none is better appreciated by the sportsman than little Bob White. He may be found from southern Maine and Canada to the Gulf, and from the Atlantic to the high central plains, and he is known by various names. In the North and East, he is called Quail; in the South and West, he is Partridge; while everywhere, he is known as Bob White. Let us then call him as he calls himself, and we will not be berated for our ignorance of natural history. In fact, he is neither quail nor partridge; but, to our mind he seems more akin to the latter than to the former of his European cousins. The quail of Europe is a smaller and more dumpy bird than our little friend. His flesh is dark and loaded with fat. His plumage is dull and his aspect plebeian. He does not form into coveys, but flocks at the periods of his migrations, when he flies at night, and in the company of countless numbers, during the month of April crosses the Mediterranean to the European shores and islands, returning to Africa in the autumn.* He is a polygamous, pugnacious, selfish little Arab, and lacks entirely that gallant bearing and affectionate nature which are marked characteristics of the American bird. A wretched husband, he abandons his wives and young to their fate at the waning of the honeymoon; and his selfish manners are inherited by his chicks, who "are hardly full grown when they separate, or, if kept together, fight obstinately, and their quarrels are terminated only by their common destruction." It belies both the appearance and character of Bob White to call him after such a mean-looking, disreputable bird as the European quail.

The common European gray-partridge differs somewhat in form from our bird, which in this particular resembles more closely the red-legged partridge of Europe; but what is said of the habits of Bob White applies equally well to the European partridge. The latter weighs twice as much as Bob White, but he has not Bob's sturdy, rapid, and often long-continued flight. Like our bird, his flesh is white; he forms into coveys; is monogamous, and keeps with his wife and brood till the following spring. He is not migratory or nocturnal in his habits. His wings are similar in form to those of our bird, having the third quill-feather the longest, which is a characteristic of the partridges, and distinguishes them from the quails, which have the first quill-feather the longest.

It is true that Bob White is sometimes partly migratory in his habits. It is said that he has "a running season" in October, when, joining a pack, he leaves the region of his birth and travels on foot in a southerly and easterly direction till he reaches the borders of streams and bays, where he may remain till November, when he returns to his former haunts. During his travels it would be useless to hunt him, for he then runs with great rapidity before the dog and will not take wing.

* "The quails assemble at the approach of autumn, to cross the Black Sea over to the southern coast: the order of this emigration is invariable: toward the end of August the quails, in a body, choose one of those fine days when the wind, blowing from the north at sunset, promises them a fine night; they take their departure about seven in the evening, and finish a journey of fifty leagues by break of day,—a wonderful distance for a short-winged bird, and that is generally fat and sluggish of flight."

"Such prodigious quantities have appeared on the western coasts of the kingdom of Naples, in the vicinity of Nettuno, that *one hundred thousand* have in one day been taken, within the space of four or five miles."—*Daniel's "Rural Sports."*

[Copyright, 1883, by THE CENTURY CO. All rights reserved.]

The European partridge and Bob White differ in their call-notes and in their longevity. Daniel, in his superb "Rural Sports," London, 1812, states: "It is said the partridge, if unmolested, lives from fifteen to seventeen years; others dispute this computation, and maintain that they live seven years, and give over laying in the sixth, and are in full vigor when two years old." Dr. Elisha T. Lewis, in his "American Sportsman," Philadelphia, 1857, says that the average duration of Bob White's life is three to five years; but neither of these authors states how these facts were ascertained. Our distinguished ornithologist, Dr. Coues, classes Bob White among the partridges, and says:

"Our partridges [viz. Bob White, the Mountain, Valley, and Massena quails, etc.] may be distinguished among American *Gallinæ*, by the foregoing characters, but not from those of the Old World; and it is highly improbable that, as a group, they are separable from all the forms of the latter by any decided peculiarities. I find that the principal supposed character, namely, a toothing of the under mandible, is very faintly indicated in some forms, and entirely wanting in others. Pending final issue, however, it is expedient to re-organize the group, so strictly limited geographically, if not otherwise. * * * In habits, they agree more or less completely with the well known Bob White: Head completely feathered, and usually crested, the crest frequently assuming a remarkable shape, nasal fosse not filled with feathers; the nostrils covered with a naked scale; tarsi and toes naked, the latter scarcely or not fringed."

If, however, many of our friends should persist—as they certainly will—in calling Bob White a quail, then they should call a brood of these birds *a bevy;* while *a covey* should designate a brood, if they call him a Virginia partridge. The plumage differs so much with latitude, that some naturalists have made out three species: the *Ortyx. Virginianus*, the *O. Floridanus*, and the *O. Texanus.* The male of the *Floridanus* is about the size of the female *Virginianus.* Its bill is longer and jet black; its colors are darker and its black markings are heavier. The *Texanus* is of the size of the *Floridanus;* the colors are paler, the prevailing shade being rather gray than brown; upper part much variegated with tawny. Sometimes he dons a coat which is nearly white. One of these little colorless birds is shown in the engraving on page 486. He was shot in the month of November, by Mr. Charles Hallock, near Berlin, in Worcester County, Maryland.

If, after a day of successful shooting over a considerable area, the sportsman will count the number of cock and hen birds which have fallen to his aim, he will find the former always outnumbering the latter. The exact ratio I do not know. I have but once separated them; then, in a bag of forty, I found twenty-four cocks to sixteen hens. According to the European naturalist, Ray, the European

"BOB WHITE!"

partridge hatches one-third more males than females.

The average weight of Bob White varies considerably with the nature of his feeding-ground, the weather preceding the time when he is shot, and the age of the bird. Probably six and three-quarter ounces is a fair average weight. In Southern Maryland, I have shot a few cock-birds which weighed eight ounces and one-quarter, and one even as high in weight as eight ounces and three-quarters. Fifty birds shot in the middle of North Carolina, last December, averaged seven ounces. Those birds were cocks and hens, old and young, just as they came to bag in the field. Mr. Frank Schley says: "I have often killed a bag of birds along the Monocacy and Potomac bottoms in Maryland, in the month of December, that would average eight ounces." Dr. Lewis, in his "American Sportsman," gives a record of ten braces of birds shot in the neighborhood of Mount Holly, New Jersey, that averaged eight ounces.

PARTRIDGES (PERDIX CINEREA), MALE AND FEMALE.

While the woodcock and Wilson snipe are fated to disappear as civilization robs them of their restricted feeding-grounds, Bob White, if protected by the enforcement of judicious game laws, will thrive in the midst of cultivated lands, and will continue to test the gamecraft and marksmanship of future generations. He is destined to remain the game-bird of America, and he is worthy of it; for there is none more impetuous in his flight, none that has such extended range in his feeding-grounds and coverts, none that de-

WHITE BOB WHITE.

mands of the gunner more knowledge of his habits in order to find him, and none that tests so well the training of a dog and the eye and nerve of the sportsman. We should be thankful that he, with the black-bass, will be spared in the relentless action of that artificial selection which is slowly but surely taking from us the woodcock, the snipe, the grouse, and the wild trout.

Unlike the grouse and the European quail, our little American is a faithful husband and devoted father. To find Bob in Mormon practices is rare. Should he, however, discover that his gallant bearing and spruce attire have made him doubly beloved, he will show impartial devotion to his two spouses. From a fence-rail overhead, with his two wives on their nests, not two feet apart, he will gladden both their little hearts with his love-song. But he is naturally a monogamist. He selects his mate and makes his courtship in the spring, soon after the snow and frost have gone, when the willows have turned yellow, while the frogs are piping in the marsh, and the Wilson snipe is drumming above the meadows. If the wintry storm should come back, the mates will re-assemble in a covey and keep each other warm o' nights and huddle on the sunny slopes during the day.

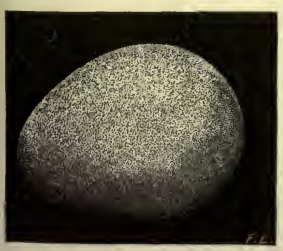
In the month of May they build their simple nest, formed of a slight depression in the ground lined with dried leaves and soft grasses. This nest may be found under a tussock of grass, beneath a small bush, in the brier-grown corner of a worm-fence, at the foot of an old stump, alongside a log, or often in the open fields of wheat or clover. The nest is sometimes closed above with stubble mingled with the grass tussock or briers, and provided with a side entrance; but the nest is as often found open above as closed.

In this nest the hen-bird lays from one dozen to two dozen eggs of a pure, brilliant white. While the hen is laying and during her time of nesting, the cock is the happiest of husbands. Filled with joy and pride, he sits on the low bough of a neighboring tree, or perches on the fence-rail quite near his spouse, whom he never wearies of telling that he is "Bob White —your Bob White," in such a brilliant, happy

voice that the farmer stops his work to listen to him.

In from three to four weeks the little downy young leave the egg, and even with pieces of egg-shell yet sticking on their backs they go off with their parents to be taught to search for food. They feed on the seeds of various grasses, weeds, and cereals, and on berries; and they return a hundred-fold the bounty of their landlord, by destroying for his benefit not only countless numbers of destructive insects, but quantities of weed-seed, one to two gills of which the adult birds can stow away in their little crops during a day's feeding.

BOB WHITE AND EUROPEAN QUAIL. (COTURNIX COMMUNIS.)



BOB WHITE EGG (FULL SIZE).

If rain should come on, or the cold wind blow, the mother calls her younglings under her wings, where they nestle safe from the chilling storm. When night comes on, she and her spouse take their little ones to some place removed from the thicket, where prowl the fox and the weasel. Soon after being hatched, the young, in running, assist themselves with their tiny wings, and when two weeks old they take wing with a flutter that is very amusing to those familiar with the startling whir of the old birds. When too large to gather under the mother they take their flight at night-fall, from the stubble or grain field where they have been feeding, and thus, breaking the scent, drop down in a compact cloud into some open space under a bush or tussock, and cozily huddling up to one another, form a little circle with their heads outward. Thus nestled, they see on all sides, and can spring at a moment from their bed to evade any foe that may steal on them in the night or at the early dawn. If the ground be covered with snow or hoar frost, or the weather be wet or blustering, they may remain huddled together all day, or may not venture to feed till late in the forenoon. But if they are greeted with the sunrise and good weather, they cheep a good-morning to one another in soft, cheerful voices, and go at once to their feeding-grounds, where they regale themselves on the wheat of the stubbles, the buckwheat, the seeds of grasses, and the rag-weed, and on the berries of the haw, the gum, and the chicken-grape. About ten or eleven o'clock they retire to the sunny side of a covert, and they do not venture forth again till three or four in the afternoon, when they again seek their food till sundown and bed-time.

In October and November, the sportsman often "springs" coveys containing birds too small to be shot; sometimes half the covey will be in this condition, the other half full-grown birds. This fact may be accounted for thus: The eggs and the young are often destroyed by the wet and cold of the early summer, or by beasts and birds of prey. If this calamity should overtake them, the hen again goes to laying, and this second brood is retarded by the time lost between the first and second nestings. When birds of two sizes are found in the same covey, it seems to show that the parents have raised two broods; and this, I think, happens oftener to the south than to the north of the James River,—the summer of our middle and and northern States being generally too short for the raising of two broods. Baird says: "They have two broods in a season, the second in August"; while Audubon states that "in Texas, the Floridas, and as far eastward as the neighborhood of Charleston, in South Carolina, it breeds twice in the year, first in May, and again in September."

AT DAWN.

The cock-bird shares with the hen the duties and restraints of incubation. If his spouse should desire another brood, he will take charge of the half-grown young while she makes her second nesting. When the second brood appears, it runs with the first, and they form together one happy family, and remain with their parents till the following spring, in the pairing season, when the old family ties are severed.

The devotion of the parents to their unfledged young, and the real affection which the members of a family have for one another up to the time of their separation in the spring, have been so touchingly described by two of the most gifted of our writers on field sports, that I must here quote them; especially as the writings of W. P. Hawes ("J. Cypress, Jr.") are now rarely met with. He says:

"If you would see the purest, the sincerest, the most affecting piety of a parent's love, startle a family of young quails and watch the conduct of the mother. She will not leave you. No, not she. But she will fall at your feet, uttering a noise which none but a distressed mother can make, and she will run, and flutter, and seem to try to be caught, and cheat your outstretched hand, and affect to be wing-broken, and wounded, and yet have just strength to tumble along, until she has drawn you, fatigued, a safe distance from her threatened children, and the hopes of her young heart; and then she will mount, whirring with glad strength, and away through the maze of trees you had not seen before, like a close-shot bullet, fly to her skulking infants. Listen, now! Do you hear those three half-plaintive notes, quickly and clearly poured out? She is calling the boys and girls together. She sings not now 'Bob White!' nor 'Ah! Bob White!' That is her husband's love-call, or his trumpet-blast of defiance. But she calls sweetly and softly for her lost children. Hear them 'Peep! peep! peep!' at the welcome voice of their mother's love! They are coming together. Soon the whole family will meet again."

The following is by Henry William Herbert ("Frank Forrester"):

"Unlike the young broods of the woodcock, which are mute, save the twitter with which they rise, the bevies of quail appear to be attached to each other by tender affection. If dispersed by accidental causes, either in the pursuit of their food, or from being flushed by some casual intruder, so soon as their first alarm has passed over, they begin calling to each other with a small, plaintive note, quite different from the amorous whistle of the male bird, and from their merry, day-break cheeping, and each one running toward the sound, and repeating it at intervals, they soon collect themselves together into one happy little family.

"If, however, the ruthless sportsman has been

CALIFORNIA VALLEY PARTRIDGE OR QUAIL. (LOPHORTYX CALIFORNICUS.)

among them with his well-trained setter and unerring gun, so that death has sorely thinned their numbers, they will protract their little call for their lost comrades even to night-fall; and in such cases — I know not if it be fancy on my part — there has often seemed to me to be an unusual degree of melancholy in their wailing whistle.

"Once this struck me especially. I had found a small bevy of thirteen birds in an orchard, close to the house in which I was passing a portion of the autumn, and in a very few minutes killed twelve of them, for they lay hard in the tedded clover, and it was perfectly open shooting. The thirteenth and last bird, rising with two others which I killed right and left, flew but a short distance and dropped among some sumacs in the corner of a rail fence. I could have shot him certainly enough, but some undefined feeling induced me to call my dog to heel, and spare his little life; yet afterward I almost regretted what I certainly intended at the time for mercy. For day after day, so long as I remained in the country, I heard his sad call from morn till dewy eve, crying for his departed friends, and full, apparently, of memory, which is, alas! but too often another name for sorrow.

"It is a singular proof how strong is the passion for the chase and the love of pursuit implanted by nature in the heart of man, that however much, when not influenced by the direct heat of sport, we deprecate the killing of these little birds, and pity the individual sufferers, the moment the dog points and the bevy springs, or the propitious morning promises good sport, all the compunction is forgotten in the eagerness and emulation which are natural to our race."

Bob White schools the wing-shot as severely as the wily trout tries the angler. Like the trout, he has habits which we must be acquainted with in order to find him. If the weather be fair, start early, for the birds will be on their feeding-grounds at sunrise, and will be found in the fields of stubble, or in the midst of the rag-weed, and along the brier-fringed ditches; and do not forget the field of buckwheat, for they are especially fond of it. About ten or eleven they will cease feeding, and will seek the sunny side of some covert near a stream, where they will quench their thirst after their morning meal. Here they will dust and preen themselves, and take their noonday siesta. The birds will generally remain here till three or four hours after mid-

EUROPEAN RED-LEGGED PARTRIDGE. (CACCABIS RUFA.)

day, and closely huddled as they are. they are difficult for the dog to find.

The sportsman, if wise, will now follow the example of the birds, and seeking the quiet of some sheltered sunny nook, will take his lunch and rest himself and his dogs. How well we remember that pleasant spring side, with the dogs stretched before us to catch the warm rays of the sun, their eyes furtively glancing at us, waiting for their share of the lunch; the fragrant cigar, with pleasant jokes at our bad shots and untimely tumble, the generous admiration of our companions' skill, and talk about the wonderful working of the dogs.

If the weather is very dry, do not seek the birds on the uplands, for Bob White, though no hydropathist, likes the vicinity of water. But if your hunt occurs after a rainy spell, go to the upland stubble-fields, and work your dogs along the border of the driest and sunniest of the coverts.

If it is windy and cold, the birds will be found in covert along the sunny lee slopes of the valleys, in the tall rag-weed and briers of the hollows, and on the sunny borders of the woods and hedge-rows. They will not now lie well to the dog, and when flushed will go like bullets into the deepest thickets. Should you hope to prevent this by getting them in between you and the dogs, you may often be mistaken, for in all likelihood they will spring over your head like sparks from under a blacksmith's hammer. The shooting is now difficult, for you will have to turn rapidly on your heel as the bird passes over you, and drop your aim just *under* him while he is only momentarily in sight.

If you had a fair day yesterday, but after a long spell of wet weather, and you returned home last night in a clear, cold, quiet air, you may expect to see the sunshine of to-morrow sparkling in the hoar frost which covers the ground and all the herbage. Tarry at home till the sun has nearly melted the ice off the meadows, for you will get nothing but wet legs by tramping the fields while the ground is iced and while the birds are yet huddled and have not spread their scent.

When the dogs are seeking the coveys, let them range widely. When they stand the covey, do not exhaust yourself with haste in reaching them, but approach leisurely and quietly. When the covey springs be very quick, but very, *very* steady, and do not fire till you are sure of your aim. Remember that it is your left arm and wrist that direct your gun; so grasp it well forward on the fore-end, and not near the breech, as some do. You will thus be able to give your gun that quick and firm motion which is indispensable to skill in "snap-shooting"; and all shooting at Bob White is of that character.

If it is your first shot of the season, and you are not gifted with a very steady nerve, you will do well to charge your gun with but one cartridge. By doing so, it is probable that a bird will drop to your first shot. If you had had two shots, you might have been too anxious for two birds, and thus have lost both. After two or three successes with a single barrel, try "a double" over the next point.

Always flush the birds yourself, for a dog "hied on" to flush may do so of his own accord when you are out of gunshot. At the springing of the covey, the dog must "down charge," or "drop to shot," and in either case hold his charge till ordered to "hold up" or to "seek dead." If he "break shot," he will often cause you great vexation in the loss of shots by his flushing birds which did not spring with their fellows, but which now get up in rapid succession, and before you have had time to reload. But a good retriever has his greatest pleasure in fetching a dead bird, and the intense satisfaction this act gives to him often causes him to lose his head and rush in on the report of the gun. The dropping to shot and retaining charge is one of

the prime requisites in a dog, and is as difficult to teach a good retriever as it is essential to the true enjoyment of sport.

If the dog is unsteady and apt to "break shot," do not load if you have fired only one barrel, for in so doing other birds may rise just as you have opened your gun or are handling a cartridge.

After the covey has been scattered give your dog but little range. Keep your eye well on him as you approach the ground where you or your gillie has marked the birds. Be ready, if he be rash when he "winds" the birds, to chide him, in a voice just sufficient to be heard. *Steady, there! Toho!*

Above all things, do not get excited and gain in voice as you lose in temper. Take it leisurely, be quiet and cool, if you would enjoy the sport and kill cleanly. By all means, train your dog, if possible, to hunt without shouting to him. A short, quick whistle should call his attention. Then give him the order he waits for by waves of the hand: forward, for "on"; a wave to the right or left, as you may desire him to quarter; while the upraised arm, with the palm of your hand toward him, should bring him to "toho." Or, two short whistles may be often better for the same order, while one much prolonged should bring him "to heel."

A dog that with head well up winds his birds and is stanch on a covey, that will drop to shot and retain his charge till ordered to retrieve, and will receive and obey your orders from the whistle and the motions of your arm and hand, is a dog indeed. Such dogs exist. Should you shoot over such a one, make a note of him as having the education which your next puppy shall receive. You may never possess such a dog; but if a true sportsman, you will ever endeavor to have one like him.

After the covey has been flushed and shot at and the birds have been well scattered, the real enjoyment in Bob White shooting begins. One may now have single and double shots over all kinds of ground and at birds taking every conceivable direction of flight. But often, the best of markers will be baffled in finding the birds whose flight he has carefully noted after the springing of the covey. The following incident is typical of the experience of all sportsmen: A large covey was once flushed and shot at, three birds falling to our fire. My friend and I watched the other birds as they flew across a swale, where we sprung them, and we saw them sail with extended wings over a large field on the valley slope, into which they dropped after a few flutters of their wings. There could be no doubt as to the whereabouts of the birds, because the whole field, from its inclination to our line of sight, was in full view, and was quite an open sedge field with its surface sparsely studded with stunted pines. On our approach to the field, the dogs quartered it, but they did not come to a stand. One dog flushed a bird on which he came suddenly, and he at once "charged." We found the dogs useless, and calling them to "heel," we walked slowly into the sedge. When we were about in the center of the field, the birds began to rise successively and singly in all directions; in front, on our side, and sometimes behind us, giving us delightful shots. Similar experiences recurring so often have made some sportsmen suppose that Bob White has a voluntary power of retaining his scent, and thus in time of danger eludes the dogs. But this well known occurrence can be explained otherwise. Often when the frightened birds alight, they do not run but instantly crouch with their wings closely pressed against their bodies, so as to squeeze themselves into the smallest compass. This act, no doubt, causes a diminution in the emission of their effluvia. But if the birds have run after alighting, the dogs will surely find them, provided they do not run rapidly and to great distances; in which case the dogs are baffled by the multiplicity of scents; and especially will this be so if the dog gets on the trail of a bird which doubles like a hare on its track.

This baffling of a dog on ground containing a recently scattered covey shows that time should be allowed for the birds to recover from their confusion and to begin to run together, before you "hie on" the dogs to find them. If you are familiar with the country and can remember the landmarks, the proper method is to flush two or three coveys, and then begin to hunt the scattered birds of the respective coveys in the order in which you flushed them.

To become a successful shot at Bob White, the sportsman should bear in mind that Bob, immediately after he has sprung, flies with a velocity which probably exceeds that of any other bird; and also that, unless fairly hit, he can carry off a large number of pellets. When a covey springs, it rises at a considerable angle with the ground. Hence, in shooting at a bird in a flushed covey, the sportsman of unsteady nerve and sluggish muscles is apt to undershoot, the bird rising with such velocity that by the time the gunner has brought his gun into position the bird has passed above his line of sight. As a rule, I think that about one second generally elapses between the instant of springing of the bird and the moment of fire. This interval gives the bird time to gain a moderately horizontal line of flight, and allows the sportsman to get a fair aim.

MRS. BOB WHITE AND FAMILY.

In shooting at an incoming bird, let him be out of sight and just below the rib of your gun at the moment of firing. At a bird going overhead, wait till he has passed well over; then shoot under him. At straight-away shots hold a little high, so that you just catch a glimpse of the bird over your barrels.

In shooting at cross shots, it should be understood that the velocity of an ounce of No. 8 shot driven with three drams of powder is near to 900 feet per second. In that second a Bob White, if under full headway, will go 88 feet, if we estimate the velocity of his flight so low as only a mile a minute. If he is flying directly across your line of sight and thirty yards off, the shot will take one-tenth of a second to reach that distance, and in one-tenth of a second the bird has gone over eight and eight-tenths feet. So, if we should fire a snap-shot directly at a cross-flying bird thirty yards distant, the center of the cloud of shot would fall about nine feet behind him, and he would pass by unscathed. To kill him "clean," you must hold nine feet ahead of him. To some sportsmen, nine feet may seem a great distance to "hold ahead" on a cross-flying bird thirty yards away, but not to those who have noticed attentively the relations of the line of their aim to the position of the bird *at the very moment they hear the report of their gun.* Also, estimations of distances in the air beside a small and quickly moving object are very unreliable, and often when the sportsman thinks he has fired only one foot ahead of a bird he has really held ahead three feet. Let some one suspend horizontally in the air an unfamiliar object that must be distant from fence rails and other things whose dimensions you know, and then guess its length. You will, after a few trials, be satisfied that the estimation of actual lengths at thirty yards is very loose guess-work.

Bob White is a tough and hardy little fellow, and the true sportsman, always a humane man, will remember this and endeavor to kill him outright. This can be done only by hitting him fairly with the center of the charge. Often a bird will fly two or three hundred yards though mortally wounded. It is the duty of all sportsmen to watch carefully the flight of the birds he has shot at, and his experience of the nature of their flight will tell him if the bird has been struck. If he concludes that he has been, then it is his bounden

duty to bring that bird to bag, and that right quickly.

The extraordinary vitality of this vigorous bird was once forcibly impressed on me. A covey was flushed at about one hundred yards from the edge of a wood. Only a few of the birds flew to the woods. One of them, going at a tremendous velocity, crossed my position at a distance of about forty yards. Holding my gun at what I judged was the proper distance ahead of him, I fired. This was the only shot fired at the birds making for the wood.

"Sam," said I to our negro gillie, "I think I hit that bird."

"No, sah," said Sam; "I tink not, sah. He's a-gwine to whah he forgit he lef' suffin, sah!".

Sam is a good marker, and has carefully watched the flight of hundreds of birds shot at. Yet I could not entirely satisfy myself that the bird was not fairly hit, though he kept straight on in his vigorous flight. A sprained foot prevented rapid walking, and my companion entered the wood, with the dogs, before me. As I struck the edge of the woods I heard the report of his gun, and after proceeding about one hundred yards I heard a second shot, and in another instant a bird tumbled through the air and fell about a dozen feet in advance of me. I called out:

"I have them both!"

"Both what?" said he. "I only shot one bird, and the other flew away from your direction and I missed him clean."

The bird my friend shot lay with his head toward me; the other, a large cock, lay on his back with his bill pointing toward the other bird, and not more than a foot from him. Both birds were warm. The large cock was the one I had fired at. He was struck fairly in the head and chest, and yet he had pitched into the woods and gone altogether nearly two hundred yards before he succumbed to his death-wounds. But for the remarkable circumstances which led to the finding of this bird, I should never have surely known that I had shot him.

Rules for shooting are of value, and directions founded on theory may serve to inform the beginner why he misses and thus show him the way to improvement in his marksmanship; but no matter how well we may know *how* the shooting should be done, *to do it* is an art which can be attained only by the assiduous cultivation and development of certain peculiar natural gifts.

A beginner who, out of three shots can bring one Bob White to bag, need not be discouraged or ashamed; with sufficient practice, he may one day kill one out of two birds fired at. The sportsman who does not select his shots (and no man really a sportsman *can* do that), but takes his chances in the open and in covert on all birds which offer a probability of success to his skill, and who, the season through, brings to his bag three out of five birds fired at, is an accomplished sportsman. If he can make three successful shots out of four, he is a phenomenal marksman.

Last season, I shot with the best wing-shot I ever hunted with. At my request, this gentleman, Mr. H. K. B. Davis, of Philadelphia, has written for me the following statement; which, coming from one who has had such unusual opportunities in hunting Bob White, in North Carolina, cannot fail to be of interest to all sportsmen:

"I find, on referring to my record containing the number of coveys found and the number of birds killed, that the average is but little over three birds brought to bag from each covey flushed. When it is remembered that the usual number of birds found in a covey runs from ten to eighteen, it will give some idea of the difficulties to be overcome, and the large proportion of birds that escape even with good shooting, as the same record shows that seventy-three out of every hundred birds shot at were brought to bag. This record, extending over four years and running up into the thousands of birds killed, gives very reliable data to base calculations upon.

"The dogs I hunted with I have every reason to believe are above the average in speed, endurance, and scenting powers; so there is only one conclusion to arrive at, and that is that these birds are exceedingly difficult both to find and to kill.

"There are many opinions as to the proper method of shooting on the wing. Some hold that 'snap-shooting' is the only way to shoot successfully. Snap-shooting is generally understood to consist in putting the gun to the shoulder and firing the instant it is in position; making the allowance to the right, left, under, or above, as the case may require, before raising the gun; just as you point your finger, instinctively, to any object without having to sight along it. Others are just as sure that no one ever shot decently unless he followed the bird with the sight on the gun and covered it before firing. Some, again, insist that you must swing your gun along with the course of the bird after pulling the trigger. In my opinion, every one who has shot very much acquires a style peculiar to himself, and depending on his temperament and the kinds of birds he has had the most practice on.

"It may be well to give a few hints as to the necessary allowance to be made in taking aim at a bird flying so rapidly as Bob White. The most difficult shot is a bird coming directly toward you, and flying about twenty feet above the ground. I have been quite successful in this shot, by holding directly at the bird until he is within range, and then, just as I touch the trigger, I raise the muzzle of the gun about six inches. I would only advise trying this shot where there is more than one bird, and you want to use the second barrel. When there is only one incoming bird, wait until he passes over you, and then by shooting under him, more or less, according to the speed and elevation at which he is flying, you will be pretty sure to kill.

"In cross shots, at thirty yards and over, hold above the line of flight and from six to nine feet ahead of the bird. This may seem entirely too much, but I have frequently shot Bob White when flying parallel

to a rail-fence, when I aimed the full length of the rail ahead of him, this being nearly twelve feet."

The shooting of Bob White demands such quick action in handling the gun, and such long tramps to discover his retreats, that I would advise light guns for his pursuit. A pound more in weight will be felt in the afternoon of a long day's hunt, and the rapidity and ease with which a light and short gun can be handled, makes it very efficient in snap-shooting in covert. A twelve-gauge seven-pound gun, of twenty-eight-inch barrels, carrying one ounce of No. 8 shot and three drams of powder, or a sixteen-gauge of six pounds weight and twenty-six-inch barrels, charged with seventh-eighths of an ounce of shot and two and three-quarter drams of powder, is to my liking in this most enjoyable of field sports; in which occupation may next season find you, my sportsman reader, when,

"Full of the expected sport, your heart beats high
As, with impatient steps, you haste to reach
The stubbles where the scattered grain affords
A sweet repast to the yet heedless game.
Near yonder hedge-row where high grass and ferns
The secret hollow shade, your pointers stand.
How beautiful they look! With outstretched tails,
With heads immovable and eyes fast fixed,
One fore-leg raised and bent, the other firm,
Advanced forward, presses on the ground."

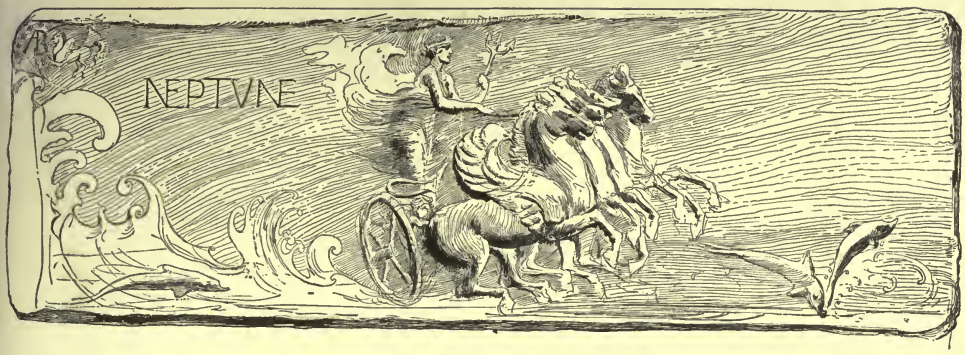
Alfred M. Mayer.

THY WILL BE DONE.

Blow on, fierce tempest, blow!
Pour down thy drenching rain,
Flash thy red lightning's glow,
O'er trembling land and main,—
I, but an humble lily of the field,
Resistless to thy swinging furies yield,
Let without pause or stay
All bonds and fetters burst,
Wild winds and torrents sway,
Wreak on my head their worst!

What though they snap and drown
Blossom and branch and root,
Wither and blast far down
Fair bud and tender shoot,—
From my crushed, broken heart may still rise up,
Like incense from a shivered golden cup,
A last faint breath to Heaven,
Left without star or sun,—
He took what He had given,
Thy will, my God, be done!

Stuart Sterne.



SONGS OF THE SEA.

THE STORMY PETREL.

When fierce along his ocean-path
The North wind rushes in his wrath,
And down the vast, insatiate wave
The great ship shudders to her grave,
Whence is it that thy tiny form
Exults, and challenges the storm?

Oh, not for thee the bloom-sweet gales
Of orchards, or in thymy vales
The bee's low hum: the rush and roar
Of breakers on some savage shore,
Or organ-winds through sea-caves blown,
Are harmonies for thee alone!

Man's argosies are swept to naught;
Yet o'er the havoc, tempest-wrought,
Companion of the wandering sea,
Tumult and Death but toy with thee,
And cheer thee in thy lonely flight,
Making our horror thy delight!

Oh, would, strange bird, I too could sweep
Unharmed along life's angry deep,
Nor heed the lowering clouds that roll
And darken round the struggling soul—
Like thee could soar, and breast, elate,
The mists of doubt, the storms of fate!

Henry S. Cornwell.

THE SEA-KING.

From out his castle on the sand
He led his tawny-bearded band
In stormy bark from land to land.

The red dawn was his goodly sign:
He set his face to sleet and brine,
And quaffed the blast like ruddy wine;

And often felt the swirling gale
Beat, like some giant thresher's flail,
Upon his battered coat of mail;

Or sacked, at times, some windy town,
And from the pastures, parched and brown,
He drove the scurrying cattle down;

And kissed the maids, and stole the bell
From off the church below the fell,
And drowned the priest within the well.

And he had seen, on frosty nights,
Strange, whirling forms and elfin sights,
In twilight land, by Northern Lights;

Or, sailing on by windless shoal,
Had heard, by night, the song of troll
Within some cavern-haunted knoll.

Off Iceland, too, the sudden rush
Of waters falling, in a hush
He heard the ice-fields grind and crush.

His prow the sheeny south seas clove;
Warm, spicèd winds from lemon-grove
And heated thicket round him drove.

The storm-blast was his deity;
His lover was the fitful sea;
The wailing winds his melody.

By rocky scaur and beachy head
He followed where his fancy led,
And down the rainy waters fled;

And left the peopled towns behind,
And gave his days and nights to find
What lay beyond the western wind.

L. Frank Tooker.

THE ROCK IN THE SEA.

They say that yonder rock once towered
Upon a wide and grassy plain,
Lord of the land, until the sea
Usurped his green domain:
Yet now remembering the fair scene
Where once he reigned without endeavor,
The great rock in the ocean stands
And battles with the waves forever.

How oft, O rock, must visit thee
Sweet visions of the ancient calm
All amorous with birds and bees,
And odorous with balm!
Ah me, the terrors of the time
When the grim, wrinkled sea advances,
And winds and waves with direful cries
Arouse thee from thy happy trances!

To no soft tryst they waken thee,
No sunny scene of perfect rest,
But to the raging sea's vanguard
Thundering against thy breast:
No singing birds are round thee, now,
But the wild winds, the roaring surges,
And gladly would they hurl thee down
And mock thee in eternal dirges.

But be it thine to conquer them;
And may thy firm-enduring form
Still frown upon the hurricane,
Still grandly front the storm:
And while the tall ships come and go,
And come and go the generations,
May thy proud presence yet remain
A wonder unto all the nations.

Sometime, perchance, O lonely rock,
Thou mayest regain thine ancient seat,
Mayest see once more the meadow shine,
And hear the pasture bleat:
But ah, methinks even then thy breast
Would stir and yearn with fond emotion,
To meet once more in glorious war
The roaring cohorts of the ocean.

Let me, like thee, thou noble rock,
Pluck honor from the seas of time;
Where Providence doth place my feet
There let me stand sublime:
O life, 'tis very sweet to lie
Upon thy shores without endeavor,
But sweeter far to breast thy storms
And battle with thy waves forever.

Henry Ames Blood.

SEA-PICTURES.

I. MORNING.

The morning sun has pierced the mist,
And beach and cliff and ocean kissed.
Blue as the lapis-lazuli
The sea reflects the azure sky.
In the salt healthy breeze I stand
Upon the solid floor of sand.
Along the untrodden shore are seen
Fresh tufts of weed, maroon and green;
And ruffled kelp with stranded sticks
And shells and stones and sea-moss mix.
The low black rocks forever wet
Lie tangled in their pulpy net.
The shy sand-pipers fly and light:
The swallows circle out of sight:
And on the horizon blue, afar
Each white sail glimmers like a star.
Old Ocean smiles as though amid
His leagues of brine no treachery hid.
And safe upon the sandy marge,
By stranded boat and floating barge,
Gay children leap and laugh and run,
Browned by the salt air and the sun.

II. EVENING.

Now thickening twilight presses down
Upon the harbor and the town;
And all around a misty pall
Of dull gray cloud hangs over all.
The huddling fishing-sloops lie safe;
While far away the breakers chafe.
And now the landsman's straining eye
Mingles the gray sea and the sky.
Far out upon the darkening deep
The white ghosts of the ocean leap.
Boon-Island light, a lonely star,
Is flashing o'er the waves afar.
Upon the beach the sea rolls in
In never-ending foam and din;
And all along the craggy shore
Resounds one long continuous roar.
We turn away to hail each gleam
Where lamps from cottage windows stream.
For sad and solemn is the moan
Of ocean when the day has flown,
And borne on dusky wings, the night
Wraps in a shroud the dying light.

Christopher P. Cranch.

ALPHONSE DAUDET.

I.

"THE novel of manners grows thick in England, and there are many reasons for it. In the first place, it was born there, and a plant always flourishes in its own country." So wrote M. Taine, the French critic, many years ago. But those were the years of Dickens and Thackeray (as a prelude to a study of the latter of whom the remark was made); and the branch of literature mentioned by M. Taine has no longer, in the soil of our English-speaking genius, so strong a vitality. The French may bear the palm to-day in the representation of manners by the aid of fiction. Formerly, it was possible to oppose Balzac and Madame Sand to Dickens and Thackeray; but at present we have no one, either in England or in America, to oppose to Alphonse Daudet. The appearance of a new novel by this admirable genius is to my mind the most delightful literary event that can occur just now; in other words, Alphonse Daudet is at the head of his profession. I say of his profession advisedly, for he belongs to our modern class of trained men of letters; he is not an occasional or a desultory poet; he is a novelist to his finger-tips—a soldier in the great army of constant producers. But such as he is, he is a master of his art, and I may as well say, definitely, that if I attempt to sketch in a few pages his literary countenance, it will be found that the portrait is from the hand of an admirer. We, most of us, feel that among the artists of our day certain talents have more to say to us and others less; we have our favorites and we have our objects of indifference. I have always had a sympathy for the author of the "Lettres de mon Moulin"; I began to read his novels with a prejudice in their favor. This prejudice sprang from the Letters aforesaid, which do not constitute a novel, but a volume of the lightest and briefest tales. They had, to my mind, an extraordinary charm; they put me quite on the side of Alphonse Daudet, whatever he might do in the future. One of the first things he did was to publish the history of "Fromont Jeune et Risler Aîné." It is true that this work did not give me the pleasure that some of its successors have done, and though it has been crowned by the French Academy I still think it rather less rich than "Les Rois en Exil" and "Numa Roumestan." But I liked it better on a second reading than on a first; it contains some delightful things. After that came "Jack" and "Le Nabab," and the two novels I have just mentioned, and that curious and interesting tale of "L'Évangéliste," which appeared a few months since, and which proves that the author's genius, though on the whole he has pressed it hard, is still nervous, fresh and young. Each of these things has been better than the last, with the exception, perhaps, of "L'Évangéliste," which, to my taste, is not superior to "Numa Roumestan." "Numa Roumestan" is a masterpiece; it is really a perfect work; it has no fault, no weakness. It is a compact and harmonious whole. Daudet's other works have had their inequalities, their anomalies, certain places where, if you tapped them, they sounded hollow. His danger has always been a perceptible tendency to the factitious; sometimes he has fallen into the trap laid for him by a taste for superficial effects. In "Fromont Jeune," for instance, it seems to me difficult to care much for the horrid little heroine herself, carefully as she is studied. She has been studied, but she has not been caught, for she is not interesting (even for a *coquine*, as the French say), not even human. She is a mechanical doll, with nothing for the imagination to take hold of. She is one more proof of the fact that it is difficult to give the air of consistency to vanity and depravity, though the portraiture of the vicious side of life would seem, from the pictorial point of view, to offer such attractions. The reader's quarrel with Sidonie Chèbe is not that she is bad, but that she is not *felt*, as the æsthetic people say. In "Jack" the hollow spot, as I have called it, is the episode of Doctor Rivals and his daughter Cécile, which reminds us of the weaker parts of Dickens. It is, perhaps, because to us readers of English speech the figure of the young girl, in a French novel, is almost always wanting in reality—seems to be thin and conventional; in any case, poor Jack's love-affair, at the end of the book, does not produce the illusion of the rest of his touching history. In "Le Nabab" this artificial element is very considerable; it centers about the figure of Paul de Géry, and embraces the whole group of M. Joyeuse and his blooming daughters, with their pretty attitudes—taking in also the very shadowy André Maranne, so touchingly re-united to his mother, who had lived for ten years with an Irish doctor to whom she

was not married. In "Les Rois en Exil," Tom Lévis and the diabolical Séphora seem to me purely fanciful creations, without any relation to reality. They are the weak part of the book. They are very clever, very picturesque, and the comedian Tom is described with immense spirit, an art which speaks volumes as to a certain sort of Parisian initiation. But if this artistic and malignant couple are very clever sketching, they are not really humanity. Ruffians and rascals have a certain moral nature, as well as the better-behaved; but in the case I have mentioned M. Daudet fails to put his finger upon it. The same with Madame Autheman, the evil genius of poor Éline Ebsen, in the "L'Évangéliste." She seems to me terribly, almost grotesquely, hollow. She is an elaborate portrait of a fanatic of Protestantism, a bigot to the point of monstrosity, cold-blooded, implacable, cruel. The figure is painted with Alphonse Daudet's inimitable art; no one that handles the pen to-day is such a pictorial artist as he. But Madame Autheman strikes me as quite automatic; psychologically she is a blank. One does not see the operation of her character. She must have had a soul, and a very curious one. It was a great opportunity for a piece of spiritual portraiture; but we know nothing about Madame Autheman's soul, and I think we fail to believe in her. I should go so far as to say that we get little more of an inside view, as the phrase is, of Éline Ebsen; we are not shown the spiritual steps by which she went over to the enemy—vividly, admirably, as the outward signs and consequences of this disaster are depicted. The logic of the matter is absent in both cases, and it takes all the magic of the author's legerdemain to prevent us from missing it. These things, however, are exceptions, and the tissue of each of his novels is, for all the rest, really pure gold. No one has such grace, such lightness and brilliancy of execution; it is a fascination to see him at work. The beauty of "Numa Roumestan" is that it has no hollow places; the logic and the image melt everywhere into one. Émile Zola, criticising the work in a very friendly spirit, speaks of the episode of Hortense Le Quesnoy and the Provençal *tambourinaire* as a false note, and declares that it wounds his sense of delicacy. Valmajour is a peasant of the south of France; he is young, handsome, picturesque, and a master of the rustic fife and tambourine—instruments that are much appreciated in his part of the country. Mademoiselle Le Quesnoy, living in Paris, daughter of a distinguished member of the French judiciary—"*le premier magistrat de France*"—young, charming, imaginative, romantic, marked out for a malady of the chest, and with a certain innocent perversity of mind, sees him play before an applauding crowd in the old Roman arena at Nîmes, and forthwith conceives a secret, a singular, but not, under the circumstances, an absolutely unnatural passion for him. He comes up to Paris to seek his fortune at the "variety" theaters, where his feeble and primitive music quite fails to excite enthusiasm. The young girl, reckless and impulsive, and full of sympathy with his mortification, writes him in three words (upon one of her little photographs) an assurance of her devotion; and this innocent missive, falling soon into the hands of his rapacious and exasperated sister (a wonderful figure, one of the most living that has ever come from Daudet's pen), becomes a source of infinite alarm to the family of Mademoiselle Le Quesnoy, who see her compromised, calumniated and blackmailed, and finally of complete humiliation to poor Hortense herself, now fallen into a rapid consumption and cured of her foolish infatuation by a nearer view of the vain and ignorant Valmajour. An agent of the family recovers the photograph (by the aid of ten thousand francs), and the young girl, with the bitter taste of her disappointment still in her soul, dies in her flower. This little story, as I say, is very shocking to M. Zola, who cites it as an example of the folly of a departure from consistent realism. What is observed, says M. Zola, on the whole very justly, is strong; what is invented is always weak, especially what is invented to please the ladies. "See in this case," he writes, "all the misery of invented episodes. This love of Hortense, with which the author has doubtless wished to give the impression of something touching, produces a discomfort, as if it were a violation of nature. It is therefore the pages written for the ladies that are repulsive—even to a man accustomed to the saddest dissections of the human corpse." I am not of M. Zola's opinion—delightful as it would be to be of that opinion when M. Zola's sense of propriety is ruffled. The incident of Hortense and Valmajour is not (to my sense) a blot upon "Numa Roumestan"; on the contrary, it is perfectly conceivable, and it is treated with admirable delicacy. "This romantic stuff," says M. Zola, elsewhere, "is as painful as a pollution. That a young girl should lose her head over a tenor, that may be explained, for she loves the operatic personage in the interpreter. She has before her a young man sharpened and refined by life, elegant, having at least certain appearances of talent and intelligence. But this tambourinist, with his drum and penny-whistle, this village dandy, a poor devil who doesn't even know how to speak!

No, life has not such cruelties as that, I protest, I who certainly, as a general thing, am not accustomed to give ground before human aberrations!" This objection was worth making; but I should look at the matter in another way. It seems to me much more natural that a girl of the temper and breeding that M. Daudet has described should take a momentary fancy to a prepossessing young rustic, bronzed by the sun of Provence (even if it be conceded that his soul was vulgar), than that she should fasten her affections upon a "lyric artist," suspected of pomatum and paint and illuminated by the footlights. These are points which it is vain to discuss, however, both because they are delicate and because they are details. I have come so far simply from a desire to justify my high admiration of "Numa Roumestan." But Émile Zola, again, has expressed this feeling more felicitously than I can hope to do. "This, moreover, is a very slight blemish in a work which I regard as one of those, of all Daudet's productions, that is most personal to himself. He has put his whole nature into it, helped by his southern temperament, having only to make large draughts upon his most intimate recollections and sensations. I do not think that he has hitherto reached such an intensity either of irony or of geniality. * * * Happy the books which arrive in this way, at the hour of the complete maturity of a talent! They are simply the widest unfolding of an artist's nature; they have in happy equilibrium the qualities of observation and the qualities of style. For Alphonse Daudet 'Numa Roumestan' will mark this interfusion of a temperament and a subject that are made for each other, the perfect plenitude of a work which the writer exactly fills."

II.

As I say, however, these are details, and I have touched them prematurely. Alphonse Daudet is a charmer, and the effect of his brilliant, friendly, indefinable genius is to make it difficult, in speaking of him, to take things in their order or follow a plan. In writing of him some time ago, in another place, I so far lost my head as to remark, with levity, that he was "a great little novelist." The diminutive epithet then, I must now say, was nothing more than a term of endearment, the result of an irresistible impulse to express a sense of personal fondness. This kind of feeling is difficult to utter in English, and the utterance of it, so far as this is possible, is not thought consistent with the dignity of a critic. If we were talking French, nothing would be simpler than to say that Alphonse Daudet is adorable, and have done with it. But this resource is denied me, and I must arrive at my meaning by a series of circumlocutions. I am not able even to say that he is very "personal"; that epithet, so valuable in the vocabulary of French literary criticism, has, when applied to the talent of an artist, a meaning different from the sense in which we use it. "A novelist so personal and so penetrating," says Émile Zola, speaking of the author of "Numa Roumestan." That phrase, in English, means nothing in particular; so that I must add to it, that the charm of Daudet's talent comes from its being charged to an extraordinary degree with his temperament, his feelings, his instincts, his natural qualities. This, of course, is a charm, in a style, only when nature has been generous. To Alphonse Daudet she has been exceptionally so; she has placed in his hand an instrument of many chords. A delicate, nervous organization, active and indefatigable in spite of its delicacy, and familiar with emotion of almost every kind, equally acquainted with pleasure and with pain; a light, quick, joyous, yet ironical, imagination, a faculty of seeing images, making images, at every turn, of conceiving everything in the visible form, in the plastic spirit; an extraordinary sensibility to all the impressions of life, and a faculty of language which is in perfect harmony with his wonderful fineness of perception — these are some of the qualities of which he is the happy possessor and which make his equipment for the work he has undertaken exceedingly rich. There are others besides; but enumerations are ponderous, and we should avoid that danger in speaking of a genius whose lightness of touch never belies itself. His elder brother, who has not his talent, has written a little book about him in which the word *modernité* perpetually occurs. M. Ernest Daudet, in "Mon Frère et Moi," insists upon his possession of the qualities expressed by this barbarous substantive, which is so indispensable to the new school. Alphonse Daudet is, in truth, very modern; he has all the newly-developed perceptions. Nothing speaks so much to his imagination as the latest and most composite things, the refinements of current civilization, the most delicate shades of the actual. It is scarcely too much to say that (especially in the Parisian race) modern manners, modern nerves, modern wealth and modern improvements, have engendered a new sense, a sense not easily named nor classified, but recognizable in all the most characteristic productions of contemporary art. It is partly physical, partly moral, and the shortest way to describe it is to say that it is a more analytic

consideration of the appearance of things. It is known by its tendency to resolve its discoveries into pictorial form. It sees the connection between feelings and external conditions, and it expresses such relations as they have not been expressed hitherto. It deserves to win victories, because it has opened its eyes well to the fact that the magic of the arts of representation lies in their appeal to the associations awakened by things. It traces these associations into the most unlighted corners of our being, into the most devious paths of experience. The appearance of things is constantly more complicated, as the world grows older, and it needs a more and more patient art to divide it into its parts. Of this art, Alphonse Daudet has a wonderfully large allowance, and that is why I say that he is peculiarly modern. It is very true that his manner is not the manner of patience—though he must always have had a great deal of that virtue in the preparation of his work. The new school of fiction in France is based very much on the taking of notes; the library of the great Flaubert, of the brothers de Goncourt, of Émile Zola, and of the writer of whom I speak, must have been in a large measure a library of memorandum-books. This, of course, only puts the patience back a stage or two. In composition, Daudet proceeds by quick, instantaneous vision, by the happiest divination, by catching the idea as it suddenly springs up before him with a whirr of wings. What he mainly sees is the great surface of life and the parts that lie near the surface. But life is, immensely, a matter of surface, and if our emotions, in general, are interesting, the *form* of those emotions has the merit of being more definite. Like most French imaginative writers (judged, at least, from the English standpoint), he is much less concerned with the moral, the metaphysical world than with the sensible. We proceed usually from the former to the latter, while the French reverse the process. They are uncomfortable in the presence of abstractions, and lose no time in reducing them to the concrete. But even the concrete, for them, is a field for poetry; which brings me to the fact that the delightful thing in Daudet's talent is the inveterate poetical touch. This is what mainly distinguishes him from the other lights of the realistic school—modifies so completely in his case the hardness of consistent realism. There is something very hard, very dry, in Flaubert, in Edmond de Goncourt, in the robust Zola; but there is something very soft in Alphonse Daudet. "Benevolent nature," says Zola, "has placed him at that exquisite point where poetry ends and reality begins." That is happily said; Daudet's great characteristic is this mixture of the sense of the real with the sense of the beautiful. His imagination is constantly at play with his theme; it has a horror of the literal, the limited; it sees an object in all its intermingled relations—on its sentimental, its pathetic, its comical, its pictorial side. Flaubert, in whom Alphonse Daudet would probably recognize to a certain degree a literary paternity, is far from being a simple realist; but he was destitute of this sense of the beautiful, destitute of facility and grace. He had, to take its place, a sense of the strange, the grotesque, to which "Salammbo," the "Tentation de Saint-Antoine," his indescribable posthumous novel of "Bouvard et Pécuchet," abundantly testify. The talent of the brothers Goncourt strikes us as a talent that was associated originally with a sense of beauty; but we receive an impression that this feeling has been perverted and polluted. It has ceased to be natural and free; it has become morbid, and, as the French say, *raffiné;* it has turned mainly to curiosity and mannerism. And these two authors are capable, during a whole book (as in "Germinie Lacerteux" or "La Fille Élisa"), of escaping from its influence altogether. No one would probably ever think of accusing Émile Zola of having a perception of the beautiful. He has an illimitable, and at times a very valuable, sense of the ugly, of the unclean; but when he "goes in," as the phrase is, for the poetic aspect of things, as in "La Faute de l'Abbé Mouret," he is apt to have terrible misadventures.

III.

It is for the expressive talents that we feel an affection, and Daudet is eminently expressive. His manner is the manner of talk, and if the talk is sincere, that makes a writer touch us. Daudet expresses many things; but he most frequently expresses himself—his own temper in the presence of life, his own feeling on a thousand occasions. This personal note is especially to be observed in his earlier productions—in the "Lettres de mon Moulin," the "Contes du Lundi," "Le Petit Chose"; it is also very present in the series of prefaces which he has undertaken to supply to the octavo edition of his works (very handsome, save that Alphonse Daudet should never be in octavo!). In these prefaces he gives the history of each successive book—relates the circumstances under which it was written. These things are ingeniously told, but what I am chiefly conscious of in regard to them is that Alphonse Daudet must express himself. His brother informs us that he is writing his Memoirs, and this will have been another

opportunity for expression. Ernest Daudet, as well (as I have mentioned), has attempted to express him. "Mon Frère et Moi" is one of those productions which it is difficult for an English reader to judge in fairness; it is so much more confidential than we, in public, ever venture to be. The French have, on all occasions, the courage of their emotion, and M. Ernest Daudet's leading emotion is a boundless admiration for his junior. He lays it before us very frankly and gracefully — not, on the whole, indiscreetly; and I have no quarrel whatever with his volume, for it contains a considerable amount of information on a very interesting subject. Indirectly, indeed, as well as directly, it helps us to a knowledge of his brother. Alphonse Daudet was born in Provence; he comes of an expansive, a confidential race. His style is impregnated with the southern sunshine, and his talent has the sweetness of a fruit that has grown in the warm open air. He has the advantage of being a Provençal converted, as it were — of having a southern temperament and a northern reason. We know what he thinks of the southern temperament — "Numa Roumestan" is a vivid exposition of that. "*Gau de carriero, doulou d'oustau*," as the Provençal has it; "*joie de rue, douleur de maison* — joy in the street and pain in the house" — that proverb, says Alphonse Daudet, describes and formulates a whole race. It has given him the subject of an admirable story, in which he has depicted with equal force and tenderness the amiable weaknesses, the mingled violence and levity, of the children of the clime of the fig and olive. He has put before us, above all, their mania for speech, their irrepressible garrulity, the qualities that, with them, render all passion, all purpose, inordinately vocal. Himself a complete "*produit du Midi*," like the *famille* Mèfre in "Numa Roumestan," he has achieved the feat of becoming objective to his own vision, getting outside of his ingredients and judging them. This he has done by the aid of his Parisianized conscience, his exquisite taste, and that finer wisdom which resides in the artist, from whatever soil he springs. Successfully as he has done it, however, he has not done it so well but that he too does not show a little of the exaggerated color, the superabundant statement, the restless movement of his compatriots. He is nothing if not demonstrative; he is always in a state of feeling; he has not a very definite ideal of reserve. It must be added that he is a man of genius, and that genius never spends its capital; that he is an artist, and that an artist always has a certain method and order. But it remains characteristic of his origin that the author of "Numa Roumestan," one of the happiest and most pointed of satires, should have about him the aroma of some of the qualities satirized. There are passages in his tales and in his prefaces that are genuine "*produits du Midi*," and his brother's account of him could only have been written by a Provençal brother.

To be *personnel* to that point, transparent, effusive, gushing, to give one's self away in one's books, has never been, and will never be, the ideal of us of English speech; but that does not prevent our enjoying immensely, when we meet it, a happy example of this alien spirit. For myself, I am free to confess, half my affection for Alphonse Daudet comes from the fact that he writes in a way in which I would not write even if I could. There are certain kinds of feeling and observation, certain impressions and ideas, to which we are unwilling to give a voice and yet are equally unwilling to suppress altogether. In these matters Alphonse Daudet renders us a great service; he expresses such things on our behalf. I may add that he usually does it much better than the cleverest of us could do even if we were to try. I have said that he is a Provençal converted, and I should do him a great injustice if I did not dwell upon his conversion. His brother relates the circumstances under which he came up to Paris, at the age of twenty (in a threadbare overcoat and a pair of india-rubbers), to seek his literary fortune. His beginnings were difficult, his childhood had been hard, he was familiar with poverty and disaster. He had no adventitious aid to success — his whole fortune consisted in his exquisite organization. But Paris was to be, artistically, a mine of wealth to him, and of all the anxious and eager young spirits who on the battle-field of uncarpeted *cinquièmes* have laid siege to the indifferent city, none can have felt more deeply conscious of the mission to take possession of it. Alphonse Daudet, at the present hour, is in complete possession of Paris; he knows it, loves it, uses it; he has assimilated it to its last particle. He has made of it a Paris of his own — a Paris like a vast crisp water-color, one of the water-colors of the school of Fortuny. The French have a great advantage in the fact that they admire their capital very much as if it were a foreign city. Most of their artists, their men of letters, have come up from the provinces, and well as they may learn to know the metropolis, it never ceases to be a spectacle, a wonder, a fascination for them. This comes partly from the intrinsic brilliancy and interest of the place, partly from the poverty of provincial life, and partly from the degree to which the faculty of appreciation is developed in Frenchmen of the

class of which I speak. To Daudet, at any rate, the familiar aspects of Paris are endlessly pictorial, and part of the charm of his novels (for those who share his relish for that huge flower of civilization) is in the way he recalls it, evokes it, suddenly presents it, in parts or as a whole, to our senses. The light, the sky, the feeling of the air, the odors of the streets, the look of certain vistas, the silvery, muddy Seine, the cool, gray tone of color, the physiognomy of particular quarters, the whole Parisian expression, meet you suddenly in his pages and remind you again and again that if he paints with a pen he writes with a brush. I remember that when I read "Le Nabab" and "Les Rois en Exil" for the first time, I said to myself that this was the *article de Paris* in supreme perfection, and that no reader could understand such productions who had not had a copious experience of the scene. It is certain, at any rate, that those books have their full value only for minds more or less Parisianized; half their meaning, their magic, their subtlety of intention, is liable to be lost. It may be said that this is a great limitation—that the works of the best novelists may be understood by all the world. There is something in that; but I know not, all the same, whether the fact I indicate be a great limitation. It is certainly a very positive quality. Daudet has caught the tone of a particular development of manners; he applies it with the lightest, surest hand, and his picture shines and lives. The most generalized representation of life cannot do more than that. I shrink very much from speaking of systems, in relation to such a genius as this; I should incline to believe that Daudet's system is simply to be as vivid as he can. Émile Zola has a system—at least, he says so; but I do not remember, on the part of the author of "Numa Roumestan," the smallest technical profession of faith. Nevertheless, he has taken a line, as we say, and his line is to sail as close as possible to the actual. The life of Paris being his subject, his attempt, most frequently, is to put his finger upon known examples; so that he has been accused of portraying individuals instead of portraying types. There are few of his figures to which the name of some celebrity of the day has not been attached. The Nabob is François Bravay; the Duc de Mora is the Duc de Morny. The Irish Doctor Jenkins is an English physician who flourished in Paris from such a year to such another; people are still living (wonderful to say) who took his little pills *à base arsénicale*. Félicia Ruys is Mademoiselle Sarah Bernhardt; Constance Crenmitz is Madame Taglioni; the Queen of Illyria is the Queen of Naples; the Prince of Axel is the Prince of Orange; Tom Lévis is an English house-agent (*not* in the Rue Royale, but hard by); Élysée Méraut is a well-known journalist, and Doctor Bouchereau a well-known surgeon. Such is the key, we are told, to these ingenious mystifications, and to many others which I have not the space to mention. It matters little, to my mind, whether in each case the cap fits the supposed model; for nothing is more evident than that Alphonse Daudet has proposed to himself to represent not only the people but the persons of his time. The conspicuity of certain individuals has added to the force with which they speak to his imagination. His taste is for salient figures, and he has said to himself that there is no greater proof of being salient than being known. The temptation to "put people into a book" is a temptation of which every writer of fiction knows something, and I hold that to succumb to it is not only legitimate but inevitable. Putting people into books is what the novelist lives upon; the only question in the matter is a question of taste; the operation must be judged by the manner in which it is performed. Daudet has been accused of doing the thing too boldly, and I believe that two or three of his portraits have provoked a protest. He is charged with ingratitude for having produced an effigy of the Duke of Morny, who had been his benefactor and employed him as a secretary. Such a matter as this is between M. Daudet and his conscience, and I am far from pretending to pronounce upon it. The uninitiated reader can only say that the portrait is a very kindly one—such a portrait as (it may be imagined) the Duc de Morny would not be displeased to have inspired. It may fairly be conceded, however, that Daudet is much more an observer than an inventor. The invented parts of his tales, like the loves of Jack and of Paul de Géry and the machinations of Madame Autheman (the theological vampire of "L'Évangéliste," to whom I shall return for a moment), are the vague, the ineffective, as well as the romantic parts. (I remember that, in reading "Le Nabab," it was not very easy to keep Paul de Géry and André Maranne apart.) It is the real—the transmuted real—that he gives us best; the fruit of an observation that is never colorless nor dry. His brightness and gayety are always there, even when the subject is dusky and painful. They are part of his spirit—part of his way of seeing things. "L'Évangéliste" is the saddest story conceivable; but it is lighted, throughout, by the author's irrepressibly humorous view of the conditions in which its successive elements present themselves, and by the extraordinary vivacity with which, in his hands, narration and description

proceed. His humor is of the finest; it is needless to say that it is never violent nor vulgar. It is a part of the high spirits—the animal spirits, I should say, if the phrase had not an association of coarseness—that accompany the temperament of his race; and it is stimulated by the perpetual entertainment which so keen a visual faculty naturally finds in the spectacle of life, even while encountering there a multitude of distressing things. Daudet's gayety is a part of his poetry, and his poetry is a part of everything he touches. There is little enough gayety in the subject of "Jack," and yet the whole story is told with a smile. To complete the charm of the thing, the smile is full of feeling. Here and there he has given great liberty to his humor, and the result is a delightful piece of drollery. "Les Aventures Prodigieuses de Tartarin de Tarascon" contains all his high spirits; it is one of his few stories in which laughter and tears are not intermingled. This little tale, which is one of his first, is, like "Numa Roumestan," a satire on a southern foible. Tartarin de Tarascon is an excellent man who inhabits the old town on the Rhone, over which the palace of the good King René keeps guard; he has not a fault in the world except an imagination too vivid. He is liable to visions, to hallucinations; the desire that a thing shall happen speedily resolves itself into the belief that the thing will happen—then that it is happening—then that it *has* happened. Tartarin accordingly presents himself to the world (and to himself) as a gentleman to whom all events are familiar; his experience blooms with the flowers of his ambition. The coveted thing for a man of his romantic mold is that he shall be the bravest of the brave, and he passes his life in a series of heroic exploits, in which, as you listen to him, it is impossible not to believe. He passes over from Marseilles to Algiers, where his adventures deepen to a climax, and where he has a desperate flirtation with the principal ornament of the harem of a noble Arab. The lady proves, at the end, to be a horribly improper little Frenchwoman, and poor Tartarin, abused and disabused, returns to Tarascon to meditate on what might have been. Nothing could be more charming than the light comicality of the sketch, which fills a small volume. This is the most joyous, the most completely diverting of all Daudet's tales; but the same element, in an infinitely subtler form, runs through the others. The essence of it is the wish to please, and this brings me back to the point to which I intended to return. The wish to please is the quality by which Daudet touches his readers most; it is this that elicits from them that tender interest, that confession that they are charmed, of which I spoke at the beginning of these remarks. It gives a brightness and sweetness to his manner, in spite of the fact that he describes all sorts of painful and odious things. This contradiction is a part of his originality. He has no pretension to being simple, he is perfectly conscious of being complex, and in nothing is he more modern than in this expressive and sympathetic smile—the smile of the artist, the skeptic, the man of the world—with which he shows us the miseries and cruelties of life. It is singular that we should like him for that—and doubtless many people do not, or think they do not. What they really dislike, I believe, is the things he relates, which are often most lamentable.

IV.

THE first of these were slight and simple, and for the most part cheerful; little anecdotes and legends of Provence; impressions of an artist's holidays in that strange, bare, lovely land, and of wanderings further afield, in Corsica and Algeria; sketches of Paris during the siege; incidents of the invasion, the advent of the Prussian rule in other parts of the country. In all these things there is *la note émue*, as the French have it, the smile which is only a more synthetic sign of being touched at the heart. And then such grace of form, such lightness of touch, such suppleness of observation! Some of the chapters of the "Lettres de mon Moulin" are such perfect vignettes that the brief treatment of small subjects might well have seemed, at first, Alphonse Daudet's appointed work. He had almost invented a manner, and it was impossible to do better than he what the French call the *pièce*, or even the passage. Glimpses, reminiscences, accidents, he rendered them with the brilliancy of a violinist improvising on a sudden hint. The "Lettres de mon Moulin," moreover, are impregnated with the light, with the fragrance of a Provençal summer; the rosemary and thyme are in the air as we read, the white rocks and the gray foliage stretch away to an horizon of hills—the Alpilles, the little Alps—on which color is as iridescent as the breast of a dove. The Provence of Alphonse Daudet is a delightful land; even when the mistral blows there it has a music in its whistle. Émile Zola has protested against this; he, too, is of Provençal race, he passed his youth in the old Languedoc, and he intimates that his fanciful friend throws too much sweetness into the picture. It is beyond contradiction that Daudet, like Tartarin de Tarascon and Numa Roumestan, exaggerates a little; he sees with great intensity and is very sensitive to agreeable impressions.

"Le Petit Chose," his first long story, reads to-day like the attempt of a beginner, and of a beginner who had read and enjoyed Dickens. I risk this allusion to the author of "Copperfield" in spite of a conviction that Alphonse Daudet must be tired of hearing that he imitates him. It is not imitation; there is nothing so gross as imitation in the length and breadth of Daudet's work; but it is conscious sympathy, for there is plenty of that. There are pages in his tales which seem to say to us that at one moment of his life Dickens had been a revelation to him — pages more particularly in "Le Petit Chose," in "Fromont Jeune," and in "Jack." The heroine of the first of these works (a very shadowy personage) is never mentioned but as the "black eyes"; some one else is always spoken of as the *dame de grand mérite;* the heroine's father, who keeps a flourishing china-shop, never opens his mouth without saying "*C'est le cas de le dire.*" These are harmless, they are, indeed, sometimes very happy, Dickensisms. We make no crime of them to M. Daudet, who must have felt as intelligently as he has felt everything else the fascinating form of the English novelist's drollery. "Fromont Jeune et Risler Aîné" is a study of life in the old quarter of the Marais, the Paris of the seventeenth century, whose stately *hôtels* have been invaded by the innumerable activities of modern trade. When I say a study, I use the word with all those restrictions with which it must be applied to a genius who is truthful without being literal, and who has a pair of butterfly's wings attached to the back of his observation. If sub-titles were the fashion to-day, the right one for "Fromont Jeune" would be — "or the Dangers of Partnership." The action takes place for the most part in a manufactory of wall-papers, and the persons in whom the author seeks to interest us are engaged in this useful industry. There are delightful things in the book, but, as I intimated at the beginning of these remarks, there are considerable inequalities. The pages that made M. Daudet's fortune — for it was with "Fromont Jeune" that his fortune began — are those which relate to the history of M. Delobelle, the superannuated tragedian, his long-suffering wife, and his adorable lame daughter, who makes butterflies and humming-birds for ladies' headdresses. This eccentric and pathetic household was an immense hit, and Daudet has never been happier than in the details of the group. Delobelle himself, who has not had an engagement for ten years and who never will have one again, but who holds none the less that it is his duty not to leave the stage, "not to renounce the theater," though his platonic passion is paid for by the weary eyesight of his wife and daughter, who sit up half the night attaching little bead-eyes to little stuffed animals — the blooming and sonorous Delobelle, ferociously selfish and fantastically vain, under the genial forms of melodrama, is a beautiful representation of a vulgarly factitious nature. The book revealed a painter; all the descriptive passages, the pictorial touches, had the truest felicity. No one better than Daudet gives what we call the feeling of a place. The story illustrates, among other things, the fact that a pretty little woman who is consumed with the lowest form of vanity and unimpeded in her operations by the possession of a heart, may inflict an unlimited amount of injury upon people about her if she only have the opportunity. The case is well demonstrated, and Sidonie Chèbe is an elaborate study of flimsiness; her papery quality, as I may call it, her rustling dryness, are effectively rendered. But I think there is a limit to the interest which the English-speaking reader of French novels can take to-day in the adventures of a lady who leads the life of Madame Sidonie. In the first place, he has met her again and again — he knows exactly what she will do and say in every situation; and in the second, there always seems to him to be in her vices, her disorders, an element of the conventional. There is a receipt among French novelists for making little high-heeled devils. However this may be, he has at least a feeling that at night all cats are gray and that the particular *nuance* of depravity of a woman whose nature has the shallowness of a sanded floor is not a very fruitful object of consideration. Daudet has expended much ingenuity in endeavoring to hit the particular *nuance* of Sidonie; he has wished to make her a type — the type of the daughter of small unsuccessful shopkeepers (narrow-minded and self-complacent to imbecility), whose corruption comes from the examples, temptations, opportunities of a great city, as well as from her own poor blood and the infection of the meanest circumstances. But there is something too arid in such specifications. The early chapters of "Jack" are admirable; the later ones suffer a little, I think, from the story being drawn out too much, like an accordion when it wishes to be plaintive. Jack is a kind of younger brother of the Petit Chose, though he takes the troubles of life rather more stoutly than that delicate and diminutive hero; a poor boy with a doting and disreputable mother, whose tenderness is surpassed by her frivolity and who sacrifices her son to the fantastic egotism of an unsuccessful man of letters, with whom she passes

several years of her life. She is another study of flimsiness—she is another *nuance;* but she is a more apprehensible figure than Sidonie Chèbe—she is, indeed, a very admirable portrait. The success of the book, however, is the figure of her lover—that is, of her tyrant and bully, the unrecognized genius aforesaid, author of "Le Fils de Faust," an uncirculated dramatic poem in the manner of Goethe, and center of a little group of *ratés*—a collection of dead-beats, as we say to-day, as pretentious, as impotent, as envious and as bilious as himself. He conceives a violent hatred of the offspring of his amiable companion, and the subject of "Jack" is the persecution of the boy by this monstrous charlatan. This persecution is triumphantly successful; the youthful hero dies on the threshold of manhood, broken down by his tribulations and miseries (he has been thrown upon the world to earn his bread, and among other things seeks a livelihood as a stoker on an Atlantic steamer). Jack has been taken young, and though his nature is gentle and tender, his circumstances succeed in degrading him. He is reduced at the end to a kind of bewildered brutishness. The story is simply a history of continuous suffering, elaborately, expansively told, and I am afraid that Mr. Charles Dudley Warner, who, in writing lately about "Modern Fiction,"* complains of the abuse of pathetic effects in that form of composition, would find little to commend in this brilliant photography of pain. Mr. Warner's complaint is eminently just, and the fault of "Jack" is certainly the abuse of pathos. Mr. Warner does not mention Alphonse Daudet by name, but it is safe to assume that in his reflections upon the perversity of those writers who will not make a novel as comfortable as one's stockings or as pretty as a Christmas card, he was thinking of the author of so many uncompromising *dénouements*. It is true that this probability is diminished by the fact that when he remarks that surely "the main object in the novel is to entertain," he appears to imply that the writers who furnish his text are faithless to this duty. It is possible he would not have made that implication if he had had in mind the productions of a story-teller who has the great peculiarity of being "amusing," as the old-fashioned critics say, even when he touches the source of tears. The word entertaining has two or three shades of meaning; but in whatever sense it is used I may say, in parenthesis, that I do not agree with Mr. Warner's description of the main object of the novel. I should put the case differently; I should say that the main object of the novel is to represent life. I cannot understand any other motive for combining imaginary incidents, and I do not perceive any other measure of the value of such combinations. The *effect* of a novel—the effect of any work of art—is to entertain; but that is a very different thing. The success of a work of art, to my mind, may be measured by the degree to which it produces a certain illusion; that illusion makes it appear to us for the time that we have lived another life—that we have had a miraculous enlargement of experience. The greater the art, the greater the miracle, and the more certain also the fact that we have been entertained—in the best meaning of that word, at least, which signifies that we have been living at the expense of some one else. I am perfectly aware that to say the object of a novel is to represent life does not bring the question to a point so fine as to be uncomfortable for any one. It is of the greatest importance that there should be a very free appreciation of such a question, and the definition I have hinted at gives plenty of scope for that. For, after all, may not people differ infinitely as to what constitutes life—what constitutes representation? Some people, for instance, hold that Miss Austen deals with life, that Miss Austen represents. Others attribute these accomplishments to the brilliant "Ouida." Some people find that illusion, that enlargement of experience, that miracle of living at the expense of others, of which I have spoken, in the novels of Alexandre Dumas. Others revel in them in the pages of Mr. Howells.

* In the "Atlantic Monthly," for April, 1883.

V.

M. DAUDET'S unfortunate Jack, at any rate, lives altogether at his own cost—that of his poor little juvenile constitution and of his innocent affections and aspirations. He is sent to the horrible Gymnase Moronval, where he has no beguiling works of fiction to read. The Gymnase Moronval is a Dotheboys' Hall in a Parisian "Passage"—a very special class of academy. Nothing could be more ingenious than Daudet's picture of this horrible institution, with its bankrupt and exasperated proprietors, the greasy penitentiary of a group of unremunerative children whose parents and guardians have found it convenient to forget them. The episode of the wretched little hereditary monarch of an African tribe who has been placed there for a royal education, and who, livid with cold, short rations and rough usage, and with his teeth chattering, with a sense of dishonor steals away and wanders in the streets of Paris, and then, recaptured and ferociously punished, sur-

renders his little dusky soul in the pestilential dormitory of the establishment — all this part of the tale is a masterpiece of vivid description. We seem to assist at the terrible soirées where the *ratés* exhibit their talents (M. Moronval is of course a *raté*) and where the wife of the principal, a very small woman with a very big head and a very high forehead, expounds the wonderful *Méthode-Décostère* (invented by herself and designated by her maiden name) for pronouncing the French tongue with elegance. My criticism of this portion of the book, and indeed of much of the rest of it, would be that the pathetic element is too intentional, too *voulu*, as the French say. And I am not sure that the reader enters into the author's reason for making Charlotte, Jack's mother, a woman of the class that we don't specify in American magazines. She is a good-natured idiot, but her good nature is unfortunately not consecutive, and she consents at the instigation of the diabolical d'Argenton, to her child's being brought up like a pauper. D'Argenton, like Delobelle, is a study of egotism pushed to the grotesque; but the portrait is still more complete, and some of the details are inimitable. As regards the infatuated Charlotte, who sacrifices her child to the malignity of her lover, I repeat, that certain of the features of her character appear to me a mistake, judged in relation to the effect that the author wishes to produce. He wishes to show us all that the boy loses in being disinherited — if I may use that term with respect to a situation in which there is nothing to inherit. But his loss is not great when we consider that his mother had, after all, very little to give him. She had divested herself of important properties. Bernard Jansoulet, in "Le Nabab," is not, like the two most successful figures that Daudet has previously created, a representation of full-blown selfishness. The unhappy nabob is generous to a fault; he is the most good-natured and accommodating of men, and if he has made use of all sorts of means to build up his enormous fortune, he knows an equal number of ways of spending it. This voluminous tale had an immense success; it seemed to show that Daudet had found his manner, a manner that was perfectly new and remarkably ingenious. As I have said, it held up the mirror to contemporary history, and attempted to complete for us, by supplementary revelations, those images which are projected by the modern newspaper and the photographic album. "Les Rois en Exil" is an historical novel of this pattern, in which the process is still more thoroughly applied. In these two works Daudet enlarged his canvas surprisingly, and showed his ability to deal with a multitude of figures.

The distance traversed artistically from the little anecdotes of the "Lettres de mon Moulin" to the complex narrative of "Le Nabab" and its successor are like the transformation — often so rapid — of a slim and charming young girl into a blooming and accomplished woman of the world. The author's style had taken on bone and muscle and become conscious of treasures of nervous agility. I have left myself no space to speak of these things in detail, and it was not part of my purpose to examine Daudet's novels piece by piece; but I may say that it is the items, the particular touches, that make the value of writing of this kind. I am not concerned to defend the process, the system, so far as there is a system; but I cannot open either "Le Nabab" or "Les Rois en Exil," cannot rest my eyes upon a page, without being charmed by the brilliancy of execution. It is difficult to give an idea, by any general terms, of Daudet's style — a style which defies convention, tradition, homogeneity, prudence, and sometimes even syntax, gathers up every patch of color, every colloquial note, that will help to illustrate, and moves eagerly, lightly, triumphantly along, like a clever woman in the costume of an eclectic age. There is nothing classic in this mode of expression; it is not the old-fashioned drawing in black and white. It never rests, never is satisfied, never leaves the idea sitting half-draped, like Patience on a monument; it is always panting, straining, fluttering, trying to add a little more, to produce the effect which shall make the reader see with his eyes, or rather with those marvelous eyes of Alphonse Daudet. "Le Nabab" is full of episodes which are above all pages of execution, triumphs of *rendu*, as the French say, in that ingenious vocabulary in which they express the technicalities of art. The author has drawn up a list of the great Parisian occasions and painted the portrait — or given a summary — of each of them. The opening day at the Salon, a funeral at Père-la-Chaise, a debate in the Chamber of Deputies, the *première* of a new play at a favorite theater, furnish him with as many opportunities for his gymnastics of observation. I should like to say how rich and entertaining I think the figure of Jansoulet, the robust and good-natured son of his own works (originally a dock-porter at Marseilles), who, after amassing a fabulous number of millions in selling European luxuries on commission to the Bey of Tunis, comes to Paris to try to make his social fortune, as he has already made his financial, and after being a nine-days' wonder, a public joke, and the victim of his boundless hospitality; after being flattered by charlatans, rifled by advent-

urers, belabored by newspapers, and "exploited" to the last penny of his coffers and the last pulsation of his vanity by every one who comes near him, dies of apoplexy in his box at the theater, while the public hoots him for being unseated for electoral frauds in the Chamber of Deputies, where for a single mocking hour he has tasted the sweetness of political life. I should like to say, too, that however much or however little the Duc de Mora may resemble the Duc de Morny, the character depicted by Daudet is a wonderful study of that modern passion, the love of "good form." The chapter that relates the death of the Duke, and describes the tumult, the confusion of his palace, the sudden extinction of the rapacious interests that cluster about him and to which the collapse of his splendid security comes as the first breath of a revolution — this chapter is famous, and gives the fullest measure of what Daudet can do when he fairly warms to his work. "Les Rois en Exil," however, has a greater perfection. It is simpler, more equal, and it contains much more of the beautiful. In "Le Nabab" there are various lacunæ and a certain want of logic; it is not a sustained narrative, but a series of almost diabolically clever pictures. But the other book has more largeness of line — a fine tragic movement which deepens and presses to the catastrophe. Daudet had observed that several dispossessed monarchs had taken up their residence in the French capital — some of them waiting and plotting for a restoration and chafing under their disgrace; others indifferent, resigned, relieved, eager to console themselves with the pleasures of Paris. It occurred to him to suppose a drama in which these exalted personages should be the actors, and which, unlike either of his former productions, should have a pure and noble heroine. He was conscious of a dauntless little imagination, the idea of making kings and queens talk among themselves had no terror for him; he had faith in his good taste, in his exquisite powers of divination. The success is worthy of the spirit — the gallant artistic spirit — in which it was invoked. "Les Rois en Exil" is a masterly production. He has had, it is true, to simplify his subject a good deal to make it practicable; the court of the king and queen of Illyria, in the suburb of Saint-Mandé, is a little too much like a court in a fairy-tale. But the amiable depravity of Christian, in whom conviction, resolution, attention, are hopelessly dead, and whose one desire is to enjoy Paris with the impunity of a young man about town; the proud, serious, concentrated nature of Frederica, who believes ardently in her royal function and lives with her eyes fixed on the crown, which she regards as a symbol of duty; both of these conceptions do M. Daudet the utmost honor, and prove that he is capable of handling great situations — situations which have a depth of their own, and do not depend for their interest on amusing occasions. It takes, perhaps, some courage to say so, but the feelings, the passions, the view of life, of royal personages, differ essentially from those of common mortals; their education, their companions, their traditions, their exceptional position, take sufficient care of that. Alphonse Daudet has embraced the difference; and I scarcely know, in the last few years, a straighter flight of imagination. The history of the Queen of Illyria is a tragedy. Her husband sells his birthright for a few million of francs and rolls himself in the Parisian gutter; her child perishes from poverty of blood; she herself dries up in her despair. There is nothing finer in all Daudet than the pages at the end of the book, which describe her visits to the great physician Bouchereau, when she takes her poor half-blind child by the hand and (wishing an opinion unbiased by the knowledge of her rank) goes to sit in his waiting-room like one of the vulgar multitude. Wonderful are the delicacy, the verity, the tenderness of these pages; I always point to them to justify my predilection. But I must stop pointing. I will not say more of "Numa Roumestan" than I have already said; for it is better to pass so happy a work by than to speak of it inadequately. I will only repeat that I delight in "Numa Roumestan." Alphonse Daudet's last book is a novelty at the time I write; "L'Évangéliste" has been before the public but a month or two at the moment of writing. I will say but little of it, partly because my opportunity is already over, and partly because I have found that, for a fair judgment of one of Daudet's works, the book should be read a second time, after a certain interval has elapsed. This interval has not brought round my second perusal of "L'Évangéliste." My first suggests that, with all the author's present mastery of his resources, the book has a grave defect. It is not that the story is painful; that is a defect only when the sources of this element are not, as I may say, well founded. It treats of a young girl (a Danish Protestant) who is turned to stone by a Medusa of Calvinism, the somber and fanatical wife of a great Protestant banker. Madame Autheman persuades Éline Ebsen to wash her hands of her poor old mother, with whom, up to this moment, she has lived in the closest affection, and go forth into strange countries to stir up the wicked to conversion. The excellent Madame Ebsen, bewildered, heart-broken, desperate, terrified at

the imagined penalties of her denunciation of the rich and powerful bigot (so that she leaves her habitation and hides in a household of small mechanics to escape from them —one of the best episodes in the book), protests, struggles, goes down on her knees in vain; then, at last, stupefied and annihilated, desists, looks for the last time at her inexorable, impenetrable daughter, who has hard texts on her lips and no recognition in her eye, and who lets her pass away, without an embrace, forever. The incident in itself is perfectly conceivable; many well-meaning persons have held human relationships cheap in the face of a religious call. But Daudet's weakness has been simply a want of acquaintance with his subject. Proposing to himself to describe a particular phase of French Protestantism, he has "got up" certain of his facts with commendable zeal; but he has not felt nor understood the matter, has looked at it solely from the outside, sought to make it above all things grotesque and extravagant. Into these excesses it doubtless frequently falls; but there is a general human verity which regulates even the most stubborn wills, the most perverted lives; and of this saving principle the author, in the quest of striking pictures, has rather lost his grasp. His pictures are striking, as a matter of course; but to us readers of Protestant race, familiar with the large, free, salubrious life which the children of that faith have carried with them over the globe, there is almost a kind of drollery in these over-ingenious pictures of the Protestant temperament. The fact is that M. Daudet has not, (to my belief) any natural understanding of the religious passion; he has a quick perception of many things, but that province of the human mind cannot be quickly perceived; experience, there, is the only explorer. Madame Autheman is not a real bigot; she is simply a dusky effigy, she is undemonstrated. Éline Ebsen is not a victim, inasmuch as she is but half alive, and victims are victims only in virtue of being thoroughly sentient. I do not easily perceive her spiritual joints. All the human part of the book, however, has the author's habitual felicity; and the reader of these remarks knows what I hold that to be. It may seem to him, indeed, that in making the concession I made just above — in saying that Alphonse Daudet's insight fails him when he approaches the question of spiritual things — I partly take back some of the admiration I have expressed for him. For that amounts, after all, to saying that he has no high imagination, and, as a consequence, no philosophy. It is very true, I am afraid, that he has but little philosophy. There are certain things he does not conceive — certain forms that never appear to him. Imaginative writers of the first order always give us an impression that they have a kind of ideal. I should be at a loss what to say about Daudet's ideal. "And yet you have praised him so much," I fancy I hear it urged; "you have praised him as if he were one of the very first." All that is very true, and yet I take nothing back. Determinations of rank are a delicate matter, and it is sufficient priority for an author that one likes him immensely. Daudet is bright, vivid, tender; he has an intense artistic life. And then he is so free. For the spirit that moves slowly, going carefully from point to point, the sight of that freedom is delightful.

Henry James.

A ROSE.

Too-perfect rose, thy heavy breath has power
To wake a dim, an unexplained regret:
Art body to the soul of some deep hour
That all my seasons have not yielded yet?

But if it be so — Hour, too-perfect Hour,
Ah, blow not full, though all the yearning days
Should tremble bud-like! since the wind must shower
Thine unreturning grace along the ways.

Helen Gray Cone.

POEMS.

QUALITY.

TAKE, ere the bee hath sipped,
The courtly, maiden-lipped,
And dewy oleander,
And breathe, and dream, and wander.
But ah! take not another,
Lest fragrance fragrance smother.

What all your wreathéd wine,
If what I taste of mine
Be pure? The Burgund sun
Reflects as warm in one
Flame-kindled drop as 'twere
The vintage of a year.

Stranger, thy passing word
My leaping heart hath heard;
Its tone makes strangeness end—
This hour thou art my friend;
And could not dearer be,
Loved an eternity.

Beauty, or joy, or mirth—
Of all that's best on earth,
One is a thousand worth.

TO-MORROW.

ONE walks secure in wisdom-guarded ways
That lead to peaceful nights through happy days—
Health, fame, friends, children, and a gentle wife,
All Youth can covet or Experience praise,
And Use withal to crown the ease of life.
Ah, thirsting for another day,
How dread the fear
If he but knew the danger near!

Another, with some old inheritance
Of Fate, unmitigated yet by Chance,—
Condemned by those he loves, with no appeal
To his own fearful heart, that ever pants
For newer circlings of the cruel Wheel!
Ah, thirsting for another day,
What need of fear,
If he but knew the help that's near?

Robert Underwood Johnson.

THE PRESENT CONDITION OF THE MISSION INDIANS IN SOUTHERN CALIFORNIA.

THE old laws of the Kingdom of the Indies are interesting reading, especially those portions of them relating to Indians. A certain fine and chivalrous quality of honor toward the helpless, and tenderness toward the dependent, runs all through their quaint and cumbrous paragraphs.

It is not until one studies these laws, in connection with the history of the confusions and revolutions of the secularization period, and of the American conquest of California, that it becomes possible to understand how the California Mission Indians could have been left so absolutely unprotected, as they were, in the matter of ownership of the lands they had cultivated for sixty years.

"We command," said the Spanish king, "that the sale, grant, and composition of lands be executed with such attention that the Indians be left in possession of the full amount of lands belonging to them, either singly or in communities, together with their rivers and waters; and the lands which they shall have drained or otherwise improved, whereby they may by their own industry have rendered them fertile, are reserved, in the first place, and can in no case be sold or aliened. And the judges who have been sent thither shall specify what Indians they may have found on the land, and what lands they shall have left in possession of each of the elders of tribes, caciques, governors, or communities."

Grazing estates for cattle are ordered to be located "apart from the fields and villages of the Indians." The king's command is that no such estates shall be granted "in any parts or place where any damage can accrue to the Indians." Every grant of land must be made "without prejudice to the Indians"; and "such as may have been granted to their prejudice and injury" must be "restored to whomever they by right shall belong."

"In order to avoid the inconveniences and damages resulting from the sale or gift to Spaniards of tracts of land to the prejudice of Indians, upon the suspicious testimony of witnesses," the king orders that all sales and gifts are to be made before the attorneys of the royal audiencias, and "always with an eye to the benefit of the Indians"; and "the king's solicitors are to be protectors of the Indians and plead for them." "After distributing to the Indians what they may justly want to cultivate, sow, and raise cattle, confirming to them what they now hold, and granting what they may want besides, all the remaining land may be reserved to us," says the old decree, "clear of any incumbrance, for the purpose of being given as rewards, or disposed of according to our pleasure."

In those days everything in New Spain was thus ordered by royal decrees. Nobody had grants of land in the sense in which we use the word. When the friars wished to reward an industrious and capable Indian, and test his capacity to take care of himself and family, by giving him a little farm of his own, all they had to do, or did, was to mark off the portion of land, put the Indian on it and tell him it was his. There would appear to have been little more formality than this in the establishing of the Indian pueblos which were formed in the beginning of the secularization period. Governor Figueroa, in an address in 1834, speaks of three of these, San Juan Capistrano, San Dieguito, and Las Flores, says that they are flourishing, and that the comparison between the condition of these Indians and that of the Spanish townsmen in the same region is altogether in favor of the Indians.

On November 16, 1835, eighty-one "desafiliados"—as the ex-neophytes of missions were called—of the San Luis Rey mission settled themselves in the San Pasqual valley, which was an appanage of that mission. These Indian communities appear to have had no documents to show their right, either as communities or individuals, to the land on which they had settled. At any rate, they had nothing which amounted to a protection, or stood in the way of settlers who coveted their lands. It is years since the last trace of the pueblos Las Flores and San Dieguito disappeared, and the San Pasqual valley is entirely taken up by white settlers, chiefly on preëmption claims. San Juan Capistrano is the only one of the four where are to be found any Indians' homes. If those who had banded themselves together, and had been set off into pueblos, had no recognizable or defensible title, how much more helpless and defenceless were individuals, or small communities without any such semblance of pueblo organization!

Most of the original Mexican grants included tracts of land on which Indians were living, sometimes large villages of them. In many of these grants, in accordance with the old Spanish law or custom, was incorporated a clause protecting the Indians. They were to be left undisturbed in their homes: the portion of the grant occupied by them did not belong to the grantee in any such sense as to entitle him to eject them. The land on which they were living, and the land they were cultivating at the time of the grant, belonged to them as long as they pleased to occupy it. In many of the grants, the boundaries of the Indians' reserved portion of the property were carefully marked off; and the instances were rare in which Mexican grantees disturbed or in any way interfered with Indians living on their estates. There was no reason why they should. There was plenty of land and to spare, and it was simply a convenience and an advantage to have the skilled and docile Indian laborer on the ground.

But when the easy-going, generous improvident Mexican needed or desired to sell his grant, and the sharp American was on hand to buy it, then was brought to light the helplessness of the Indians' position. What cared the sharp American for that sentimental clause, "without injury to the Indians"? Not a farthing. Why should he? His government, before him, had decided that all the lands belonging to the old missions, excepting the small portions technically held as church property, and therefore "out of commerce," were government lands. None of the Indians living on those lands at the time of the American possession were held to have any right—not even "color of right"—to them. That they and their ancestors had been cultivating them for three-quarters of a century made no difference. Americans wishing to preëmpt claims on any of these so-called government lands did not regard the presence, on them, of Indian families or communities as any more of a barrier than the presence of so many coyotes or foxes. They would not hesitate to certify to the Land Office that such lands were "unoccupied." Still less, then, need the purchaser of tracts covered by old Mexican grants hold himself bound to regard the poor cumberers of the ground, who, having no legal right whatever, had been all their years living on the tolerance of a silly, good-hearted Mexican proprietor. The American wanted every rod of his land, every drop of water on it; his schemes were boundless; his greed insatiable; he had no use for Indians. His plan did not embrace them and could not enlarge itself to take them in. They must go. This is, in brief, the summing up of the way in which has come about the present pitiable state of the California Mission Indians.

In 1852, a report in regard to these Indians was made to the Interior Department by the Hon. B. D. Wilson, of Los Angeles. It is an admirable paper, clear and exhaustive. Mr. Wilson was an old Californian, had known the Indians well, and had been eye-witness to much of the cruelty and injustice done them. He says: "In the fall of the missions, accomplished by private cupidity and political ambition, philanthropy laments the failure of one of the grandest experiments ever made for the elevation of this unfortunate race." He estimates that there were at that time in the counties of Tulare, Santa Barbara, Los Angeles, and San Diego, over fifteen thousand Indians who had been connected with the missions in those counties. They were classified as the Tulareños, Cahuillas, San Luiseños, and Diegueños, the latter two being practically one nation, speaking one language, and being more generally Christianized than the others. They furnished, Mr. Wilson says, "the majority of the laborers, mechanics, and servants of San Diego and Los Angeles counties." They all spoke the Spanish language, and a not inconsiderable number could read and write it. They had built all the houses in the country, had taught the whites how to make brick, mud mortar, how to use asphalt on roofs; they understood irrigation, were good herders, reapers, etc. They were paid only half the wages paid to whites; and being immoderate gamblers, often gambled away on Saturday night and Sunday all they had earned in the week. At that time in Los Angeles nearly every other house in town was a grog-shop for Indians. In the San Pasqual valley there were twenty white vagabonds, all rum-sellers, squatted at one time around the Indian pueblo. The Los Angeles ayuntamiento had passed an edict declaring that "all Indians without masters"—significant phrase—must live outside the town limits; also, that all Indians who could not show papers from the alcalde of the pueblo in which they lived should be treated as "horse thieves and enemies."

On Sunday nights, the squares and streets of Los Angeles were often to be seen full of Indians lying about helpless in every stage of intoxication. They were picked up by scores, unconscious, carried to jail, locked up, and early Monday morning hired out to the highest bidders at the jail gates. Horrible outrages were committed on Indian women and children. In some instances, the Indians armed to avenge these and were themselves killed.

OLD MISSION INDIAN, AND ADOBE RUINS OF MISSIONS. SAN JUAN CAPISTRANO.

These are a few out of hundreds of similar items to be gathered from the newspaper records of the time. Conditions such as these could have but one outcome. Twenty years later, when another special report on the condition of the California Mission Indians was asked for by the Government, not over five thousand Indians remained to be reported on. Vice and cruelty had reaped large harvests each year. Many of the rich valleys which at the time of Mr. Wilson's report had been under cultivation by Indians were now filled by white settlers, the Indians all gone, no one could tell where. In some instances, whole villages of them had been driven off at once by fraudulently procured and fraudulently enforced claims. One of the most heart-rending of these cases was that of the Temecula Indians.

The Temecula valley lies in the north-east corner of San Diego County. It is watered by two streams and has a good soil. The Southern California Railroad now crosses it. It was an appanage of the San Luis Rey Mission, and the two hundred Indians who were living there were the children and grandchildren of San Luis Rey neophytes. The greater part of the valley was under cultivation. They had cattle, horses, sheep. In 1865, a "special agent" of the United States Government held a grand Indian convention there. Eighteen villages were represented, and the numbers of inhabitants, stock, vineyards, orchards were reported. The Indians were greatly elated at this evidence of the Government's good intentions toward them. They set up a tall liberty-pole, and bringing forth a United States flag, which they had kept carefully hidden away ever since the beginning of the civil war, they flung it out to the winds in token of their loyalty. "It is astonishing," says one of the San Diego newspapers of the day, "that these Indians have behaved so well, considering the pernicious teachings they have had from the secessionists in our midst."

There was already anxiety in the minds of the Temecula Indians as to their title to their lands. All that was in existence to show that

NEW GRAVE-YARD AT RINCON.

they had any, was the protecting clause in an old Mexican grant. To be sure, the man was still alive who had assisted in marking off the boundaries of their part of this original Temecula grant; but his testimony could establish nothing beyond the letter of the clause as it stood. They earnestly implored the agent to lay the case before the Interior Department. Whether he did or not I do not know, but this is the sequel: On April 15, 1869, an action was brought in the District Court in San Francisco, by five men, against "Andrew Johnson, Thaddeus Stevens, Horace Greeley, and one thousand Indians and other parties whose names are unknown." It was "a bill to quit title," an "action to recover possession of certain real estate bounded thus and thus." It included the Temecula valley. It was based on grants made by Governor Micheltorena in 1844. The defendants cited were to appear in court within twenty days.

The Indians appealed to the Catholic bishop to help them. He wrote to one of the judges an imploring letter, saying, "Can you not do something to save these poor Indians from being driven out?" But the scheme had been too skillfully plotted. There was no way — or, at any rate, no way was found — of protecting the Indians. The day came when a sheriff, bringing a posse of men and a warrant which could not be legally resisted, arrived to eject the Indian families from their houses and drive them out of the valley. The Indians' first impulse was as determined as it could have been if they had been white, to resist the outrage. But, on being reasoned with by friends, who sadly and with shame explained to them that, by thus resisting, they would simply make it the duty of the sheriff to eject them by force, and, if necessary, shoot down any who opposed the executing of his warrant, they submitted. But they refused to lift hand to the moving. They sat down, men and women, on the ground, and looked on, some wailing and weeping, some dogged and silent, while the sheriff and his men took out of the neat little adobe houses their small stores of furniture, clothes, and food, and piled them on wagons to be carried — where? — anywhere the exiles chose, so long as they did not chance to choose a piece of any white man's land.

A Mexican woman is now living in that Temecula valley who told me the story of this moving. The facts I had learned before from records of one sort and another. But standing on the spot, looking at the ruins of the little adobe houses, and the walled grave-yard full of graves, and hearing this woman tell how she kept her doors and windows shut, and could not bear to look out while the deed was being done, I realized forcibly how different a thing is history seen from history written and read.

INDIAN CARTS AND HOUSES. RINCON MISSION.

It took three days to move them. Procession after procession, with cries and tears, walked slowly behind the wagons carrying their household goods. They took the tule roofs off the little houses, and carried them along. They could be used again. Some of these Indians, wishing to stay as near as possible to their old home, settled in a small valley, only three miles and a half away to the south. It was a dreary, hot little valley, bare, with low, rocky buttes cropping out on either side, and with scanty growths of bushes; there was not a drop of water in it. Here the exiles went to work again; built their huts of reeds and straw; set up a booth of boughs for the priest, when he came, to say mass in; and a rude wooden cross to consecrate their new grave-yard on a stony hill-side. They put their huts on barren knolls here and there, where nothing could grow. On the tillable land they planted wheat or barley or orchards—some patches not ten feet square, the largest not over three or four acres. They hollowed out the base of one of the rocky buttes, sunk a well there, and found water.

I think none of us who saw this little refugee village will ever forget it. The whole place was a series of pictures: and knowing its history, we found in each low roof and paling the dignity of heroic achievement. Near many of the huts stood great round baskets woven of twigs, reaching half way up to the eaves, and looking like huge birds'-nests. These were their granaries, holding acorns and wheat. Women with red pottery jars on their heads, and on their backs, were going to and from the well; old men were creeping about, bent over, carrying loads of fagots that would have seemed heavy for a donkey; aged women sitting on the ground were diligently plaiting baskets, too busy, or too old, to give more than a passing look at us. A group of women was

OLD SQUAW WEAVING BASKETS.

at work washing wool in great stone bowls, probably hundreds of years old. The interiors of some of the houses were exquisitely neat and orderly, with touching attempts at adornment,—pretty baskets and shelves hanging on the walls, and over the beds canopies of bright calico. On some of the beds, the sheets and pillow-cases were trimmed with wide hand-wrought lace made by the Indian women themselves. This is one of their arts which date back to the mission days. Some of the lace is beautiful and fine and of patterns like the old church laces. It was pitiful to see the poor creatures in almost every one of the hovels bringing out a yard or two of their lace to sell, and there was hardly a house which had not the lace-maker's frame hanging on the wall with an unfinished piece of lace stretched in it. The making of this lace requires much time and patience. It is done by first drawing out all the lengthwise threads of a piece of fine linen or cotton; then the threads which are left are sewed over and over into an endless variety of intricate patterns. Sometimes the whole design is done in solid button-hole stitch, or solid figures are filled in on an open network made of the threads.

The baskets were finely woven, of good shapes, and excellent decorative patterns in brown and black on yellow or white.

Every face, except those of the very young, was sad beyond description. They were stamped indelibly by generations of suffering, immovable distrust also underlying the sor-

PACKING WATER UP THE MOUNTAIN.

row. It was hard to make them smile. To all our expressions of good-will and interest they seemed indifferent, and received in silence the money we paid them for baskets and lace.

The word Temecula is an Indian word, signifying grief or mourning. It seems to have had a strangely prophetic fitness for the valley to which it was given.

While I am writing these lines, the news comes, that, by an executive order of the President, the little valley in which these Indians took refuge has been set apart for them as a reservation. No doubt they know how much executive orders creating Indian reservations are worth. There have been several such made and revoked in California within their memories. The San Pasqual valley was at one time set apart by executive order as a reservation for Indians. This was in 1870. There were then living in the valley between two and three hundred Indians; some of them had been members of the original pueblo established there in 1835.

The comments of the California newspapers on this executive order are amusing, or would be if they did not record such tragedy. It was followed by an outburst of virtuous indignation all along the coast. One paper said:

INDIAN INTERIOR. RINCON.

"The iniquity of this scheme is made manifest when we state the fact that the Indians of that part of the State are Mission Indians who are settled in villages and engaged in farming like the white settlers." * * * "It would be gross injustice to the Indians themselves as well as to the white settlers in San Pasqual." * * * "These Indians are as fixed in their habitations as the whites, and have fruit-trees, buildings, and other valuable improvements to make them contented and comfortable. Until within the past two or three years they raised more fruit than the white settlers of the southern counties. There is belonging to an Indian family there a fig-tree that is the largest in the State, covering a space sixty paces in diameter." * * * "A remonstrance signed by over five hundred citizens and indorsed by every office-holder in the county has gone on to Washington against this swindle." * * * "This act on the part of the Government is no better than highway robbery, and the persons engaged in it are too base to be called men. There is not a person in either of these valleys that will not be ruined pecuniarily if these orders are enforced."

Looking through files of newspapers of that time, I found only one that had the moral courage to uphold the measure. That paper said:

"Most of the inhabitants are now Indians who desire to be protected in their ancient possessions, and the Government is about to give them that protection, after a long delay."

One editor, having nearly exhausted the resources of invective and false statement, actually had the hardihood to say that Indians could not be induced to live on this reservation because "there are no acorn-bearing trees there, and the acorns furnish their principal food."

The congressmen and their clients were successful. The order was revoked. In less than four years, the San Pasqual Indians are heard from again. A justice of the peace, in the San Pasqual valley, writes to the district attorney to know if anything can be done to protect these Indians.

"Last year," he says, "the heart of this rancheria (village) was filed on and preëmpted. The settlers are beginning to plow up the land. The Los Angeles land office has informed the Indians that, not being citizens, they cannot retain any claim. It seems very hard," says the judge, "aside from the danger of difficulties likely to arise from it."

About this time a bill, introduced in Congress, to provide homes for the Mission Indians on the reservation plan, was reported unfavorably upon by a Senate committee, on the ground that all the Mission Indians were really American citizens. The year following the chief of the Pala Indians, being brought to the county clerk's office to register as a voter, was refused on the ground that, being an Indian, he was not a citizen. In 1850, a small band of Indians living in San Diego County were taxed to the amount of six hundred dollars, which they paid, the sheriff said, "without a murmur." The next year they refused. The sheriff wrote to the dis-

trict attorney, who replied that the tax must be paid. The Indians said they had no money. They had only bows, arrows, wigwams, and a few cattle. Finally, they were compelled to drive in enough of their cattle to pay the tax. said he, 'if I had not done it, somebody else would, for all agree that the Indian has no right to public lands.'"

This sketch of the history of the San Pasqual and Temecula bands of Indians is a

WOVEN GRANARIES.

One of the San Diego newspapers spoke of the transaction as "a small business to undertake to collect taxes from a parcel of naked Indians."

The year before these events happened a special agent, John G. Ames, had been sent out by the Government to investigate and report upon the condition of the Mission Indians. He had assured them "of the sincere desire of the Government to secure their rights and promote their interests, and of its intention to do whatever might be found practicable in this direction." He told them he had been "sent out by the Government to hear their story, to examine carefully into their condition, and to recommend such measures as seemed under the circumstances most desirable."

Mr. Ames found in the San Pasqual valley a white man who had just built for himself a good house, and claimed to have preëmpted the greater part of the Indians' village. He "had actually paid the price of the land to the register of the land office of the district, and was daily expecting the patent from Washington. He owned that it was hard to wrest from these well-disposed and industrious creatures the homes they had built up. 'But,' fair showing of what, with little variation, has been the fate of the Mission Indians all through Southern California. The combination of cruelty and unprincipled greed on the part of the American settlers, with culpable ignorance, indifference, and neglect on the part of the Government at Washington, has resulted in an aggregate of monstrous injustice, which no one can fully realize without studying the facts on the ground. In the winter of 1882, I visited this San Pasqual valley. I drove over from San Diego with the Catholic priest, who goes there three or four Sundays in a year, to hold service in a little adobe chapel built by the Indians in the days of their prosperity. This beautiful valley is from one to three miles wide, and perhaps twelve long. It is walled by high-rolling, soft-contoured hills, which are now one continuous wheat-field. There are, in sight of the chapel, a dozen or so adobe houses, many of which were built by the Indians; in all of them except one are now living the robber whites, who have driven the Indians out; only one Indian still remains in the valley. He earns a meager living for himself and family by doing day's work for the farmers who have taken his

INDIAN WOMAN.

land. The rest of the Indians are hidden away in the canyons and rifts of the near hills; wherever they can find a bit of ground to keep a horse or two and raise a little grain. They have sought the most inaccessible spots, reached often by miles of difficult trail. They have fled into secret lairs like hunted wild beasts. The Catholic priest of San Diego is much beloved by them. He has been their friend for many years. When he goes to hold service, they gather from their various hiding-places and refuges; sometimes, on a special fête day, over two hundred come. But on the day I was there, the priest being a young man who was a stranger to them, only a few were present. It was a pitiful sight. The dilapidated adobe building, empty and comfortless; the ragged poverty-stricken creatures, kneeling on the bare ground—a few Mexicans, with some gaudiness of attire, setting off the Indians' poverty still more. In front of the chapel, on a rough cross-beam supported by two forked posts, set awry in the ground, swung a bell bearing the date of 1770. It was one of the bells of the old San Diego Mission. Standing bareheaded, the priest rang it long and loud: he rang it several times, before the leisurely groups that were plainly to be seen in doorways or on road-sides bestirred themselves to make any haste to come. After the service, I had a long talk, through an interpreter, with an aged Indian, the oldest now living in the county. He is said to be considerably over a hundred, and his looks corroborate the statement. He is almost blind, and has snow-white hair, and a strange voice, a kind of shrill whisper. He says he recollects the re-

THE CALL TO SUNRISE MASS, PALA.

building of the San Diego Mission; though he was a very little boy then, he helped to carry the mud mortar. This was one hundred and three years ago. Instances of much greater longevity than this, however, are not uncommon among the California Indians. I asked if he had a good time in the mission. "Yes, yes," he said, turning his sightless eyes up to the sky; "much good time," "plenty to eat," "*atole*," "*pozzole*," "meat"; now "no meat"; "all the time to beg, beg"; "all the time hungry." His wife, who is older than he, is still living, though "her hair is not so white." She was ill, and was with relatives far away in the mountains; he lifted his hand and pointed in the direction of the place. "Much sick, much sick; she will never walk any more," he said, with deep feeling in his voice.

During the afternoon, the Indians were continually coming and going at the shop connected with the inn where we had stopped, some four miles from the valley. The keeper of the shop and inn said he always trusted them. They were "good pay." "Give them their time and they'll always pay, and if they die

their relations will pay the last cent." Some of them he would "trust any time as high as twenty dollars." When I asked him how they earned their money, he seemed to have no very distinct idea. Some of them had a little stock; they might now and then sell a horse or a cow, he said; they hired as laborers whenever they could get a chance, working at sheep-shearing in the spring and autumn, and at grape-picking in the vintage season. A few of them had a little wheat to sell; sometimes they paid him in wheat. There were not nearly so many of them, however, as there had been when he first opened his shop; not half so many, he thought. Where had they gone? He shrugged his shoulders. "Who knows?" he said.

The most wretched of all the Mission Indians now, however, are not these who have been thus driven into hill fastnesses and waterless valleys to wrest a living where white men would starve. There is in their fate the climax of misery, but not of degradation. The latter cannot be reached in the wilderness. It takes the neighborhood of the white man to accomplish it. On the outskirts of the town of San Diego are to be seen, here and there, huddled groups of what, at a distance, might be taken for piles of refuse and brush, old blankets, old patches of sail-cloth, old calico, dead pine boughs, and sticks all heaped together in shapeless mounds; hollow, one perceives on coming nearer them, and high enough for human beings to creep under. These are the homes of Indians. I have seen the poorest huts of the most poverty-stricken wilds in Italy, Bavaria, Norway, and New Mexico, but never have I seen anything, in shape of shelter for human creatures, so loathsome as the kennels in which some of the San Diego Indians are living. Most of these Indians are miserable worthless beggars, drunkards of course, and worse. Even for its own sake, it would seem that the town would devise some scheme of help and redemption for such outcasts. There is a school in San Diego for the Indian children; it is supported in part by the Government, in part by charity; but work must be practically thrown away on children that are to spend eighteen hours out of the twenty-four surrounded by such filth and vice.

Coming from the study of the records of the old mission times, with the picture fresh and vivid of the tranquil industry and comfort of the Indians' lives in the mission establishments, one gazes with double grief on such a spectacle as this. Some of these Indian hovels are within a short distance of the beach where the friars first landed, in 1769, and began their work. No doubt, Father Junipero and Father Crespi, arm in arm, in ardent converse, full of glowing anticipation of the grand future results of their labors, walked again and again, up and down, on the very spot where these miserable wretches are living to-day. One cannot fancy Father Junipero's fiery soul, to whatever far sphere it may have been translated, looking down on this ruin without pangs of indignation.

There are still left in the mountain ranges of South California a few Indian villages which will probably, for some time to come, preserve their independent existence. Some of them number as many as two or three hundred inhabitants. Each has its chief, or, as he is now called, "captain." They have their own system of government of the villages; it is autocratic, but in the main it works well. In one of these villages, that of the Cahuillas, situated in the San Jacinto range, is a school whose teacher is paid by the United States Government. She is a widow with one little daughter. She has built for herself a room adjoining the school-house. In this she lives, alone with her child, in the heart of the Indian village; there is not a white person within ten miles. She says that the village is as well-ordered, quiet, and peaceable as it is possible for a village to be, and she feels far safer, surrounded by these three hundred Cahuillas, than she would feel in most of the California towns. The Cahuillas (pronounced Kaweeyahs) were one of the fiercest and most powerful of the tribes. The name signifies "master," or "powerful nation." A great number of the neophytes of the San Gabriel Mission were from this tribe; but a large proportion of them were never attached to any mission.

Their last great chief, Juan Antonio, died twenty years ago. At the time of the Mexican war, he received the title of General from General Kearny, and never afterward appeared in the villages of the whites without some fragmentary attempts at military uniform. He must have been a grand character, with all his barbarism. He ruled his band like an emperor, and never rode abroad without an escort of from twenty to thirty men. When he stopped, one of his Indians ran forward, bent down, took off his spurs, then, kneeling on all-fours, made of his back a stool, on which Juan stepped in dismounting and mounting. In 1850, an Indian of this tribe, having murdered another Indian, was taken prisoner by the civil authorities, and carried to Jurupa to be tried. Before the proceedings had begun, Juan, with a big following of armed Indians, dashed up to the court-house, strode in alone, and demanded that the prisoner be surrendered to him.

"I come not here as a child," he said. "I wish to punish my people my own way. If they deserve hanging, I will hang them. If a white man deserves hanging, let the white man hang him. I am done."

The prisoner was given up. The Indians strapped him on a horse, and rode back to their village, where, in an open grave, the body of the murdered man had been laid. Into this grave, on the top of the corpse of his victim, Juan Antonio, with his own hands, flung the murderer alive, and ordered the grave instantly filled up with earth.

There are said to have been other instances of his dealings with offenders nearly as summary and severe as this. He is described as looking like an old African lion, shaggy and fierce; but he was always cordial and affectionate in his relations with the whites. He died in 1863, of small-pox, in a terrible epidemic which carried off thousands of Indians.

This Cahuilla village is in a small valley, high up in the San Jacinto range. The Indians are very poor, but they are industrious and hard-working. The men raise stock, and go out in bands as sheep-shearers and harvesters. The women make baskets, lace, and from the fiber of the yucca plant, beautiful and durable mats, called "cocas," which are much sought after by California ranchmen as saddle-mats. The yucca fibers are soaked and beaten like flax; some are dyed brown, some bleached white, and the two woven together in a great variety of patterns.

In the San Jacinto valley, some thirty miles south of these Cahuillas, is another Indian village called Saboba. These Indians have occupied and cultivated this ground since the days of the missions. They have good adobe houses, many acres of wheat-fields, little peach and apricot orchards, irrigating ditches, and some fences. In one of the houses, I found a neatly laid wooden floor, a sewing-machine, and the walls covered with pictures cut from illustrated newspapers which had been given to them by the school teacher. There is a Government school here, numbering from twenty to thirty; the children read as well as average white children of their age, and in manners and in apparent interest in their studies, were far above the average of children in the public schools.

One of the colony schemes, so common now in California, has been formed for the opening up and settling of the San Jacinto valley. This Indian village will be in the colony's way. In fact, the colony must have its lands and its water. It is only a question of a very little time, the driving out of these Saboba families as the Temeculas and San Pasquales were driven — by force, just as truly as if at the point of the bayonet.

In one of the beautiful canyons opening on this valley is the home of Victoriano, an aged chief of the band. He is living with his daughter and grandchildren, in a comfortable adobe house at the head of the canyon. The vineyard and peach-orchard, which his father planted there, are in good bearing. His grandson, Jesus, a young man twenty years old, in the summer of 1881 plowed up and planted twenty acres of wheat. The boy also studied so faithfully in school that year — his first year at school — that he learned to read well in the "Fourth Reader"; this, in spite of his being absent six weeks in both spring and autumn with the sheep-shearing band. A letter of his, written at my request to the Secretary of the Interior, in behalf of his people, is touching in its simple dignity.

SAN JACINTO, CAL., May 29, 1882.

MR. TELLER.

DEAR SIR: At the request of my friends, I write you in regard to the land of my people.

More than one hundred years ago, my great grandfather, who was chief of his tribe, settled with his people in the San Jacinto valley. The people have always been peaceful, never caring for war, and have welcomed Americans into the valley.

Some years ago a grant of land was given to the Estudillos by the Mexican Government. The first survey did not take in any of the land claimed by the Indians; but four years ago a new survey was made taking in all the little farms, the stream of water, and the village. Upon this survey the U. S. Government gave a patent. It seems hard for us to be driven from our homes that we love as much as other people do theirs, and this danger is at our doors now, for the grant is being divided and the village and land will be assigned to some of the present owners of the grant.

And now, dear sir, after this statement of facts, I, for my people (I ask nothing for myself), appeal to you for help.

Cannot you find some way to right this great wrong done to a quiet and industrious people?

Hoping that we may have justice done us, I am

Respectfully yours,

JOSÉ JESUS CASTILLO.

He was at first unwilling to write it, fearing he should be supposed to be begging for himself, rather than for his people. His father was a Mexican, and he has hoped that on that account their family would be exempt from the fate of the village when the colony comes into the valley. But it is not probable that, in a country where water is gold, a stream of water, such as runs by Victoriano's door, will be left long in the possession of any Indian family, whatever may be its relations to rich Mexican proprietors in the neighborhood. Jesus's mother is a tall, superbly formed woman, with a clear skin; hazel nut-brown eyes that thrill one with their limpid brightness; a nose straight and strong, and a mouth like an Egyptian priestess.

She is past forty, but she is strikingly handsome still, and one does not wonder at hearing the tragedy of her early youth; when, for years, she believed herself the wife of Jesus's father, lived in his house as a wife, and the San Pasqual bands were ejected, and with far more show of legal right.

In the vicinity of the San Juan Capistrano Mission are living a few families of Indians, some of them the former neophytes of the

LAURA, SAID TO BE 102 YEARS OF AGE. BENJAMINA, 117 YEARS.

worked as a wife, and bore him his children. Her heart broke when she was sent adrift, a sadder than Hagar, with her half-disowned offspring. Money and lands did not heal the wound. Her face is dark with the sting of it to-day. When I asked her to sell me the lace-trimmed pillow-case and sheet from her bed, her cheeks flushed at first, and she looked away haughtily before replying. But, after a moment, she consented. They needed the money. She knows well that days of trouble are in store for them.

Since the writing of this paper, news has come that the long-expected blow has fallen on this Indian village. The colony scheme has been completed; the valley has been divided up; the land on which the village of Saboba stands is now the property of a San Bernardino merchant. Any day he chooses, he can eject these Indians as the Temecula mission. An old woman there, named Carmen, is a splendid specimen of the best longevity which her race and the California air can produce. We found her in bed, where she spends most of her time,—not lying, but sitting cross-legged, looking brisk and energetic, and always busy making lace. Nobody makes finer lace than hers. Yet she laughed when we asked if she could see to do such fine work without spectacles.

"Where could I get spectacles?" she said, her eyes twinkling. Then she stretched out her hand for the spectacles of our old Mexican friend who had asked her this question for us; took them, turned them over curiously, tried to look through them, shook her head and handed them back to him with a shrug and a smile. She was twenty years older than he, but her strong young eyes could not see through his glasses. He recol-

lected her well, fifty years before, an active, handsome woman, taking care of the sacristy, washing the priests' laces, mending vestments, and filling various offices of trust in the mission. A sailor from a French vessel lying in the harbor wished to marry her; but the friars would not give their consent, because the man was a drunkard and dishonest. Carmen was well disposed to him, and much flattered by his love-making. He used to write letters to her, which she brought to this Mexican boy to read. It was a droll sight to see her face, as he, now white-haired, and looking fully as old as she, reminded her of that time and of those letters, tapping her jocosely on her cheek, and saying some things I am sure he did not quite literally translate to us. She fairly colored, buried her face in her hands for a second, then laughed till she shook, and answered in voluble Spanish, of which also I suspect we did not get a full translation. She was the happiest Indian we saw; indeed, the only one who seemed really gay of heart or even content.

A few rods from the old mission church of San Gabriel, in a hut made of bundles of the tule reeds lashed to sycamore poles, as the San Gabriel Indians made them a hundred years ago, live two old Indian women, Laura and Benjamina. Laura is one hundred and two years old, Benjamina one hundred and seventeen. The record of their baptisms is still to be seen in the church books; so there can be no dispute as to their age. It seems not at all incredible, however. If I had been told that Benjamina was a three-thousand-year-old Nile mummy, resuscitated by some mysterious process, I should not have demurred much at the tale. The first time I saw them, the two were crouching over a fire on the ground, under a sort of booth porch, in front of their hovel. Laura was making a feint of grinding acorn meal in a stone bowl; Benjamina was raking the ashes, with her claw-like old fingers, for hot coals to start the fire afresh; her skin was like an elephant's, shriveled, black, hanging in folds and welts on her neck and breast and bony arms; it was not like anything human; her shrunken eyes, bright as beads, peered out from under thickets of coarse grizzled gray hair. Laura wore a white cloth band around her head, tied on with a strip of scarlet flannel; above that, a tattered black shawl, which gave her the look of an aged imp. Old baskets, old pots, old pans, old stone mortars and pestles, broken tiles and bricks, rags, straw, boxes, legless chairs, — in short, all conceivable rubbish, — were strewn about or piled up in the place, making the weirdest of backgrounds for the aged crones' figures. Inside the hut were two bedsteads and a few boxes, baskets, and nets; and drying grapes and peppers hung on the walls. A few feet away was another hut, only a trifle better than this; four generations were living in the two. Benjamina's step-daughter, aged eighty, was a fine creature. With a white band straight around her forehead close to the eyebrows and a gay plaid handkerchief thrown on above it, falling squarely each side of her face, she looked like an old Bedouin sheik.

DOVE-COTE. RINCON MISSION.

Our Mexican friend remembered Laura as she was fifty years ago. She was then, even at fifty-two, celebrated as one of the swiftest runners and best ball-players in all the San Gabriel games. She was a singer, too, in the choir. Coaxing her up on her feet, patting her shoulders, entreating and caressing her as one

would a child, he succeeded in persuading her to chant for us the Lord's Prayer and part of the litanies, as she had been wont to do it in the old days. It was a grotesque and incredible sight. The more she stirred and sang and lifted her arms, the less alive she looked. We asked the step-daughter if they were happy and wished to live. Laughing, she repeated the question to them. "Oh, yes, we wish to live forever," they replied. They were greatly terrified, the daughter said, when the railway cars first ran through San Gabriel. They thought it was the devil bringing fire to burn up the world. Their chief solace is tobacco. To beg it, Benjamina will creep about in the village by the hour, bent double over her staff, tottering at every step. They sit for the most part silent, motionless, on the ground; their knees drawn up, their hands clasped over them, their heads sunk on their breasts. In my drives in the San Gabriel valley, I often saw them sitting thus; as if they were dead. The sight had an indescribable fascination. It seemed that to be able to penetrate into the recesses of their thoughts would be to lay hold upon secrets as old as the earth.

One of the most beautiful appanages of the San Luis Rey Mission, in the time of its prosperity, was the Pala valley. It lies about twenty-five miles east of San Luis, among broken spurs of the coast range, watered by the San Luis River and also by its own little stream, the Pala Creek. It was always a favorite home of the Indians; and at the time of the secularization, over a thousand of them used to gather at the weekly mass in its chapel. Now, on the occasional visits of the San Juan Capistrano priest, to hold service there, the dilapidated little church is not half filled, and the numbers are growing smaller each year. The buildings are all in decay; the stone steps leading to the belfry have crumbled; the walls of the little grave-yard are broken in many places, the paling and the graves are thrown down. On the day we were there, a memorial service for the dead was going on in the chapel: a great square altar was draped with black, decorated with silver lace and ghastly funereal emblems; candles were burning; a row of kneeling black-shawled women were holding lighted candles in their hands; two old Indians were chanting a Latin mass from a tattered missal bound in rawhide; the whole place was full of chilly gloom, in sharp contrast to the bright valley outside, with its sunlight and silence. This mass was for the soul of an old Indian woman named Margarita, sister of Manuelito, a somewhat famous chief of several bands of the San Luiseños. Her home was at the Potrero, a mountain meadow, or pasture, as the word signifies, about ten miles from Pala, high up the mountain-side, and reached by an almost impassable road. This farm, or "saeter" it would be called in Norway, was given to Margarita by the friars, and by some exceptional good fortune she had a title, which, it is said, can be maintained by her heirs. In 1871, in a revolt of some of Manuelito's bands, Margarita was hung up by her wrists till she was near dying, but was cut down at the last minute and saved.

One of her daughters speaks a little English, and finding that we had visited Pala solely on account of our interest in the Indians, she asked us to come up to the Potrero and pass the night. She said timidly that they had plenty of beds, and would do all that they knew how to do to make us comfortable. One might be in many a dear-priced hotel less comfortably lodged and served than we were by these hospitable Indians in their mud house, floored with earth. In my bedroom were three beds, all neatly made, with lace-trimmed sheets and pillow-cases and patchwork coverlids. One small square window, with a wooden shutter was the only aperture for air, and there was no furniture except one chair and a half-dozen trunks. The Indians, like the Norwegian peasants, keep their clothes and various properties all neatly packed away in boxes or trunks. As I fell asleep, I wondered if in the morning I should see Indian heads on the pillows opposite me; the whole place was swarming with men, women, and babies, and it seemed impossible for them to spare so many beds; but, no, when I waked, there were the beds still undisturbed; a soft-eyed Indian girl was on her knees rummaging in one of the trunks; seeing me awake, she murmured a few words in Indian, which conveyed her apology as well as if I had understood them. From the very bottom of the trunk she drew out a gilt-edged china mug, darted out of the room, and came back bringing it filled with fresh water. As she set it in the chair, in which she had already put a tin pan of water and a clean coarse towel, she smiled, and made a sign that it was for my teeth. There was a thoughtfulness and delicacy in the attention which lifted it far beyond the level of its literal value. The gilt-edged mug was her most precious possession; and, in remembering water for the teeth, she had provided me with the last superfluity in the way of white man's comfort of which she could think.

The food which they gave us was a surprise; it was far better than we had found the night before in the house of an Austrian colonel's son, at Pala. Chicken, deliciously

MASS FOR THE DEAD, PALA.

cooked, with rice and chile; soda-biscuits delicately made; good milk and butter, all laid in orderly fashion, with a clean table-cloth, and clean, white stone china. When I said to our hostess that I regretted very much that they had given up their beds in my room, that they ought not to have done it, she answered me with a wave of her hand that "it was nothing; they hoped I had slept well; that they had plenty of other beds." The hospitable lie did not deceive me, for by examination I had convinced myself that the greater part of the family must have slept on the bare earth in the kitchen. They would not have taken pay for our lodging, except that they had just been forced to give so much for the mass for Margarita's soul, and it had been hard for them to raise the money. Twelve dollars the priest had charged for the mass; and in addition they had to pay for the candles, silver lace, black cloth, etc., nearly as much more. They had earnestly desired to have the mass said at the Potrero, but the priest would not come up there for less than twenty dollars, and that, Antonia said, with a sigh, they could not possibly pay. We left at six o'clock in the morning; Margarita's husband, the "capitan," riding off with us to see us safe on our way. When we had passed the worst gullies and bowlders, he whirled his horse, lifted his ragged old sombrero with the grace of a cavalier, smiled, wished us good-day and good luck, and was out of sight in a second, his little wild pony galloping up the rough trail as if it were as smooth as a race-course.

Between the Potrero and Pala are two Indian villages, the Rincon and Pauma. The Rincon is at the head of the valley, snugged up against the mountains, as its name signifies, in a "corner." Here were fences, irrigating ditches, fields of barley, wheat, hay, and peas; a little herd of horses and cows grazing, and several flocks of sheep. The men were all away sheep-shearing; the women were at work in the fields, some hoeing, some clearing out the irrigating ditches, and all the old women plaiting baskets. These Rincon Indians, we were told, had refused a school offered them by the Government; they said they would accept nothing at the hands of the Government until it gave them a title to their lands.

The most picturesque of all the Mission Indians' hiding-places which we saw was that on the Carmel River, a few miles from the San Carlos Mission. Except by help of a guide it cannot be found. A faint trail turning off from the road in the river-bottom leads down to the river's edge. You follow it into the river and across, supposing it a ford. On the opposite bank there is no trail, no sign of one. Whether it is that the Indians purposely always go ashore at different points of the bank, so as to leave no trail; or whether they so seldom go out, except on foot, that the trail has faded away, I do not know. But certainly, if we had had no guide, we

HOLY WATER FONT, PALA.

should have turned back, sure we were wrong. A few rods up from the river-bank, a stealthy narrow foot-path appeared; through willow copses, sunk in meadow grasses, across shingly bits of alder-walled beach it creeps, till it comes out in a lovely spot,— half basin, half rocky knoll,—where, tucked away in nooks and hollows are the little Indian houses, eight or ten of them, some of adobe, some of the tule reeds; small patches of corn, barley, potatoes, and hay; and each little front yard fenced in by palings, with roses, sweet-peas, poppies, and mignonette growing inside. In the first house we reached, a woman was living alone. She was so alarmed at the sight of us that she shook. There could not be a more pitiful comment on the state of perpetual distrust and alarm in which the poor creatures live, than this woman's face and behavior. We tried in vain to re-assure her; we bought all the lace she had to sell, chatted with her about it, and asked her to show us how it was made. Even then she was so terrified, that although she willingly took down her lace frame to sew a few stitches, for us to see, her hands still trembled. In another house, we found an old woman evidently past eighty, without glasses, working button-holes in fine thread. Her daughter-in-law, — a beautiful half-breed, with a still more beautiful baby in her arms,— asked the old woman, for us, how old she was. She laughed merrily at the silly question. "She never thought about it," she said; "it was written down once in a book at the Mission, but the book was lost."

There was not a man in the village. They were all away at work, farming or fishing. This little handful of people are living on land to which they have no shadow of title, and from which they may be driven any day,—these Carmel Mission lands having been rented out, by their present owner, in great dairy

farms. The parish priest of Monterey told me much of the pitiable condition of these remnants of the San Carlos Indians. He can do little or nothing for them, though their condition makes his heart ache daily. In that half foreign English, which is always so much more eloquent a language than the English-speaking peoples use, he said: "They have their homes there only by the patience of the thief. It may be that the patience do not last to-morrow." The phrase is worth preserving: it embodies so much history—history of two races.

In Mr. Wilson's report are many eloquent and strong paragraphs, bearing on the question of the Indians' right to the lands they had under cultivation at the time of the secularization. He says:

"It is not natural rights I speak of, nor merely possessory rights, but rights acquired and contracts made—acquired and made when the laws of the Indies had force here, and never assailed by any laws or executive acts since, till 1834 and 1846; and impregnable to these. * * * No past maladministration of laws can be suffered to destroy their true intent, while the victims of the maladministration live to complain, and the rewards of wrong have not been consumed."

Of Mr. Wilson's report in 1852, of Mr. Ames's report in 1873, and of the various other reports called for by the Government from time to time, nothing came, except the occasional setting off of reservations by executive orders, which, if the lands reserved were worth anything, were speedily revoked at the bidding of California politicians. There are still some reservations left, chiefly of desert and mountainous lands, which nobody wants, and on which the Indians could not live.

The last report made to the Indian Bureau by their present agent closes in the following words:

"The necessity of providing suitable lands for them in the form of one or more reservations has been pressed on the attention of the Department in my former reports; and I now, for the third and perhaps the last time, emphasize that necessity by saying that whether Government will immediately heed the pleas that have been made in behalf of these people or not, it must sooner or later deal with this question in a practical way or else see a population of over three thousand Indians become homeless wanderers in a desert region."

I have shown a few glimpses of the homes, of the industry, the patience, the long-suffering of the people who are in this immediate danger of being driven out from their last foot-holds of refuge, "homeless wanderers in a desert."

If the United States Government does not take steps to avert this danger, to give them lands and protect them in their rights, the chapter of the history of the Mission Indians will be the blackest one in the black record of our dealings with the Indian race.

It must be done speedily if at all, for there is only a small remnant left to be saved. These are in their present homes "only on the patience of the thief, and it may be that the patience do not last to-morrow."

H. H.

MUSIC IN NATURE.

FAR, far away, in fields of waving gold,
I hear the tassels' rustling symphonies,
While myriad insect orchestras unfold
Their rasping medleys in the apple-trees.

In seas of creamy clover, white and pink,
Hum tippling bees, all drowsy with perfume;
And, in the orchard, one wild bobolink
Breaks the repose of twilight's dreamy gloom.

The wind wakes solos in the somber pine,
Upon the hill-side desolate and lone;
And, in the wood, through labyrinths of vine,
Is heard the brooklet's lisping monotone—

Which mossy caverns, echoing, repeat;
While o'er my soul, in tender changes, flows—
Murmurous, melodious, and strangely sweet—
The subtle music no musician knows.

R. K. Munkittrick.

CARLYLE.

I.

In the lately published Emerson and Carlyle correspondence, there is a passage from Emerson's note-book, upon Carlyle, that may well serve to start us upon our course in this essay. "He has," says Emerson, "manly superiority rather than intellectuality"; "there is more character than intellect in every sentence." This fact, with the consequent steep inclination of all Carlyle's faculties toward personality or personal prowess, affords the master-key to him, to his life, his works, his opinions, and is a brief summary of much that I have written upon him. He was a man of vehement and overweening conceit in man. A sort of anthropological greed and hunger possessed him, an insatiable craving for strong, picturesque characters, and for contact and conflict with them. This was his ruling passion (and it amounted to a passion) all his days. He fed his soul on heroes and heroic qualities, and all his literary exploits were a search for these things. Where he found them not, where he did not come upon some trace of them in books, in society, in politics, he saw only barrenness and futility. He was an idealist who was inhospitable to ideas; he must have a man, the flavor and stimulus of ample concrete personalities. "In the country," he said, writing to his brother in 1821, "I am like an alien, a stranger and pilgrim from a far distant land." His faculties were "up in mutiny, and slaying one another for lack of fair enemies." He must to the city, to Edinburgh, and finally to London, where, thirteen years later, we find his craving as acute as ever. "Oct. 1st. This morning, think of the old primitive Edinburgh scheme of *engineership;* almost meditate for a moment resuming it *yet!* It were a method of gaining bread, of getting into contact with men, my two grand wants and prayers."

This thirst for man, for personal force, sprang from his own intense and rampant individualism. Never was a soul housed, and, in some respects, imprisoned in a more striking and original idiosyncrasy. All there is of him is Carlylean, shot through and through, as if under enormous heat and pressure, with his own concrete quality. To do the work he felt called on to do, to offset and withstand the huge, roaring, on-rushing modern world as he did, required an enormous egoism. In more senses than one do the words applied to the old prophet apply to him: "For, behold, I have made thee this day a defended city, and an iron pillar, and brazen walls against the whole land, against the Kings of Juda, against the princes thereof, against the priests thereof, and against the people of the land." He was a defended city, an iron pillar, and brazen wall, in the extent to which he was riveted and clinched in his own purpose and aim as well as in his attitude of opposition or hostility to the times in which he lived.

A selfish or self-seeking man he in no sense was, though it has so often been charged upon him. He was the victim of his own genius; and he made others the victims, not of his selfishness. This genius no doubt came nearer the demon of Socrates than that of any other modern man. He is under its lash and tyranny from first to last. But the watchword of his life was "*Entsagen*," renunciation, self-denial, which he learned from unself-denying Goethe. His demon did not possess him lightly, but dominated and drove him.

One would as soon accuse St. Simeon Stylites, thirty years at the top of his penitential pillar, of selfishness. Seeking his own ends, following his own demon, St. Simeon certainly was; but seeking his ease or pleasure, or animated by any unworthy, ignoble purpose, he certainly was not. No more was Carlyle; each one of whose books was a sort of pillar of penitence or martyrdom atop of which he wrought and suffered, shut away from the world, renouncing its pleasures and prizes, wrapped in deepest gloom and misery, and wrestling with all manner of real and imaginary demons and hindrances. During his last great work,—the thirteen years spent in his study at the top of his house, writing the history of Frederick,—this isolation, this incessant toil and penitential gloom was such as only religious devotees have voluntarily imposed upon themselves.

Regarded simply as a man of ideas, the possessor of a multitude of clear and shapely thoughts, Carlyle ranks below Landor or Ruskin; as philosopher, he is not on a par with Mill or Spencer; certainly not with the latter, who is mainly a systematizer and organ-

izer of ideas—a sort of intellectual clearing-house on a scale befitting the nineteenth century.

We can only come at the worth and significance of Carlyle by regarding him as a source of moral power, as a medium and exemplar of the living quality of heroes, projected into current literature and politics with the emphasis of gunpowder and torpedoes. He probably brought more original invigorating force into the world than any other man of his time. His own test of originality was sincerity, not variety or novelty of ideas. "The believing man is the original man." This test is sufficient for himself at least. He believed in certain things, accepted them, combined with them, so to speak, with a kind of chemical fierceness and inevitableness. Much heat and power are disengaged by the eagerness of the combination; probably some gas also.

He is the last man in the world to be reduced to a system, or tried by logical tests. You might as well try to bind the sea with chains. How he scoffs at your abstract idea, your philosophy of history, your rights of man, your rose-colored philanthropies, your potato gospels (vegetarianism), your "paralytic radicalism," and the like. The doctrine of Comte, or *Positivism*, he characterizes as the "miserablest phantasmal *algebraic ghost* I have yet met with among the ranks of the living!" Evolution, as an arithmetical ghost, probably, was no more acceptable to him. The real and the ideal were no more separable with him than form and substance. His vivid Dantesque imagination must see every thought, every conception, issue in deed, in practicality, in personality. In fact, nothing but man, but heroes, touched him, moved him, satisfied him. He stands for heroes and hero-worship, and for that alone. Bring him the most plausible theory, the most magnanimous idea in the world, and he is cold, indifferent, or openly insulting; but bring him a brave, strong man, or the reminiscence of any noble personal trait—sacrifice, obedience, reverence, —and every faculty within him stirred and responded. He is a doctor who would cure the patient not by medicine, but by a heroic regimen—the cold plunge and the bastinado. Dreamers and enthusiasts, with their schemes for the millennium, rushed to him for aid and comfort, and usually had the door slammed in their faces. They forgot it was a man he had advertised for, and not an idea. Indeed, if you had the blow-fly of any popular ism or reform buzzing in your bonnet, No. 5 Cheyne Row was the house above all others to be avoided. But welcome to any man with real work to do and the courage to do it; welcome to any man who stood for any real, tangible thing in his own right. "In God's name, what *art* thou? Not Nothing, sayest thou! Then, How much and what? This is the thing I would know, and even *must* soon know, such a pass am I come to!" ("Past and Present.")

Caroline Fox, in her memoirs, tells how, in 1842, Carlyle's sympathies were enlisted in behalf of a Cornish miner who had kept his place in the bottom of a shaft, above a blast the fuse of which had been prematurely lighted, and allowed his comrade to be hauled up when only one could escape at a time. He sought out the hero, who, as by miracle, had survived the explosion, and set on foot an enterprise to raise funds for the bettering of his condition. In a letter to Sterling, he said, there was help and profit in knowing that there was such a true and brave workman living, and working with him on the earth at that time. "Tell all the people," he said, "that a man of this kind ought to be hatched—that it were shameful to eat him as a breakfast egg!"

All Carlyle's sins of omission and commission grew out of this terrible predilection for the individual hero; this bent or inclination determined the whole water-shed, so to speak, of his mind; every rill and torrent swept swiftly and noisily in this one direction. It is the tragedy in Burns's life that attracts him; the morose heroism in Johnson's, the copious manliness in Scott's, the lordly and regal quality in Goethe. Emerson praised Plato to him; but the endless dialectical hair-splitting of the Greek philosopher——"how does all this concern me at all?" he said. But when he discovered that Plato hated the Athenian democracy most cordially and poured out his scorn upon it, he thought much better of him. History swiftly resolves itself into biography to him; the tide in the affairs of men ebbed and flowed in obedience to the few potent wills. We do not find him exploiting or elucidating ideas and principles, but moral qualities,—always on the scent, on the search of the heroic.

He raises aloft the standard of the individual will, the supremacy of man over events. He sees the reign of law; none see it clearer. "Eternal Law is silently present everywhere and everywhen. By Law, the Planets gyrate in their orbits; by some approach to Law, the street-cabs ply in their thoroughfares." But law is still personal will with him, the will of God. He can see nothing but individuality, but conscious will and force in the universe. He believed in a personal God. He had an inward ground of assurance of it, in his own intense personality and vivid appre-

hension of personal force and genius. He seems to have believed in a personal devil. At least, he abuses "Auld Nickie-ben" as one would hardly think of abusing an abstraction. However impractical we may regard Carlyle, he was entirely occupied with practical questions; an idealist turned loose in the actual affairs of this world and intent only on bettering them. That which so drew reformers and all ardent ideal natures to him was not the character of his conviction, but the torrid impetuosity of his belief. He had the earnestness of fanaticism, the earnestness of rebellion; the earnestness of the Long Parliament and the National Convention—the only two parliaments he praises. He did not merely see the truth and placidly state it, standing aloof and apart from it; but, as soon as his intellect had conceived a thing as true, every current of his being set swiftly in that direction; it was an outlet at once for his whole pent-up energies, and there was a flood and sometimes an inundation of Carlylean wrath and power. Coming from Goethe, with his marvelous insight and cool, uncommitted moral nature to the great Scotchman, is like coming from a dress parade to a battle, from Melanchthon to Luther. It would be far from the truth to say that Goethe was not in earnest: he was all eyes, all vision; he saw everything, but saw it for his own ends and behoof, for contemplation and enjoyment. In Carlyle, the vision is productive of pain and suffering, because his moral nature sympathizes so instantly and thoroughly with his intellectual: it is a call to battle and every faculty is enlisted. It was this that made Carlyle akin to the reformers and the fanatics and led them to expect more of him than they got. The artist element in him, and his vital hold upon the central truths of character and personal force, saved him from any such fate as overtook his friend Irving.

Carlyle owed everything to his power of will and to his unflinching adherence to principle. He was in no sense a lucky man, had no good fortune, was borne by no current, was favored and helped by no circumstance whatever. His life from the first was a steady pull against both wind and tide. He confronted all the cherished thoughts, beliefs, tendencies of his time; he spurned and insulted his age and country. No man ever before poured out such withering scorn upon his contemporaries. The opinions and practices of his times in politics, religion, and literature were as a stubbly, brambly field, to which he would fain apply the match and clean the ground for a nobler crop. He would purge and fertilize the soil by fire. His attitude was at once like that of the old prophets, one of warning and rebuking. He was refused every public place he ever aspired to—every college and editorial chair. Every man's hand was against him. He was hated by the Whigs and feared by the Tories. He was poor, proud, uncompromising, sarcastic; he was morose, dyspeptic, despondent, compassed about by dragons and all manner of evil menacing forms; in fact, the odds were fearfully against him, and yet he succeeded, and succeeded on his own terms. He fairly conquered the world—yes, and the flesh and the devil. But it was one incessant, heroic struggle and wrestle from the first. All through his youth and his early manhood, he was nerving himself for the conflict. Whenever he took counsel with himself it was to give his courage a new fillip. In his letters to his people, in his private journal, in all his meditations, he never loses the opportunity to take a new hitch upon his resolution, to screw his purpose up tighter. Not a moment's relaxation, but ceaseless vigilance and "desperate hope." In 1830, he says in his journal: "Oh, I care not for poverty, little even for disgrace, nothing at all for want of renown. But the horrible feeling is when I cease my own struggle, lose the consciousness of my own strength, and become positively quite worldly and wicked." A year later he wrote: "To it, thou *Taugenichts!* Gird thyself! stir! struggle! forward! forward! Thou art bundled up here and tied as in a sack. On, then, as in a sack race; running, not raging!" Carlyle made no terms with himself nor with others. He would not agree to keep the peace; he would be the voice of absolute conscience, of absolute justice, come what come might. "Woe to them that are at ease in Zion," he once said to John Sterling. The stern, uncompromising front which he first turned to the world he never relaxed for a moment. He had his way with mankind at all times, or rather conscience had its way with him at all times in his relations with mankind. He made no selfish demands, but ideal demands. Jeffrey, seeing his attitude and his earnestness in it, despaired of him; he looked upon him as a man butting his head against a stone wall; he never dreamed that the wall would give way before the head did. It was not mere obstinacy, it was not the pride of opinion: it was the thunder of conscience, the awful voice of Sinai within him; he *dared* not do otherwise.

Like knows like; deep answers deep. It was this intense and regnant personality of Carlyle, this emphasis and specialization in the direction of man, that gave him such insight into character and such power of human portraiture. It is, perhaps, not too much to say

that in all literature there is not another such master portrait-painter, such a limner and interpreter of historical figures and physiognomies. That power of the old artists to paint or to carve a man, to body him forth, almost to recreate him, so rare in the moderns, Carlyle had in a preëminent degree. As an artist, it is his distinguishing gift, and puts him on a par with Rembrandt and Angelo, and with the antique masters of sculpture. He could put his finger upon the weak point and upon the strong point of a man as unerringly as fate. His pictures of Johnson, of Boswell, of Voltaire, of Mirabeau, what masterpieces! His portrait of Coleridge will doubtless survive all others; one fears also that poor Lamb has been stamped to last. None of Carlyle's characterizations have excited more ill-feeling than this same one of Lamb. But it was plain from the outset, that Carlyle could not like such a verbal acrobat as Lamb. He doubtless had him or his kind in view when he wrote this passage in "Past and Present": "His poor fraction of sense has to be perked into some epigrammatic shape, that it may prick into me,— perhaps (this is the commonest) to be topsy-turvied, left standing on its head, that I may remember it the better! Such grinning inanity is very sad to the soul of man. Human faces should not grin on one like masks; they should look on one like faces! I love honest laughter as I do sunlight, but not dishonest; most kinds of dancing, too, but the St. Vitus kind, not at all!"

Carlyle fairly evolves Cromwell from his inner consciousness, he does not merely depict him; he bodies him forth dramatically. "At last," says Taine, "we are face to face with Cromwell"; "I see a fact, and not an account of a fact." "I can touch the truth itself." The fame and power of "The French Revolution" rests upon the same vivid presentation of personality, the same artist grasp and portraiture of man's moral, generic nature. We are eye-witnesses of the terrible drama. Carlyle's method of writing history is foreshadowed in a paragraph in his note-book when he was but thirty-one. "An historian must write, so to speak, in *lines;* but every event is a *superficies*. Nay, if we search out its causes, a *solid*. Hence, a primary and almost incurable defect in the art of narration, which only the very best can so much as approximately remedy. N. B. I understand this myself, I have known it for years, and have written it now, with the purpose, perhaps, of writing it at large elsewhere." His historical writings are clearly attempts in this direction. They are by no means the customary linear performances, flat surface narratives. "The French Revolution" is like a transverse section, a geologist's map, rather than a topographer's. What abysses of power and meaning are laid bare!

If Carlyle had taken to the brush instead of to the pen, he would probably have left a gallery of portraits such as this century has not seen. In his letters, journals, reminiscences, etc., for him to mention a man is to describe his face, and with what graphic pen-and-ink sketches they abound. Let me extract a few of them, not the best, but of best-known men. Here is Rousseau's face, from "Heroes and Hero Worship": "A high but narrow contracted intensity in it: bony brows; deep, strait-set eyes, in which there is something bewildered-looking,—bewildered, peering with lynx-eagerness; a face full of misery, even ignoble misery, and also of the antagonism against that; something mean, plebeian there, redeemed only by *intensity:* the face of what is called a Fanatic—a sadly *contracted* Hero!" Here a glimpse of Danton: "Through whose black brows and rude, flattened face there looks a waste energy as of Hercules." Camille Desmoulins: "With the face of dingy blackguardism wondrously irradiated with genius, as if a naphtha-lamp burned in it." Through Mirabeau's "shaggy beetle-brows, and rough-hewn, seamed, carbuncled face there look natural ugliness, small-pox, incontinence, bankruptcy,—and burning fire of genius; like comet-fire, glowing fuliginous through murkiest confusions." On first meeting with John Stuart Mill, he describes him to his wife as "a slender, rather tall, and elegant youth, with small, clear, Roman-nosed face, two small, earnestly smiling eyes; modest, remarkably gifted with precision of utterance; enthusiastic, yet lucid, calm; not a great, yet distinctly a gifted and amiable youth." A London editor whom he met about the same time, he describes as "a tall, loose, lank-haired, wrinkly, wintery, vehement-looking flail of a man." He goes into the House of Commons on one of his early visits to London: "Althorp spoke, a thick, large, broad-whiskered, farmer-looking man; Hume also, a powdered, clean, burly fellow; and Wetherell, a beetle-browed, sagacious, quizzical old gentleman; then Davies, a Roman-nosed dandy," etc. He must touch off the portrait of every man he sees. De Quincey "is one of the smallest men you ever in your life beheld; but with a most gentle and sensible face, only that the teeth are destroyed by opium, and the little bit of an under lip projects like a shelf." Leigh Hunt: "dark complexion (a trace of the African, I believe); copious, clean, strong black hair; beautifully shaped head; fine, beaming, serious hazel

eyes; seriousness and intellect the main expression of the face (to our surprise at first)." One of his classmates at Edinburgh, of his name, with whom his professor often confounded himself, he describes as a "bigger boy with red hair, wild buck-teeth and scorched complexion, and the worst Latinist of all my acquaintance." His Irish journey abounds in striking portraiture. "Dr. Murray—head cropped like stubble, red-skinned face, harsh gray Irish eyes; full of fiery Irish zeal, too, and rage, which, however, he had the art to keep down under buttery vocables." "In white neckcloth, opposite side, a lean figure of sixty; wrinkly, like a washed blacksmith, in the face, yet like a gentleman, too,—elaborately washed and dressed, yet still dirty looking." A face "wrinkled into stereotype of smile or of stoical frown, you couldn't say which." In one of his letters to Emerson there is a portrait of Webster. "As a logic-fencer, advocate, or parliamentary Hercules, one would incline to back him, at first sight, against all the extant world. The tanned complexion, that amorphous crag-like face; the dull black eyes under their precipice of brows, like dull anthracite furnaces, needing only to be *blown;* the mastiff-mouth accurately closed; I have not traced as much of *silent Berserkir rage*, that I remember of, in any other man." In writing his histories, Carlyle valued, above almost anything else, a good portrait of his hero, and searched far and wide for such. He roamed through endless picture-galleries in Germany searching for a genuine portrait of Frederick the Great, and at last, chiefly by good luck, hit upon the thing he was in quest of. "If one would buy an indisputably authentic *old shoe* of William Wallace for hundreds of pounds, and run to look at it from all ends of Scotland, what would one give for an authentic visible shadow of his face, could such, by art natural or art magic, now be had?" "Often I have found a portrait superior in real instruction to half a dozen written 'biographies,' as biographies are written;—or, rather, let me say, I have found that the portrait was a small lighted *candle* by which the biographies could for the first time be *read*, and some human interpretation be made of them."

II.

CARLYLE stands at all times, at all places, for the hero, for power of will, authority of character, adequacy and obligation of personal force. He offsets completely, and with the emphasis of a clap of thunder, the modern leveling impersonal tendencies, the "manifest destinies," the blind mass movements, the merging of the one in the many, the rule of majorities, the no-government, no-leadership, *laissez-faire* principle. Unless there was evidence of a potent, supreme, human will guiding affairs, he had no faith in the issue; unless the hero was in the saddle, and the dumb blind forces well bitted and curbed beneath him, he took no interest in the venture. The cause of the North, in the War of the Rebellion, failed to enlist him, or touch him. It was a people's war; the hand of the strong man was not conspicuous; it was a conflict of ideas, rather than of personalities; there was no central and dominating figure around which events revolved. He missed his Cromwell, his Frederick. So far as his interest was aroused at all, it was with the South, because he had heard of the Southern slave-driver; he knew Cuffee had a master, the vagabond must work, and the crack of the planter's whip upon lazy backs was sweeter music to him than the crack of antislavery rifles, behind which he recognized only a vague, misdirected philanthropy.

Carlyle was not the relic of a former period, as Taine calls him—a mastodon strayed into a world not made for him. Probably no man is ever to be regarded as such, certainly not this man. He is as much a resultant of modern democracy as Walt Whitman; the compensation for its aridness and flatness; the one signal reaction against it that has head and force enough to stand, that we are bound to respect and heed; a tremendous counterweight whose final effect is as an equalizer and distributer of power. In him is stored up such momentum upon the significance of personal worth, veracity, heroism, the inequality of men, that democracy will ever move the steadier and safer for it. The condition of the masses, of the laboring man, of the poor, occupied his thought for years. "Chartism," "Past and Present," and "Latter-Day Pamphlets" were the outcome of his wrestlings and agonizings upon these subjects. No literary man of our time has given so much serious thought to them, or uttered deeper words of warning and counsel concerning them.

I would fain get at the bottom of Carlyle's opposition to democracy, to America, and find the meaning of it—the value of it. Of course, it arises primarily from the force with which he is shot in the direction I have indicated, the direction of heroes and hero-worship; but heroes may arise under a democracy. Indeed, where so free a field and so open a way? If a man have any insight and capacity in him above the common, where else can he find so sure and prompt an investment of it

as under a democracy? Here is no privileged class, no impossible barrier, no tragedy of a Burns, or neglect of a Johnson. True, in Nature's seed-field the tares choke down the wheat; but, unfortunately, we have no human wheat that we may guard and perpetuate, and raise a crop of Cromwells to order. The hero is and must always be a seedling, a wild, unbidden growth, and the danger that he will be choked down by the tares and nettles is, perhaps, less under free institutions than under any other.

"Democracy," Carlyle says, "is, by the nature of it, a self-canceling business, and gives in the long run a net result of *zero*." And, yet, we know that in every village and community, and in the great seed-fields of Time and continental areas, where nations and races are the competitors, the democratic principle is the only vitally active and triumphing one. The great prizes are not arbitrarily distributed, but more or less according to merit; they are carried off by the ablest, the bravest, the worthiest. Might, in the last analysis, means right. The race *is* to the swift; the battle *is* to the strong.

Carlyle's political writings are full of encouraging passages on this subject, as this, for instance, from "Past and Present": "The smallest item of human Slavery is the oppression of man by his Mock-Superiors; the palpablest, but, I say, at bottom the smallest. Let him shake off such oppression, trample it indignantly under his feet; I blame him not; I pity and commend him. But oppression by your Mock-Superiors well shaken off, the grand problem yet remains to solve: That of finding government by your Real-Superiors! Alas, how shall we ever learn the solution of that, benighted, bewildered, sniffling, sneering, God-forgetting unfortunates as we are? It is a work for centuries, to be taught us by tribulations, confusions, insurrections, obstructions; who knows if not by conflagration and despair!"

Yet, this is the American problem, the problem of all democracies — a difficult one, it is true, but perhaps not so difficult or important as Carlyle teaches; not so difficult, at least for us in this country, for it is to be, and in a measure has been, solved by education and a free ballot; not so important, because the political rulers, the law-makers and law-executors, in a free country, play but a small part in the sum-total of life there.

Let me quote a long and characteristic passage from Carlyle's "Latter-Day Pamphlets," one of dozens, illustrating his misconception of universal suffrage:

"Your ship cannot double Cape Horn by its excellent plans of voting. The ship may vote this and that, above decks and below, in the most harmonious exquisitely constitutional manner; the ship to get round Cape Horn, will find a set of conditions already voted for and fixed with adamantine rigor by the ancient Elemental Powers, who are entirely careless how you vote. If you can, by voting or without voting, ascertain these conditions, and valiantly conform to them, you will get around the Cape; if you cannot, — the ruffian Winds will blow you ever back again; the inexorable Icebergs, dumb privy-councillors from Chaos, will nudge you with most chaotic 'admonition'; you will be flung half frozen on the Patagonian cliffs, or admonished into shivers by your iceberg councillors and sent sheer down to Davy Jones, and will never get around Cape Horn at all! Unanimity on board ship; — yes, indeed, the ship's crew may be very unanimous, which doubtless, for the time being, will be very comfortable to the ship's crew and to their Phantasm Captain if they have one; but if the tack they unanimously steer upon is guiding them into the belly of the Abyss, it will not profit them much! Ships accordingly do not use the ballot-box at all; and they reject the Phantasm species of Captain. One wishes much some other Entities — since all entities lie under the same rigorous set of laws — could be brought to show as much wisdom and sense at least of self-preservation, the *first* command of nature. Phantasm Captains with unanimous votings; this is considered to be all the law and all the prophets at present."

Here is the real crushing Carlylean wit and picturesqueness of statement, but is the case of democracy, of universal suffrage fairly put? The eternal verities appear again, as they appear everywhere in our author in connection with this subject. They recur in his pages like "minute-guns," as if in deciding, by the count of heads, whether Jones or Smith should go to Parliament or to Congress was equivalent to sitting in judgment upon the law of gravitation. What the ship in doubling Cape Horn would very likely do, if it found itself officerless, would be to choose, by some method more or less approaching a count of heads, a captain, an ablest man to take command, and put the vessel through. If none were able, then indeed the case were desperate; with or without the ballot-box, the abyss would be pretty sure of a victim. In any case, there would perhaps be as little voting to annul the storms, or change the ocean currents, as there is in democracies to settle ethical or scientific principles by an appeal to universal suffrage. But Carlyle was fated to see the abyss lurking under, and the eternities presiding over, every act of life. He saw everything in fearful gigantic perspective. It is true that one cannot loosen the latchet of his shoe without bending to forces that are cosmical, siderial; but whether he bends or not, or this way or that, he passes no verdict upon them. The temporary, the expedient — all those devices and adjustments that are of the nature of scaffolding, and that enter so largely into the administration of the coarser affairs of this world,

were with Carlyle equivalent to the false, the sham, the phantasmal, and he would none of them. As the ages seem to have settled themselves, for the present and the future, in all civilized lands—and especially in America—politics is little more than scaffolding; it certainly is not the house we live in, but an appurtenance or necessity of the house. A government, in the long run, can never be better or worse than the people governed. It is but the bark of the tree, the coarse outside rind,—a kind of scaffolding, very important it may be, and yet of no account in itself. In voting for Jones for constable, am I voting for or against the unalterable laws of the universe—an act wherein the consequences of a mistake are so appalling that voting would better be dispensed with and the selection of constables be left to the evolutionary principle of the solar system?

Yet Carlyle chose his ground, and took his bearings against universal suffrage, according to certain indisputable facts. These, namely, that wise men, the wisest men, are always in a minority, generally persecuted, rejected, crucified by the majority (Did not the multitude cry out, "Crucify him, crucify him"?); that the great books are read by the few, while the foolish book, the sensational novel, is eagerly read by the ten thousand; that the most transparent humbugs, if unblushingly pushed and noisily trumpeted abroad, are sure of the notice of the masses; that the quack doctor, the quack anything, by judicious advertising, thrives while patient merit starves; that virtue, integrity, sobriety, truthfulness, etc., are less taking to the multitude, are less sure of their votes, than pretentiousness, gilded falsehood, glibness, bribery, and skillful lobbying. Broad is the road that leads to perdition, a veritable democratic highway; the road that leads in the other direction is narrow and rugged and few walk therein. "Can it be proved that, since the beginning of the world, there was ever given a universal vote in favor of the worthiest man or thing? I have always understood that true worth, in any department, was difficult to recognize; that the worthiest, if he appealed to universal suffrage, would have but a poor chance." There is no disputing these facts, and if they really bear upon the question of popular government, of a free ballot, then the ground is clean shot away from under it. The world is really governed and led by minorities, and always will be. The many, sooner or later, follow the one. We have all become abolitionists in this country, some of us much to our surprise and bewilderment; we hardly know yet how it happened; but the time was when abolitionists were hunted by the multitude. Marvelous to relate, also, civil service reform has become popular among our politicians. Something has happened; the tide has risen while we slept, or while we mocked and laughed, and away we all go on the current.

Universal suffrage as exemplified in America is productive of evils enough, it is true; but dare we say the government—municipal, state, national—is not in the long run fairly representative of the people; that our rulers and law-makers are not, on the whole, as good as we are; that Congress does not fairly embody what of virtue and wisdom there is in the country? We shall have purer and more exalted rulers when we are a purer and more exalted people. The fault is not in the suffrage: making it broader, if that were possible, or making it narrower, would not mend matters; but elevate the standard of wisdom and morality of all classes—that would mend matters.

There is probably not much difference in the aggregate popular amount of morbific virus, whether under a European monarchy or in an American democracy. The difference, to scientific estimate, is that the latter certainly does, and most intensely does, what the other abstains from, or goes against—brings all the bad stuff to the surface, where it can be seen of men, and its medication considered.

Necessity is the mother of heroes always. We cannot call them or choose them to rule over us, because in ordinary times we do not know them; they do not know themselves. "We know not what we are any more than what we shall be," says Carlyle writing on Voltaire. He leaves out of his counts entirely the competitive principle that operates everywhere in nature—in your onion-bed, as well as in political states and amid teeming populations—natural selection, the survival of the fittest. What a sorting and sifting process went on in our army during the secession war, till the real captains, the real leaders, were found; not Fredericks or Wellingtons, perhaps, but the best the land afforded. "Will the ballot-box raise the Noblest to the chief place? does any sane man deliberately believe such a thing?" Carlyle asks. But it may be the proximate way. It is not an air-line to the point, the course as the bird flies, as the idealist dreams, but the most feasible, actual road—devious, circuitous, up hill and down dale—that mankind have yet found out. If Carlyle had only suggested a better way, the way according to his survey of the ground to be passed over; but he did not. The lofty, inflexible idealist that he was, he cut his own way through life as imperiously and autocratically as a Russian czar, permitting no

swerving from a right line, and he insisted upon a like rectitude in the rest of mankind. The universe itself, he said, was a Monarchy and Hierarchy, and this is as practical a suggestion as we get from him.

America, he said, was "Anarchy *plus* a street constable," and most of the transfixing shafts aimed at this country were aimed at a man of straw of his own setting-up: he did not and could not appreciate our case. Yet he looked fondly and yearningly upon America, the country of Emerson, the country to which his own thoughts and hopes had once turned in the darkest hours of his life. What would have been the results to *him*, had he emigrated to our shores? Emigration, in the main, to the individual and to the race, means liberation; a loosening of old ties and customs, an escape from old ruts, and Carlyle would doubtless have in some measure been freed from the hags and demons that vexed his prophetic soul had he come to America.

"America's battle," he said, in 1850, "is yet to fight; and we, sorrowful though nothing doubting, will wish her strength for it. New Spiritual Pythons, plenty of them; enormous Megatherions, as ugly as were ever born of mud, loom huge and hideous out of the twilight Future on America; and she will have her own agony, and her own victory, but on other terms than she is yet quite aware of." But he failed to recognize the real python that was threatening us in his own time, and when we were battling with it and all but "cracking our sinews," he mocked; his sardonic laugh came echoing over the waters in the "American Iliad in a nutshell." But we may love and reverence the irate Scotchman all the same. His opposition to America and to the American idea is self-cancelling. He really plays into our hands, he lays the emphasis upon the right things, upon that upon which America has staked her all. He bids up manliness, veracity, courage, earnestness, to such a pitch that they become too precious for any but free institutions where the reliance is entirely upon them. The right of the weak to be governed by the strong, of the blind to be led by those who have eyes, in no way contravenes the right of life, liberty, and the pursuit of happiness.

None knew better than Carlyle himself that, whoever be the ostensible potentates and law-makers, the wise do virtually rule, the natural leaders do lead. Wisdom will out: it is the one thing in this world that cannot be suppressed or annulled. There is not a parish, township, or community little or big, in this country or in England, that is not finally governed, shaped, directed, built up by what of wisdom there is in it. All the leading industries and enterprises gravitate naturally to the hands best able to control them. The wise furnish employment for the unwise, capital flows to capital hands as surely as water seeks water.

> "Winds blow and waters roll
> Strength to the brave."

There never is and never can be any goverment but by the wisest. In all nations and communities, the law of nature finally prevails. If there is no wisdom in the people there will be none in their rulers; the virtue and intelligence of the representative will not be essentially different from that of his constituents. The dependence of the foolish, the thriftless, the improvident, upon his natural master and director, for food, employment, for life itself, is just as real to-day in America as it was in the old feudal or patriarchal times. The relation between the two is not so obvious, so intimate, but it is just as vital and essential. How shall we know the wise man unless he makes himself felt or seen or heard? How shall we know the master unless he masters us? Is there any danger that the real captains will not step to the front, and that we shall not know them when they do? Shall we not know a Luther, a Cromwell, a Franklin, a Washington?

"Man," says Carlyle, "little as he may suppose it, is necessitated to obey superiors; he is a social being in virtue of this necessity; nay, he could not be gregarious otherwise; he obeys those whom he esteems better than himself, wiser, braver, and will forever obey such; and ever be ready and delighted to do it." Why all this pother, then, and this clamorous calling for a divinely appointed task-master? We have already got him in one shape or another, and never have been and never can be without him; we are the tools of stronger minds, of stronger hands than our own. If there are no heroes in our midst, no master hearts and heads, more's the pity, but there is no remedy. The soil of a country determines its crops, the character of a people determines its heroes. "Where the great mass of men is tolerably right," Carlyle again says, "all is right; where they are not right, all is wrong." Think in how many ways, through how many avenues in our times, the wise man can reach us and place himself at our head, or mold us to his liking, as orator, statesman, poet, philosopher, preacher, editor. If he has any wise thing to speak, any scheme to unfold, there is the rostrum or pulpit and crowds ready to hear him, or there is the steam power-press ready to disseminate his wisdom to

the four corners of the earth. He can set up a congress or a parliament and really make and unmake the laws, by his own fireside, in any country that has a free press. "If we will consider it, the essential truth of the matter is, every British man can now elect *himself* to Parliament without consulting the hustings at all. If there be any vote, idea, or notion in him, or any earthly or heavenly thing, cannot he take a pen and therewith autocratically pour forth the same into the ears and hearts of all people, so far as it will go?" ("Past and Present.") Or there is the pulpit everywhere waiting to be worthily filled. What may not the real hero accomplish here? "Indeed, is not this that we call spiritual guidance properly the soul of the whole, the life and eyesight of the whole?"

In more primitive times, and amid more rudely organized communities, the hero, the strong man, could step to the front and seize the leadership like the buffalo of the plains or the wild horse of the pampas; but in our time, at least among English-speaking races, he must be more or less called by the suffrage of the people. With respect, therefore, to this question of the leadership of the wisest, Carlyle seems to me like a man who denies the sun because the day is cloudy. Such light as there is is sunlight and not cloud-light; and such light of wisdom as there is in the world, by which we guide our steps, however much it may be dimmed and obstructed, is the light of the wise men in it tempered, it is true, by many potent half-rays or shadows representing other, perhaps conflicting, facts and influences (doubtless meaning something equally important), and by the capacity of the eyesight of the times to absorb true light; which latter contingency, one cannot too often repeat, is probably the main affair. The sky of every age and people is always more or less overcast; the pure rays of wisdom do not and cannot have unobstructed sway. The stupidity of men, the inefficiency of materials, and the dust and confusion of the strife that always hides the character of an age from itself, all balk and hinder it. We probably have little conception to what extent the proudest names in history were blurred and belittled to contemporary times. The soldier in battle knows little of the part his general played in the victory or in the defeat. At a sufficient distance from an age, its true lights and leaders appear; we look athwart the clouds; the temporary, the accidental, has fallen away, the dust and heat of battle are gone. We view the mountain range from a vantage-ground, and can easily pick out the highest peak. It is quite certain that had there been a seventeenth or eighteenth century Carlyle, he would not have seen the hero in Cromwell, or in Frederick, that the nineteenth century Carlyle saw in each. In any case, in any event, the dead rule us more than the living; we cannot escape the past. It is not merely by virtue of the sunlight that falls now, and the rain and dew that it brings, that we continue here; but by virtue of the sunlight of eons of past ages.

"This land of England has its conquerors, possessors, which change from epoch to epoch, from day to day; but its real conquerors, creators, and eternal proprietors are these following and their representatives if you can find them: all the Heroic Souls that ever were in England, each in their degree; all the men that ever cut a thistle, drained a puddle out of England, contrived a wise scheme in England, did or said a true and valiant thing in England." "Work? The quantity of done and forgotten work that lies silent under my feet in this world, and escorts and attends me and supports and keeps me alive, wheresoever I walk or stand, whatsoever I think or do, gives rise to reflections!" In our own politics, has our first President ever ceased to be President? Does he not still sit there the stern and blameless patriot uttering counsel? Let me make a nation's dead rulers, and I care not who makes the living.

Carlyle had no faith in the inherent tendency of things to right themselves, to adjust themselves to their own proper standards; the conservative force of nature, the checks and balances by which her own order and succession is maintained; the astronomic principle by which the systems are kept in poise in the spheral harmony; the Darwinian principle according to which the organic life of the globe has been evolved, the higher and more complex forms mounting from the lower, the principle or power, name it Fate, name it Necessity, name it God, or what you will, which finally lifts a people, a race, an age, and even a community above the reach of choice, of accident, of individual will, into the region of general law. So little is life what we make it, after all; so little is the course of history, the destiny of nations, the result of any man's purpose, or direction or will, so great is Fate, so insignificant is man! The human body is made up of a vast congeries or association of minute cells, each with its own proper work and function at which it toils incessantly night and day, and thinks of nothing beyond. The shape, the size, the color of the body, its degree of health and strength, etc., no cell or series of cells decides these points; a law above and beyond the cell determines these points. The final destiny and summing up of a nation is,

perhaps, as little within the conscious will and purpose of the individual citizens. When you come to large masses, to long periods, the law of nature steps in. The day is hot or the day is cold, the spring is late or the spring is early; but the inclination of the earth's axis makes the winter and summer sure. The wind blows this way and blows that, but the great storms gyrate and travel in one general direction. There is a wind of the globe that never varies, and there is the breeze of the mountain that is never two days alike. The local hurricane moves the waters of the sea to a depth of but a few feet; but the tidal impulse goes to the bottom. Men and communities in this world are often in the position of arctic explorers, who are making great speed in a given direction, while the ice-floe beneath them is making greater speed in the opposite direction. This kind of progress has often befallen political and ecclesiastical parties in this country. Behind mood lies temperament; back of the caprice of will lies the fate of character; back of both is the bias of family; back of that the tyranny of race; still deeper the power of climate, of soil, of geology, the whole physical and moral environment. Still, we are free men only so far as we rise above these. We cannot abolish fate, but we can in a measure utilize it. The projectile force of the bullet does not annul or suspend gravity; it uses it. The floating vapor is just as true an illustration of the law of gravity as the falling avalanche.

Carlyle, I say, had sounded these depths that lie beyond the region of will and choice, beyond the sphere of man's moral accountability; but in life, in action, in conduct, no man shall take shelter here. One may summon his philosophy when he his beaten in battle, and not till then. You shall not shirk the hobbling Times to catch a ride on the sure-footed Eternities. The times are bad; very well, you are there to make them better. "The public highways ought not to be occupied by people demonstrating that motion is impossible." ("Chartism.")

III.

Caroline Fox, in her "Memoirs of Old Friends," reports a smart saying about Carlyle, current in her time, which has been current in some form or other ever since, namely, that he had a large capital of faith uninvested,—carried it about him as ready money, I suppose, working capital. It is certainly true that it was not locked up in any of the various social or religious safe deposits. He employed a vast deal of it in his daily work. It took not a little to set Cromwell up and Frederick. Indeed, it is doubtful if among his contemporaries there was a man with so active a faith—so little invested in paper securities. His religion as a present living reality went with him into every question. He did not believe that the Maker of this universe had retired from business, or that he was merely a sleeping partner in the concern. "Original sin," he says, "and such like are bad enough, I doubt not; but distilled gin, dark ignorance, stupidity, dark corn-law, bastille, and company, what are they?" For creeds, theories, philosophies, plans for reforming the world, etc., he cared nothing, he would not invest one moment in them; but the hero, the worker, the doer, justice, veracity, courage, these drew him,—in these he put his faith. What to other people were mere abstractions were urgent, pressing realities to Carlyle. Every truth or fact with him has a personal inclination, points to conduct, points to duty. He could not invest himself in creeds and formulas, but in that which yielded an instant return in force, justice, character. He has no philosophical impartiality. He has been broken up; there have been moral convulsions; the rock stands on end. Hence the vehement and precipitous character of his speech—its wonderful picturesqueness and power. The spirit of gloom and dejection that possesses him, united to such an indomitable spirit of work and helpfulness, is very noteworthy. Such courage, such faith, such unshaken adamantine belief in the essential soundness and healthfulness that lay beneath all this weltering and chaotic world of folly and evil about him, in conjunction with such pessimism and despondency, was never before seen in a man of letters. I am reminded that in this respect he was more like a root of the tree of Igdrasil than like a branch; one of the central and master roots with all which that implies, toiling and grappling in the gloom, but full of the spirit of light. How he delves and searches; how much he made live and bloom again; how he sifted the soil for the last drop of heroic blood. The fates are there, too, with water from the sacred well. He is quick, sensitive, full of tenderness and pity; yet he is savage and brutal when you oppose him or seek to wrench him from his holdings.

"The quantity of sorrow he has, does it not mean withal the quantity of *sympathy* he has, the quantity of faculty and victory he shall yet have? 'Our sorrow is the inverted image of our nobleness.' The depth of our despair measures what capability, and height of claim we have, to hope." ("Cromwell.")

Carlyle was like an unhoused soul, naked and bare to every wind that blows. He felt

the awful cosmic chill. He could not take shelter in the creed of his fathers nor in any of the opinions and beliefs of his time. He could not and did not try to fend himself against the keen edge of the terrible doubts, the awful mysteries, the abysmal questions and duties. He lived and wrought as in the visible presence of God. This was no myth to him, but a terrible reality. How the immensities open and yawn about him! He was like a man who should suddenly see his relations to the universe, both physical and moral, in gigantic perspective, and never through life lose the awe, the wonder, the fear, the revelation inspired. The veil, the illusion of the familiar, the commonplace, is torn away. The natural becomes the supernatural. Every question, every character, every duty, was seen against the immensities, like figures in the night against a background of fire, and seen as if for the first time. The siderial, the cosmical, the eternal,—we grow familiar with these or lose sight of them entirely. But Carlyle never lost sight of them; his sense of them became morbidly acute, preternaturally developed, and it was as if he saw every movement of the hand, every fall of a leaf, as an emanation of solar energy. "That haggard mood of the imagination" (his own phrase) was habitual with him. His moral nature was thrown into peaks and chasms—the strata were rent asunder. He could see only the tragical in life and in history. Events were imminent, poised like avalanches that a word might loosen. We see his friends perpetually amazed at his earnestness, the gradations in his mind were so steep; the descent from the thought to the deed was so swift and inevitable.

"Daily and hourly," he says (at the age of 38), "the world natural grows more of a world magical to me; this is as it should be. Daily, too, I see that there is no true poetry but in *reality*." "The gist of my whole way of thought," he says again, "is to raise the natural to the supernatural." To his brother John he wrote, in 1832: "I get more earnest, graver, not unhappier every day. The whole creation seems more and more divine to me, the natural more and more supernatural." His eighty-five years did not tame him at all, did not blunt his conception of the "fearfulness and wonderfulness of life." The anodyne of life acted rather as an excitant upon Carlyle, and instead of quieting or benumbing him, filled him with portentous imaginings and fresh cause for wonder. There is a danger that such a mind, if it takes to literature, will make a mess of it. But Carlyle is saved by his tremendous gripe upon reality. Do I say the ideal and the real were one with him? He made the ideal *the* real, and the only real. Whatever he touched he made tangible, actual, and vivid. Ideas are hurled like rocks, a word blisters like a branding-iron, a metaphor transfixes like a javelin. There is something in his sentences that lays hold of things, as the acids bite metals. His subtle thoughts, his marvelous wit, like the viewless gases of the chemist, combine with a force that startles the reader.

Carlyle differs from the ordinary religious enthusiast in the way he bares his bosom to the storm. His attitude is rather one of gladiatorial resignation than supplication. He makes peace with nothing, takes refuge in nothing. He flouts at happiness, at repose, at joy. "There is in man a *higher* than love of happiness; he can do without happiness, and instead thereof find blessedness." "The life of all gods figures itself to us as a sublime sadness—earnestness of infinite battle against infinite labor. Our highest religion is named the 'Worship of Sorrow.' For the Son of Man there is no noble crown, well worn or even ill worn, but is a crown of thorns." His own worship is a kind of defiant admiration of Eternal Justice. He asks no quarter, and will give none. He turns upon the grim destinies a look as undismayed and as uncompromising as their own. Despair cannot crush him; he will crush it. The more it bears on, the harder he will work. The way to get rid of wretchedness is to despise it; the way to conquer the devil is to defy him; the way to gain heaven is to turn your back upon it, and be as unflinching as the gods themselves. Satan may be roasted in his own flames; Tophet may be exploded with its own sulphur. "Despicable biped!" (Teufelsdröckh is addressing himself.) "What is the sum-total of the worst that lies before thee? Death? Well, death; and say the pangs of Tophet, too, and all that the devil and man may, will, or can do against thee! Hast thou not a heart? Canst thou not suffer whatso it be, and as a child of freedom, though outcast, trample Tophet itself under thy feet while it consumes thee? Let it come, then; I will meet it and defy it." This is the "Everlasting No" of Teufelsdröckh, the annihilation of self. Having thus routed Satan with his own weapons, the "Everlasting Yea" is to people his domain with fairer forms; to find your ideal in the world about you: "Thy condition is but the stuff thou art to shape that same ideal out of: what matters whether such stuff be of this sort or of that, so the form thou give it be heroic, be poetic?" Carlyle's watchword through life, as I have said, was the German word "*Entsagen*," or renunciation. The perfect flower of

religion opens in the soul only when all self-seeking is abandoned. The divine, the heroic attitude is: "I seek not Heaven, I fear not Hell; I crave the truth alone, whithersoever it may lead." "Truth! I cried, though the heavens crush me for following her: no falsehood, though a celestial lubberland were the price of apostasy." The truth — what is the truth? Carlyle answers that which you believe with all your soul and all your might and all your strength, and are ready to face Tophet for,— that, for you, is the truth. Such a seeker was he himself. It matters little whether we agree that he found the truth or not. The law of this universe is such that where the love, the desire, is perfect and supreme, the truth is already found. That is the truth, not the letter, but the spirit; the seeker and the sought are one. Can you by searching find out God? No; but make your actions Godlike, and He is already with you. This is Carlyle's position, so far as it can be defined. He hated dogma as he hated poison. No direct or definite statement of religious belief or opinion could he tolerate. He abandoned the church for which his father designed him, because of his inexorable artistic sense; he could not endure the dogma that the church rested upon, the pedestal of clay upon which the golden image was reared. The gold he held to as do all serious souls, but the dogma of clay he quickly dropped. "Whatever becomes of us," he said, referring to this subject in a letter to a friend when he was in his twenty-third year, "never let us cease to behave like honest men."

It was this artistic sense, this refusal to name the unspeakable, to translate the emotions of the soul in the presence of the Infinite Mystery into the language of the understanding that so bewildered the elder Henry James. Carlyle was before all things an artist, though no man hated so royally the current cant and twaddle about art. He was an artist in this: he must have and would have concrete realities and identities. He said to Emerson, apropos of some visionary Emerson had sent him: "I can do nothing with vapors, but wish them *condensed*." Realities, but realities impelled by the ideal as a ship by the gale.

It may be added that Carlyle was one of those men whom the world can neither make nor break,— a meteoric rock from out the fiery heavens, bound to hit hard if not self-consumed and not looking at all for a convenient or a soft place to alight,— a blazing star in his literary expression, but in his character and purpose the most tangible and unconquerable of men.

"Thou, O World, how wilt thou secure thyself against this man? Thou canst not hire him by thy guineas; nor by thy gibbets and law penalties restrain him. He eludes thee like a Spirit. Thou canst not forward him, thou canst not hinder him. Thy penalties, thy poverties, neglects, contumelies: behold, all these are good for him."

SINCE the foregoing pages were written, the letters of Mrs. Carlyle have been given to the world, and it may be worth our while to glance briefly at the woman of whom we have heard so much, and over whose fate so much sympathy has been indulged in. No new light of consequence is thrown upon the great author himself by the publication, but the wife whom he so lauds in his "Reminiscences," and over whose memory he is so remorseful and self-accusing, stands clearly and definitely before us. Clearness and definiteness are among her most marked characteristics. She always knows her mind, can reach a decision quickly, and hits the mark every time. Carlyle said her eye could correct the plumb and square of the carpenter. The tone of the letters is as clear as a bell, not a false note in them; but, apart from the ill health of which they are the record, they reveal a terribly unhappy mind, and a sort of suppressed life like that of a plant under a stone. The stone, it will be quickly said, as has been said over and over again, was her husband; which is true, but in no sense for which he can be held responsible; every husband, intensely preoccupied, his whole heart and soul in his work, is in the same way a stone to the wife who does not glory in his preoccupation, and who has not ample and worthy outlets and occupations of her own. The wife must either find her happiness in merging her life in that of her husband's, making his aims and his successes her own, or she must have ample original resources to fall back upon. Mrs. Carlyle did not do the former and she had not the latter. She was jealous of her husband's absorption in his work; and in the menial service which she was so assiduous in rendering him,— shielding him from cocks, dogs, donkeys, parrots, pianos, servants, and all household annoyances and interruptions, mending his trowsers and making his puddings,— she found no worthy outlet for the genius that was in her. That was not her proper mission. Just what her mission was, she herself was in much doubt. She said she had a devil in her, always calling to her "'March! march!' and bursting into infernal laughter when requested to be so good as to specify whither." This was the gipsy element in her to which she confesses, and which was bound to give her trouble.

She said she had thought that in a civil war she might possibly find her work. One could almost fancy in her another Joan of Arc; easy enough, another Charlotte Corday. In any case, a childless marriage with a man whose genius overtopped her own, and whose ways were the ways of fate, was not the best lot for her. Hence, one is not surprised to find her writing to Forster: "I do think there is much truth in the Young German idea that marriage is a shockingly immoral institution, as well as what we have long known it for—an extremely disagreeable one." The fire that melts a woman's heart is not the fire that fills the prophet's soul; nor yet is it the furnace heat that smelts such mountains of crude ore as that out of which "Frederick" and "Cromwell" came.

With a will of adamant and a preoccupation like that of Hercules cleansing his stables or descending into Hades, it is certain in advance that Carlyle will prove in some respects an unsatisfactory husband and lover. He was not lacking in heart and sympathy, but he was probably deficient in, and blind to, the sentiment of the sexes; and hence his shortcomings as a husband appear to have been in those little attentions, flatteries, caresses, intimacies, etc., that a woman expects of her lover.

"In great matters," says his wife, "he is always kind and considerate; but these little attentions which we women attach so much importance to he was never in the habit of rendering to any one; his up-bringing and the severe turn of mind he has from nature had alike indisposed him toward them." Yet how the dear woman whistles to keep her courage up. "It is odd," she says, "what notions men seem to have of the scantiness of a woman's resources. They do not find it anything out of nature that they should be able to exist by themselves; but a woman must always be borne about on somebody's shoulders, and dandled and chirped to, or it is supposed she will fall into the blackest melancholy." Now, Mrs. Carlyle was intensely womanly in this; she laid great stress upon little matters, and she was famishing for the little caresses and attentions she sneered at.

Her power over men, quite depriving them of their wits for the time being, even infatuating old Sterling, and leading him to write to her in a way that angered her very much, means a good deal. It means, among other things, the possession of charms, to which Carlyle, by the nature of him, was unresponsive, and that wasted their sweetness on the desert air.

More than that, she allowed her life to be absorbed in little things. She was the victim of trifles. Her letters are mainly a record of the petty ills and annoyances of one's life. She chronicles all her tears, woman fashion, and all her tremors and hysterical spasms. She says: "It is not only a faculty with me, but a necessity of my nature, to make a great deal out of nothing." Her letters are all to be read in the light of this confession. She was a finely organized creature, and had that "preternatural intensity of sensation" (her own phrase) which so magnifies the little. The sting of a wasp nearly killed her (letter 114), and she fairly broke her heart over her husband's innocent admiration for Lady Ashburton. She says in a letter to her husband, a few weeks before her sudden death: "I don't pretend to be an ordinary man or woman; I am perfectly extraordinary, especially in the power I possess of fretting and worrying myself into one fever after another, without any cause to speak of." The dear, honest creature! Fatigue, she says, which makes a healthy human being sleepy, makes her delirious. Her lot was exceptionally severe only in the matter of ill health; in other respects, fortune was more than kind to her. She magnifies all her trials in a way worthy her husband himself, who wrote to his brother John, that getting settled in the house at Craigenputtock was a battle like that of St. George and the Dragon. Her intellectual narrowness (in this case blindness) is shown in the remark that Emerson had no ideas of his own (but mad ones) except what he had got from Carlyle.

Then, like her husband, she was not made for happiness. She is reported as saying she hated joy, and in one of her letters she says, "Happiness is but a low thing." She had no wholesome human indifference, none of that unctuous, self-complacent quality that turns aside so many of the petty ills and annoyances of this world, and that is to the human sensibilities what the oil is to the duck's back. With Mrs. Carlyle every drop penetrated, found the pores open, and her spirits are habitually bedraggled. It was a trick or vanity of both man and wife, and unworthy them both, never to acknowledge they took pleasure in anything. The wife protests that she hates letter-writing, and often wrote with the back of the pen; and yet few women have ever written such bright, readable letters. Carlyle detested lecturing, and yet those who heard him say he spoke as one inspired. Neither had any reticence upon the subject of their ills and miseries, though here, perhaps, the husband groans the louder, because he is the stronger. To suffer and be silent was not a virtue of either. Indeed, in many ways, this famous couple were much alike; too much so, one would say. They did not complement

and offset each other at enough points. Before their marriage, Carlyle wrote: "It is the earnest, affectionate, warm-hearted, enthusiastic Jane that I love. The acute, sarcastic, clear-sighted, derisive Jane I can at best but admire." Now both had just this dual nature, and you are never sure which side of the penny will turn up. The wife shows the acute and sarcastic side to the husband very often in this correspondence; as to which side he shows in his letters to her, we have Froude's testimony that he is uniformly tender and affectionate.

All the husband's ills and annoyances reappear in the wife in an exaggerated form. She is more sleepless than he is; more addicted to blue pills and morphia; more disturbed by dogs, cats, bugs, cocks, donkeys, parrots, locomotives; more used up by travel, boats, hotels, etc. When he takes snuff, she sneezes with a vengeance. His worry becomes almost distraction in her. When he is compelled to serve on a jury, she is nearly made sick; when she hears him jump out of bed at night in the room above her, unable to sleep, her heart is in her throat till he turns in again; when she makes the awful discovery that a cock and hens have suddenly appeared in the next yard, she is in torment till she has bought the owner up; in short, when the husband has indigestion, the wife has nightmare; and this through her genius for worriment; she catches it, and a spark in others becomes a flame in her. She was acute in every sense; all her maladies take an acute form; her colds and headaches are severer than those of other people, and she at last dies of some acute nervous disease — chronic in its obstinacy, but acute in its intensity.

Yet, probably, she was happier with Carlyle than she could have been with any other man. Writing to his mother, in 1837, she says of Carlyle: "Numbers of people love me often, after their fashion, far better than I deserve; but then his fashion is so different from all these, and seems alone to suit the crotchety creature that I am."

The most serious want one feels in Mrs. Carlyle's relation to her husband, as already intimated, is that she did not share in any adequate measure, or apparently aspire to share, his high and heroic life, only his petty, humdrum kitchen life; she was not his companion or helpmate in the writing of his books, did not even read them all, but was jealous of his absorption in them. His tasks, he says, were no choice of hers, but fell upon her like ill-health or foul weather; and remembering her silent indifference, he reproaches himself for talking to her, night after night, of the battle of Molwitz, while he was writing "Frederick." Interest in remote persons or events, or in general questions, she had not; yet that she was the most bright and intelligent of women, these letters abundantly testify; and that she was an extremely lovable one, winning the hearts of both old and young wherever she went, and keeping them, is equally certain.

John Burroughs.

THE VOICE OF D. G. R.

From this carved chair wherein I sit to-night,
The dead man read in accents deep and strong,
Through lips that were like Chaucer's, his great song
About the Beryl and its virgin light;
And still that music lives in death's despite,
And though my pilgrimage on earth be long,
Time cannot do my memory so much wrong
As e'er to make that gracious voice take flight.
I sit here with closed eyes; the sound comes back,
With youth, and hope, and glory on its track,
A solemn organ-music of the mind;
So, when the oracular moon brings back the tide,
After long drought, the sandy channel wide
Murmurs with waves, and sings beneath the wind.

Edmund W. Gosse.

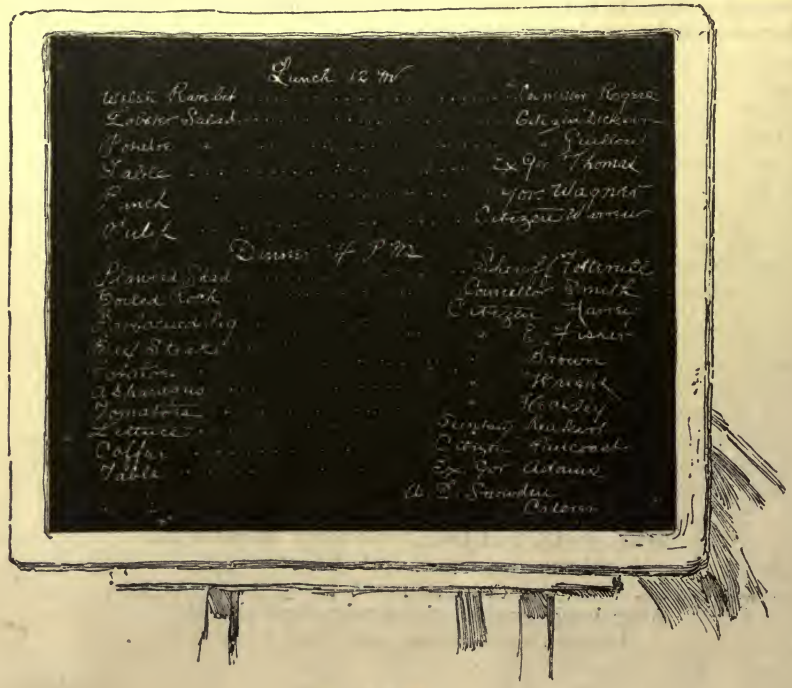
THE OLDEST CLUB IN AMERICA.

THE CLUB EMBLEM.

In early colonial days, much time and thought were bestowed in Pennsylvania upon recreation and simple and healthful social pleasures. In pursuance of this object, in May, 1732, a few of the original settlers, many of them emigrants with William Penn, met and determined to found a colony on the banks of the beautiful "Manaiung," as the Schuylkill was then called. They sought a patron in the person of William Warner, Esq., and settled on a portion of his well wooded estate, "Eaglesfield," and proceeded to fence in an acre of ground whereon to carry out their peculiar ideas. To prove that "Baron" Warner enforced his proprietary rights, the following receipt, preserved among the archives of the State, is offered:

"June 1st, 1749, received of the Honorable Thomas Stretch, Esquire, & Co., three sun perch, in full for one year's rent of the court-house lot on Schuylkill, due this present month.

"WILLIAM WARNER."



A BILL OF FARE.

SKETCHES IN CAMP.

This payment of free socage came, in time, to be attended with some ceremony. The Governor appointed a committee of three citizens, who placed the three sun perch on the large pewter dish, heavily stamped with the family coat-of-arms, which was brought to this country by William Penn and presented to the colony. Thus the rent due to the "Manor House" was presented, with great respect, to the "Baron." The colonists then proceeded to organize a form of government and to draw up a code of laws. The first of May was fixed upon as Gala Day, the beginning of the fishing and fowling season, and October 1st as Election Day, to close the official year. At the first enjoyment of their new franchise as free and independent colonists, October, 1732, they chose a governor, five members of Assembly, a sheriff, and a coroner. A secretary of state was appointed by the Governor. On such occasions rounds of beef, barbecued pig, sirloin steaks, and the products of the rod and gun were set forth, the feast closing with the social pipe. Among the early executive acts of the Colonial Governor the following official warrant was issued:

"COLONY OF SCHUYLKILL, ss.

To —— and all other Schuylkillians whom it may concern:

"Whereas, great quantities of rabbits, squirrels, pheasants, partridges, and others of the game kind, have presumed to infest the coasts and territories of Schuylkill in a wild, bold, and ungovernable manner: These are therefore to authorize and require you or any of you to make diligent search for the said rabbits, squirrels, pheasants, partridges, and others of the game kind, in all suspected places where they may be found, and bring the respective bodies of so many as you shall find before the Justices, etc., at a General Court to be held Thursday, the fourth day of October next, there to be proceeded against, as by the said Court shall be adjudged; and for your or any of your so doing, this shall be your sufficient Warrant. Witness, myself, the twenty-ninth day of September, in the twelfth year of my Government, and year of our Lord one thousand seven hundred and forty-four.

[L. S.] "THOMAS STRETCH."

Under Governor Stretch the colony prospered in its peaceful pursuits. In the year 1747, for their more convenient accommodation, they resolved to build a court-house for the meetings of the Governor, Assembly and colonists, on the slope facing the river, amid the stately walnut trees, some of which furnished the timber. As early as 1759 the Rev. Andrew Burnaby, A. M., vicar of Greenwich, England, thus writes of this aristocratic colony in his "Travels through the Middle Settlements of North America," published in London the following year:

"There is a society of sixteen ladies and as many gentlemen, called the 'Fishing Company,' which meet once a fortnight upon the Schuylkill. They have a very pleasant room erected in a romantic situation upon the banks of that river, where they generally

THE CASTLE.

A NEW MEMBER.

dine and drink tea. There are several pretty walks about it, and some wild and rugged rocks which, together with the water and fine groves that adorn the banks, form a most beautiful and picturesque scene. There are boats and fishing-tackle of all sorts, and the company divert themselves with walking, dancing, singing, conversing, going upon the water and fishing, or just as they please. The ladies wear an uniform, and appear with great ease and advantage from the neatness and simplicity of it. The first and most distinguished people of the colony are of this society, and it is very advantageous to a stranger to be introduced to it, as he thereby gets acquainted with the best and most respected company in Philadelphia."

It was found impossible to enjoy and fully protect the "right and privilege to hunt in the woods and fish in the waters of the Schuylkill," granted to the colony by the Lenape tribe, without the power to enforce the same. Accordingly, in 1760, a law was passed, entitled "An act for the support of the navy in Schuylkill."

After a long and prosperous administration of thirty-four years, Governor Stretch laid down his rod never again to command the "fishing fleet." During the Revolution, Samuel Morris, Governor of Schuylkill, became Captain of the "Philadelphia Light-Horse," the muster of which contained the names of many of the citizens of the Schuylkill Colony. This corps served with distinction in the Jersey campaigns, participated in the battles of Trenton and Princeton, was Washington's body-guard, and received his especial commendation on their discharge from service. In 1781, a committee was appointed to repair the long-abandoned court-house, the neglected navy, and dilapidated dock-yard, and put them in a state suitable for the importance of the step about to be taken by the colonists. On the 11th of October, of the following year, the Governor, Assembly, and citizens, as many as could be gathered, met in the court-house, and unanimously passed a declaration of independence and fourteen enactments providing fully for the government of the colony as a sovereign and independent State, and that the court-house was henceforth to be known as the Castle of the State in Schuylkill.

The citizens of the State quaffed many bowls of punch in toasting and foretelling its prospects; and as their lusty cheers ran through the "Baron's" wood,

> "Schuylkill heard the merry strain
> Repeated o'er and o'er again,
> Her ebbing tide bore on the air
> And echoed it to Delaware."

The death of the worthy "Baron" Warner, a few years later, freed the commonwealth of its only vestige of feudal ties. On Thursday, June 14th, 1787, George Washington was entertained at the Castle.

In 1825, "Little Schuylkill" invited General Lafayette and suite to dine in state at the Castle. The citizens, habited in white linen aprons and ample straw hats, formed in open file facing inward, near the north front entrance to the Castle. The three banners were on the right. General Lafayette and

SHELLING PEAS.

suite, and the gentlemen in attendance on him as escort deputed by the city authorities, alighted at the lines of the State. They were conducted between the open files toward the Castle by the Secretary of State; at the threshold of which Councillor Morris, in the absence of his Excellency the Governor, received Lafayette, as the guest of the State,

GOVERNOR SAMUEL MORRIS. (AFTER A BUST BY WILLIAM RUSH.)

with a cordial welcome, and presented him with a certificate of honorary membership as a duly qualified citizen. To the welcome the General promptly replied:

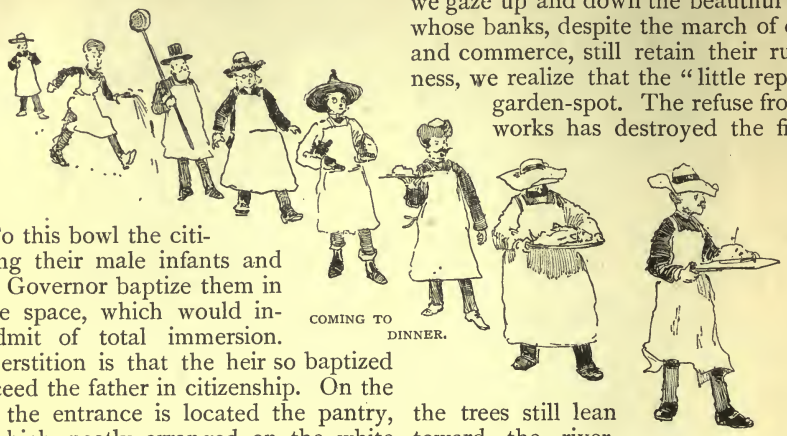
"My Dear Sir: I feel sincere pleasure in visiting your ancient institution, so pleasantly situated on the bank of your beautiful river. It is the more grateful to me as it completes my tour to all the States of the Union. About half a century ago, I first crossed your beautiful stream in times of peril; far different now are the sensations I realize in meeting my friends on so pleasant an occasion. I feel honored by your polite invitation and kind reception in your ancient and agreeable State in Schuylkill. May you long continue happy and prosperous."

The Marquis, expressing a desire as a member to do his duty, was duly invested by the Councillors with a hat and apron, and introduced to the kitchen, where he was initiated into business by attention to the turning of the beefsteaks on the gridiron. The banquet was served at four o'clock. All fared sumptuously, and the mirth was greatly enhanced by the happy witticism of Judge Richard Peters, who sang several excellent songs, to the delight of his veteran friend Lafayette.

Since that time there has been little change in the simple manners and quaint customs of the State in Schuylkill. The erection of the dam at Fairmount in 1822 for the Philadelphia Water-Works stopped the tide-water and threatened destruction to the fishing. The "Schuylkillians" with sorrow relinquished the land they had occupied for ninety years, trusted their "Castle" to the waters of the Schuylkill, and, floating it five miles down the river, located their settlement at Rambo Rock, below Grey's Ferry. Here the Castle still stands, surrounded by a wood of lofty forest trees planted by the Freemen of that date, whose descendants alone remain to enjoy the grateful shade.

As we enter the long lane, shaded by buttonwoods, on a gala day, we see at the Castle busy men in long aprons and broad-brimmed hats. In dimensions the building itself is not awe-inspiring. Over the portal you may read the date 1732. The structure is of wood, and the many coats of yellow wash, peeling from its sides, reveal the secret of its preservation. The absence of glass, the board shutters being painted in imitation of windows, tells of a primitive period, while the bare floor and whitewashed walls speak of the ancient simplicity that has been preserved. The citizens are appointed in turn to market for the kitchen and to assign the preparation of the dishes to different members. Economy is the first requisite, and a thorough knowledge of the capabilities of the

cooks the second. The large bowl, out of which we ladle our famous "Fish-House Punch" with the curious wooden "dipper" that never spills, was imported and presented to the State by Captain Charles Ross, in 1812. To this bowl the citizens bring their male infants and have the Governor baptize them in its ample space, which would indeed admit of total immersion. The superstition is that the heir so baptized will succeed the father in citizenship. On the right of the entrance is located the pantry, within which, neatly arranged on the white sanded shelves, stands the china, each piece stamped with the company's emblem, a sun perch. On the immediate right, in the main or dining-hall of the Castle, stands the company's chest, in which are kept the ingredients of the punch. On two stout supports rests the "Penn Platter," already referred to in the payment of socage. To describe the objects of interest suspended on the walls, presented from time to time by visitors, would make an interesting and miscellaneous catalogue. Several of the early State papers bearing dates of the first half of the eighteenth century appear on the walls, neatly framed. Near the door leading to the piazza facing the river stands the bust of Samuel Morris, who was governor of Schuylkill for forty-six years, and to whose urbane manner and rigid simplicity the foundation of the State owes its existence and long-continued prosperity. As we gaze up and down the beautiful Schuylkill, whose banks, despite the march of civilization and commerce, still retain their rural loveliness, we realize that the "little republic" is a garden-spot. The refuse from the gas-works has destroyed the fishing, but the trees still lean toward the river, seeking the moisture rising from its surface. Lunch is served on the long wooden table, set under the protecting shade of the oaks and maples and underspread by a carpet of violets, daisies, and buttercups. Comfortably placed in the deep-seated, high-backed chairs, the guests are served with lobster salad, cold corn-beef, and Welsh rare-bit. Lunch is hardly over before the Castle bell rings out from the tower, and the Sheriff appears at the door, calling out, "Oyez! Oyez!" making proclamation in the name of the Governor, summoning all citizens to assemble in the hall of the Castle to consider affairs appertaining to the State.



COMING TO DINNER.

THE KITCHEN.

THE FIRE-PLACE.

To the deliberations of the Assembly none but citizens are admitted. Upon the adjournment of the Assembly, a busy scene presents itself in the kitchen. This building is about forty feet long by fifteen feet deep. The front wooden wall is hung on hinges, which when swung up and supported on props makes a convenient shed. The floor is bricked and shelves run round the room, on which stand every implement of the culinary art. In the center of the back wall is the huge fire-place, eight feet by six, with its roaring fire. Above and around the fire-place hang the old-fashioned gridirons and frying-pans; the latter, which have handles six feet long, are no longer in use. These belong to the "tossing" days. Before the fishing was destroyed, one or two members would sleep at the Castle the night before Gala Day, and would be up at day-break to catch the early tide and return with dozens of white perch for the day's repast. These, being duly inspected and cleaned by the Coroner, would be assigned to some citizen to cook. To insure a successful toss, great care was used in placing the perch in the pan; the largest were placed at the outer rim, the heads meeting where the handle joins the pan. The next in size succeeded, and so on until the pan was full. When the fish were thoroughly cooked on one side, the cook would announce the fact, and everybody would gather around to see the toss. Loosening the fish by a lateral movement of the pan, with a further movement only to be learned by practice, the cook would toss and turn the entire pan of fish, replacing them in the pan with the cooked side up and each fish relatively in its original position. Owing to the destruction of the fishing, the toss is now nearly a lost art. When a crowd gathers round the old pump, it is a sign that the "Coroner" is cleaning the shad for planking. This is a matter of some ceremony. The senior apprentice claims the right to hold and turn the first shad for the "Coroner," after which one of the juniors is allowed to learn the art of cleaning and splitting a shad properly. Thoroughly washed, they are laid on the draining-board, and during their drying the boards, four feet by

THE LAST TOSSER.

two, are placed before the fire to be heated. The shad are then nailed thereon with their backs to the boards, and having been properly seasoned are stood before the fire and carefully watched till done. The hour for dinner is designated by the "Caterer," and every cook is held strictly accountable if his dish is not ready. Another cook will prepare the roe sauce to accompany the shad—another specialty of this family of cooks, the like of which is never tasted save within the bounds

DRESSED FOR THE OCCASION.

of this commonwealth. On the "altar" at the end of the kitchen, on whose surface the bed of burning coals is constantly kept alive, may be seen the *pièce de résistance*, the pigs split and laid upon the gridiron and being "barbecued." Near by, a member prepares the pig sauce. Neither fork nor knife is allowed ever to penetrate the meats of these epicures; no juice must be allowed to escape; beefsteak tongs, imported from England, alone are used to turn the roasts.

Not a grain of seasoning is allowed on steaks; but cooked over wood coals quickly, constantly turned, and served the instant they are done, the full flavor comes out as the juice flows when they are carved. Outside the kitchen an equally busy scene presents itself. The lawn is studded with cabooses, over one of which a Councillor may be seen carefully skimming the water covering his twelve-pound salmon, or testing a boiling pot of potatoes, peas or asparagus. Meanwhile, the banquet table has been set in the Castle by the apprentices, critically superintended by the ex-Governor; the distance of a plate and a half for each guest has been rigidly enforced, and the glasses have been arranged with mathematical precision. The Mandarin hats have been decorated in honor of this Gala Day, and, as is the custom, a live perch swims round the suspended glass globe to announce that the fishing season has opened.

At the stroke of four, the Caterer announces to the Governor that dinner is served, all file into the Castle, and, sinking into the spacious high-backed chairs, are prepared to do justice to the novelties placed before them. On the one hundred and fiftieth anniversary of the State many distinguished guests were present. The Governor of Pennsylvania sat on the right of the Governor of the State in Schuylkill, and, for once, within his own commonwealth acknowledged a higher authority. The famous Beefsteak Club of London, which, since the destruction of the fishing, the State in Schuylkill closely resembles, is its junior by three years, and none other with a continuous history approaches it in antiquity. Composed of the first citizens of Philadelphia, it counts many honored names on its roll. The candidate for membership must serve a trying apprenticeship and receive the unanimous support of the limited membership of twenty-five.

Robert Adams, Jr.

AT THE MILL.

WHAT do you see, my farmer?
Gray walls of wood and of stone.
A mill-wheel turning to grind your grist,
And turning for that alone.

You hear the millstone's murmur,
The splash of the tumbling rill,
As you plod with your oxen slowly down
The sunny slopes of the hill.

The heavens are blue above you,
There's sun and shade on the road:
You touch the brindled backs of your team
And reckon the bags in the load.

You clip the heads of the daisies,
And wonder that God should need
To litter the fields with the staring blooms
Of a stubborn and worthless weed.

You're honest and true and sturdy,
Here, give me your brawny hand,—
A singer of idle songs, I greet
The farmer who tills the land.

Plod home with your grist in the gloaming;
The baby crows at the gate:
And over the hill by the pasture bars
The lowing cattle wait.

What do I see, my farmer?
The mill and the rill and the wheel.
The moss on the shingles, the mold on the stones,
And the floating mists of meal.

But the poet's vision is clearer,
Revealing the hidden things:
I see the rivulet flow to the sea
From cool, clear, woodland springs.

I see the brown fields quicken
With the green of the growing wheat,
When the swallow's a-tilt at the bending eaves,
And the breath of the morn is sweet.

I see the swaying reapers
In fields of the golden grain;
And oxen that pant in the summer sun,
Yoked to a loaded wain.

I see white sails careening
On the opal tinted seas,
When the silvery sunlight glints the waves,
That are stirred by a freshening breeze.

I see the storm-rack gather,
That blots out the evening star;
And flung in the foam of a billow's crest,
A drowned man lashed to a spar.

I see in a city's shadows,
A figure that creeps and scrawls
"Give blood, or bread," while the wine flows red,
And there's mirth in the city halls.

I see a rich man's darlings
As fresh as the rose's bloom;
And the gaunt white face of a little child
Dead, in a barren room.

Plod home with your grist, my farmer,
Nor heed how the wide world fares;
The eyes that are clearest are saddest alway,
With their burden of alien cares.

Hushed is the millstone's murmur.
The dripping wheel is still.
And over the dusky vale, I hear
The song of the Whippoorwill.

E. C. Messer.

THE legends run that in the days of Cecrops, king of Attica, the two rival deities, Neptune and Minerva, strove for the worship of the Athenians. Each claimed priority of right: Neptune, by a salt spring which his trident had opened in the rock of the Acropolis; Minerva, by pointing to the olive tree which at her voice had sprung from the soil. The gods in council decided that the latter was the earlier and more useful gift, and Minerva became the tutelary deity of the city.

Under this pleasing fable, told in various ways, is doubtless shadowed forth the endeavors of the early Athenian rulers to turn the attention of the citizens from warlike and sea-faring pursuits to the cultivation of the soil and the peaceful arts; and, on the coins of Attica before the time of Pericles, an olive branch appeared with the moon and owl. Goats were sacrificed to Minerva because they were thought to do special injury to the olive tree, and Virgil follows the popular myth in calling her "*oleæ inventrix*." There is a deeper meaning to the fable, the realization of which is still, alas! as much a dream as it was

in the days of Cecrops; but the olive branch remains the emblem of the world's hope, although the vision of the "thousand years of peace" seems still to flit before us as the centuries advance.

One can hardly imagine the Tuscan hills as having ever been without

"The mystic floating gray of olive trees,"

but Pliny assures us that the olive did not exist in Europe or on the African coast in the year of Rome 183. It was probably brought to the French Riviera by those intrepid voyagers, the Phœnicians, about B. C. 500 or 600. The ancient olives in Sicily are still called *Saraceni* in the popular dialect, thus denoting the traditions of their Asian origin.

The frequent mention of the olive in the Bible, both in a literal and figurative manner, has made it one of the most interesting trees in the world, even to those who have never seen it. We all know the difference between the "wild olive" and the "good," or cultivated "olive tree," and how the one is grafted upon the other. To this day, the wild olive grows in barren places; its trunk is crooked; its branches are short and gnarled; its fruit is scanty and bitter. The olive is still, with the Jew as with the Greek, the emblem of peace and plenty, with an added signification of holiness; and the associations of it with the last days of Jesus have made it also sacred to sorrow. There is nothing, indeed, more tenderly sad in its aspect than an olive-covered hill. As I write, I look out upon such a hill, where hundreds of these trees are swaying to the south wind that turns their leaves upward, showing an expanse of whitest gray and grayest green. As a stranger walks for the first time through a grove of these trees, which, in the brightest sunshine throw only the ghosts of flickering shadows on the turf, he is inclined to agree with Augustus Hare, in calling such a walk "one of the most melancholy things in the "world." But the eye soon becomes accustomed to and loves the chastened tone which the olives, ilexes, and cypresses impart to a landscape, finding them accord as truly with the brilliant skies and sharply defined cloud-forms of Italy, as does the intense green of English grass and trees with the pale sky and misty atmosphere of that land. The best description I have ever seen of the appearance of olive trees is that variously attributed saying, that "they look as if they grew by moonlight."

But not to linger longer on the history and associations of the olive, my special purpose is to give some account of its present culture in Italy, where it forms an important branch of agriculture and commerce.

The *Olea Europæa* is thought by Risso to be a descendant of the *Olea ferruginea*, the rusty-leaved olive of the country between the upper Indus and the Suleiman mountains bordering on Afghanistan. He mentions forty varieties. The *O. E. polymorpha*, or "*olivier pleureur*" as it is called on the French Riviera, is the variety most fruitful on the Mediterranean shores. It attains a height of thirty feet, and bears fruit on alternate years. The *O. E. pignola* and *O. E. rostrata* are also adapted for the sea-coast. In the inland valleys, the *O. E. uvaria*, so called from having its fruit in grape-like clusters, does well. The *O. E. regalis* and *O. E. corniola*, being hardier, do well on the hill-sides; and the hardiest of all are the *O. E. Præcox*, and the *O. E. atrorubens*.

Generally speaking, the olive will flourish wherever the vine does well. It will not bear a temperature below 21 degrees or 22 degrees Fahrenheit, and cannot be grown in Europe above the latitude 46 degrees, which possesses a climate nearly corresponding to that in America of latitude 40 degrees. A few hours of severe cold after rain or snow suffice to destroy the young plants and fruit. "I have seen," says Fodéré, "an olive orchard in the vicinity of Marseilles, which had brought to the owner an income of ten thousand francs in a single year, and seemed likely to do so again in the autumn of 1792, when one night the mercury went down to 10 degrees below freezing, and in the morning all hope of a harvest was gone." Many trees on the French Riviera were destroyed by the cold winters of 1788–9, 1820, and 1837.

The localities in Italy where the olive grows best are Sicily, Calabria, the Abruzzi, Puglia, Lucca, and the Riviera. The best table-oil exported to America is from the province of Lucca. The olives prepared for eating come from Spain, those of Italy being inferior for this use, although they are eaten by the lower classes. The olives of the plain yield more fruit than those of the hills, but the oil is more fatty and less delicate. A gentle slope, well sheltered from cold winds, is the most favorable situation. In moderate climates, the exposure should be to the east; in warmer ones, toward the west and north; while on the utmost northern limit only a full southern exposure will content the tree. It prefers a dry and rather stiff soil; the fat plains make it corpulent and short-lived.

The kernel of the olive requires two years to germinate naturally, but it has been found that by macerating it in a mixture of clay and cow-manure the process may be hastened

so that it will germinate the same year. The plant should remain two years in a forcing-house before being transplanted to the nursery, where it must spend from five to fourteen years before being placed in the orchard. While in the nursery the plant must be grafted, which is done in various ways fully treated of in books on olive culture, but whose details would be out of place in this sketch. In its fifth year it begins to assume the appearance of a miniature tree, being then pruned of its lateral shoots to the height necessary for the trunk, usually from four to five feet from the ground. The lower remaining branches are then tied down in the manner represented in the cut on page 557, in order that other branches may spring out at their conjunction with the trunk. There are various other methods of propagation, as by excrescences on the roots of the parent tree, by shoots, and by sprouts, and the living roots of a dead tree; but that which insures the longest life and greatest resistance of the plant to cold is its growth from the seed. An olive orchard should have the trees set at least twenty-five feet apart. They are placed in deep pits, in which has been put a layer of rags, pebbles, and potsherds; plenty of manure is put about the roots, and straw is spread on the ground about the trunk. A trench is also dug at a little distance all around the tree, to preserve it from drought.

All the authorities advise the alternating of crops of vegetables and grain in the olive orchard, it being found that when the same crop is raised year after year the olive suffers. Grain grows well in these orchards, the trees not casting sufficiently dense shadows to interfere with its ripening.

We have seen that the olive is a very slow-growing tree. When raised from seed it rarely bears fruit under fifty years, and when propagated in other ways it requires at least from twenty to twenty-five years. But, on the other hand, it lives for centuries. The monster olive at Beaulieu, near Nice, is supposed by Risso to be a thousand years old. Its trunk at four feet from the ground has a circumference of twenty-three feet, and it is said to have yielded five hundred pounds of oil in a single year. In regard to the olive trees in the "Garden of Gethsemane," Dean Stanley says:

"In spite of all the doubts that can be raised against their antiquity or the genuineness of their site, the eight aged olive-trees, if only by their manifest difference from all others on the mountain, have always struck even the most indifferent observers. They are now, indeed, less striking in the modern garden inclosure built round them by the Franciscans than when they stood free and unprotected on the rough hill-side; but they will remain, so long as their already protracted life is spared, the most venerable of their race on the surface of the earth. Their gnarled trunks and scanty foliage will always be regarded as the most affecting of the sacred memorials in or about Jerusalem."

The olive blossoms in the neighborhood of Nice in April, and in Tuscany a month later. Its flowers are insignificant, of a dull, creamy white, with thick, waxy petals. The period of greatest beauty for the olive is when the fruit is ripening, and the boughs are laden with the plum-shaped berries, varying in tint from bright green to dark red and bluish purple. The picking season begins in the early autumn, the oil from unripe fruit being more piquant and better for table use than any other; but of course the yield is less copious. From November to January, according to situation and variety, the fruit ripens. It is gathered by shaking the tree, or by picking; the more care being taken, of course the better the oil. It is stored in dry rooms till a sufficient quantity is obtained for pressing. This is done by means of a mill not unlike a cider-mill worked by either horse or water power. When the olives are reduced to a pulpy mass, this is put into baskets of hemp made in a peculiar form. Ten or twelve of these are piled up together and pressure is applied. The oil thus obtained is called "virgin oil," and is of the first quality. Boiling water is then poured on the mass to facilitate the expression of the remaining oil. The refuse, or *marc* as it is called, is left to undergo a short fermentation, and then again put into the press with boiling water poured on as before. From this is obtained the first *huile de receuse*, which is of inferior, fatty quality. The residue is now thrown into a brick or stone trough filled with water, and communicating with others into which the liquid flows off as the mass is stirred and beaten with poles; and the oil rising to the surface is skimmed off. The remainder is put into caldrons and boiled with water; and a new pressure brings out what is called the second *huile de receuse*, or refuse oil, which is mixed with the first, and used for the manufacture of soap. All the different waters used in the process and in cleansing the utensils, are poured into reservoirs, and the oil called *l'enfer*, which comes to the surface clear and limpid, though useless on account of its strong taste and odor for table purposes, is the best for burning. Olive oil is still preferred to petroleum by many Italian and French families, as it gives a softer and less dazzling light. The picturesque old Etruscan lamps are still in use for carrying about the house and for lighting visitors down the stairways of houses in Florence and Rome, as well as in humble towns.

The dregs remaining in the caldron are pressed into cakes and used for heating the water in the oil mills; the kernels which were separated from the fruit in the first trough, are also sold for heating purposes, and even their ashes are useful, as they contain a good deal of potassium. The baskets are much sought after for manure, as they are saturated with oil.

The oil is preserved in great earthen jars, varnished on the inside, or in cisterns lined with cement, which are tightly closed to exclude air and light.

One hundred kilograms of olives freshly picked from trees in good condition ought to return a fifth of their weight in virgin oil.

As an article of food, oil has a most important place. The Italian workman finds bread and oil and wine an ample midday meal; if he can add thereto a salad or an onion, it is a feast. In the *cuisine* of Southern Italy, oil takes the place of butter, and is by many considered more healthful than any animal grease. "There is a curious dish," says a traveler, "which the millers' men at Mentone sometimes indulge in. It is called *brandada*, and needs an iron stomach to digest it. The foundation of the dish is salt fish, from which they remove the bones, and after boiling it to rags, stir or pound it into a paste. An assistant then slowly pours in olive-oil, while the head cook stirs. The addition of parsley and other herbs, and further stirring to complete the amalgamation of the whole, renders the *brandada* fit for the table."

The olive has lately acquired for Americans a new and practical interest from the discovery that it can be easily and profitably grown in California. Residents of California have been accustomed to consider a small bottle of "Mission oil" for their salad as a treasure; for it far surpasses in purity and sweetness any imported oil. But it is only within a few years that private owners of land in Southern California have seriously considered the question whether olive culture could be made a paying enterprise. So many possibilities cling to the broad lands and rich soil of the Golden State, that it is not wonderful if some of them have been overlooked. And, though experiments in olive-growing have been made on a small scale with good success during the last twenty years, popular interest is only now beginning to be awakened. In the first place, there was the drawback, peculiarly great to the American temperament, of the slowness of growth, and irregular productiveness of the olive in Europe. The old Tuscan saying is, "Plant a vineyard for yourself, an orange grove for your children, and an olive orchard for your grandchildren." As a people, we are not fond of looking far into the future; and besides, judging from ourselves, we are not at all sure that our grandchildren will wish to live where we do. But the olive is good enough to adapt itself to the rapidity of American demands. It matures much earlier than in Europe, and bears oftener and more plentifully. The system of propagation from cuttings, as far as can be judged at present, gives, in our rich soil, robust trees; and there is no need to employ the slow process of raising them from the seed. Five years is surely not long to wait for a fruit crop; and after that time, according to the best California authorities, the trees will yield a full, and in many cases an annual harvest. At a late meeting of the State Horticultural Society in San Francisco, it was stated that one olive farm yielded $2200 to the acre. These trees bore every year, and were situated on "adobe" hill-sides, the bottom lands being found, as in Italy, less favorable to the fruit. The variety was the "Mission olive," which has not been identified with any of the varieties now cultivated in Europe. The olive was introduced into South America in 1560, by Antonio Ribera; but the California trees sprang from seeds sent from San Blas in Mexico by Don Joseph de Galvez with his expedition to rediscover the port of Monterey. Of this expedition and of Father Junipero Serra, its spiritual head, an account was given in THE CENTURY for May, 1883. It resulted in the establishment of the San Diego mission, the parent of those of San Gabriel, Santa Barbara, San Luis Obispo, and other stations, to all of which the fruits which Galvez had introduced were carried, and where they throve abundantly.

As to individual experience, olive culture has not yet become general enough to elicit many reports of progress, and it is difficult to get at the facts. The following statement is from a pamphlet on "Olive Culture," by Ellwood Cooper, of Santa Barbara:

"My oldest orchard was planted February 21st, 1872. At four years, I gathered from some of the trees over two gallons of berries; in 1878, over thirty gallons each off a few of the best trees, the orchard then being only six years old. In 1879, the seventh year, the crop was not nearly so large. I had planted several thousand cuttings in the spring of 1873, but these trees did not give, at six years, a result equal to the first planting. The present crop (1880) is quite good—the oldest orchard now being eight years, and I think I do not overestimate, when I state that the yield of some of the best and fullest trees will be over forty gallons. Trees large enough to give this quantity of fruit, planted at a distance of twenty feet, will occupy nearly all the ground, and therefore give all the fruit that can be produced on one acre. An orchard bearing uniformly the quantity as above would give the following result: One hundred trees to the acre at forty gallons each, four thousand gallons. This would be an enormous crop, unprece-

dented, and far beyond any statistics given in European publications. The one-fourth of the quantity yearly would be a very profitable crop."

In 1879, Mr. B. B. Redding, of San Francisco, read before the Academy of Arts and Sciences an interesting paper on the olive, which was afterward published in a San Francisco paper; and from which I take the following statement (somewhat abridged) as to the places in California suitable for olive growing:

"It will be remembered that the requisites of successful and profitable cultivation are, that the mean temperature for the year must be as warm as 57 degrees 17-100. The mean for the coldest month must be as warm as 41 degrees 5-100, and at no time must the temperature fall below 14 degrees. I cannot find in any authority how high a temperature it will bear, but as it is successfully grown in Algeria and Egypt, it could hardly be injured by the highest temperatures that occur at the places mentioned in the following list:

PLACES.	*Height above the sea — in feet.*	*Mean of temperature for the year.*	*Mean of temperature for the coldest month.*	*Lowest temperature shown by thermometer in any year.*
San Diego	150	62.49	53.30	26—December, 1854
Los Angeles	257	67.69	58.95	29—December, 1876
San Jose	86	59.60	46.58	28—December, 1874
Livermore	485	61.49	49.52	28—December, 1870
Benicia	64	58.77	47.43	19—January, 1854
Vallejo	0	58.77	47.41	29—December, 1877
Fort Tejon	3240	58.03	42.05	22—December, 1855
Merced	171	63.16	48.14	28—January, 1876
Sacramento	30	60.48	46.21	28—December, 1849
Auburn	1363	60.71	45.88	27—January, 1871
Colfax	2421	60.05	45.49	26—January, 1873-4

"For the purpose of comparing the temperatures of the above named places in California with those of regions in which the produce of the olive is among the articles of the first agricultural and commercial importance, I have compiled from Blodgett's 'Climatology' the mean annual and the mean winter temperatures, as also the mean temperature of the coldest month of the following places:

PLACES.	*Mean of temperature for the year.*	*Mean of temperature for the winter.*	*Mean of temperature for the coldest months.*
Rome	60.05	46.07	45.00
Lisbon	61.04	52.05	51.04
Marseilles	58.03	45.02	43.02
Algiers	64.03	51.02	53.02
Jerusalem	62.06	49.06	47.04

One gallon of oil will fill five bottles, and the producer can sell it at $1.00 a bottle, the retail price of California oil being $1.25. At least, these are current prices in 1883. I have before me a letter from another gentleman at Santa Barbara, who has been experimenting on a large scale, and is sanguine as to the speedy returns and large profits to be had from olives. He employs mostly Italian laborers; and this suggests that the Italian emigrants to America, who drag out a miserable existence in our Northern States, for whose climate and modes of life they are totally unfitted, might, being almost all of them familiar with the work of the Italian farmer, turn their skill to profit in our Southern country, should the olive and the vine receive the attention of large land-owners. Very simple machinery may be used for expressing the oil. Mr. Cooper's press is "an old-fashioned wooden-beam one, such as is used in the New England and Middle States for making cider." He advises, however, the use of the oleomargarine press as economical. He sums up the cost of his machinery thus:

"Drier, $150; mill, $250; two presses, $500; two tanks, $200; filterers, $50; corker, tin foiler, $50; wooden building, $400. Total, $1600."

In our Southern Atlantic States, the few experiments made in olive culture have been unsuccessful. This has been attributed to the fact that the mercury occasionally falls very low, in that usually temperate region. But so it does, as we have seen, on the Mediterranean coast, where, notwithstanding, the olive is a profitable fruit. It is well known that the olive will bear a greater degree of cold than the orange; and in the province of Lucca, whence comes the best Italian oil, the orange will not grow except in sheltered spots, and with winter protection. Taking this into consideration, with the fact which we have mentioned, that the olive needs the same conditions as the vine, and it appears impossible that there should not be many parts of our sea-coast where it would flourish well. Sea air is, indirectly at least, beneficial to it.

In regard to the consumption of olive-oil in the United States, Mr. Redding says that, during the year ending June 30, 1877, there were imported 348,431 gallons, on which a duty of $232,776.75 was paid. Great Britain imports not far from 5,000,000 gallons annually. Of these importations but a small part is for the table, of course; large quantities of an inferior quality being used for machinery, and especially for the manufacture of broadcloth. That which comes to us from Europe is largely adulterated, much of it with cotton-seed oil, which is shipped from our own country to the Mediterranean for that use. And Mr. Cooper mentions that, while he was in the shipping business in New York, his firm had one telegraphic order for *one thousand tierces* of hog's lard, for the same purpose.

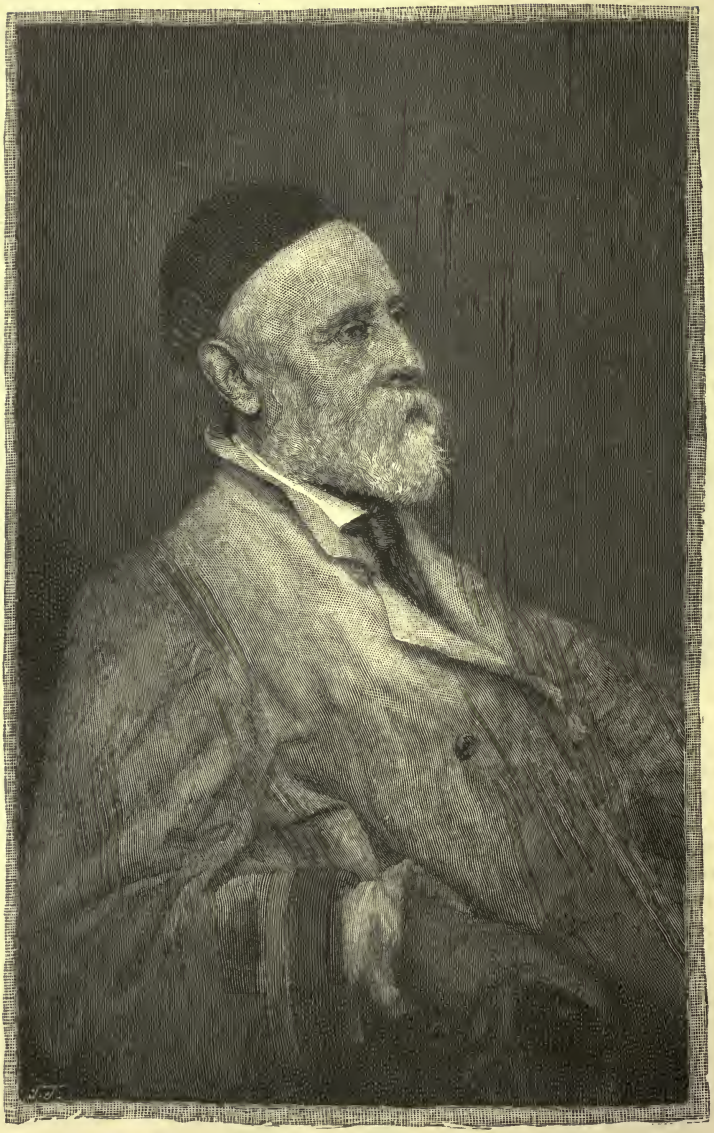
But let no one suppose that the cultivation of the olive calls for less vigilance and care than that of other fruits. On the contrary, it is peculiarly liable to the ravages of insects, and quite as dependent upon proper manuring and pruning as the strawberry or the grape. Scraping, burning, treating with sulphur, hot water, lime, petroleum, tobacco, and coal-tar, are among the preventives or remedies continually needed, and every tree should be examined at least once a month. Knowledge, experience, and *hard work* are in this, as in all other kinds of farming, the only conditions of success.

I shall be glad if this slight and imperfect sketch may help to increase in my own country the interest in a tree which has become endeared to me by many associations in my adopted home.

E. D. R. Bianciardi.

IN AN OLIVE ORCHARD.

MR. WATTS AT THE GROSVENOR GALLERY.



FREDERICK WATTS, R. A.

ENGRAVED BY T. JOHNSON FROM A PHOTOGRAPH FROM LIFE BY HOLLYER.

THE recent exhibition of Mr. Watts's pictures, at the Grosvenor Gallery, in London, has given the lovers of contemporary art an opportunity such as is rarely to be obtained for passing in review the works of a great living artist. It is hardly necessary to say that so complete a collection of any man's works forms an ordeal for the painter of a very trying kind. But Mr. Watts may fairly be said to have stood the test. His pictures are remarkable, from first to last, for unity of aim and persistent nobility of sentiment. There is indeed a marked contrast of style between his earlier and later works, and a strange uneven-

ness of attainment even in those of one epoch; but a strong idiosyncrasy asserts itself throughout. Influenced as he was, at the outset of his career, by the preraphaelite movement, he never gave himself up to its extravagances, and he speedily worked out a style of his own. All painters of genius employ different methods of presenting their thoughts at different epochs of their lives, and Mr. Watts is no exception to the rule; but his changes of manner have been comparatively slight, and we are unable to trace in his work such various phases of æsthetic thought as were illustrated in the collection of Mr. Millais' works the year before. The delicacy and minuteness of Mr. Watts's earlier pictures gave way to greater breadth of effect and rapidity of execution; his coloring, at first somewhat crude, became less brilliant but richer, more harmonious and subdued, while a greater depth of feeling, a somber grandeur or melancholy, sometimes almost "sicklied o'er with the pale cast of thought," has taken the place of the sunnier light-heartedness of youth. From the first, Mr. Watts's mind has shown a bent toward the tragic side of art, toward the abstract and ideal, and much musing on these thoughts has produced an unmistakable effect. But this effect has been gradually, not suddenly produced, and however much the later work may differ from the earlier, there has been no revolution in Mr. Watts's mind, but a similar tendency is visible throughout.

Mr. Watts's genius, like that of Mr. Browning, is not one that readily appeals to the popular appreciation. His work, at least his most characteristic work, is too full of thought to impress the crowd of sight-seers who troop through a picture gallery, led by fashion and curiosity rather than by love of art. His poetical conceptions are generally of too abstract and ideal a nature to be grasped at first sight. They are too deeply felt to arouse sympathy in the masses. To one who does not study them they will appear all but unmeaning, while only considerable attention will unveil their full significance. This is why Mr. Watts is not and cannot, in these days, be a really popular painter. The fashion of the age prescribes for art bounds which it cannot pass without forfeiting its universality. It is no longer the business of art to teach but to amuse; and if Orcagna or Michael Angelo were to live and paint again, it is doubtful whether he would not die in penury. We admire these masters of old days, because our instructors have dinned their greatness into our ears till we are fain to believe; but if the statue of Moses were to appear for the first time in next year's Academy, we should be told that his horns were ridiculous, and his beard half a yard too long. And so it is with Mr. Watts. Those who wish to be amused go away unsatisfied, and laugh at the power they cannot feel. Moreover, it must be confessed that Mr. Watts sometimes fails to make his meaning clear, and that now and then his want of humor lays him open to those who have a keen sense of the ridiculous. A painter who constantly strains his power to the utmost, who delights in facing difficulties and in scaling heights, will sometimes come dangerously near the abyss which awaits the sublime. But such a man is rather to be judged by his successes; and even where he fails, there is often more to be learned than in the triumphs of a weaker mind.

If Mr. Matthew Arnold is right in claiming for Wordsworth the first place among English poets by virtue of the purity and dignity of his moral ideas, we may surely award to Mr. Watts a somewhat similar praise. If Mr. Ruskin is right in demanding that Art shall be conscious of its moral power, and that a painting shall be finally judged by the poetical and moral grandeur of the truths that it conveys, then surely we may find in Mr. Watts's work one at least of the essential conditions of all that is noble and valuable in art. It is a mere truism to say that poetry and painting set before themselves dissimilar aims; but it is equally true that painting, like poetry, has its moral influence and its moral responsibility. The moral ideas which attract Mr. Arnold in Wordsworth are not to be confused with sermons, nor should we expect to find sermons in Mr. Watts. But a high rank is to be given to his painting, as it is to be given to the best English poetry, on account of the elevated and poetical spirit in which it treats the highest problems of the human mind. These characteristics of Mr. Watts's genius have naturally led him to devote himself mainly to two departments of pictorial art—portraits and ideals. All great painters of ideal subjects have paid considerable attention to portraiture, and Mr. Watts is no exception to the rule. Like Antæus, the portrait-painter touches mother earth whenever he paints a human face, and comes back refreshed and enriched with a new experience. The lack of such recreation, as in the truest sense it may be called, leads, as in Mr. Burne-Jones, to a monotony of form and expression and a want of humanity, for which no amount of esoteric beauty and no intensity of poetical feeling can atone. The greatest painter of ideal landscape, Turner, constantly refreshed his imagination by an intimate and faithful study of nature. So, too, the painter who attempts the expression of poetical ideas or ideal emotions, by means of the human

figure, will become narrow and vapid unless he invigorate his genius by frequent draughts from the living, thinking, suffering humanity around him. Mr. Watts is one of those painters whose two-edged activity manifests the mutual helpfulness of portrait and ideal. The varied experience of the portrait-painter supplies the material whence ideas arise, and the concentrated study which is essential to successful portraiture gives a firm hold on natural truth. On the other hand, the process of abstraction, the effort to rise above detail, which is implied in the expression of the ideal, strengthens and enlarges the mind, and enables the portrait-painter to detect at once, beneath what is trivial or conventional, the essential characteristics of the man. In Mr. Watts, we have a portrait-painter of remarkable fidelity and comprehension and a painter of ideal subjects, distinguished at once by truth and vigor of drawing and by breadth and originality of conception. His greatness in the one branch is not to be separated from his greatness in the other.

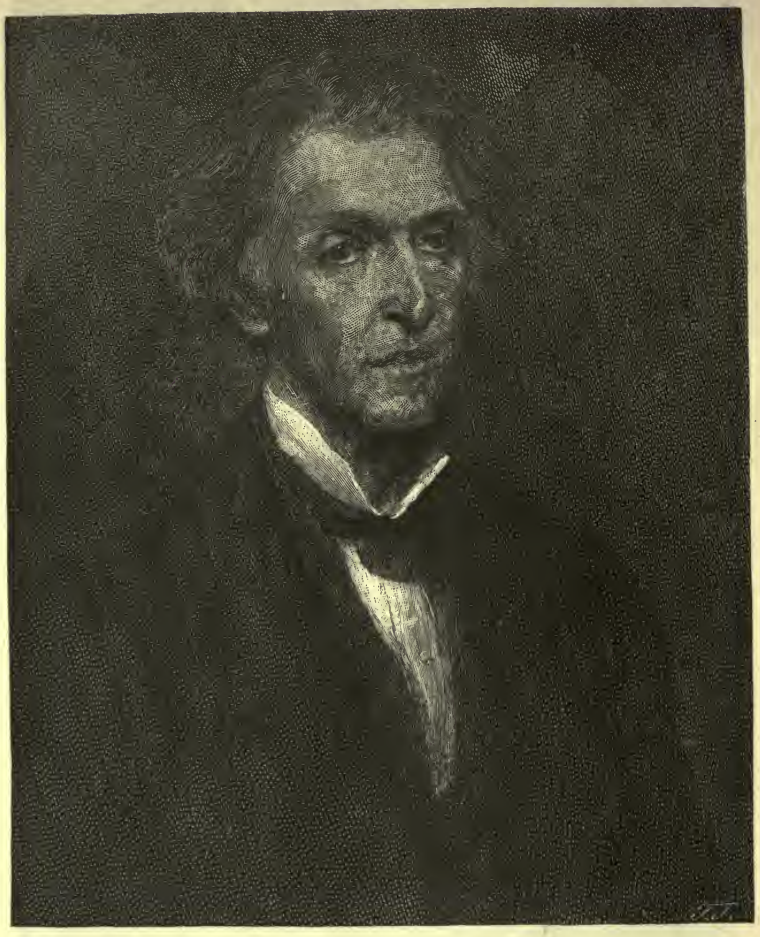
Mr. Watts's portraits vary, however, to an unusual degree in excellence. Faithful and intelligent they always are; sympathetic they not unfrequently are not. Broadly speaking, his portraits of men are superior to his portraits of women, while his portraits of children are sometimes little better than failures. His genius is of a thoughtful and somber, even melancholy kind, and expands fully only when it meets its like. Thought, action, experience, the masculine characteristics in fine, are more to his taste than feminine grace, elegance, or vivacity. For what is essential in the beauty of childhood he seems to have little sympathy. A painter of his power will always produce what is worth examination; but a comparison of the best of his children with almost any child of Reynolds, Gainsborough, or Millais, will show how far he stands, in this respect, below those painters who have made the portraiture of children a distinctive excellence of English art.

Mr. Watts's earlier portraits are characterized by great care and minuteness, and a preraphaelite attention to detail; but they are comparatively ineffective, and their color is sometimes very unpleasing. The differences of style and treatment that manifest themselves in this period show that Mr. Watts did not for some years fix upon the treatment most suitable to his mind. His great time as a portrait-painter extends about from the year 1860 to 1875. Within this period fall almost all the best of his works in this line. It would be hard, indeed, to point out a portrait of this generation more admirable in every respect than that of John Stuart Mill, so wonderfully reproduced by M. Rajon. The keen and subtle intellect of the philosopher is apparent in the clear-cut features, the deep-set eyes, the absorbed and concentrated gaze, the fine, curved nose, the straight, thin-lipped, passionless mouth. It is not a face to inspire enthusiasm, for it is too intellectual, too far above the failings and weaknesses of ordinary humanity; but it infuses profound respect, and admiration of a distant kind, as of a man who combined the highest moral courage with the rarest mental gifts. Technically, too, the picture is worthy of its subject: it is a perfect piece of work, highly finished, subdued and harmonious in color. It is fortunate indeed that Mill, who never sat for another portrait, fell into Mr. Watts's hands. Equally striking in another line is the portrait of Lord Lawrence. In Mill we have the man of thought: here we have the man of action. Mill was a creator of ideas, Lord Lawrence was a leader of men. Command is written on every feature of the face; the heavy brow, the massive chin, the broad straight nose, the fiery eye, the direct and searching gaze; while the pose of the head and the strong thick neck betray a physical power fit for a man of herculean energy and indomitable will. The portrait of the late Sir Anthony Panizzi, librarian of the British Museum, exemplifies most clearly Mr. Watts's insight into character, and his fearless love of truth. He has not flattered his subject in the least, and to many observers there would have been nothing remarkable in the plain heavy face, poring over an old book. But Mr. Watts has seen, and enables us to see, in those unattractive features, all the grandeur of concentrated thought and patient labor which make what was valuable in the man.

It would be tedious, did space permit, to go through Mr. Watts's portraits in detail, but we may remark the extraordinary number of great men whose features he has handed down to posterity. To be in the Grosvenor Gallery, last winter, was to be in the presence of much that is or has been most remarkable in this generation in science, in philosophy, in politics, in poetry, in art. Mr. Watts's subjects do not indeed, as we have already remarked, all fare equally well at his hands. Lawyers and politicians are, perhaps, the least successful. On the other hand, with what breadth of sympathy and keenness of insight has Mr. Watts depicted the thoughtful and spiritual features of Dr. Martineau; the scientific ardor of Mr. Spottiswoode; the religious benevolence of Lord Shaftesbury; the critical, almost fretful acuteness of Mr. Leslie Stephen! In one part of the room there hung a group of poets. What intensity of feeling and depth

MRS. PERCY WYNDHAM.

ENGRAVED BY MISS C. A. POWELL, FROM A PHOTOGRAPH BY HOLLYER OF THE PAINTING BY FREDERICK WATTS, R. A



REV. JAMES MARTINEAU, D. D.

ENGRAVED BY T. JOHNSON, AFTER A PHOTOGRAPH BY HOLLYER OF THE PAINTING BY FREDERICK WATTS, R. A.

of meditation are visible in the towering brow and down-drawn eyes of the Laureate! what robust and manly vigor, as of one of his own Norse heroes, in the open features of Mr. Morris! what power of thought and dignity of character in the massive profile of Mr. Browning! There, too, was a group of painters: Sir Frederick Leighton, whose Grecian beauty of feature and luxuriant hair seem to indicate the peculiarities of his genius; Mr. Calderon, whose face recalls the melancholy knight of La Mancha; the sad and secluded fancy of Mr. Burne-Jones; the artistic power and poetical enthusiasm of Mr. Watts himself.

It cannot be said that the portraits of women exhibited in this collection of last winter, beautiful as many of them are, are as successful on the whole as those of the eminent men already noticed. The color of the flesh-painting, often unpleasing in Mr. Watts's portraits, is sometimes almost repulsive in his female faces, while in the full-length pictures there is little of that easy grace and elegance which render charming every fold of a woman's robe in the hands of Reynolds or of Gainsborough. At the same time, Mr. Watts's wonderful feeling for beauty of outline shows itself, for instance, in the portrait of Miss Lindsay; while that of Mrs. Percy Wyndham is equally remarkable for dignity and statuesque repose. The latter picture was indeed one of the triumphs of the exhibition. The pose of the figure is easy, yet noble and high-bred; the coloring is rich, subdued, and harmonious; the deep greens and browns, the dull gold sunflowers on the dress, and the laurel-leaves of the background harmonize exquisitely with the dark hair and the sallow complexion of the face.

But we must not pause longer in this department of Mr. Watts's work. Nor need we linger over the few examples of animal and landscape painting exhibited in the recent collection. It is not as a painter of animals or landscape that Mr. Watts has sought to be remembered, nor is it even on his portraits that his highest fame will ultimately rest. His greatest power, that which is most original and peculiar in his genius, shows itself in his ideal and poetical compositions. It is the poetry of human life that possesses for him the highest attraction. He uses inanimate nature solely as an aid or accompaniment to the central theme. It is this all-pervading human interest, this direct expression of humanity, added to the purity and loftiness of his sentiments, that justifies us in calling Mr. Watts's pictures poetical in the highest sense. Poetical no one who examines them with the slightest attention will deny them to be, for they express in a visible form the human emotions with which poetry has to deal. The absence from the recent collection of his works of what are called *genre* pictures is no less striking than the frequency of the tragic element. Whatever else may be said of his painting, the most adverse critic will hardly find in it anything vulgar or even trivial, scarcely anything that is commonplace. It may, however, be objected that his pictures, when viewed together, produce a gloomy or depressing effect. Their pervading gloom is oppressive to a public that wishes to be amused, to take refuge for a moment in some sunny clime or some gay scene from the murkiness and insipidity of daily life. But it should be observed that the general characteristic of Mr. Watts's work is rather seriousness than sadness. The melancholy of his pictures, where it occurs, is not mere empty or languid joylessness. It is rather the melancholy that seems inseparable from higher poetic feeling. It is the melancholy of those who sympathize with suffering, or who are occupied with the insoluble but absorbing problems which human life at every turn presents to the thoughtful and sympathetic mind. There is much, too, in Mr. Watts's work that is anything but gloomy or sad. If there is anguish in the "Paolo and Francesca," or a tale of woe to be read in the crouching figure "Under a Dry Arch," there is the joy of supreme beauty in the "Daphne," sunny peace in the "Arcadia," devotion and lofty hope in the "Galahad," trust and chivalry in "Una and the Red Cross Knight," brotherly affection and generosity in the "Meeting of Jacob and Esau." Any one who regards these works attentively will be rather elevated and consoled than saddened or depressed by their contemplation. For one thing, at least, is never lacking in them that is sadly lacking in the world at large, and that is the energy of a noble thought.

It is not, indeed, always that Mr. Watts has succeeded in bringing his thought to the birth, or in giving it adequate expression. Greek poetry, for instance, is but inadequately symbolized by the recumbent figure which Mr. Watts, in one of his pictures, intends to represent it. The subject is too vast to be treated in such a way. It is, in truth, just as impossible for one figure, however pregnant with significance, to express what we mean by Greek poetry as for one man to have written the Iliad, the Pythian Odes, and the Antigone. Sometimes, again, Mr. Watts's ideas are too subtile or complicated to lend themselves properly to pictorial expression. In ideal pictures clearness and simplicity are indispensable to effect, and if the subject has to be explained at length in the catalogue, it is clear that the painter has transcended the limits of pictorial art. This is not, indeed, a common fault with Mr. Watts, for generally his pictures explain themselves; but now and then there is considerable obscurity. We may, however, safely leave fault-finding to others. It is a more pleasing task to turn to those triumphs which we can fully and heartily admire. Mr. Watts has not drawn very much from the aspects of social life around him; but where he has done so, he has handled it in the spirit of Hood or Mr. Browning, with deep sympathy for the woes of suffering humanity. The two pictures entitled "Found Drowned" might serve as illustrations of Hood's famous poem on "The Bridge of Sighs," while "The Needlewoman" breathes all the pathos of the "Song of the Shirt." The sadness of these and other pictures of the same kind shows that Mr. Watts possesses one, at least, of the essentials of a great poet—the comprehension of what is meant by pain.

Very remarkable, as illustrating another phase of his poetic mind, is the group of subjects taken from the Bible. There was not a single picture of the kind ordinarily called religious in the recent collection, but Mr. Watts has treated the Bible as a store-house of poetic imagery, as affording abundant material for lofty pictorial treatment. His subjects are taken almost exclusively from the Old Testament; and when he turns to the New, it is from the moral or poetical portions, from the Parables or the Apocalypse, that he prefers to draw his inspiration. His diploma picture, "The Death of Abel," is a very impressive composition. The dead body of the murdered man lies at his brother's feet; the fire from heaven mingles with the flames of the

LOVE AND DEATH.

ENGRAVED BY T. COLE, AFTER THE PHOTOGRAPH BY HOLLYER OF THE PAINTING BY FREDERICK WATTS, R. A.

altar; the ministers of divine vengeance descend upon the slayer's head; he clasps his hands to his face and flees from the hideous sight to wander an outcast in the world. Equally striking is Mr. Watts's conception of "Esau." The gaunt, uncouth being stands solitary, wrapped in his rugged mantle, in the midst of the desert that is his home. With downcast eyes and melancholy pose, he meditates sadly on the birthright bargained away and the blessing lost for ever. We feel a strange sympathy for him, as for Ishmael and others of the supplanted, a sympathy akin to that aroused by Browning's "Saul." A striking and highly poetical conception is that entitled "Watchman, what of the Night?" A white face, pale and weary with anxious waiting and suspense, looks out into the darkness. "Watchman, will the night soon pass?" The drawn lips repeat the question; but the answer—"The night is departing, the day is at hand"—has not yet come. The grandeur of thought, nobility of expression, and originality of treatment manifested in this series of Biblical and allegorical pictures, remind us of Michael Angelo more than of any other painter.

Mr. Watts's intense feeling for physical beauty shows itself in a remarkable series of studies of the female form. As we should expect from the character of his genius, the beauty that attracts him is of a severe and classic kind. We find in his women no trace of the fleshy robustness of Rubens, or the voluptuous undulations of Tintoret. In place of these qualities, we have beauty of a graver and purer type, statuesque in character, depending for its attractiveness on outline and molding rather than on richness and color. But a fair exterior is not the only, nor even the primary, object which Mr. Watts has in view. Physical beauty, however worthy of admiration in itself, is chiefly valued by him as heightening the effect of the poetical ideas which the picture is intended to convey. The lovely shoulders and swelling bosom of "Pygmalion's Wife," in all their marble coldness, at once account for the sculptor's love, and help us to imagine the intensity of that kiss that could warm so stony a being into life. The drooping form and hanging limbs of the "Psyche," with their slight and girlish grace, are full of pathetic sadness, touching resignation, and self-reproach. Her sister's jealousy has gained its end; poisoned by the breath of suspicion, love has fled, and the girl awakes to find herself alone. One feather from his wing has fallen to the floor, and as she gazes down upon it the truth begins to dawn on her that she has lost the god. But of all this group of pictures, the "Daphne," preëminent in physical beauty and poetic thought, is most characteristic of Mr. Watts's mind. The figure of the nymph, shaded but not hidden by the laurel boughs, is resplendent with combined beauty, purity, and grace. The rich warm flesh-tints, as of limbs that have basked in a southern sun, harmonize with the dark green leaves behind. Faint and weary with her flight, the girl leans against the tree, into which the indistinct outlines of her form seem to be already melting away. It is hard to say where the human life ends and the vegetable life begins. The nature-worship of the Greek religion could hardly be rendered visible in a purer and more poetical form than this.

We have reserved till now a group of pictures, in which, more than in any others, Mr. Watts's poetical genius is displayed. Each is in itself a lyric poem, in which form, color, and expression stir the sympathies and the emotions with the force of rhythmical and harmonious words. Of this group we will select four, with which to conclude our review. Some objection may be taken, in the "Orpheus and Eurydice," to the violence of the action and the treatment of the female figure. But no one can fail to appreciate the agony of Orpheus, or the awful suddenness of the blow that leaves him again bereaved. He has hardly time to turn and gaze upon her whom the power of his song has recovered from the shades, when the retribution falls upon him. In the very instant in which he breaks the divine command, the dread verdict is fulfilled. The lyre falls from his hand, the lily from hers; but before they have touched the ground, almost before he can catch her in his arms, the lifeless head drops back, the limbs hang down, and he holds in his despairing grasp only the corpse of his twice-lost love. A very different note is touched by the figure of "Sir Galahad." The youthful knight, with auburn hair and eager face, stands in an attitude of rapt adoration, as if his yearning spirit had placed the sacred object of his quest before his very eyes. His horse waits patiently behind, his hands are clasped before him, his sword hangs sheathed at his side. Glowing with rich, deep, and harmonious color, the picture breathes throughout the spirit of youthful enthusiasm, the inspiration of a great ideal. It is the Galahad of Tennyson's noble poem. "His strength is as the strength of ten, because his heart is pure." More akin in feeling to the "Orpheus and Eurydice" is the "Paolo and Francesca." No picture in the gallery is animated by a deeper and more tragic pathos than this. Mr. Watts's conception of the subject is doubly interesting when compared with those of M. Doré and of Dela-

roche, both of which have been exhibited lately in London. For poetry, purity, and taste, we do not hesitate to give Mr. Watts the palm. M. Doré shows us a vigorous drawing of a handsome, voluptuous woman, whose face is expressive rather of physical than mental pain, with no sign of death about her save a wound whose ghastly truthfulness recalls visions of the morgue. Powerful, no doubt, the picture is; but the conception is vulgar and superficial, and instead of the spiritual Francesca of whom we love to think, we have a materialistic study from the nude. In the picture by Delaroche there were at any rate no faults of taste, but the higher poetry of Mr. Watts's ideal was absent. The composition of the great French painter is full of flowing ease and grace; the lines of Francesca's figure are exquisite; but it is rather of her physical beauty that we are led to think, and we almost forget that she is dead. Turn now to Mr. Watts. It may perhaps be doubted whether Dante's oft-told tale can gain anything by pictorial rendering, whether the attempt to render visible the most touching passage in all literature will not weaken rather than increase the effect of the poet's simple words. But we cannot think that the story loses in Mr. Watts's hands. The two lovers, whose fate we know so well, float onward still clasped in that last embrace, their gray robes projected against a background of lurid smoke and flame. They are dead indeed; death is apparent in the bloodless hue, the drawn features, the eyelids livid and not fully closed, the stiffened limbs. But their death is as Dante conceived it. The body is dead, but the soul lives; it cannot yet free itself of the earthy part, which has to be purged away, and through which it suffers still. There is unutterable sadness in those faces, no longer meeting, but still turned yearningly toward each other. His right hand has loosed its hold in death: her fingers press feebly on his outstretched palm. Her face rests on his shoulder, full of longing but hopeless love: his face bends downward with more resignation, but as deep despair. But with all the pain, there is a sense of rest already in some part won. The earthly passion is gone, the agony of longing abated. But love remains, the spiritual love that shall unite their souls when the sin that murdered them is purged away, and the bitter trial has to be endured no more. Equally if not even more impressive is the picture called "Love and Death." The subject has been long in Mr. Watts's head, for a smaller study for it was exhibited ten or twelve years ago, while the larger work only appeared about two years ago, and has since then been retouched by the artist. It would be interesting, did space permit, to note in how many points Mr. Watts has improved upon his first idea. We can, however, only deal with the larger picture. Nowhere are the originality of Mr. Watts's imagination and the masculine breadth of his poetry more apparent than here. The agony of despairing love, the resistless march of fate, the impotence of human effort in the face of destiny, are depicted with a grandeur and simplicity more akin to the spirit of Greek tragedy than to anything in modern literature. The huge veiled figure of Death, whose face we cannot and would not see, clad in a robe of ashen gray, presses onward up the steps with a calm force which nothing can withstand. His raiment, loose and flowing, yet discloses the massive bulk and gigantic strength beneath. No grinning Death's-head, no grisly skeleton is here, but a divine being, beautiful if terrible in his overwhelming power. His head is shrouded, and the face looks down, as if in pity for the poor humanity, his prey. His sinewy arm is stretched out over the head of Love, to burst open the door and seize the victim in his home. The climbing rose that Love has planted at the threshold is rudely torn away, and its petals scattered upon the ground. Love himself, nerved with all the energy of despair, stands athwart the path of Death, his right arm pressed against the breast of the figure whose dreadful visage absorbs his gaze. His brilliant wings are dashed against the door-post; his contorted brows and close-pressed lips betray at once his resolution and his pain; the shadow of Death passes over him, darkening the warm flesh-tint, and leaving only a sunny fleck on the brow and knee. For one brief moment he seems to hold his own; but, another second, and we feel that the arm will have given way, and his enemy will have passed beyond him into the room. It is broad daylight: the rays of heaven strike on the cold gray arm of the invading figure, but cannot warm it into color. Life and joy and happiness are awake in the world outside, and the horror of death is deepened by contrast with the light of the sun. Had Mr. Watts never painted any picture but this, he would have won a high place among English painters of this or any other age.

G. W. Prothero.

THE BREAD-WINNERS.

I.

A MORNING CALL.

A FRENCH clock on the mantel-piece, framed of brass and crystal, which betrayed its inner structure as the transparent sides of some insects betray their vital processes, struck ten with the mellow and lingering clangor of a distant cathedral bell. A gentleman, who was seated in front of the fire reading a newspaper, looked up at the clock to see what hour it was, to save himself the trouble of counting the slow, musical strokes. The eyes he raised were light gray, with a blue glint of steel in them, shaded by lashes as black as jet. The hair was also as black as hair can be, and was parted near the middle of his forehead. It was inclined to curl, but had not the length required by this inclination. The dark brown mustache was the only ornament the razor had spared on the wholesome face, the outline of which was clear and keen. The face suited the hands—it had the refinement and gentleness of one delicately bred, and the vigorous lines and color of one equally at home in field and court; and the hands had the firm, hard symmetry which showed they had done no work, and the bronze tinge which is the imprint wherewith sky and air mark their lovers. His clothes were of the fashion seen in the front windows of the Knickerbocker Club in the spring of the year 1877, and were worn as easily as a self-respecting bird wears his feathers. He seemed, in short, one of those fortunate natures, who, however born, are always bred well, and come by prescription to most of the good things the world can give.

He sat in a room marked, like himself, with a kind of serious elegance—one of those apartments which seem to fit the person like a more perfect dress. All around the walls ran dwarf book-cases of carved oak, filled with volumes bound in every soft shade of brown and tawny leather, with only enough of red and green to save the shelves from monotony. Above these the wall space was covered with Cordovan leather, stamped with gold *fleurs-de-lis* to within a yard of the top, where a frieze of palm-leaves led up to a ceiling of blue and brown and gold. The whole expression of the room was of warmth and good manners. The furniture was of oak and stamped leather. The low book-cases were covered with bronzes, casts, and figurines, of a quality so uniformly good that none seemed to feel the temptation either to snub or to cringe to its neighbor. The Owari pots felt no false shame beside the royal Satsuma; and Barbédienne's bronzes, the vases of Limoges and Lambeth and bowls from Nankin and Corea dwelt together in the harmony of a varied perfection.

It was an octagon room, with windows on each side of the fire-place, in which a fire of Ohio coal was leaping and crackling with a cheerful and unctuous noisiness. Out of one window you could see a pretty garden of five or six acres behind the house, and out of the other a carefully kept lawn, extending some hundred yards from the front door to the gates of hammered iron which opened upon a wide-paved avenue. This street was the glory of Buffland, a thriving city on Lake Erie, which already counted, though still very young, a population of over two hundred thousand souls. The people of Clevalo, a rival town, denied that there was anything like so many inhabitants, and added that "the less we say about 'souls' the better." But this was pure malice; Buffland was a big city. Its air was filled with the smoke and odors of vast and successful trade, and its sky was reddened by night with the glare of its furnaces, rising like the hot breath of some prostrate Titan, conquered and bowed down by the pitiless cunning of men. Its people were, as a rule, rich and honest, especially in this avenue of which I have spoken. If you have ever met a Bufflander, you have heard of Algonquin Avenue. He will stand in the Champs Elysées, when all the vice and fashion of Europe are pouring down from the Place of the Star in the refluent tide that flows from Boulogne Wood to Paris, and calmly tell you that "Algonquin Avenue in the sleighing season can discount this out of sight." Something is to be pardoned to the spirit of liberty; and the avenue is certainly a fine one. It is three miles long and has hardly a shabby house in it, while for a mile or two the houses upon one side, locally called "the Ridge," are unusually fine, large, and costly. They are all surrounded with well-kept gardens and separated from the street by velvet lawns which need scarcely fear comparison with the emerald wonders

which centuries of care have wrought from the turf of England. The house of which we have seen one room was one of the best upon this green and park-like thoroughfare. The gentleman who was sitting by the fire was Mr. Arthur Farnham. He was the owner and sole occupant of the large stone house—a widower of some years' standing, although he was yet young. His parents had died in his childhood. He had been an officer in the army, had served several years upon the frontier, had suffered great privations, had married a wife much older than himself, had seen her die on the Plains from sheer want, though he had more money than he could get transportation for; and finally, on the death of his grandfather he had resigned, with reluctance, a commission which had brought him nothing but suffering and toil, and had returned to Buffland, where he was born, to take charge of the great estate of which he was the only heir. And even yet, in the midst of a luxury and a comfort which anticipated every want and gratified every taste, he often looked longingly back upon the life he had left, until his nose inhaled again the scent of the sage-brush and his eyes smarted with alkali dust. He regretted the desolate prairies, the wide reaches of barrenness accursed of the Creator, the wild chaos of the mountain cañons, the horror of the Bad Lands, the tingling cold of winter in the Black Hills. But the Republic holds so high the privilege of serving her that, for the officer who once resigns—with a good character—there is no return forever, though he seek it with half the lobby at his heels. So Captain Farnham sat, this fine April morning, reading a newspaper which gave the stations of his friends in the "Tenth" with something of the feeling which assails the exile when he cons the court journal where his name shall appear no more.

But while he is looking at the clock a servant enters.

"That same young person is here again."

"What young person?"

There was a slight flavor of reproach in the tone of the grave Englishman as he answered:

"I told you last night, sir, she have been here three times already; she doesn't give me her name nor yet her business; she is settin' in the drawin'-room, and says she will wait till you are quite at leisure. I was about to tell her," he added with still deeper solemnity, "that you were hout, sir, but she hinterrupted of me and said, 'He isn't gone, there's his 'at,' which I told her you 'ad several 'ats, and would she wait in the drawin'-room and I'd see."

Captain Farnham smiled.

"Very well, Budsey, you've done your best—and perhaps she wont eat me after all. Is there a fire in the drawing-room?"

"No, sir."

"Let her come in here, then."

A moment afterward the rustle of a feminine step made Farnham raise his head suddenly from his paper. It was a quick, elastic step, accompanied by that crisp rattle of drapery which the close clinging garments of ladies produced at that season. The door opened, and as the visitor entered Farnham rose in surprise. He had expected to see the semi-mendicant, with sad-colored raiment and doleful whine, calling for a subscription for a new "Centennial History," or the confessed genteel beggar whose rent would be due tomorrow. But there was nothing in any way usual in the young person who stood before him. She was a tall and robust girl of eighteen or nineteen, of a singularly fresh and vigorous beauty. The artists forbid us to look for physical perfection in real people, but it would have been hard for the coolest-headed studio-rat to find any fault in the slender but powerful form of this young woman. Her color was lacking in delicacy, and her dark hair was too luxuriant to be amenable to the imperfect discipline to which it had been accustomed; but the eye of Andrea, sharpened by criticising Raphael, could hardly have found a line to alter in her. The girl who now entered Farnham's library had thrown her shawl over one arm, because the shawl was neither especially ornamental nor new, and she could not afford to let it conceal her dress of which she was innocently proud; for it represented not only her beautiful figure with few reserves, but also her skill and taste, and labor. She had cut the pattern out of an illustrated newspaper, had fashioned and sewed it with her own hands; she knew that it fitted her almost as well as her own skin; and although the material was cheap and rather flimsy, the style was very nearly the same as that worn the same day on the Boulevard of the Italians. Her costume was completed by a pair of eyeglasses with steel rims, which looked odd on her rosy young face.

"I didn't send in my name," she began with a hurried and nervous utterance, which she was evidently trying to make easy and dashing, "because you did not know me from Adam—— I have been trying to see you for some time," she continued.

"It has been my loss that you have not succeeded. Allow me to give you a chair."

She flushed and seemed not at all comfortable. She tried to call up an easy and gay

demeanor, but the effort was not entirely successful. She continued:

"I called this morning—it may surprise you to receive a visit from a young lady. My name is Miss Maud Matchin."

Farnham bowed, and rejoined:

"My name is ——"

She laughed outright, and said:

"I know well enough what your name is, or why should I have come here? Everybody knows the elegant Mr. Farnham."

The smile faded from his face.

"She is more ill-bred than I suspected," he thought; "we will condense this interview."

He made no reply to her compliment, but looked steadily at her, waiting to hear what she wanted, and thinking it was a pity she was so vulgar, for she looked like the huntress Diana.

Her eyes fell under his glance, which was not at all re-assuring. She said in almost a humble tone:

"I have come to ask a great favor of you. I am in a good deal of trouble."

"Let us see what it is and what we can do," said Farnham, and there was no longer any banter in his voice.

She looked up with sudden pleasure, and her glasses fell from her eyes. She did not replace them, but, clasping her hands tightly together, exclaimed:

"Oh, sir, if you can do anything for me—— But I don't want to make you think——" She paused in evident confusion, and Farnham kindly interposed.

"What I may think is not of any consequence just now. What is it you want, and how can I be of service to you?"

"Oh, it is a long story, and I thought it was so easy to tell, and I find it isn't easy a bit. I want to do something—to help my parents—I mean they do not need any help—but they can't help me. I have tried lots of things." She was now stammering and blushing in a way that made her hate herself mortally and the innocent man in front of her tenfold more, but she pushed on manfully and concluded, "I thought may be you could help me get something I would like."

"What would you like?"

"Most anything. I am a graduate of the high school. I write a good hand, but I don't like figures well enough to clerk. I hear there are plenty of good places in Washington."

"I could do nothing for you if there were. But you are wrong: there are no good places in Washington, from the White House down."

"Well, you are president of the Library Board, aint you?" asked the high-school graduate. "I think I would like to be one of the librarians."

"Why would you like that?"

"Oh, the work is light, I suppose, and you see people, and get plenty of time for reading, and the pay is better than I could get at anything else. The fact is," she began to gain confidence as she talked, "I don't want to go on in the old humdrum way forever, doing housework and sewing, and never getting a chance at anything better. I have enough to eat and to wear at home, but the soul has some claims too, and I long for the contact of higher natures than those by whom I am now surrounded. I want opportunities for self-culture, for intercourse with kindred spirits, for the attainment of a higher destiny."

She delivered these swelling words with great fluency, mentally congratulating herself that she had at last got fairly started, and wishing she could have struck into that vein at the beginning. Farnham was listening to her with more of pain than amusement, saying to himself: "The high school has evidently spoiled her for her family and friends, and fitted her for nothing else."

"I do not know that there is a vacancy in the library."

"Oh, yes, there is," she rejoined, briskly; "I have been to see the librarian himself, and I flatter myself I made a favorable impression."

"No doubt," said Farnham; "but I do not know what are the chances. You would do well to get some of your friends to write a letter or two in your behalf, and I will see what can be done at the next meeting of the Board."

But her returning fluency had warmed up Miss Maud's courage somewhat, and instead of taking her leave she began again, blushingly, but still boldly enough:

"There is something I would like much better than the library."

Farnham looked at her inquiringly. She did not hesitate in the least, but pushed on energetically, "I have thought you must need a secretary. I should be glad to serve you in that capacity."

The young man stared with amazement at this preposterous proposal. For the first time, he asked himself if the girl's honest face could be the ambush of a guileful heart; but he dismissed the doubt in an instant, and said, simply:

"No, thank you. I am my own secretary, and have no reason for displacing the present incumbent. The library will suit you better in every respect."

In her embarrassment she began to feel for her glasses, which were lying in her lap.

Farnham picked up a small photograph from the table near him, and said:

"Do you recognize this?"

"Yes," she said. "It is General Grant."

"It is a photograph of him, taken in Paris, which I received to-day. May I ask a favor of you?"

"What is it?" she said, shyly.

"Stop wearing those glasses. They are of no use to you, and they will injure your eyes."

Her face turned crimson. Without a word of reply she seized the glasses and put them on, her eyes flashing fire. She then rose and threw her shawl over her arm, and said, in a tone to which her repressed anger lent a real dignity:

"When can I learn about that place in the library?"

"Any time after Wednesday," Farnham answered.

She bowed and walked out of the room. She could not indulge in tragic strides, for her dress held her like a scabbard, giving her scarcely more freedom of movement than the high-born maidens of Carthage enjoyed, who wore gold fetters on their ankles until they were married. But in spite of all impediments her tall figure moved, with that grace which is the birthright of beauty in any circumstances, out of the door, through the wide hall to the outer entrance, so rapidly that Farnham could hardly keep pace with her. As he opened the door she barely acknowledged his parting salutation, and swept like a huffy goddess down the steps.

Farnham gazed after her a moment, admiring the undulating line from the small hat to the long and narrow train which dragged on the smooth stones of the walk. He then returned to the library. Budsey was mending the fire.

"If you please, sir," he said, "Mrs. Belding's man came over to ask, would you dine there this evening, quite informal."

"Why didn't he come in?"

"I told him you were engaged."

"Ah, very well. Say to Mrs. Belding that I will come, with pleasure."

II.

A HIGH-SCHOOL GRADUATE.

MISS MATCHIN picked up her train as she reached the gate, and walked down the street in a state of mind by no means tranquil. If she had put her thoughts in words they would have run like this:

"That was the meanest trick a gentleman ever played. How did he dare know I wasn't near-sighted? And what a fool I was to be caught by that photograph—saw it as plain as day three yards off. I had most made up my mind to leave them off anyway, though they are awful stylish; they pinch my nose and make my head ache. But I'll wear them now," and here the white teeth came viciously together, "if they kill me. Why should he put me down that way? He made me shy for the first time in my life. It's a man's business to be shy before me. If I could only get hold of him somehow! I'd pay him well for making me feel so small. The fact is, I started wrong. I did not really know what I wanted; and that graven image of an English butler set me back so; and then I never saw such a house as that. It is sinful for one man to live there all alone. Powers alive! How well that house would suit my complexion! But I don't believe I'd take it with *him* thrown in."

It is doubtful whether young girls of Miss Matchin's kind are ever quite candid in their soliloquies. It is certain she was not when she assured herself that she did not know why she went to Farnham's house that morning. She went primarily to make his acquaintance, with the hope also that by this means she might be put in some easy and genteel way of earning money. She was one of a very numerous class in large American towns. Her father was a carpenter, of a rare sort. He was a good workman, sober, industrious, and unambitious. He was contented with his daily work and wage, and would have thanked Heaven if he could have been assured that his children would fare as well as he. He was of English blood, and had never seemed to imbibe into his veins the restless haste and hunger to rise which is the source of much that is good and most that is evil in American life. In the dreams of his early married days he created a future for his children, in the image of his own decent existence. The boys should succeed him in his shop, and the daughters should go out to service in respectable families. This thought sweetened his toil. When he got on well enough to build a shop for himself, he burdened himself with debt building it firmly and well, so as to last out his boys' time as well as his own. When he was employed on the joiner-work of some of those large houses in Algonquin Avenue, he lost himself in reveries in which he saw his daughters employed as house-maids in them. He studied the faces and the words of the proprietors, when they visited the new buildings, to guess if they would make kind and considerate employers. He put many an extra stroke of fine work upon the servants' rooms he finished, thinking: "Who knows but my Mattie may live here sometime?"

But Saul Matchin found, like many others of us, that fate was not so easily managed. His boys never occupied the old shop on Dean street, which was built with so many sacrifices and so much of hopeful love. One of them ran away from home on the first intimation that he was expected to learn his father's trade, shipped as a cabin-boy on one of the lake steamers, and was drowned in a storm which destroyed the vessel. The other, less defiant or less energetic, entered the shop, and attained some proficiency in the work. But as he grew toward manhood, he became, as the old man called it, "trifling"; a word which bore with it in the local dialect no suggestion of levity or vivacity, for Luke Matchin was as dark and lowering a lout as you would readily find. But it meant that he became more and more unpunctual, did his work worse month by month, came home later at night, and was continually seen, when not in the shop, with a gang of low ruffians, whose head-quarters were in a den called the "Bird of Paradise," on the lake shore. When his father remonstrated with him, he met everything with sullen silence. If Saul lost his temper at this mute insolence and spoke sharply, the boy would retort with an evil grin that made the honest man's heart ache.

"Father," he said one day, "you'd a big sight better let me alone, if you don't want to drive me out of this ranch. I wasn't born to make a nigger of myself in a free country, and you can just bet your life I aint a-going to do it."

These things grieved Saul Matchin so that his anger would die away. At last, one morning, after a daring burglary had been committed in Buffland, two policemen were seen by Luke Matchin approaching the shop. He threw open a back window, jumped out and ran rapidly down to the steep bluff overlooking the lake. When the officers entered, Saul was alone in the place. They asked after his boy, and he said:

"He can't be far away. What do you want of him? He haint been doing nothing, I hope."

"Nothing, so far as we know, but we are after two fellows who go by the names of Maumee Jake and Dutch George. Luke runs with them sometimes, and he could make a pile of money by helping of us get them."

"I'll tell him when he comes in," said Saul, but he never saw or heard of his son again.

With his daughters he was scarcely more successful. For, though they had not brought sorrow or shame to his house, they seemed as little amenable to the discipline he had hoped to exert in his family as the boys were. The elder had married, at fifteen years of age, a journeyman printer; and so, instead of filling the place of housemaid in some good family, as her father had fondly dreamed, she was cook, housemaid, and general servant to a man aware of his rights, and determined to maintain them, and nurse and mother (giving the more important function precedence) to six riotous children. Though his child had thus disappointed his hopes, she had not lost his affection, and he even enjoyed the Sunday afternoon romp with his six grandchildren, which ordinarily took place in the shop among the shavings. Wixham, the son-in-law, was not prosperous, and the children were not so well dressed that the sawdust would damage their clothes.

The youngest of Matchin's four children was our acquaintance Miss Maud, as she called herself, though she was christened Matilda. When Mrs. Matchin was asked, after that ceremony, "Who she was named for?" she said, "Nobody in partic'lar. I call her Matildy because it's a pretty name, and goes well with Jurildy, my oldest gal." She had evolved that dreadful appellation out of her own mind. It had done no special harm, however, as Miss Jurildy had rechristened herself Poguy at a very tender age, in a praiseworthy attempt to say "Rogue," and the delighted parents had never called her anything else. Thousands of comely damsels all over this broad land suffer under names as revolting, punished through life, by the stupidity of parental love, for a slip of the tongue in the cradle. Matilda got off easily in the matter of nicknames, being called Mattie until she was pretty well grown, and then having changed her name suddenly to Maud, for reasons to be given hereafter.

She was a hearty, blowzy little girl. Her father delighted in her coarse vigor and energy. She was not a pretty child, and had not a particle of coquetry in her, apparently; she liked to play with the boys when they would allow her, and never presumed upon her girlhood for any favors in their rough sport; and good-natured as she was, she was able to defend herself on occasion with tongue and fists. She was so full of life and strength that, when she had no playing to do, she took pleasure in helping her mother about her work. It warmed Saul Matchin's heart to see the stout little figure sweeping or scrubbing. She went to school but did not "learn enough to hurt her," as her father said; and he used to think that here, at least, would be one child who would be a comfort to his age. In fancy he saw her, in a neat print dress and white cap, wielding a broom in one of those fine houses he had helped to

build, or coming home to keep house for him when her mother should fail.

But one day her fate came to her in the shape of a new girl, who sat near her on the school-bench. It was a slender, pasty young person, an inch taller and a year or two older than Mattie, with yellow ringlets, and more pale-blue ribbons on her white dress than poor Mattie had ever seen before. She was a clean, cold, pale, and selfish little vixen, whose dresses were never rumpled, and whose temper was never ruffled. She had not blood enough in her veins to drive her to play or to anger. But she seemed to poor Mattie the loveliest creature she had ever seen, and our brown, hard-handed, blowzy tomboy became the pale fairy's abject slave. Her first act of sovereignty was to change her vassal's name.

"I don't like Mattie; it aint a bit romantic. I had a friend in Bucyrus whose name was Mattie, and she found out somehow—I believe the teacher told her—that Queen Matilda and Queen Maud was the same thing in England. So you're Maud!" and Maud she was henceforward, though her tyrant made her spell it Maude. "It's more elegant with an *e*," she said.

Maud was fourteen and her school-days were ending when she made this new acquaintance. She formed for Azalea Windom one of those violent idolatries peculiar to her sex and age, and in a fortnight she seemed a different person. Azalea was rather clever in her books, and Maud dug at her lessons from morning till night to keep abreast of her. Her idol was exquisitely neat in her dress, and Maud acquired, as if by magic, a scrupulous care of her person. Azalea's blonde head was full of pernicious sentimentality, though she was saved from actual indiscretions by her cold and vaporous temperament. In dreams and fancies, she was wooed and won a dozen times a day by splendid cavaliers of every race and degree; and as she was thoroughly false and vain, she detailed these airy adventures, part of which she had imagined and part read in weekly story-papers, to her worshiper, who listened, with wide eyeballs, and a heart which was just beginning to learn how to beat. She initiated Maud into that strange world of vulgar and unhealthy sentiment found in the cheap weeklies which load every news-stand in the country, and made her tenfold more the child of dreams than herself.

Miss Windom remained but a few months at the common school, and then left it for the high school. She told Maud one day of her intended flitting, and was more astonished than pleased at the passion of grief into which the announcement threw her friend. Maud clung to her with sobs that would not be stilled, and with tears that reduced Miss Azalea's dress to limp and moist wretchedness, but did not move the vain heart beneath it. "I wonder if she knows," thought Azalea, "how ugly she is when she bawls like that. Few brunettes can cry stylishly anyhow." Still, she could not help feeling flattered by such devotion, and she said, partly from a habit of careless kindness and partly to rescue the rest of her raiment from the shower which had ruined her neck-ribbon,—

"There, don't be heart-broken. You will be in the high school yourself in no time."

Maud lifted up her eyes and her heart at these words.

"Yes, I will, darling!"

She had never thought of the high school before. She had always expected to leave school that very season, and to go into service somewhere. But from that moment she resolved that nothing should keep her away from those walls that had suddenly become her Paradise.

Her mother was easily won over. She was a woman of weak will, more afraid of her children than of her husband, a phenomenon of frequent occurrence in that latitude. She therefore sided naturally with her daughter in the contest which, when Maud announced her intention of entering the high school, broke out in the house and raged fiercely for some weeks. The poor woman had to bear the brunt of the battle alone, for Matchin soon grew shy of disputing with his rebellious child. She was growing rapidly and assuming that look of maturity which comes so suddenly and so strangely to the notice of a parent. When he attacked her one day with the brusque exclamation, "Well, Mattie, what's all this blame foolishness your ma's being tellin' me?" she answered him with a cool decision and energy that startled and alarmed him. She stood straight and terribly tall, he thought. She spoke with that fluent clearness of girls who know what they want, and used words he had never met with before out of a newspaper. He felt himself no match for her, and ended the discussion by saying: "That's all moonshine—you shan't go! D'ye hear me?" but he felt dismally sure that she would go, in spite of him.

Even after he had given up the fight, he continued to revenge himself upon his wife for his defeat. "We've got to have a set of gold spoons, I guess. These will never do for highfliers like us." Or, "Drop in at Swillem's and send home a few dozen champagne; I can't stummick such common drink as coffee for breakfast." Or, "I must fix up and make some calls on Algonkin Av'noo. Sence

we've jined the Upper Ten, we mustn't go back on Society." But this brute thunder had little effect on Mrs. Matchin. She knew the storm was over when her good-natured lord tried to be sarcastic.

It need hardly be said that Maud Matchin did not find the high school all her heart desired. Her pale goddess had not enough substantial character to hold her worshiper long. Besides, at fifteen, a young girl's heart is as variable as her mind or her person; and a great change was coming over the carpenter's daughter. She suddenly gained her full growth; and after the first awkwardness of her tall stature passed away, she began to delight in her own strength and beauty. Her pride waked at the same time with her vanity, and she applied herself closely to her books, so as to make a good appearance in her classes. She became the friend instead of the vassal of Azalea, and by slow degrees she found their positions reversed. Within a year, it seemed perfectly natural to Maud that Azalea should do her errands and talk to her about her eyes; and Miss Windom found her little airs of superiority of no avail in face of the girl who had grown prettier, cleverer, and taller than herself. It made no difference that Maud was still a vulgar and ignorant girl — for Azalea was not the person to perceive or appreciate these defects. She saw her, with mute wonder, blooming out before her very eyes, from a stout, stocky, frowzy child, with coarse red cheeks and knuckles like a boot-black, into a tall, slender girl, whose oval face was as regular as a conic section, and whose movements were as swift, strong, and graceful, when she forgot herself, as those of a race-horse. There were still the ties of habit and romance between them. Azalea, whose brother was a train-boy on the Lake Shore road, had a constant supply of light literature, which the girls devoured in the long intervals of their studies. But even the romance of Miss Matchin had undergone a change. While Azalea still dreamed of dark-eyed princes, lords of tropical islands, and fierce and tender warriors who should shoot for her the mountain eagle for his plumes, listen with her to the bulbul's song in valleys of roses, or hew out a throne for her in some vague and ungeographical empire, the reveries of Miss Maud grew more and more mundane and reasonable. She was too strong and well to dream much; her only visions were of a rich man who should love her for her fine eyes. She would meet him in some simple and casual way; he would fall in love at sight, and speedily prosper in his wooing; they would be married,—privately, for Maud blushed and burned to think of her home at such times,— and then they would go to New York to live. She never wasted conjecture on the age, the looks, the manner of being of this possible hero. Her mind intoxicated itself with the thought of his wealth. She went one day to the Public Library to read the articles on Rothschild and Astor in the encyclopedias. She even tried to read the editorial articles on gold and silver in the Ohio papers.

She delighted in the New York society journals. She would pore for hours over those wonderful columns which described the weddings and the receptions of rich tobacconists and stock-brokers, with lists of names which she read with infinite gusto. At first, all the names were the same to her, all equally worshipful and happy in being printed, black on white, in the reports of these upper-worldly banquets. But after a while her sharp intelligence began to distinguish the grades of our republican aristocracy, and she would skip the long rolls of obscure guests who figured at the "coming-out parties" of thrifty shop-keepers of fashionable ambition, to revel among the genuine swells whose fathers were shop-keepers. The reports of the battles of the Polo Club filled her with a sweet intoxication. She knew the names of the combatants by heart, and had her own opinion as to the comparative eligibility of Billy Buglass and Tim Blanket, the young men most in view at that time in the clubs of the metropolis.

Her mind was too much filled with interests of this kind to leave any great room for her studies. She had pride enough to hold her place in her classes, and that was all. She learned a little music, a little drawing, a little Latin, and a little French — the French of "Stratford-atte-Bowe," for French of Paris was not easy of attainment at Buffland. This language had an especial charm for her, as it seemed a connecting link with that elysium of fashion of which her dreams were full. She once went to the library and asked for "a nice French book." They gave her "La Petite Fadette." She had read of George Sand in newspapers, which had called her a "corrupter of youth." She hurried home with her book, eager to test its corrupting qualities, and when, with locked doors and infinite labor, she had managed to read it, she was greatly disappointed at finding in it nothing to admire and nothing to shudder at. "How could such a smart woman as that waste her time writing about a lot of peasants, poor as crows, the whole lot!" was her final indignant comment.

By the time she left the school her life had become almost as solitary as that of the bat in the fable, alien both to bird and beast.

She made no intimate acquaintances there; her sordid and selfish dreams occupied her too completely. Girls who admired her beauty and cleverness were repelled by her heartlessness, which they felt, but could not clearly define. Even Azalea fell away from her, having found a stout and bald-headed railway conductor, whose adoration made amends for his lack of romance. Maud knew she was not liked in the school, and being, of course, unable to attribute it to any fault of her own, she ascribed it to the fact that her father was a mechanic and poor. This thought did not tend to make her home happier. She passed much of her time in her own bedroom, looking out of her window on the lake, weaving visions of ignoble wealth and fashion out of the mists of the morning sky and the purple and gold that made the north-west glorious at sunset. When she sat with her parents in the evening, she rarely spoke. If she was not gazing in the fire, with hard bright eyes and lips, in which there was only the softness of youth, but no tender tremor of girlhood's dreams, she was reading her papers or her novels with rapt attention. Her mother was proud of her beauty and her supposed learning, and loved, when she looked up from her work, to let her eyes rest upon her tall and handsome child, whose cheeks were flushed with eager interest as she bent her graceful head over her book. But Saul Matchin nourished a vague anger and jealousy against her. He felt that his love was nothing to her; that she was too pretty and too clever to be at home in his poor house; and yet he dared not either reproach her or appeal to her affections. His heart would fill with grief and bitterness as he gazed at her devouring the brilliant pages of some novel of what she imagined high life, unconscious of his glance, which would travel from her neatly shod feet up to her hair, frizzed and banged down to her eyebrows, "making her look," he thought, "more like a Scotch poodle-dog than an honest girl." He hated those books which, he fancied, stole away her heart from her home. He had once picked up one of them where she had left it; but the high-flown style seemed as senseless to him as the words of an incantation, and he had flung it down more bewildered than ever. He thought there must be some strange difference between their minds when she could delight in what seemed so uncanny to him, and he gazed at her, reading by the lamp-light, as over a great gulf. Even her hands holding the book made him uneasy; for since she had grown careful of them, they were like no hands he had ever seen on any of his kith and kin. The fingers were long and white, and the nails were shaped like an almond, and though the hands lacked delicacy at the articulations, they almost made Matchin reverence his daughter as his superior, as he looked at his own.

One evening, irritated by the silence and his own thoughts, he cried out with a sudden suspicion:

"Where do you git all them books, and what do they cost?"

She turned her fine eyes slowly upon him and said:

"I get them from the public library, and they cost nothing."

He felt deeply humiliated that he should have made a blunder so ridiculous and so unnecessary.

After she had left the school—where she was graduated as near as possible to the foot of the class—she was almost alone in the world. She rarely visited her sister, for the penury of the Wixham household grated upon her nerves, and she was not polite enough to repress her disgust at the affectionate demonstrations of the Wixham babies. "There, there! get along, you'll leave me not fit to be seen!" she would say, and Jurilda would answer in that vicious whine of light-haired women, too early overworked and overprolific: "Yes, honey, let your aunt alone. She's too tiffy for poor folks like us"; and Maud would go home, loathing her lineage.

The girls she had known in her own quarter were by this time earning their own living: some in the manufactories, in the lighter forms of the iron trade, some in shops, and a few in domestic service. These last were very few, for the American blood revolts against this easiest and best-paid of all occupations, and leaves it to more sensible foreigners. The working bees were clearly no company for this poor would-be butterfly. They barely spoke when they met, kept asunder by a mutual embarrassment. One girl with whom she had played as a child had early taken to evil courses. Her she met one day in the street, and the bedraggled and painted creature called her by her name.

"How dare you?" said Maud, shocked and frightened.

"All right!" said the shameless woman. "You looked so gay, I didn't know."

Maud, as she walked away, hardly knew whether to be pleased or not. "She saw I looked like a lady, and thought I could not be one honestly. I'll show them!"

She knew as few men as women. She sometimes went to the social gatherings affected by her father's friends, Odd Fellows' and Druids' balls and the festivities with which the firemen refreshed themselves after

their toils and dangers. But her undeniable beauty gained her no success. She seemed to take pains to avoid pleasing the young carpenters, coachmen, and journeyman printers she met on these occasions. With her head full of fantastic dreams, she imagined herself a mere visitor at these simple entertainments of the common people, and criticised the participants to herself with kindly sarcasm. If she ever consented to dance, it was with the air with which she fancied a duchess might open a ball of her servants. Once, in a round game at a "surprise" party, it came her turn to be kissed by a young blacksmith, who did his duty in spite of her struggles with strong arms and a willing heart. Mr. Browning makes a certain queen, mourning over her lofty loneliness, wish that some common soldier would throw down his halberd and clasp her to his heart. It is doubtful if she would really have liked it better than Miss Maud did, and she was furious as a young lioness. She made herself so disagreeable about it that she ceased to be invited to those lively entertainments; and some of the most eligible of the young "Cariboos"—a social order of a secret and mysterious rite, which met once a week in convenient woodsheds and stable-lofts—took an oath with hands solemnly clasped in the intricate grip of the order, that "they would never ask Miss Matchin to go to party, picnic, or sleigh-ride, as long as the stars gemmed the blue vault of heaven," from which it may be seen that the finer sentiments of humanity were not unknown to the Cariboos.

Maud came thus to be eighteen, and though she was so beautiful and so shapely that no stranger ever saw her without an instant of glad admiration, she had had no suitor but one, and from him she never allowed a word of devotion. Samuel Sleeny, a carpenter who worked with her father, and who took his meals with the family, had fallen in love with her at first sight, and, after a year of dumb hopelessness, had been so encouraged by her father's evident regard that he had opened his heart to Saul and had asked his mediation. Matchin undertook the task with pleasure. He could have closed his eyes in peace if he had seen his daughter married to so decent a man and so good a joiner as Sleeny. But the interview was short and painful to Matchin. He left his daughter in possession of the field, and went to walk by the lake shore to recover his self-possession, which had given way beneath her firm will and smiling scorn. When he returned to the shop Sleeny was there, sitting on a bench and chewing pine shavings.

"What did she say?" asked the young fellow. "But never mind—I see plain enough it's no use. She's too good for me, and she knows it."

"Too good!" roared Saul. "She's the gold-erndest——"

"Hold on there," said Sleeny. "Don't say nothin' you'll have to take back. Ef you say anything ag'in her, you'll have to swaller it, or whip me."

Saul looked at him with amazement.

"Well! you beat me, the pair of you! You're crazy to want her, and she's crazy not to want you. She liked to a' bit my head off for perposin' you, and you want to lick me for calling her a fool."

"She aint no fool," said Sleeny with sullen resignation; "she knows what she's about," and he picked up another shaving and ruminated upon it.

The old man walked to and fro, fidgeting with his tools. At last he came back to the young man and said, awkwardly dusting the bench with his hand:

"Sam, you wasn't 'lowin' to leave along o' this here foolishness?"

"That's just what I was 'lowin' to do, sir."

"Don't you be a dern fool, Sam!" and Saul followed up this judicious exhortation with such cogent reasons that poor Sleeny was glad to be persuaded that his chance was not over yet, and that he would much better stay where he was.

"How'll *she* like it?"

"Oh! it wont make a mite o' difference to her," said the old man airily, and poor Sam felt in his despondent heart that it would not.

He remained and became like the least of her servants. She valued his attachment much as a planter valued the affection of his slaves, knowing they would work the better for it. He did all her errands; fetched and carried for her; took her to church on evenings when she did not care to stay at home. One of the few amusements Saul Matchin indulged in was that of attending spiritualist lectures and séances, whenever a noted medium visited the place. Saul had been an unbeliever in his youth, and this grotesque superstition had rushed in at the first opportunity to fill the vacuum of faith in his mind. He had never succeeded, however, in thoroughly indoctrinating his daughter. She regarded her father's religion with the same contempt she bestowed upon the other vulgar and narrow circumstances of her lot in life, and so had preferred her mother's sober Presbyterianism to the new and raw creed of her sire. But one evening, when she was goaded by more than usual restlessness, Sleeny asked her, if she would go with him to a "sperritual lectur." To escape from her

own society, she accepted, and the wild, incoherent, and amazingly fluent address she heard excited her interest and admiration. After that, she often asked him to take her, and in the long walk to and from the Harmony Hall, where the long-haired brotherhood held their sessions, a sort of confidential relation grew up between them, which meant nothing to Maud, but bound the heart of Sleeny in chains of iron. Yet he never dared say a word of the feeling that was consuming him. He feared he should lose her forever, if he opened his lips.

Of course, she was not at ease in this life of dreamy idleness. It did not need the taunts of her father to convince her that she ought to be doing something for herself. Her millionaire would never come down to the little house on Dean street to find her, and she had conscience enough to feel that she ought to earn her own clothes. She tried to make use of the accomplishments she had learned at school, but was astonished to find how useless they were. She made several attempts to be a teacher, but it was soon found that her high-school diploma covered a world of ignorance, and no board, however indulgent, would accept her services. She got a box of colors, and spoiled many fans and disfigured many pots by decorations which made the eyes of the beholder ache; nobody would buy them, and poor Maud had no acquaintances to whom she might give them away. So they incumbered the mantels and tables of her home, adding a new tedium to the unhappy household. She answered the advertisements of several publishing companies and obtained agencies for the sale of subscription books. But her face was not hard enough for this work. She was not fluent enough to persuade the undecided, and she was too proud to sue *in forma pauperis;* she had not the precious gift of tears by which the traveling she-merchant sells so many worthless wares. The few commissions she gained hardly paid for the wear and tear of her high-heeled boots.

One day at the public library she was returning a novel she had read, when a gentleman came out of an inner room and paused to speak to the librarian's assistant, with whom Maud was at the moment occupied—a girl whom she had known at school, and with whom she had renewed acquaintance in this way. It was about a matter of the administration of the library, and only a few words were exchanged. He then bowed to both the ladies, and went out.

"Who was that?" Maud asked.

"Don't you know?" rejoined the other. "I thought everybody knew the elegant Captain Farnham. He is president of our board, you know, and he is just lovely. I always manage to stop him as he leaves a board meeting and get a word or two out of him. It's worth the trouble if I only get a bow."

"I should think so," assented Maud. "He is as sweet as a peach. Is there any chance of getting one of those places? I should like to divide those bows with you."

"That would be perfectly splendid," said her friend, who was a good-natured girl. "Come, I will introduce you to the old Doctor now."

And in a moment Maud was in the presence of the librarian.

She entered at a fortunate moment. Dr. Buchlieber was a near-sighted old gentleman who read without glasses, but could see nothing six feet away. He usually received and dismissed his visitors without bothering himself to discover or imagine what manner of people they were. "I do not care how they look," he would say. "They probably look as they talk, without form and void." But at the moment when Maud entered his little room he had put on his lenses to look out of the window, and he turned to see a perfect form in a closely fitting dress, and a face pretty enough to look on with a critical pleasure. He received her kindly and encouraged her to hope for an appointment, and it was in accordance with his suggestion that she called upon Farnham, as we have related.

She did not go immediately. She took several days to prepare what she called "a harness" of sufficient splendor, and while she was at work upon it she thought of many things. She was not even yet quite sure that she wanted a place in the library. The Doctor had been very kind, but he had given her clearly to understand that the work required of her would be severe, and the pay very light. She had for a long time thought of trying to obtain a clerkship at Washington,—perhaps Farnham would help her to that,—and her mind wandered off among the possibilities of chance acquaintance with bachelor senators and diplomats. But the more she thought of the coming interview, the more her mind dwelt upon the man himself whom she was going to see—his bow and his smile, his teeth and his mustache, and the perfect fit of his clothes. One point in regard to him was still vague in her mind, and as to that her doubts were soon resolved. One evening she said to her father:

"Did you ever see Captain Farnham?"

"Now, what a fool question that is! I'd like to know who built his greenhouses, ef I didn't?"

"He is pretty well off, aint he?"

Saul laughed with that satisfied arrogance of ignorant men when they are asked a question they can answer easily.

"I rather guess he is; that is, ef you call three, four, five millions well off. I don't know how it strikes you" (with a withering sarcasm), "but *I* call Arthur Farnham pretty well fixed."

These words ran in Maud's brain with a ravishing sound. She built upon them a fantastic palace of mist and cloud. When at last her dress was finished and she started, after three unsuccessful attempts, to walk to Algonquin avenue, she was in no condition to do herself simple justice. She hardly knew whether she wanted a place in the library, a clerkship at Washington, or the post of amanuensis to the young millionaire. She was daunted by his reception of her; his good-natured irony made her feel ill at ease; she was nervous and flurried; and she felt, as she walked away, that the battle had gone against her.

III.

THE WIDOW AND HER DAUGHTER.

MRS. BELDING'S house was next to that of Mr. Farnham, and the neighborly custom of Algonquin avenue was to build no middle walls of partition between adjoining lawns. A minute's walk, therefore, brought the young man to the door of Mrs. Belding's cottage. She called it a cottage, and so we have no excuse for calling it anything else, though it was a big three-storied house, built of the soft creamy stone of the Buffland quarries, and it owed its modest name to an impression in the lady's mind that gothic gables and dormer windows were a necessary adjunct of cottages. She was a happy woman, though she would have been greatly surprised to hear herself so described. She had not been out of mourning since she was a young girl. Her parents, as she sometimes said, "had put her into black"; and several children had died in infancy, one after the other, until at last her husband, Jairus Belding, the famous bridge-builder, had perished of a malarial fever caught in the swamps of the Wabash, and left her with one daughter and a large tin box full of good securities. She never afterward altered the style of her dress, and she took much comfort in feeling free from all further allegiance to milliners. In fact, she had a nature which was predisposed to comfort. She had been fond of her husband, but she had been a little afraid of him, and, when she had wept her grief into tranquillity, she felt a certain satisfaction in finding herself the absolute mistress of her income and her bedroom. Her wealth made her the object of matrimonial ambition once or twice, and she had sufficient beauty to flatter herself that she was loved more for her eyes than her money; but she refused her suitors with an indolent good-nature that did not trouble itself with inquiries as to their sincerity. "I have been married once, thank you, and that is enough"; this she said simply without sighing or tears. Perhaps the unlucky aspirant might infer that her heart was buried in the grave of Jairus. But the sober fact was that she liked her breakfast at her own hours. Attached to the spacious sleeping-room occupied in joint tenancy by herself and the bridge-builder were two capacious closets. After the funeral of Mr. Belding, she took possession of both of them, hanging her winter wardrobe in one and her summer raiment in the other, and she had never met a man so fascinating as to tempt her to give up to him one of these rooms.

She was by no means a fool. Like many easy-going women, she had an enlightened selfishness which prompted her to take excellent care of her affairs. As long as old Mr. Farnham lived, she took his advice implicitly in regard to her investments, and after his death she transferred the same unquestioning confidence to his grandson and heir, although he was much younger than herself and comparatively inexperienced in money matters. It seemed to her only natural that some of the Farnham wisdom should have descended with the Farnham millions. There was a grain of good sense in this reasoning, founded as it was upon her knowledge of Arthur's good qualities; for upon a man who is neither a sot nor a gambler, the possession of great wealth almost always exercises a sobering and educating influence. So, whenever Mrs. Belding was in doubt in any matter of money, she asked Arthur to dine with her, and settle the vexing questions somewhere between the soup and the coffee. It was a neighborly service, freely asked and willingly rendered.

As Farnham entered the widow's cozy library, he saw a lady sitting by the fire whom he took to be Mrs. Belding; but as she rose and made a step toward him, he discovered that she was not in mourning. The quick twilight was thickening into night, and the rich glow of the flaming coal in the grate, deepening the shadows in the room, while it prevented him from distinguishing the features of her face, showed him a large full form with a grace of movement, which had something even of majesty in it.

"I see you have forgotten me," said a voice

as rich and full as the form from which it came. "I am Alice Belding."

"Of course you are, and you have grown as big and beautiful as you threatened to," said Farnham, taking both the young girl's hands in his, and turning until she faced the fire-light. It was certainly a bonny face which the red light shone upon, and quite uncommon in its beauty. The outline was very pure and noble; the eyes were dark-brown and the hair was of tawny gold, but the complexion was of that clear and healthy pallor so rarely met with among blonde women. The finest thing about her face was its expression of perfect serenity. Even now, as she stood looking at Farnham, with her hands in his, her cheek flushed a little with the evident pleasure of the meeting, she received his gaze of unchecked admiration with a smile as quiet and unabashed as that of a mother greeting a child.

"Well, well!" said Farnham, as they seated themselves, "how long has it taken you to grow to that stature? When did I see you last?"

"Two years ago," she answered, in that rich and gentle tone which was a delight to the ear. "I was at home last summer, but you were away—in Germany, I think."

"Yes, and we looked for you in vain at Christmases and Thanksgivings."

"Mamma came so often to New York that there seemed no real necessity of my coming home until I came for good. I had so much to learn, you know. I was quite old and very ignorant when I started away."

"And you have come back quite young and very learned, I dare say."

She laughed a little, and her clear and quiet laugh was as pleasant as her speech.

Mrs. Belding came in with gliding footsteps and cap-strings gently fluttering.

"Why, you are all in the dark! Arthur, will you please light that burner nearest you?"

In the bright light Miss Alice looked prettier than ever; the jet of gas above her tinged her crisp hair with a luster of twisted gold wire and threw tangled shadows upon her low smooth forehead.

"We have to thank Madame de Veaudrey for sending us back a fine young woman," said Farnham.

"Yes, she *is* improved," the widow assented, calmly. "I must show you the letter Madame de Veaudrey wrote me. Alice is first in languages, first——"

"In peace, and first in the hearts of her country-women," interrupted Miss Alice, not smartly, but with smiling firmness. "Let Mr. Farnham take the rest of my qualities for granted, please."

"There will be time enough for you two to get acquainted. But this evening I wanted to talk to you about something more important. The 'Tribune' money article says the Dan and Beersheba Railroad is not really earning its dividends. What am I to do about that, I should like to know?"

"Draw your dividends, with a mind conscious of rectitude, though the directors rage and the 'Tribune' imagine a vain thing," Farnham answered, and the talk was of stocks and bonds for an hour afterward.

When dinner was over, the three were seated again in the library. The financial conversation had run its course, and had perished amid the arid sands of reference to the hard times and the gloomy prospects of real estate. Miss Alice, who took no part in the discussion, was reading the evening paper, and Farnham was gratifying his eyes by gazing at the perfect outline of her face, the rippled hair over the straight brows, and the stout braids that hung close to the graceful neck in the fashion affected by school-girls at that time.

A servant entered and handed a card to Alice. She looked at it and passed it to her mother.

"It is Mr. Furrey," said the widow. "He has called upon *you*."

"I suppose he may come in here?" Alice said, without rising.

Her mother looked at her with a mute inquiry, but answered in an instant, "Certainly."

When Mr. Furrey entered, he walked past Mrs. Belding to greet her daughter, with profuse expressions of delight at her return, "of which he had just heard this afternoon at the bank; and although he was going to a party this evening, he could not help stopping in to welcome her home." Miss Alice said "Thank you," and Mr. Furrey turned to shake hands with her mother.

"You know my friend Mr. Farnham?"

"Yes, ma'am—that is, I see him often at the bank, but I am glad to owe the pleasure of his acquaintance to you."

The men shook hands. Mr. Furrey bowed a little more deeply than was absolutely required. He then seated himself near Miss Alice and began talking volubly to her about New York. He was a young man of medium size, dressed with that exaggeration of the prevailing mode which seems necessary to provincial youth. His short fair hair was drenched with pomatum and plastered close to his head. His white cravat was tied with mathematical precision, and his shirt-collar was like a wall of white enamel from his shoulders to his ears. He wore white kid gloves, which he secured from spot or blem-

ish as much as possible by keeping the tips of the fingers pressed against each other. His speech was quicker than is customary with Western people, but he had their flat monotone and their uncompromising treatment of the letter R.

Mrs. Belding crossed over to where Farnham was seated and began a conversation with him in an undertone.

"You think her really improved?"

"In every way. She has the beauty and stature of a Brunhild; she carries herself like a duchess, I was going to say—but the only duchess I ever knew was at Schwalbach, and she was carried in a wicker hand-cart. But mademoiselle is lovely, and she speaks very pretty English; and knows how to wear her hair, and will be a great comfort to you, if you can keep the boys at bay for awhile."

"No danger there, I imagine; she will keep them at bay herself. Did you notice just now? Mr. Furrey called especially to see her. He was quite attentive to her last summer. Instead of going to the drawing-room to see him, she wants him to come in here, where he is in our way and we are in his. That is one of Madame de Veaudrey's notions."

"I should fancy it was," said Farnham, dryly; "I have heard her spoken of as a lady of excellent principles and manners."

"Now you are going to side against me, are you? I do not believe in importing these European ideas of surveillance into free America. I have confidence in American girls."

"But see where your theories lead you. In Algonquin avenue, the young ladies are to occupy the drawing-room, while the parents make themselves comfortable in the library. But the houses in Dean street are not so spacious. Most citizens in that quarter have only two rooms below stairs. I understand the etiquette prevailing there is for parents, when their daughters receive calls, to spend the evening in the kitchen."

"Oh, dear! I see I'm to get no help from you. That's just the way Alice talks. When she came home to-day, there were several invitations for her, and some notes from young gentlemen offering their escort. She told me in that quiet way of hers, that reminds me of Mr. Belding when he was dangerous, that she would be happy to go with me when I cared to go, and happy to stay at home if I staid. So I imagine I am booked for a gay season."

"Which I am sure you will greatly enjoy. But this Madame de Veaudrey must be a very sensible woman."

"Because I disagree with her? I am greatly obliged. But she *is* a saint, although you admire her," pursued the good-natured woman. "She was a Hamilton, you know, and married Veaudrey, who was secretary of legation in Washington. He was afterward minister in Sweden, and died there. She was returning to this country with her three girls, and was shipwrecked and they all three perished. She was picked up unconscious and recovered only after a long illness. Since then she has gone very little into the world, but has devoted herself to the education of young ladies. She never has more than three or four at a time, and these she selects herself. Alice had heard of her from Mrs. Bowman, and we ventured to write to ask admission to her household, and our request was civilly but peremptorily declined. This was while we were in New York two years ago. But a few days afterward we were at church with Mrs. Bowman, and Madame de Veaudrey saw us. She called the next day upon Mrs. Bowman and inquired who we were, and then came to me and begged to withdraw her letter, and to take Alice at once under her charge. It seems that Alice resembled one of her daughters—at all events, she was completely fascinated by her, and Alice soon came to regard her in return as the loveliest of created beings. I must admit I found her a little stiff—though she *was* lovely and, of course, being a Hamilton, a perfect lady. But still, I cannot help being afraid that she has made Alice a little too particular; you know, the young gentlemen don't like a girl to be too stiff."

Farnham felt his heart grow hot with something like scorn for the worthy woman, as she prattled on in this way. He could hardly trust himself to reply and soon took his leave. Alice rose and gave him her hand with frank and winning cordiality. As he felt the warm soft pressure of her strong fingers, and the honest glance of her wide young eyes, his irritation died away for a moment, but soon came back with double force.

"Gracious heavens!" he exclaimed, as he closed the door behind him, and stepped into the clear spring moonlight, hardly broken as yet by the budding branches of the elms and limes. "What a crazy woman that mother is! Her daughter has come home to her a splendid white swan, and she is waddling and quacking about with anxiety and fear lest the little male ducklings that frequent the pond should find her too white and too stately."

Instead of walking home he turned up the long avenue, and went rapidly on, spurred by his angry thoughts.

"What will become of that beautiful girl? She cannot hold out forever against the universal custom. She will be led by her friends and pushed by her mother, until she drops to the level of the rest and becomes a romp-

ing flirt; she will go to parties with young Furrey, and to church with young Snevel. I shall see her tramping the streets with one, and waltzing all night with another, and sitting on the stairs with a third. She is too pretty to be let alone, and her mother is against her. She is young and the force of nature is strong, and women are born for sacrifice—she will marry one of these young shrimps, and do her duty in the sphere whereto she has been called."

At this thought so sharp a pang of disgust shot through him, that he started with surprise.

"Oh, no, this is not jealousy; it is a protest against what is probable in the name of the eternal fitness of things."

Nevertheless, he went on thinking very disagreeably about Mr. Furrey.

"How can a nice girl endure a fellow who pomatums his hair in that fashion, and sounds his R's in that way, and talks about Theedore Thommus and Cinsunnatta? But they do it, and Providence must be on the side of that sort of men. But what business is all this of mine? I have half a mind to go to Europe again."

He stopped, lighted a cigar, and walked briskly homeward. As he passed by the Belding cottage, he saw that the lower story was in darkness, and in the windows above the light was glowing behind the shades.

"So Furrey is gone, and the tired young traveler is going early to rest."

He went into his library and sat down by the dying embers of the grate. His mind had been full of Alice and her prospects during his long walk in the moonlight; and now as he sat there, the image of Maud Matchin suddenly obtruded itself upon him, and he began to compare and contrast the two girls, both so beautiful and so utterly unlike; and then his thoughts shifted all at once back to his own early life. He thought of his childhood, of his parents removed from him so early that their memory was scarcely more than a dream; he wondered what life would have been to him if they had been spared. Then his school-days came up before him; his journey to France with his grandfather; his studies at St. Cyr; his return to America during the great war, his enlistment as a private in the regular cavalry, his promotion to a lieutenancy three days afterward, his service through the terrible campaign of the Peninsula, his wounds at Gettysburg, and at last the grand review of the veterans in front of the White House when the war was over.

But this swift and brilliant panorama did not long delay his musing fancy. A dull smart like that of a healing wound, drew his mind to a succession of scenes on the frontier. He dwelt with that strange fascination which belongs to the memory of hardships—and which we are all too apt to mistake for regret—upon his life of toil and danger in the wide desolation of the West. There he met, one horrible winter, the sister-in-law of a brother captain, a tall, languid, ill-nourished girl of mature years with tender blue eyes and a taste for Byron. She had no home and no relatives in the world except her sister, Mrs. Keefe, whom she had followed into the wilderness. She was a heavy burden on the scanty resources of poor Keefe, but he made her cordially welcome like the hearty soldier that he was. She was the only unmarried white woman within a hundred miles, and the mercury ranged from zero to — 20° all winter. In the spring, she and Farnham were married; he seemed to have lost the sense of there being any other women in the world, and he took her, as one instinctively takes to dinner the last lady remaining in a drawing-room, without special orders. He had had the consolation of reflecting that he made her perfectly proud and happy every day of her life that was left. Before the autumn ended, she died, on a forced march one day, when the air was glittering with alkali, and the fierce sun seemed to wither the dismal plain like the vengeance of heaven. Though Farnham was even then one of the richest men in the army, so rigid are the rules imposed upon our service, by the economy of an ignorant demagogy, that no transportation could be had to supply this sick lady with the ordinary conveniences of life, and she died in his arms, on the hot prairie, in the shade of an overloaded baggage wagon. He mourned her with the passing grief one gives to a comrade fallen on the field of honor. Often since he left the army, he reproached himself for not having grieved for her more deeply. "Poor Nellie," he would sometimes say, "how she would have enjoyed this house, if she had lived to possess it." But he never had that feeling of widowhood known to those whose lives have been torn in two.

IV.

PROTECTOR AND PROTÉGÉE.

A FEW days later, Mr. Farnham attended a meeting of the library board, and presented the name of Miss Matchin as a candidate for the place of assistant librarian. She had sent several strong letters of recommendation to the board, from prominent citizens who knew and respected her father, for when Maud informed him of her new ambition, Matchin entered heartily into the affair, and bestirred himself to use what credit he had in the ward to assist her.

Maud had not exaggerated the effect of her blandishments upon Dr. Buchlieber. The old gentleman spoke in her favor with great fluency; "she was young, healthy, active, intelligent, a graduate of the high school."

"And very pretty, is she not?" asked a member of the board, maliciously.

The Doctor colored, but was not abashed. He gazed steadily at the interrupter through his round glasses, and said:

"Yes, she is very fine looking—but I do not see that that should stand in her way."

Not another word was said against her, and a ballot was taken to decide the question. There were five members of the board, three besides Farnham and Buchlieber. Maud had two votes, and a young woman whose name had not been mentioned received the other three. Buchlieber counted the ballots, and announced the vote. Farnham turned pale with anger. Not only had no attention been paid to his recommendation, but he had not even been informed that there was another candidate. In a few sarcastic words he referred to the furtive understanding existing among the majority, and apologized for having made such a mistake as to suppose they cared to hear the merits of appointees discussed.

The three colleagues sat silent. At last, one of them crossed his legs anew and said:

"I'm sure nobody meant any offense. We agreed on this lady several days ago. I know nothing about her, but her father used to be one of our best workers in the seventh ward. He is in the penitentiary now, and the family is about down to bedrock. The reason we didn't take part in the discussion was we wanted to avoid hard feelings."

The other two crossed their legs the other way, and said they "concurred."

Their immovable phlegm, their long, expressionless faces, the dull, monotonous twang of their voices, the oscillation of the three large feet hung over the bony knees had now, as often before, a singular effect upon Farnham's irritation. He felt he could not irritate them in return; they could not appreciate his motives, and thought too little of his opinion to be angry at his contempt. He was thrown back upon himself now as before. It was purely a matter of conscience whether he should stay and do what good he could, or resign and shake the dust of the city hall from his feet. Whatever he recommended in regard to the administration of the library was always adopted without comment; but, whenever a question of the sort which the three politicians called "practical" arose, involving personal patronage in any form, they always arranged it for themselves, without even pretending to ask his or Buchlieber's opinion.

The very fact of his holding the position of chairman of the board was wounding to his self-love, as soon as he began to appreciate the purpose with which the place had been given him. He and some of his friends had attempted a movement the year before, to rescue the city from the control of what they considered a corrupt combination of politicians. They had begun, as such men always do, too late, and without any adequate organization, and the regular workers had beaten them with ridiculous ease. In Farnham's own ward, where he possessed two-thirds of the real estate, the candidates favored by him and his friends received not quite one-tenth of the votes cast. The leader of the opposing forces was a butcher, one Jacob Metzger, who had managed the politics of the ward for years. He was not a bad man so far as his lights extended. He sold meat on business principles, so as to get the most out of a carcass; and he conducted his political operations in the same way. He made his bargains with aspirants and office-holders, and kept them religiously. He had been a little alarmed at the sudden irruption of such men as Farnham and his associates into the field of ward politics; he dreaded the combined effect of their money and their influence. But he soon found he had nothing to fear—they would not use their money, and they did not know how to use their influence. They hired halls, opened committee-rooms, made speeches, and thundered against municipal iniquities in the daily press; but Jacob Metzger, when he discovered that this was all, possessed his soul in peace, and even got a good deal of quiet fun out of the canvass. He did not take the trouble to be angry at the men who were denouncing him, and supplied Farnham with beefsteaks unusually tender and juicy, while the young reformer was seeking his political life.

"Lord love you," he said to Budsey, as he handed him a delicious rib-roast the day before election. "There's nothing I like so much as to see young men o' property go into politics. We need 'em. Of course, I wisht the Cap'n was on my side; but anyhow, I'm glad to see him takin' an interest."

He knew well enough the way the votes would run; that every grog-shop in the ward was his recruiting station; that all Farnham's tenants would vote against their landlord; that even the respectable Budsey and the prim Scotch gardener were sure for him against their employer. Farnham's conscience which had roused him to this effort against Metzger's corrupt rule, would not permit him to ask for the votes of his own servants and tenants, and he would have regarded it as simply infamous to spend money to secure

the floating crowd of publicans and sinners who formed the strength of Jacob.

His failure was so complete and unexpected that there seemed to him something of degradation in it, and in a fit of uncontrollable disgust he sailed for Europe the week afterward. Metzger took his victory good-naturedly as a matter of course, and gave his explanation of it to a reporter of the "Bale-Fire" who called to interview him.

"Mr. Farnham, who led the opposition to our organize-ation, is a young gen'l'man of fine talents and high character. I aint got a word to say against him. The only trouble is, he lacks practical experience, and he aint got no pers'nal magn'tism. Now I'm one of the people, I know what they want, and on that line I carried the ward against a combine-ation of all the wealth and aristocracy of Algonkin av'noo."

Jacob's magnanimity did not rest with merely a verbal acknowledgment of Farnham's merits. While he was abroad some of the city departments were reorganized, and Farnham on his return found himself, through Metzger's intervention, chairman of the library board. With characteristic sagacity the butcher kept himself in the background, and the committee who waited upon Farnham to ask him to accept the appointment placed it entirely upon considerations of the public good. His sensitive conscience would not permit him to refuse a duty thus imposed, and so with many inward qualms he assumed a chair in the vile municipal government he had so signally failed to overthrow. He had not long occupied it, when he saw to what his selection was attributable. He was a figure-head and he knew it, but he saw no decent escape from the position. As long as they allowed him and the librarian (who was also a member of the board) to regulate the library to their liking, he could not inquire into their motives or decline association with them. He was perfectly free to furnish what mental food he chose to two hundred thousand people, and he felt it would be cowardice to surrender that important duty on any pitiful question of patronage or personal susceptibility.

So once more he stifled the impulse to resign his post, and the meeting adjourned without further incident. As he walked home, he was conscious of a disagreeable foreboding of something in the future which he would like to avoid. Bringing his mind to bear upon it, it resolved itself into nothing more formidable than the coming interview with Miss Matchin. It would certainly be unpleasant to tell her that her hopes were frustrated, when she had seemed so confident. At this thought, he felt the awakening of a sense of protectorship; she had trusted in him; he ought to do something for her, if for nothing else, to show that he was not dependent upon those ostrogoths. But what could be done for such a girl, so pretty, so uncultivated, so vulgarly fantastic? Above all, what could be done for her by a young and unmarried man? Providence and society have made it very hard for single men to show kindness to single women in any way but one.

At his door he found Sam Sleeny with a kit of tools; he had just rung the bell. He turned, as Farnham mounted the steps, and said:

"I come from Matchin's—something about the greenhouse."

"Yes," answered Farnham. "The gardener is over yonder at the corner of the lawn. He will tell you what is to be done."

Sam walked away in the direction indicated, and Farnham went into the house. Some letters were lying on the table in the library. He had just begun to read them when Budsey entered and announced:

"That young person."

Maud came in flushed with the fresh air and rapid walking. Farnham saw that she wore no glasses, and she gained more by that fact in his good-will than even by the brilliancy of her fine eyes which seemed to exult in their liberation. She began with nervous haste:

"I knew you had a meeting to-day, and I could not wait. I might as well own up that I followed you home."

Farnham handed her a chair and took her hand with a kindly earnestness, saying,

"I am very glad to see you."

"Yes, yes," she continued; "but have you any good news for me?"

The anxious eagerness which spoke in her sparkling eyes and open lips touched Farnham to the heart. "I am sorry I have not. The board appointed another person."

The tears sprang to her eyes.

"I really expected it. I hoped you would interest yourself."

"I did all I possibly could," said Farnham. "I have never tried so hard for anybody before, but a majority were already pledged to the other applicant."

She seemed so dejected and hopeless that Farnham, forgetting for a moment how hard it is for a young man to assist a young woman, said two or three fatal words, "We must try something else."

The pronoun sounded ominous to him as soon as he had uttered it. But it acted like magic upon Maud. She lifted a bright glance through her tears and said, like a happy child to whom a new game has been proposed, "What shall we try?"

Simple as the words were, both of them seemed to feel that a certain relation—a certain responsibility—had been established between them. The thought exhilarated Maud; it seemed the beginning of her long-expected romance; while the glow of kind feeling about the heart of Farnham could not keep him from suspecting that he was taking a very imprudent step. But they sat a good while, discussing various plans for Maud's advantage and arriving at nothing definite; for her own ideas were based upon a dime-novel theory of the world, and Farnham at last concluded that he would be forced finally to choose some way of life for his protégée and then persuade her to accept it.

He grew silent and thoughtful with this reflection, and the conversation languished. He was trying to think how he could help her without these continued interviews at his house, when she disposed of the difficulty by rising briskly and saying, "Well, I will call again in a day or two, about this hour?"

"Yes, if it suits you best," he answered, with a troubled brow. He followed her to the door. As she went out, she said, "May I pick a flower as I go?"

He seized his hat, and said, "Come with me to the rose-house in the garden and you shall have something better."

They walked together down the gravel paths, through the neat and well kept garden, where the warm spring sunshine was calling life out of the tender turf, and the air was full of delicate odors. She seemed as gay and happy as a child on a holiday. Her disappointment of an hour ago was all gone in the feeling that Arthur was interested in her, was caring for her future. Without any definite hopes or dreams, she felt as if the world was suddenly grown richer and wider. Something good was coming to her certainly, something good had come; for was she not walking in this lovely garden with its handsome proprietor, who was, she even began to think, her friend? The turf was as soft, the air as mild, the sun as bright as in any of her romances, and the figure of Farnham's wealth which she had heard from her father rang musically in her mind.

They went into the rose-house, and he gave her two or three splendid satiny Maréchal Niels, and then a Jacqueminot so big, so rich and lustrous in its dark beauty that she could not help crying out with delight. He was pleased with her joy, and gave her another, "for your hair," he said. She colored with pleasure till her cheek was like the royal flower. "Hallo!" thought Farnham to himself, "she does not take these things as a matter of course." When they came into the garden again, he made the suggestion which had been in his mind for the last half hour.

"If you are going home, your nearest way will be by the garden gate into Bishop's lane. It is only a minute from there to Dean street."

"Why, that would be perfectly lovely. But where is the gate?"

"I will show you." They walked together to the lower end of the lawn, where a long line of glass houses built against the high wall which separated the garden from the street called Bishop's lane, sheltered the grapes and the pine-apples. At the end of this conservatory, in the wall, was a little door of thin but strong steel plates, concealed from sight by a row of pear trees. Farnham opened it, and said, "If you like, you can come in by this way. It is never locked in the daytime. It will save you a long walk."

"Thanks," she replied. "That will be perfectly lovely."

Her resources of expression were not copious, but her eyes and her mouth spoke volumes of joy and gratitude. Her hands were full of roses, and as she raised her beautiful face to him with pleasure flashing from her warm cheeks and lips and eyes, she seemed to exhale something of the vigorous life and impulse of the spring sunshine. Farnham felt that he had nothing to do but stoop and kiss the blooming flower-like face, and in her exalted condition she would have thought little more of it than a blush-rose thinks of the same treatment. But he refrained and said "Good morning," because she seemed in no mood to say it first.

"Good-bye for a day or two," she said, gayly, as she bent her head to pass under the low lintel of the gate.

Farnham walked back to the house not at all satisfied with himself. "I wonder whether I have mended matters any? She is certainly too pretty a girl to be running in and out of my front door in the sight of all the avenue. How much better will it be for her to use the private entrance, and come and go by a sort of stealth! But then she does not regard it that way. She is so ignorant of this wicked world that it seems to her merely a saving of ten minutes' walk around the block. Well! all there is of it, I must find a place for her before she domesticates herself here."

The thought of what should be done with her remained persistently with him and kept him irritated by the vision of her provoking and useless beauty. "If she were a princess," he thought, "all the poets would be twanging their lyres about her, all the artists would be dying to paint her; she would have songs made to her and sacred oratorios given under her patronage. She would preside at church

fairs and open the dance at charity balls. If I could start her in life as a princess, the thing would go on wheels. But to earn her own living—that is a trade of another complexion. She has not breeding or education enough for a governess: she is not clever enough to write or paint; she is not steady enough to keep accounts,—by the Great Jornada! I have a grievous contract on my hands."

He heard the sound of hoofs outside his window, and, looking out, saw his groom holding a young brown horse by the bridle, the velvet coat of the animal shining in the warm sunlight. In a few moments Farnham was in the saddle and away. For awhile he left his perplexities behind, in the pleasure of rapid motion and fresh air. But he drew rein half an hour afterward at Acland Falls, and the care that had sat on the crupper came to the front again. "As a last resort," he said, "I can persuade her she has a voice, and send her to Italy, and keep her the rest of her life cultivating it in Milan."

All unconscious of the anxiety she was occasioning, Maud walked home with her feet scarcely aware of the pavement. She felt happy through and through. There was little thought, and we may say little selfishness, in the vague joy that filled her. The flowers she held in her hands recalled the faint odors she had inhaled in Farnham's house; they seemed to her a concrete idea of luxury. Her mind was crowded and warmed with every detail of her visit: the dim, wide hall; the white cravat of Budsey; the glimpse she caught of the dining-room through the open door; the shimmer of cut glass and porcelain; the rich softness of the carpets and rugs, the firelight dancing on the polished brass, the tender glow of light and repose of shadow on the painted walls and ceilings; the walk in the trim garden, amid the light and fragrance of the spring; the hot air of the rose-house, which held her close, and made her feel faint and flushed, like a warm embrace; and through all the ever-present image of the young man, with his pleasant, unembarrassed smile, the white teeth shining under the dark mustache; the eyes that seemed to see through her, and yet told her nothing; and more than all this to poor Maud, the perfect fit and fashion of his clothes, filled her with a joyous trouble. She could not dwell upon her plans for employment. She felt as if she had found her mission, her true trade,—which was to walk in gardens and smell hot-house roses. The perplexities which filled Farnham's head as to what he should do with her found no counterpart in hers. She had stopped thinking and planning; things were going very well with her as it was. She had lost the place she had wished and expected, and yet this was the pleasantest day of her life. Her responsibility seemed shifted to stronger hands. It had become Farnham's business to find something nice for her: this would be easy for him; he belonged to the class to whom everything is easy. She did not even trouble herself to think what it would be as she loitered home in the sunshine. She saw her father and informed him in a few words of her failure; then went to her room and sat down by her window, and looked for hours at the sparkling lake.

She was called to supper in the midst of her reverie. She was just saying to herself, "If there was just one man and one woman in the world, and I had the picking out of the man and the woman, this world would suit me pretty well." She resented being called into other society than that of her idle thoughts, and sat silent through supper, trying to keep the thread of her fancies from breaking. But she was not allowed to go back undisturbed to her fool's paradise.

Sleeny, who had scarcely removed his eyes from her during the meal, rose with a start as she walked into the little sitting-room of the family, and followed her. She went to the window with a novel to make use of the last moments of daylight. He stood before her without speaking, until she raised her eyes, and said sharply:

"Well, Sam, what's the matter?"

He was not quick either of thought or speech. He answered:

"Oh! nothin'. Only ——"

"Only what?" she snapped.

"Wont you go and take a walk by the Bluff?"

She threw down her book at once. She liked exercise and fresh air, and always walked with pleasure by the lake. Sam was to her such a nullity that she enjoyed his company almost as much as being alone. She was ready in a moment, and a short walk brought them to the little open place reserved for public use, overlooking the great fresh-water sea. There were a few lines of shade trees and a few seats, and nothing more; yet the plantation was called Bluff Park, and it was much frequented on holidays and Sundays by nurses and their charges. It was in no sense a fashionable resort, or Maud would never have ventured there in company with her humble adorer. But among the rude puddlers and brakemen that took the air there, it was well enough to have an escort so devoted and so muscular. So pretty a woman could scarcely have walked alone in Bluff Park without insulting approaches. Maud would hardly have

nodded to Sleeny on Algonquin avenue, for fear some millionaire might see it casually, and scorn them both. But on the Bluff she was safe from such accidents, and she sometimes even took his arm, and made him too happy to talk. They would walk together for an hour, he dumb with audacious hopes that paralyzed his speech, and she dreaming of things thousands of miles away.

This evening he was even more than usually silent. Maud, after she had worn her reverie threadbare, noticed his speechlessness, and, fearing he was about to renew the subject which was so tiresome, suddenly stopped and said:

"What a splendid sunset! Did you ever see anything like it?"

"Yes," he said, with his gentle drawl. "Less set here, and look at it."

He took his seat on one of the iron benches painted green, and decorated with castings of grapes and vine leaves. She sat down beside him and gazed out over the placid water, on which the crimson clouds cast a mellow glory. The sky seemed like another sea, stretching off into infinite distance, and strewn with continents of fiery splendor. Maud looked straight forward to the clear horizon line, marking the flight of ships whose white sails were dark against the warm brightness of the illumined water. But no woman ever looked so straight before her as not to observe the man beside her, and she knew, without moving her eyes from the spectacle of the sunset, that Sam was gazing fixedly at her, with pain and trouble in his face. At last, he said, in a timid, choking voice,

"Mattie!"

She did not turn her face, but answered:

"If it aint too much trouble, I'd like to have you call me Miss when we're alone. You'll be forgetting yourself, and calling me Mattie before other people, before you know it."

"Hold on," he burst out. "Don't talk to me that way to-night—I can't stand it."

She glanced at him in surprise. His face was pale and disordered; he was twisting his fingers as if he would break them.

"Your temper seems to be on the move, Mr. Sleeny. We'd better go home," she said quietly, drawing her shawl about her.

"Don't go till I tell you something," he stammered hastily.

"I have no curiosity to hear what you have to say," she said, rising from her seat.

"It aint what you think—it aint about me!"

Her curiosity awoke, and she sat down again. Sleeny sat twisting his fingers, growing pale and red by turns. At last, in a tremulous voice, he said:

"*I* was there to-day."

She stared at him an instant and said:

"Where?"

"Oh, I was there, and I seen you. I was at work at the end of the greenhouse there by the gate when you come out of the rose-house. I was watchin' for you. I was on the lawn talkin' with the gardener when you went in the house. About an hour afterward I seen you comin' down the garden with him to the rose-house. If you had 'a' staid there a minute more, I would ha' went in there. But out you come with your hands full o' roses, and him and you come to the gate. I stopped workin' and kep' still behind them pear trees, and I heard everything."

He uttered each word slowly, like a judge delivering sentence. His face had grown very red and hot, and as he finished his indictment he drew a yellow handkerchief from his pocket and mopped the sweat from his forehead, his chin, and the back of his neck.

"Oh!" answered Maud, negligently, "you heard everything, did you? Well, you didn't hear much."

"I tell you," he continued, with a sullen rage, "I heard every word. Do you hear me? I heard every word."

The savage vibration of his voice made her tremble, but her spirits rose to meet his anger, and she laughed as she replied:

"Well, you heard 'Thank you, sir,' and 'Good-morning.' It wasn't much, unless you took it as a lesson in manners, and goodness knows you need it."

"Now, look'ye here. It's no use foolin' with me. You know what I heard. If you don't, I'll tell you!"

"Very well, Mr. Paul Pry, what was it?" said the angry girl, who had quite forgotten that any words were spoken at the gate.

"I heard him tell you you could come in any time the back way," Sam hoarsely whispered, watching her face with eyes of fire. She turned crimson as the sunset she was gazing at, and she felt as if she could have torn her cheeks with her finger-nails for blushing. She was aware of having done nothing wrong, nothing to be ashamed of. She had been all day cherishing the recollection of her visit to Farnham as something too pleasant and delicate to talk about. No evil thought had mingled with it in her own mind. She had hardly looked beyond the mere pleasure of the day. She had not given a name or a form to the hopes and fancies that were fluttering at her heart. And now to have this sweet and secret pleasure handled and mauled by such a one as Sam Sleeny filled her with a speechless shame. Even yet she hardly comprehended the full extent of

his insinuation. He did not leave her long in doubt. Taking her silence and her confusion as an acknowledgment, he went on, in the same low, savage tone:

"I had my hammer in my hand. I looked through the pear trees to see if he kissed you. If he had 'a' done it, I would have killed him as sure as death."

At this brutal speech she turned pale a moment, as if suddenly struck a stunning blow. Then she cried out:

"Hold your vile tongue, you——"

But she felt her voice faltering and the tears of rage gushing from her eyes. She buried her face in her hands and sat a little while in silence, while Sam was dumb beside her, feeling like an awkward murderer. She was not so overcome that she did not think very rapidly during this moment's pause. If she could have slain the poor fellow on the spot, she would not have scrupled to do so; but she required only an instant to reflect that she had better appease him for the present, and reserve her vengeance for a more convenient season.

She dried her eyes and turned them on him with an air of gentle, almost forgiving reproach.

"Sam! I could not have believed you had such a bad, wicked heart. I thought you knew me better. I wont make myself so cheap as to explain all that to you. But I'll ask you to do one thing for me. When we go home this evening, if you see my father alone, you tell him what you saw—and if you've got any shame in you you'll be ashamed of yourself."

He had been irritated by her anger, but he was completely abashed by the coolness and gentleness which followed her burst of tears. He was sorely confused and bewildered by her command, but did not dream of anything but obeying it, and as they walked silently home, he was all the time wondering what mysterious motive she could have in wishing him to denounce her to her father. They found Saul Matchin sitting by the door, smoking a cob-pipe. Maud went in and Sam seated himself beside the old man.

"How'd you get along at Farnham's?" said Saul.

Sam started, as if "the boss" had read his uneasy conscience. But he answered in his drawling monotone:

"All right, I guess. That doggoned Scotchman thinks he knows it all; and it 'll take nigh on to a week to do what I could ha' done in a day or two, if I worked my way."

"Well," said Saul, "that aint none o' your look-out. Do what Scotchee tells you, and I'll keep the time on 'em. We kin stand it, ef they kin," and the old carpenter laughed with the foolish pleasure of a small mind aware of an advantage. "Ef Art. Farnham wants to keep a high-steppin' Scotchman to run his flowers, may be he kin afford it. I aint his gardeen."

Now was Sleeny's chance to make his disclosure; but his voice trembled in spite of him, as he said:

"I seen Mattie up there."

"Yes," said the old man, tranquilly. "She went up to see about a place in the library. He said there wasn't none, but he'd try to think o' somethin' else that 'ud suit her. He was mighty polite to Mat—give her some roses, and telled her to run in and out when she liked, till he got somethin' fixed. Fact is, Mat is a first-rate scholar, and takes with them high-steppers, like fallin' off a log." Saul had begun to feel a certain pride in his daughter's accomplishments which had so long been an affliction to him. The moment he saw a possibility of a money return, he even began to plume himself upon his liberality and sagacity in having educated her. "I've spared nothin'—Sam—in giving her a——" he searched an instant for a suitable adjective, "a commodious education." The phrase pleased him so well that he smoked for awhile contemplatively, so as not to mar the effect of his point.

Sam had listened with a whirling brain to the old man's quiet story, which anticipated his own in every point. He could not tell whether he felt more relieved or disquieted by it. It all seemed clear and innocent enough; but he felt, with a sinking heart, that his own hopes were fading fast, in the flourishing prospects of his beloved. He hated Farnham not less in his attitude of friendly protection than in that which he had falsely attributed to him. His jealousy, deprived of its specific occasion, nourished itself on vague and torturing possibilities. He could not trust himself to talk further with Matchin, but went away with a growing fire in his breast. He hated himself for having prematurely spoken. He hated Maud for the beauty that she would not give him, and which, he feared, she was ready to give to another. He hated Saul, for his stolid ignorance of his daughter's danger. He hated most of all Farnham, for his handsome face, his easy smile, his shapely hands, his fine clothes, his unknown and occult gifts of pleasing.

"'Taint in natur," he growled. "She's the prettiest woman in the world. If he's got eyes, he knows it. But I spoke first, and he shan't have her, if I die for it."

(To be continued.)

THE SILK DRESS STORY.

It is now about eleven years since I first heard the silk dress story. I can fix that date with precision, because it was when my wife and I, very soon after our marriage, made an excursion to Boston — which might, perhaps, have been properly called our wedding journey — to visit for a few days our friends and relatives, the Fairfields. It was there and then that the silk dress story was told to us. Concerning some of the other circumstances attending its narration, I cannot now speak so positively and precisely as of the date; and the accuracy of my recollection of certain details, as will appear further on, has not only been flatly denied by one or more of those who might be summoned as witnesses, but questioned by all of them.

According to my memory of the incident, my wife and I were one day seated comfortably in the parlor, whiling away that last half hour of the afternoon which comes too soon to be employed in dressing for dinner and too late for almost anything else, when the street-door was heard to close and Mrs. Fairfield presently entered the room and gave us her company. Evidently she had just come home from making one or more social calls; and, sitting for a brief interval in an easy-chair, resting from her exertion, she seemed to recall the events of the afternoon, and, while drawing off her gloves and loosening the fastenings of her wraps preparatory to their removal, favored us with a little story which, to judge from the manner of her recital, she had herself listened to within a short space of time, at some one of the houses on that day's visiting list. It was the story of a silk dress, and, in effect, as follows:

A certain lady, whose name seems now past finding out, but who may be called Mrs. A——, a resident of Boston, had, a short time before, been in Paris. While busily engaged there in making her preparations to return home, she had received one day from her friend and neighbor in Boston, Mrs. B——, a long letter, which, having read, she was about to fold up and lay aside, when she noticed, lying on the floor at her feet, another sheet or piece of paper which had evidently fallen from the letter she had been reading or from its envelope. This piece of paper proved to be supplementary to the letter. It bore a postscript, begging Mrs. A—— to purchase for the writer a handsome black silk dress, of certain quality and character described, and bring the same home to Boston when she came. No remittance for the purchase accompanied the request; but the social position and financial responsibility of Mrs. B—— and the friendly relations of the two ladies were such, that the slight omission of a bill of exchange was not a matter worth a moment's consideration. Mrs. A—— advanced the money, purchased the dress in compliance with the request, and in due time arrived in Boston with the valuable package in one of her trunks.

She had been at home not more than a day or two, and had not yet found time to unpack her luggage, when she met her friend and neighbor, Mrs. B——, to whom, as soon as appropriate greetings were over, she said:

"Well, I have brought your dress, but it is not yet unpacked; I will send it to you in a few days."

"What dress is that?" inquired Mrs. B——.

"Why, the dress you wrote for, of course; the black silk dress," said Mrs. A——.

"The dress I wrote for!" exclaimed Mrs. B——. "I wrote for no dress!"

"What!" said Mrs. A——. "You wrote for no dress?"

"Certainly not," was the reply.

"What can you mean?" returned Mrs. A——. "You certainly cannot have forgotten it; don't you remember writing me a long letter last month?"

"I do, distinctly," replied Mrs. B——. "But I did not write for any dress."

"Well, that is astonishing," said Mrs. A——. "I surely received a letter from you asking me to buy a handsome black silk dress. I bought it, and have brought it home. There must be some strange mistake."

"There must, indeed, be some mistake," replied Mrs. B——, "but, for that matter, a fortunate one for me. A black silk dress is always useful and never comes amiss, especially if it comes smuggled; some one else must have written for it, but I shall be only too glad to take and pay for it. I will send for it with pleasure, whenever it is ready."

The matter being thus satisfactorily arranged, if not explained, the ladies parted. In due course, Mrs. A——'s trunks were unpacked and the precious dress parcel laid out; and within a very short time thereafter a messenger called for the dress on behalf of Mrs. B——, and took it away. A few days later the ladies met again.

"And how do you like your dress?" pleasantly inquired Mrs. A——.

"Oh, I haven't seen it yet," said Mrs. B——; "is it unpacked? Shall I send for it?"

"You may not have seen it," responded Mrs. A——, "but, of course, you don't mean to say that you have not sent for it?"

"Certainly, I do," said Mrs. B——. "I have not sent for it. I thought it might not yet be unpacked."

"You have not sent for it! Why, a messenger called for it for you and took it away two or three days ago. Have you not received it?"

"Certainly not," replied Mrs. B——; "I have neither sent for it nor have I received it."

"Well, upon my word," said Mrs. A——, "that passes all understanding; I never heard of such a thing; it is certainly very mysterious."

It may readily be imagined that this gradually deepening mystery soon began to be unpleasant to both ladies. The very first steps in the way of investigation, consisting of some searching inquiries among the servants of both houses, led to highly disagreeable consequences. There could be no doubt, at least on Mrs. A——'s part, that some person, believed to be a messenger from Mrs. B——, had called for and obtained the dress. But Mrs. B—— positively denied having sent any one for it, and certainly had not received it. Was it perhaps possible that some servant or the friend of some servant in Mrs. B——'s household, learning the situation by chance or by some overheard conversation, had cleverly managed to call at Mrs. A——'s in the nick of time and had obtained the dress surreptitiously? Or, on the other hand, was there no room for the surmise that some one of Mrs. A——'s servants, quick to see and improve a good chance, had known enough of the circumstances to take advantage of them and, while pretending to have delivered the dress package to some alleged messenger, had really made quite a different disposition of it. Many and varied were the surmises and theories in the case; but all the efforts made to discover the person to whom the dress had been delivered, or to learn the particulars attending such alleged delivery by close cross-examination of the person who claimed to have delivered it, accomplished nothing more than deeply wounding the sensitive souls of all the servants, who could not but feel and resent even the very faint breath of suspicion unavoidably perceptible in the inquiries; so that, without shedding any new light on the mystery, the investigation was followed by prompt notice of intention to leave by fully half the servants of both houses.

Meantime it had, naturally enough, occurred to both ladies that a reference to Mrs. B——'s letter, if it could be found (the letter received by Mrs. A—— at Paris, bringing the request for the dress), would surely give some clew to, if it did not wholly solve, the mystery. Diligent search was therefore made by Mrs. A——, and by some lucky or, perhaps, unlucky chance, the letter at last was found. But, greatly to the surprise of Mrs. A—— and the amusement of Mrs. B——, it contained not a word of the alleged request—not a syllable referring to a black silk dress or any other dress. Now, it was suddenly remembered by Mrs. A—— that the request for the dress had been written in a postscript, as already mentioned. And now the postscript was missing because, as Mrs. A—— recalled (with a slightly perceptible touch of embarrassment at the occasion for explanation), it had been kept apart for easy reference, while shopping for the dress; it had probably been neglected or destroyed when no longer wanted.

Then some ingenious friend of the family offered an explanatory hypothesis, in effect, that the postscript was the clever but fraudulent device of some member of Mrs. B——'s household, who, happening to know the intention of the latter to write to Mrs. A——, had herself written the postscript which had been the first cause of the mischief, and somehow had managed to slip it into the envelope conveying Mrs. B——'s letter, securing thus the purchase of the dress, and finally succeeding in getting possession of it in the manner already indicated. But Mrs. A—— was certain that the postscript was written on the same kind of paper as the letter, and that nothing in the writing had suggested another hand than Mrs. B——'s. This theory of the case, moreover, seemed open to so many other obvious objections that no one attempted to maintain it long; and some of those who, at first, had regarded it as a satisfactory solution of the puzzle were, at last, inclined to attribute the mischievous postscript on the floor to the agency of spirits, and to account for the ultimate disappearance of the dress by the skillful management of some medium in Boston, who was fond of black silk.

With all the discussion there came no clearer light, and it is easy to imagine that, but for the high character and unquestionable integrity of both ladies and their abiding faith and confidence in each other, their friendly relations might, at last, have been subjected to a somewhat severe strain; for Mrs. A——, who had expended a considerable sum in the purchase of the dress, was not only out of pocket to that extent, but seemed—by Mrs. B——'s denial, first, of the request for and, then, of the receipt of the dress—to be put in the position of one who seeks to establish a wholly groundless claim; while Mrs. B——

occupied the equally unpleasant position of one liable to the suspicion, on the part of vulgar souls, of having resorted to sharp practice to get a costly dress at another's expense.

How all the delicate points involved in these complicated relations of the two friends were finally disposed of, I have never learned. Mrs. Fairfield's narrative ceased without informing us whether Mrs. B——, disturbed by the thought of her friend's losing money through an obliging willingness to render her a service, sought some slender satisfaction in paying for a dress which she had not only never received but never asked her friend to get for her, or whether, on the other hand, Mrs. A—— preferred, under the circumstances, to suffer the loss of the money the dress had cost, although, as she believed at the time, she had not only bought it at her friend's request, but had actually delivered it to her messenger. It is certain that such perplexing relations would have been likely to involve ordinary people in serious unpleasantness. In Leadville or Deadwood, those newly established centers of modern civilization, or, indeed, in some older communities whose leading citizens are quick at the trigger, the husbands or male partisans of two ladies between whom such critical relations had arisen might easily have become involved in controversies that would not have stopped short of bloodshed. It may, however, be presumed that, in the elevated and serene moral atmosphere of Boston, no such vexatious trifle could long disturb the harmony of kindred spirits; and whatever might be done, under similar circumstances, by common mortals, would certainly not be done by Bostonians. For the Bostonians are a peculiar people, and strongly adhere to the guiding precepts of their life under the most trying circumstances, not only at home but abroad. In fact, a true Bostonian is one who when he is in Rome does as the Bostonians do.

The story, as thus related to us by Mrs. Fairfield, interested my wife and myself very much. We repeated it to several friends, especially in San Francisco, where we were soon after at home. One lady there, who was about setting out on a journey to Europe, listened to it with extraordinary interest, and, laying to heart a lesson suggested by it, carefully preserved, during her absence from home, all letters from her friends which contained requests for the performance of errands or commissions or shopping of any sort, especially for the purchase of articles to be delivered after returning home. It happened, moreover, a few years later, that we ourselves went to Europe, whence I returned again, leaving my wife there. On that return journey I was charged with the care of a trunk full of costly raiment, belonging to a neighbor of ours in San Francisco who had availed herself of the opportunity thus afforded to get a little foreign shopping done. The contents of the trunk were valued at several hundred dollars, which amount, however, I had not been asked to advance; but, on passing through the custom-house, I found it necessary to pay on that trunk something over one hundred dollars duties. At Omaha, where all trunks are weighed and rechecked, I was alarmed to discover that this important piece of luggage was missing, and it seemed to me, all at once, that I was perhaps in a position very similar to that of Mrs. A——; for, if the trunk were never found, my friends would not only suffer the loss of its valuable contents, possibly through neglect or want of due care and diligence on my part, but I should be out of pocket to the extent of over one hundred dollars for the duties, which I could hardly accept with satisfaction from my friends if the loss were my fault. Fortunately, however, the trunk turned up later, and my disbursements on account of it were promptly repaid; but it vividly recalled the silk dress story, and I determined to improve the first opportunity to learn the sequel to that story, if there were one.

It was, therefore, with something more than the usual pleasure and interest that, a few weeks later, I found myself engaged to dine at the Fairfields' during a short visit to Boston, and I embraced the first available occasion to open the subject.

"By the bye, Mrs. Fairfield," I said, "I have long desired to ask you what was the sequel to your silk dress story?"

"My silk dress story!" she replied. "What story is that?"

"Why, the story about the dress; the silk dress."

"What dress? What dress do you refer to?"

"Why, the black silk dress, of course; don't you remember?"

"No, I don't remember. What is the story?"

"Why, it is your own story; you told it to us. You certainly must remember telling us a story of a dress—a black silk dress—which was bought in Paris and brought home to Boston by one lady for another lady, and caused so many complications and so much mystery. Don't you recall it?"

"I do not. It is all new to me. Pray go on. I never heard of it before."

Then I commenced the narration of the story, as nearly as I could recall it, precisely as I had first heard it from her, looking, at every word, for some sign of recognition on

her part; but she listened with constantly increasing attention to the end, when she said:

"Well, that is certainly very interesting. I never heard of such a thing."

"But," said I, "that is your story. You told it to me yourself, more than six years ago."

"Impossible!" she replied. "It is a very good story, but I assure you I never heard it before, and I certainly never could have told you a word of it."

Then her husband, the Colonel, who had listened to the conversation, shook his head, when I looked at him with inquiry in my eye, and said he had never heard such a story. He wavered a moment, however, soon after, apparently through a courteous regard for the feelings of a guest who finds himself alone in a controversy, and said: "Well—yes—perhaps there is something in it that sounds as though I might have heard it before;" but after this feeble admission he seemed inclined to return to his wife's support, and, on further reflection, finally said it was all new to him.

This was certainly a discouraging result of my search for more light on the silk dress affair. It was more than discouraging; it was astonishing. If Old Mother Hubbard had suddenly risen up and denied that she ever had a dog, the statement could hardly have surprised me more. This flat denial of the whole story,—a story which I had been telling for years, and always as "Mrs. Fairfield's story," concerning which there had been much speculation and moralizing, and on which at least one person had based certain rules of conduct with reference to foreign shopping for friends at home,—this sweeping away of the whole thing was like suddenly removing the foundations of one's faith.

My first step, after recovering from the immediate effects of this interview, was to write to my wife, telling her what the Fairfields said about the silk dress story. I thought I knew what she would say, for my parting injunction on leaving her in Europe had been, "Now don't forget Mrs. Fairfield's silk dress story; no more commissions," regarding the extra trunk I then had as a sufficient discharge of all such duty imposed upon us by the Golden Rule. By return of mail she wrote, in effect, that of course we had heard the story at the Fairfields' on the penultimate day of our visit there; she had not, however, been so impressed as I with the fact of the story's having been told before dinner, and thought it might have been after dinner; and, since there had been other company there, it was just possible, though not in accordance with her familiar remembrance, that some one else then present had told the story. Now the other company of that evening, besides the Fairfields and ourselves, had been Mr. and Mrs. Exeter and Mr. and Mrs. Edward Everett Hale. She was certain the story was told, if not by Mrs. Fairfield, then by one of the other ladies, and not by Mr. Hale, famous as he is for story-telling.

On presenting this written evidence to Mrs. Fairfield, she remained unshaken in her conviction that she had never heard the story before, and looked upon the new testimony as weakening my position, and strengthening her own, so far as it touched the question of her personal responsibility for its narration.

The next day I found Mr. Exeter in his office. I told him my dilemma and related to him briefly the story, requesting him to ask his wife if she could throw any light on the matter. Mr. Exeter replied that the story was entirely new to him; but if I would dine with them the next day, we should hear what his wife would say on the subject. On presenting myself at the appointed time, I found that Mrs. Exeter had met Mrs. Fairfield that morning, and had heard my story of the dress. She said that her first impression, at the beginning of Mrs. Fairfield's recent recital, was that she had never heard the story before, but, as it progressed, it seemed to become more and more familiar, until, at last, she was pretty sure she had heard it before, though absolutely certain she had never told it herself. Her belief was that she had probably heard it at the Fairfields' on the evening referred to; but, at best, she could only be an uncertain witness. It would thus appear that if Mrs. Fairfield, as I believe, told us the story before dinner, it might have been again referred to among the ladies during the evening.

Some engagements took me soon to San Francisco, and I left Boston without gaining any further light on the mystery. I therefore wrote to Mr. Hale from California, relating briefly the story, and referring to the existing uncertainty concerning its origin, and asking him for any information he might possess or be able to obtain on the subject. Following is a copy of his reply, omitting only some unessential lines:

"ROXBURY, MASS., March 14th, 1879.

"MY DEAR SIR: I am sorry to give you an unromantic solution to the Silk Dress Story. * * * After I had read your letter I took it in to dinner. I began reading aloud at that sacred interval when meat gives way to pudding—an excellent time for grave or gay considerations. Having come as far as the words 'Mrs. Fairfield's Silk Dress Story,' I paused dramatically and asked Mrs. Hale if she knew anything about it. To which appeal she said at once:

"'Does he mean Aunt Lizzie's silk dress?' (Aunt Lizzie was Mrs. Fairfield's mother.)

"'Pray, what was that?' said I, exactly as a fox might have done in Bidway's Fables, with which I hope

you are familiar. And before I proceeded with your story Mrs. Hale repeated the following:

"'THE STORY OF AUNT LIZZIE'S SILK DRESS.'

"'When Aunt Lizzie lived in Cincinnati, many, many years ago, she had an elegant silk dress, new, just arrived from some distinguished maker. The next morning a servant came to the door and said Mrs. X—— Y—— would be much obliged if Aunt Lizzie would let her see her new silk dress.

"'Aunt Lizzie did not know Mrs. X—— Y—— very well, nor did she much like to have her new dress imitated by half Cincinnati; but being good natured, and not wishing to offend, sent the dress, which she had never worn, down to the door, and—never saw nor heard of it again. Nor did Mrs. X—— Y——, when appealed to, know anything about the dress or the messenger.

"'End of the story of Aunt Lizzie's silk dress.'

"When Mrs. Hale had come thus far she ceased. I then read the remainder of your story, to the delight and sympathy of all hearers. But neither she nor I nor anybody remembered to have heard a word of it before.

"My daughter has since communicated these facts to Mrs. Fairfield, who does not remember anything about the story of her mother's silk dress, but will inquire.

"Pardon me if I indulge in a diagnosis, which may be right and may be wrong.

"Imprimis, I was not at the Fairfields' party [*Mark that! he says he was not there*], so I know nothing, and am a disinterested consulting physician.

"Permit me to suggest that the conversation probably turned on shopping for friends in Paris; that in this connection Mrs. Hale told the story of Aunt Lizzie's dress; that after the party you went to bed, and—Mrs. Fairfield's coffee having been good—you dreamed, with detail, the story you now write; that some days after you told it, still at Mrs. Fairfield's house, to your wife, under the impression that you had heard it all from one of the cousins; that thus it became 'Mrs. Fairfield's story,' instead of 'the story of Aunt Lizzie's dress.'

"I regret to say that Mrs. Hale has no recollection of telling the story of her aunt's dress at the Fairfields'. But that story is not new to me. I have heard her tell it before.

"I shall wait with eagerness any further light, and meanwhile * * * I am always, yours truly,

"EDWARD E. HALE."

Interesting as the foregoing letter is for the story it contains about another dress, there is but little or nothing in it about the dress which was the subject of inquiry. The theory that our somewhat mythical story might be founded on the perhaps equally questionable story told in the letter, however ingenious, is about as far from the truth as is the mistaken statement of its distinguished author, that he was not of that company at the Fairfields' where my wife and I had the not-to-be-forgotten pleasure of meeting him—an event for which our memories may be safely trusted, since it was to do us honor that he was asked to come and came.

The fact is, there is no further light on the affair of the silk dress; nor do I know of any source from which more light may yet be looked for, unless the clever but mysterious person who finally obtained possession of the dress may some day disclose the truth; or unless Mrs. A—— or Mrs. B—— might be summoned from the vague state of alphabetical unreality and caused to appear in person and give testimony; for if the fate of the dress itself must always remain unknown and unknowable, it would, at least, afford some satisfaction to see the mystery which now clouds the origin of the story cleared away. Indeed, I rarely tell the story now: for its mere narration seems to carry with it some mystifying spell. One day last summer, while crossing the continent, I had the good fortune to find upon the same train a fair traveler of my acquaintance, returning from a long visit in Boston to her home in San Rafael, California. When we reached Omaha I sought to be useful in looking up and rechecking her luggage; but after a trying half hour's search, the trunks proved to be missing, having been left behind in some unaccountable way. My fair companion was made very anxious by this misadventure, not only because her own trunks were valuable, but also because they contained many things purchased for friends and neighbors. I told her the silk dress story, and expressed the hope that she might be spared the disagreeable experiences thereby suggested. Four or five days later we were nearing San Francisco. Numerous friends came out for various distances along the road to welcome the returning traveler and give her their escort home. Among them was one who came as far as Sacramento. Soon after the exchange of greetings, the fair companion of my journey turned to her friend and said:

"Oh, I have got your satchel [I think it was a satchel], and I hope it is what you want; but my trunks are left behind or lost, and no one can say when you may expect to see it."

"I am truly sorry for the trunks," replied the friend, "but what satchel do you refer to?"

"Why, the satchel you wrote for."

"I wrote for no satchel," was the reply.

"No, I know you did not; but mamma wrote for you. Did you not ask mamma to write to me for a satchel for you?"

"I did not; I know nothing about it."

"You know nothing about it!"

"Nothing whatever; there must be some mistake."

"It is the silk dress again!" exclaimed my friend to me.

And so, indeed, it seemed; at least, I have never learned by what mistake, if any, the satchel had been sent for, or whether it ever arrived in the missing trunks, or, if so, whether finally it safely reached the hands of the person for whom it had been intended.

James D. Hague.

[Begun in the February Number.]

A WOMAN'S REASON.*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

XV.

THAT evening Helen tapped at Miss Root's door, and entered in response to the girl's invitation to "Come in!" When she showed herself within, "Oh, excuse me!" cried Miss Root, in the ready note which ladies make when they have pins in their mouths. She had her lap full of sewing, and she obviously could not get up. "I thought it was Bridget."

"Bridget wouldn't be coming to you on my errand," said Helen, with a bluntness which at once made its way with Miss Root.

"What *is* your errand?" she asked, taking three pins out of her mouth for the purpose.

"I must earn some money, somehow. I thought perhaps you could tell me—advise me——"

"I can tell you, but I can't advise you," said Miss Root, bending over her work, and treating Helen's extremity as one of the most natural things in life. "I earned money enough to come to Boston and study Art"—she pronounced it with the conventional capital rather disdainfully, as if she would have chosen a homelier expression if she could have thought of one—"by helpin' mother take boarders. We took 'em our summers, and I taught winters. That's the way *I* earned some money. But I suppose you don't want to take boarders."

Helen hardly knew how to interpret the gleam in Miss Root's eye. But—"No," she answered, simply, "I shouldn't know how to do that."

"Well, neither do most of the boardin'-house-keepers."

She stopped here so definitively that Helen was obliged to take the word, if the conversation was to go on.

"I thought," she faltered, "that perhaps you could tell me how to do something with my pencil that would sell. I can sketch a little."

"Yes," said Miss Root, non-committally; "I remember."

"And it seems to me, that if I knew how to go about it, I ought to be able to turn the study I have given it to some account."

"I suppose," said Miss Root, "that it's for some charity."

"For some charity!" cried Helen. "No, indeed! It's for myself."

"Oh," said the other, "then if I were you, I wouldn't throw my time away. You'll never succeed."

"I don't want to succeed—as an artist," retorted Helen, with a little pique. "But I have really come to the point where I must either earn some money or else borrow or beg it. There are plenty of people who would be ready to give it or lend it; but I can't let them; and I hoped that you might be able to tell me how to earn it."

Miss Root shook her head.

"Of course, I like your spirit; it's the right spirit; but I can't help you in that way. I've never sold a thing yet, and I don't know when I shall, if I ever shall. If I didn't love to paint, I should quit and go home by the first train. But I do love it, and I'm goin' to stick to it till I begin to starve. I don't ever expect to get married—*that* was finished up long ago!—and mother's married again, and here I am without a chick or a child to trouble me or trouble about me. But if I had a cat to keep, I shouldn't try to keep it on art. Oh, I presume that after years and years, I can sell a picture, may be; but I know painters in this city, *real artists*,"—she put the words unsparingly, as with a conscience against letting Helen suppose herself for a moment anything of the kind,—"that would be glad to give all they do for a regular income of a thousand dollars a year. If you've a mind to paint gimcracks," she added, and this was the only way in which she deigned to acknowledge her privity to Helen's previous performance, "you can sell 'em if some simpleton sets the fashion of buying 'em, or if people know *you* did 'em. But I presume that aint what you want."

"No, indeed," said Helen, shuddering at the thought of Mr. Truffit, and helplessly loathing herself for being at that moment a pensioner on his bounty; "it would be better to starve."

"Or," pursued Miss Root, "you might teach drawing. People have to throw away their

money somehow. But, if I understand, you don't want to go to people that have money to throw away for that any more than the other thing."

"No," murmured Helen.

She knew that Miss Root had at once divined that she had come to her instead of going to any friends of her former life, because she did not choose to let them pity her, and help her to any sort of trivial work out of pity. In the girl's straightforward sincerity, she felt the comfort that the feminine soul finds in the frankness of a man, and she subtly perceived that for all her show of indifference, Cornelia liked her, and was touched by the advance she had made in coming to her. In fact, Miss Root prided herself on her large-mindedness, a quality which she applied more impartially to people about her than is generally done. Her liberality was not merely for people of her own origin and experience, but for others who had known better fortunes and had lost them, or who had them still and were unhappy in them; and the severity which accompanied her large-mindedness began with herself, and extended only to envious and detracting spirits. If the secrets of Miss Root's soul could be unveiled, it would be seen that she had been obliged from the beginning to discipline herself into accepting Helen as worthy her esteem and regard, in spite of her beauty, her style, and her air of a finer world than Cornelia Root had known, except at a distance. The struggle was sharp, but it had ended in the interest of large-mindedness. When Mrs. Hewitt assumed, in Helen's absence from dinner, while she was lunching at Miss Kingsbury's, to be confidentially speculative about the English lord who seemed to be coming to see Miss Harkness pretty often, and spending a good deal of time when he did come, and so tittered, Cornelia led off a generous opposition.

"I don't know," she said, "how much a lord's time is worth; but if it aint worth any more than some of the fellows' time that used to come flirtin' round with our summer boarders, I don't see how he could put it in much better. I guess he aint after her fortune, any way; and *I* guess he aint goin' to find much more of a lady anywhere. If he wants to marry her, I sha'n't object, even if they don't ask me to the weddin'. I shouldn't want much to marry a lord for my own pleasure; but I don't believe but what if Miss Harkness does she'll be a credit to him."

Cornelia had steadfastly set her face against knowing or caring anything about the affair, and such was now her discipline that she believed she could keep it up till the end, whenever that was. She had not only snubbed Mrs. Hewitt the day before, but this evening, when Helen early withdrew from tea, pale, and with the evidence of having passed a day of great nervous excitement, she refused even to enter into discussion of what Mr. Evans called the phenomena, in the light of philosophico-economic speculation.

"Here," he contended, "are a most interesting series of facts. I suppose that never, since the earliest settlement of Boston, has a member of the British aristocracy called three times, on three successive days, upon a young lady resident in a boarding-house, even of such acknowledged gentility as ours. If Mrs. Hewitt will excuse me, I will assume that it is not the merits of her establishment which have attracted him, but that he has been drawn here by that charm in Miss Harkness which we all feel. He knew her in other days,—in better days,—and nobly, and like a nobleman, he has sought her out in our humble midst,—if that is a correct expression,—and laid his coronet,—if it is a coronet,—which he keeps somewhere concealed about his person, at her feet. As no human girl of the American persuasion was ever known to refuse a lord, if she got the chance, the inference is irresistible that our noble friend was instantly accepted, and has already written home to have his ancestral halls whitewashed up for the reception of his bride."

"Well, you may twist it and you may turn it as much as you please, Mr. Evans, and call it philosophico-economic speculation, or anything you want to," returned Miss Root. "*I* call it gossip; and I never *did* gossip, and I never *will*. I don't care if she was goin' to marry twenty lords; it's none of my business. All I know is that she has behaved herself like a perfect lady ever since she's been in the house."

"New Hampshire forever!" cried Mr. Evans. "The granite ribs of your native State speak in every syllable, Miss Root. But you will acknowledge that you did hate her just a little, wont you, for her superiority to us all,—which she can't conceal,—and that you would recognize the hand of Providence in the dispensation, if his lordship had jilted her to-day?"

"No, I wouldn't!" retorted Cornelia, all the more vehemently for her perception of the malicious truth in the insinuation.

"Why, that's exactly what my wife said when I taxed her with the same thing. It *must* be so. Now," said her tormentor, as Cornelia rose from the table, "don't let her see any change in your manner because you think she's going to marry a lord."

It was the insinuation in this charge that made it extremely difficult for Cornelia Root

to adjust her behavior to the occasion: if Miss Harkness *was* going to marry that lord —and Cornelia Root was principled against inquiring—she was not going to make the slightest change, and yet she was aware that some extra internal stiffness, which she must be careful not to show, would be requisite for this uniformity. When it appeared from Helen's application that she could not be going to marry the lord, at least for the present, Cornelia had to guard against self-betrayal in a too precipitate relaxation. The note of despair in Helen's confession that she could not go to people to ask pupils for the same reason that she could not ask them to buy her gimcracks, touched Cornelia, or, as she would have said, it made her feel for the girl. But feeling was the last thing, according to her belief, that any honest person ought to show. She was going to help her, but she was not going to let her see that she was capable of any such weakness as sympathy; and she had before her the difficult task of treating Helen just as she would have treated a girl who had always been poor, and of not treating her any worse.

"There are a good many things that women take up nowadays," she said, with an aspect of hard indifference. "Some of 'em learn telegraphin'—that must pay almost a cook's wages; some of 'em go into the hospitals and learn to be professional nurses—that takes you about two years before you can get a certificate, and then it's a killin' life; there are the public schools, but there are so few vacancies, and you have to wait and wait for months, even after you're prepared."

She looked at Helen as if she thought that Helen was probably not prepared, and Helen shook her head assentingly.

"No," she sighed, "I couldn't wait. But perhaps I shouldn't want to do anything for a great length of time," she said, innocently, with the thought of Robert's return in her mind. "It might only be for a limited period."

"That's what I supposed," said Miss Root. "That's the great trouble. If a man takes a thing up, he takes it up for life, but if a woman takes it up, she takes it up till some fellow comes along and tells her to drop it. And then they're always complainin' that they aint paid as much as men are for the same work. I'm not speakin' of you, Miss Harkness," she said, with a glance at Helen's face; "and I don't know whether I want to join in any cry that'll take women's minds off of gettin' married. It's the best thing *for* 'em, and it's about all they're fit for, most of 'em, and it's nature: there's no denyin' *that*. But if women are to be helped along independent of men,—and I never was such a fool as to say they were,—why, it's a drawback. And so most of 'em that can't wait to prepare themselves for anything, because they don't expect to stick to anything, they turn book-agents, or sell some little paytented thing; or they try to get a situation in a store."

Cornelia began to sew furiously, as if in an exasperation with her sex, that she could not otherwise express. "And you may be sure," she said, after a silence, "that every one of 'em tries to do something better than she's fit for, and that she despises her work, and thinks she aint paid half enough for it."

Helen did not heed this last outburst. She was trying, with a sickening chill at heart, to realize herself in the character of those resolute young women who had sometimes won a furtive access to her by asking at the door for Miss Harkness, and sending up their names as if they were acquaintances, and then suddenly developing their specimen copy of the book for which they were taking subscriptions, or the needle-threader or thimble-case, or convertible pen-wiper and boot-buttoner which they were selling. She could as little imagine herself behind the counter of a Washington street fancy or variety store, standing all day in the hot, dry air, and shrilly piping "Ca-ish!" as she had heard those poor shop-girls doing, while they rapped on the counter with their pencils for the cash-boy, and munched a surreptitious lunch of crackers and chocolate creams. If it must come to this, she did not know what she should do. She was as firm as ever that she would not touch the money in Mr. Hibbard's hands as long as the least doubt tainted it; but she began to be frightened at herself and at the prospect before her.

"And is there—is there nothing else?" she asked, in a voice which she tried to make steady, and only succeeded in making almost as low as a whisper.

"Oh, yes," said Miss Root; "there's the theater."

Helen's heart gave a throb of hope. She used to play a good deal in private theatricals; she had acted a French monologue once, and she had taken a part in German vaudeville; everybody had praised her, and she had unquestionably borne the palm from all her dramatic competitors. A brief but brilliant future dazzled before her: an actress who was evidently a lady, and carried the air and tone of good society with her on the stage; triumphs and gains in cities distant from Boston in an incognito strictly preserved; and then a sudden but inexorable retirement after a given time. It was easy work for Helen's lively fancy to contrive all this, with a shining amplification, as rapid and full as if she had dreamed it in

sleep. "Yes!" she said, with an interest which she could not at once forbid herself.

"I had a friend," pursued Miss Root, "a friend—well, she was a kind of connection, and she came up to Boston the same time I did—*crazy* to go on the stage. She used to act in the school exhibitions, and I guess she got her head turned; anyway, nothing else would do her. But she was *real* modest about it; they all are; she only wanted to play little parts like *Juliet*, and *Ophelia*, and *Lady Macbeth*. Well, she went to a manager, and he was very kind and pleasant, and I guess he saw what a simple goose she was, and he told her that he would let her have a chance to show what she could do, and he gave her a place in the ballet."

"In the ballet?" palpitated Helen. The colors had already begun to fade from her vision of histrionic success, and the crazy structure tumbled to its fall.

"She thought," resumed Cornelia, "just as I presume you do, that it was dancin'. She said she couldn't dance any; her folks had always been strict orthodox, and wouldn't let her learn; and he laughed and said most of the ballet never danced at all. She'd have to go on as a peasant, or something like that, with a lot of others, first off; and as soon as he could he'd give her a few words to say, and she could see how she got along. It wa'n't playing *Ophelia* exactly, but she was dead set on going on to the stage, and so she took up with his offer, and glad enough, and she got six dollars a week from the start."

"And has she ever—ever got on?" asked Helen, faintly.

"Well, the only time I ever saw her was one night when she had the part of a page. I guess she must have been on the stage as much as a minute, and she said at least a dozen words. But I couldn't seem to stand it, to see any friend of mine up before all those people in boy's clothes; and she seemed pretty long for a page, and kind of bony, and I went away after the first act; I was afraid she might come on again."

Helen smiled and shuddered; the idea of boy's clothes was final, even in a reverie, and she hung her head in innocent shame.

"Now," said Cornelia, with a keen glance at her abasement, and apparently convinced that she had brought her low enough, "if you really do want to do something, I can get you a chance to try."

Helen started. "In the theater? Oh, I couldn't."

Cornelia laughed. "No, not in the theater. But there's a friend of mine—well, *he's* a kind of a connection, too—used to have a photograph saloon down in our place; used to have it on wheels, and get it dragged round from one village to another; and *he's* got Boston-bit, too; and so he's come up, and he's opened a gallery down on Hanover street; well, it's pretty *far* down. Well, he haint got a very high class of custom, that's a fact; and if he had, he wouldn't have this work to do, I presume."

"What is it?" asked Helen.

"It's colorin' photographs."

"Oh, yes; I've seen them," said Helen, remembering some examples of the art, hung aloft in oval frames, in country parlors, of which they were cherished ornaments.

"It aint a very high kind of art," said Miss Root, as if she found something to reprove in Helen's tone, "but it aint every one that can do it, low as it is."

"I'm sure I don't depreciate it," returned Helen. "I should be only too glad if you thought *I* could do it."

"I guess I can get you the chance to try," said Cornelia; and now, as if she wished to leave the subject and prevent the premature acknowledgments which she felt she had not yet earned, she unpinned her sewing from her knee, and stood up holding it at arms-length from her.

"The trouble is," she mused aloud, "that you can't tell how it's going to hang, after *all* your worry."

"Why don't you let me drape it on you?" asked Helen.

Cornelia dropped the lifted arm, and let the skirt trail on the floor. "Well, if you *think*, Miss Harkness, that I've been hintin' round for anything of that kind!"

"I don't," said Helen. "Honestly! But I like to fit dresses. I used to help our cook with hers."

Cornelia Root had to discipline with uncommon severity the proud spirit that revolted at having the same hands drape its corporeal covering which had draped the person of an Irish cook. She subdued it, but it was not in human nature that she should yield gracefully. "I guess I better go to a dressmaker with it," she said. "I don't want to trouble you."

"It won't be any trouble, indeed," said Helen, taking the dress from her.

After fifteen minutes of lively discussion, of pinning back and pulling forward, and holding up and letting drop, during which Cornelia twisted her neck half off, as she said, looking at her own back; she mounted a chair and surveyed herself in the glass.

"Well, you *have* got a touch, Miss Harkness," she said.

"Oh, yes," returned Helen, simply. "I know that."

"Well, why in the world—" Cornelia began. But she checked herself.

"Why what?" asked Helen.

"Oh, nothing," returned Cornelia, with the outward hauteur which was apt to mark a spiritual struggle with her. "I'll see Zenas Pearson to-morrow about those photographs."

"That will be very kind of you," said Helen.

The next day Cornelia brought her three of the unsparing likenesses in which the art of photography sometimes unmasks its subjects. One was a gentleman in what he would have called chin-whiskers, with his hair gathered in a puff over his forehead, and a gold watch-chain wandering across his bulging shirt-front. The other was a lady in middle life, with her small-features losing themselves in the obese contour out of which her eyes looked over little cushions of fat. The gentleman was to be painted of a fair complexion, and the lady as a brunette; the third picture was the likeness of this lady's child, which was to be colored in accordance with her present appearance in the spirit-life as reported by a writing-medium.

"I don't envy you the job, any," said Cornelia Root. "Zenas apologized for not havin' any place for you to work in his gallery, but I told him I guessed you'd rather work awhile at home first."

"Oh, yes," murmured Helen, lost in a heart-sick contemplation of her subjects.

"He can allow you two dollars apiece for 'em. It's better than nothin', and it aint *much* better, and so I told him," said Cornelia.

"Oh, it's quite enough; quite," returned Helen.

After her first despair, she resolved to be very faithful and conscientious in her work, and try to make the poor things look as well as she could. She had finished them all by the end of the week, but when Cornelia carried her work to Mr. Pearson, he was critical of it. "Of course," he said, "she's done her best, and so far forth she's earned her money; but anybody can see with half an eye that she aint a natural artist. There aint any *touch* about it."

"Good gracious, Zenas Pearson!" cried Cornelia. "Do you expect to get an *artist* to paint up those scarecrows of yours?"

She put Zenas down, but he offered her no more work, and she was too proud, in Helen's behalf, to ask for it. She was more deeply hurt and discouraged than Helen herself appeared. The latter, in fact, professed a sense of relief when Cornelia, with a blunt reluctance, owned the truth.

"I *couldn't* do any more, if he had given them to you for me. I know that I don't do them well, and they're so hideous, that if I were the greatest artist in the world, I couldn't help making them wooden and staring. I *must* try something else; and I've been thinking, I've been wondering, if I couldn't write something and sell it. Do you know any people—women—who write for the magazines, or the newspapers rather?"

"Well, I know one girl: she's an art-student, and she helps herself out by correspondin'; writes for two or three papers up-country, and out West; but I never saw any of her stuff, and I don't want to; for of all the *perfect* simpletons—!" Cornelia was expressively silent; she added, thoughtfully: "Yes, I guess it must be pretty easy to do, if *that* girl can do it. I wonder I didn't think of it before. Why don't you ask that ridic'lous Mr. Evans? He's the literary editor of "Saturday Afternoon," and I guess he could tell you all about it."

"I don't like to trouble him," said Helen.

"Well, *I* do, then," retorted Cornelia. "What's he here for?"

"I can't let you," said Helen, thoughtfully folding the dollar-bills that Cornelia had brought her. "This money will last a little while, and perhaps—perhaps," she concluded rather faintly, "I can think of something to do by the time it's gone. I know I'm very weak and silly," she said, lifting her suffused eyes to Cornelia's.

"Not at all!" cried Cornelia; and that evening she cornered Mr. Evans, as she said, and attacked him about some sort of newspaper work for a friend of hers.

He was sitting before his fire in a deep chair, with his feet on the hearth of the open soap-stone stove; Cornelia assailed him from a higher chair at a little distance. "Some young man you're trying to help along?" he asked, smiling up into Cornelia's eyes.

"You know it aint any young man!" cried the girl.

"Oh! You didn't say," returned Mr. Evans, coolly. He asked presently, "Why does Miss Harkness want to write for the papers?"

"Mr. Evans! I think you're too bad! I never said it was Miss Harkness."

"But you wont say it isn't."

"I wont say anything about it. There! And if you can't give me any advice without askin' who it is—"

"Oh, that isn't necessary now. But what I *do* wish to ask, Miss Root—and I think you owe it to yourself to answer frankly—is simply this: are you sure that you are trying to befriend Miss Harkness from the highest motive?"

"Highest motive?" demanded Cornelia, whom such an appeal must always arrest. "What *does* the man mean?"

She was on such terms of offense and defense with Mr. Evans, that she often cast aside all formalities of speech in dealing with him, and came down to sincerities that seemed to afford him the purest delight.

"What do I mean? Why, I mean this,—and a person who pretends to keep such a conscience as you do, always dusted off and ready for use in any emergency, ought to be able to answer without prevarication,—are you sure that you are not doing more to help this Miss Harkness because she is a lady of fallen fortunes, than you would do for some poor girl who was struggling up, and trying to support inebriate parents, and pay a younger brother's way through college?" Cornelia opened her mouth to protest, but he hastened to prevent her. "Wait! Don't commit yourself! Are you sure that her being visited by a lord has nothing to do with your beneficent zeal? Are you sure that you are not indulging a native disposition to curry favor with worldlings and vanities generally? Are you certain that at the best you are seeking anything better than the self-flattery that comes through the ability to patronize a social superior? I merely ask you to reflect."

These were precisely the doubts which Cornelia had already exorcised; but they all sprang into new life at the touch of the laughing malice that divined them.

"I declare," she said, "you are enough to provoke a saint!"

"I'm glad to see it," said Mr. Evans. "Now, I'm *not* a saint, and I can be frank and open about a great many things that I observe saints like to fight shy of. A saint—especially a female one—is about as difficult a party to bring to book as any I know. Now *I* don't mind acknowledging all these shameful motives which *you* feel that you must blink. *I* don't mind saying that the notion of throwing something in the way of a young lady who has moved in the first circles, and still associates with lords and ladies on equal terms, is quite intoxicating to me, and that I will help you in this work with far more pleasure than if she were a mechanic's or farmer's daughter." He smiled at the rueful misgiving painted in Cornelia's countenance. "Come, Miss Root, what kind of newspaper work does your patrician protégée think she can do?"

"I don't know as I want to talk with you about it," said Cornelia. "You had no business to find out who it was."

"I know—I know. It was my fatal gift of divination. A random guess, and your own guilty soul did the rest. Well, go on, Miss Root. You know that you're not going to let a selfish pique interfere with an opportunity to do good—to one above us," he added.

"I should suppose," said Cornelia, grimly, "that you would know a great deal better than I do what she'd best try. I presume she could do 'most any kind of writin'."

"That is the presumption in regard to all refined and cultivated people till they prove the contrary—which they usually do at the first opportunity."

"I should think," pursued Cornelia, whose courage always rose in view of any but moral obstacles, "that she could write notices of books. Seems as if almost anybody could write them."

"Yes," assented the journalist, "it seems as if 'anybody' *did* write the greater part of them." He took up some novels from his tables. "Here are three novels, if she wants to try her hand on them, and she can review the batch together. That is the way we do. There's quite a range in these: one is an old writer of established fame, one has not quite proved himself yet, and one is unknown. You would naturally think that if such books are works of art they would go to people of experience and reflection for review, but that is a mistake; they go to people who can be the most flippant and impertinent about them, and we find, as a general rule, that the young ladies who write for us can be more flippant and impertinent than the young men."

He laughed as he handed the books to Miss Root, and watched her face.

"If I could ever tell," she said, taking them from him, "how much you believed of what you said, it would be *one* satisfaction."

"No, no, that isn't it, Miss Root: what you would like to know is how much *you* believe of what I say. Very little, I imagine. The philanthropist's ability to reject any truth that tells against him—or her—is unbounded."

"Well," said Cornelia, "I don't know as I care, so long as you give her this chance."

"Oh, it's perfectly safe; she'll be sure to fail," said the editor. "Tell her I want the notices next week some time. In the meantime, *I* don't know who's writing them."

He did not betray himself in any way during the ensuing week, and he left Cornelia unmolested with a secret which she did not know whether she ought or ought not to keep. Helen worked very hard at the criticisms; she had it on her conscience to do them very fairly and justly, because when she had read the books carefully through she perceived for the first time how much thought and labor must go to the construction of even indifferent stories; and she felt that it would be a sin not to do justice to all this in the case of novels which were certainly not first-rate. She thought that she ought to be care-

ful about her style, and not say anything in a slipshod or slovenly way. She wrote out her reviews in her neatest hand, and then she copied them all, so that there was not one blot or erasure. She determined that if Mr. Evans accepted them, Miss Root should tell him who had done them; for there were some points which she was doubtful about, and on which she would like his instruction. She was very simple and humble in the matter, and in her own mind looked up to the journalist in his professional quality with an awe that she had not hitherto felt for anything connected with "Saturday Afternoon." Her father used sometimes to buy that paper and send it to her when she was away from home, and she had read its social gossip with a high-minded disapproval of the entertainment it gave her. She never thought of looking at the notices of books in it; and when she first heard that Mr. Evans was connected with it, she had resolved to be very careful what she said before him, and she had partly withdrawn from anything like intimacy with Mrs. Evans for that reason. It was very well for Clara Kingsbury; Clara Kingsbury was a kind of public character herself, with her charities and enterprises, her homes and her fairs, which were always needing newspaper mention; but for Helen it was another affair. Even now, while the question of the acceptance of her work was pending, Helen asked herself whether she would like to have the Butlers know that she wrote for the "Saturday Afternoon," and was quite sure that she would not.

"If he should take them, and you tell him who did them, please ask Mr. Evans not to mention it to any one," she said, in giving her manuscript to Cornelia Root, who had suffered everything in the guilty consciousness that he knew already who had done them.

"I aint afraid," she said to Mr. Evans, in discharging herself of the business, "that you'll mention it; but if you *should* have to refuse them, and then if you should show out any way that *you* knew, it would about kill me."

"Rely upon me, Miss Root," returned the editor. "I have rejected such loads of young-lady literature, that I have become perfectly hardened, and never show out in any way that I know there are young ladies or literature in the world. Ah!" he added, carelessly opening the manuscript, "the bold, free hand of fashion, pages neatly pierced at the upper right-hand corner and strung upon a narrow red ribbon with notched edges; faint odor of the young person's favorite perfume. Yes, this is the real thing."

He laughed in the way that Cornelia Root had more than once said she could *not* stand when talking with him about serious things.

She went out after leaving the manuscript with him in the morning, and shortly afterward Helen received the card of Mr. Hibbard, who was waiting for her in the reception-room. It was rather a shock at first, and then she found a sort of relief in the second anxiety, as people do in playing one care off against the other. She said to herself, in putting her ear-rings in before the glass, that he must have heard from Captain Butler, and that if Captain Butler sided with Mr. Hibbard, she should not know what to do; she would have to yield, or at least let the whole matter rest till she had heard from Robert, to whom she had written all about it.

"Good-morning, Miss Harkness," said the lawyer, absently dropping her proffered hand. "I have a cablegram here from Captain Butler."

"Oh, I thought you must have," said Helen, in the pause which he suffered to take place before he went on, with a frown at the paper in his hand.

"He telegraphs me from Naples, in answer to my letter, and directs me to obey your wishes as to paying Mr. Everton's claim."

The lawyer lifted his eyes and looked into Helen's face, as if to wait her orders; and her heart sank. This was what she had been eager and urgent to do when they last met; it had seemed to her then that she could not rest till Mr. Everton's claim, just or unjust, was paid, since its existence involved a doubt of fraud. But in fact she had, not being able to help herself, rested very well, and she had begun to hope that the doubt could be somehow cleared away without the cost of everything to her.

"Is that all he says?" she asked, feebly.

"No; he says he will write."

He handed her the dispatch, which she mechanically read, and then twisted round her finger.

"What do you think, Mr. Hibbard?" she asked at last, pitifully.

The lawyer must have seen so many people halt between their interest and their sense of abstract right, and gladly take advantage of any doubt in their own favor, that he could not have wondered at her hesitation. But he was obliged to say:

"I can do nothing now but receive your instructions. I will contest the claim to the last, or I will pay it."

He again explained the matter, and put the points clearly before her.

"And there must always be this doubt

about it, even if we gained the case?" she asked.

"Always. Even if that scamp himself were to declare in our favor, and acknowledge that he had played upon Everton's suspicion, the doubt would remain."

"Then, I can't bear it! You must pay Mr. Everton!" cried Helen. "Anything, anything is better than living upon stolen money!" At the same time that she pronounced this heroic truth, which indeed came from her inmost heart, she burst into human tears for the loss of all that she could call her own.

"Miss Harkness," said the old lawyer, "I would not let you do this—I would take the responsibility of disobeying you and Captain Butler both; but—but I must tell you that my inquiries into the matter have not been satisfactory. I have talked confidentially with several of the gentlemen who were present at the sale, and I find that they all carried away the impression that there was something queer about the bidding toward the last. Now, as I said before, I don't believe that Everton's understanding with Mortimer will ever allow him to press the question to an issue, and that you could rest legally secure in the possession of this money; but this, as I conceive, isn't the point with you."

"Oh, no, no, no! And thank, *thank* you, Mr. Hibbard, for letting me decide the matter—and thank God for helping me to decide it rightly—before you told me this. Whatever happens now, I shall have the consolation of knowing that I wasn't influenced by the fear of what people would think or say. I know that I should have been, but I know that I wasn't." She dried her eyes, and controlled her quivering lips. "Don't lose an instant, please, about paying him, and pay him every cent. And oughtn't I—oughtn't I—to say something, do something to show that I was sorry that he was kept out of the money so long?"

"I don't think Mr. Everton will care for that," said Mr. Hibbard. "The money is what he wants. I will pay it; and then what will you do, Miss Harkness? You were coming to me for money, you said: you mustn't allow any mistaken feeling——"

"Oh, no, I wont."

"I am sure that Captain Butler will wish me to be your banker till he comes home."

"Yes, certainly; but I have a little money yet," said Helen, following Mr. Hibbard to the door.

XVI.

THE lawyer was mistaken in supposing that Mr. Everton cared for nothing in the affair except the money. He came that afternoon to make his acknowledgments to Helen, who felt it her duty to receive him when he called, and he showed himself capable of responding generously to her own action.

"I am well aware," he said, "that I owe this reparation to you, Miss Harkness, and I wished you to understand that I could appreciate your conduct. The original claim is now fully satisfied; but the interest on the money that I have been kept out of, would have amounted during the past seven months to something like two hundred dollars—a little short of two hundred dollars. I have written to your attorney that we will say nothing about this sum, that we will consider it paid."

"Thank you," said Helen, blankly.

It was not, perhaps, that she was insensible to Mr. Everton's magnanimity; but just then she was studying his personal appearance with a strange fascination. She found something horrible in the neatness of this little old man's dress, in the smug freshness of his newly shaven face, which had the puckered bloom of an apple that hangs upon the tree far into the winter's cold, and even in the smoothness and cleanness of his conspicuous linen.

He returned her absent gaze, winking his little red-lidded eyes. He presently said:

"I have had to lay out a great deal of money on the house, and I thought this might as well go into the general account. The structure was very good; but there were many things that needed going over, the plumbing especially. I have had the plumbing put into perfect order. Mrs. Everton was very particular about it—the ladies are, I believe. I think you would be pleased to see the improvement."

"Yes," said Helen.

"I have had brass pipes put in nearly everywhere; Mrs. Everton had heard that they were very much superior, and I was willing to do anything to gratify her: she was very low at the time."

He coughed behind his hand, and Helen awoke from her daze to say, gently:

"Oh, I hope she's better."

"Thank you," returned the old man. "But she is dead."

"Oh!"

"Yes, she was so far gone that she could not be moved from our old house. I never expected she could; but I made the changes to please her, and she went over them all in the architect's plans. I spared no expense. I don't suppose," said Mr. Everton, with a sort of brisk appeal to Helen, "that you would know the place now: the old cornices all down, and fresh paint and paper everywhere."

Helen did not reply; but she looked at the

man with a pathetic wonder, which he apparently did not feel.

"I think," he continued, with a certain insinuation, "it would interest you to see the changes."

"Oh, no!" Helen broke out.

Mr. Everton looked at her and passed his tongue over his red lips, fringed with dry cuticle at their edges, in apparent perplexity.

"I don't mean to say," he resumed, "that the general plan of the house is changed; that couldn't be done; Mrs. Everton saw that herself. In many respects she was a woman you could reason with. It was a great blow to lose her."

"It must have been," said Helen, relenting again, but wondering a little why Mr. Everton should speak to her of these matters.

He explained for himself.

"Your burying your father such a short time before I buried Mrs. Everton, it seems a sort of coincidence,—a kind of bond, as one may say,—and makes me feel as if—as if—you could appreciate my feelings."

"I am sorry for you with all my heart," said Helen. "I didn't know," she added, vaguely, "that you had met with any bereavement."

"Yes; she's dead," sighed the old man. "It isn't as if I were broken, or hadn't kept my health. I'm as well as ever I was, and as strong. I'm as good for business as any two young men I know of. But it's when I come home from business that I feel it; that's where the rub comes in; it's lonely. Yes, it's lonely."

"Oh, yes," said Helen, surprised into sympathetic confidence by the simple words. "I often felt it in my father's case, especially toward the end, when he seemed to live so much in the recollection of the past, and I knew that I was scarcely any companionship for him."

"Your father," said Mr. Everton, dryly, "was a much older man than I am, and he was all broken up before he died; I used to notice it. I don't believe," he went on, "but what you'd like the house as well as ever, if you saw it. I should be very sorry to think I'd done anything to it that you didn't like."

"It's very, very kind of you to say so, Mr. Everton," returned Helen, cordially. "And you mustn't think at all about it. When I made up my mind to part with it, I made up my mind never to care what became of it."

"Well, that was the right spirit," said Mr. Everton.

"And if the changes you have made in it gratified your wife in her last days, I can only be glad of them. I shall always think of my old home as it used to be; if it were burned to the ground, it would remain there, just as I left it, as long as I live."

"Well, I'm pleased to hear you say so," said the old man. "I like to see a young lady sensible ——"

"Oh, I'm not sensible," protested Helen; "but I like what you've done because you did it to gratify your wife in her last days; that makes it sacred."

"I was always on good terms with her," said the widower, "and I always determined to wait a proper time, if I should want to marry again. But if you believe you've found the right one, there's no sense in waiting too long."

He looked inquiringly at Helen, who was somewhat mystified at the turn the conversation had taken. But she said, politely, "Oh, no."

"I should want you should like the house on your own account," he continued, still more irrelevantly.

"On my own account?" faltered Helen.

"Because I want it to be yours," cried the old man, with a sort of violence. "I appreciate the course you have taken in regard to the fraud that was practiced upon me at the sale, and I say that you have acted nobly. Yes, nobly! And I should wish to give the house to you as a mark of — of — my esteem; that, and everything else I have. I'm alone in the world, and nobody has any real claim on me, no matter what her *relations* may expect, and I will deed the house to you to-day, if you say so!"

It all seemed like a dream of romance to Helen; it was fabulous, it was incredible, it must be impossible. She began to think that the old man was insane, and involuntarily left her chair. But there was nothing abnormal about him, unless it was the repressed excitement in which he sat blinking at her, as he went on:

"The house can be your home to-morrow — to-day, if you like. You have only to say the word." He seemed to form some sort of hope or expectation from her continued silence, and now he rose. "If you're willing, there's nobody to interfere, and I should soon teach them to attend to their own business if they attempted it. My mind is as clear and my health is as good as ever it was, and I would do everything I could for you. I admire you, and I respect you. I think you have right principles, and that's a very important thing. I should be proud of you. To be sure, we haven't been much acquainted, and I suppose it's only reasonable you should want time to think it over. I'm in no hurry; though, as I said, my own mind is made up."

"I don't understand what you mean,"

gasped Helen. "What *do* you mean? Why should you give me your property? and why ——"

Her eyes dwelt hopelessly upon his face, in which a smirk of cunning insinuation struggled with an anxious perplexity. He again passed his tongue over his dry, red lips, and then cleared his throat, and breathed hard:

"I meant—all I have; not that house, but half a dozen houses, and everything I'm worth. I'm not afraid of what people would say. If we're both of one mind, the difference in age is nothing." At a sign of renewed impatience from Helen, he added, desperately, "I want you to be my wife!"

She recoiled, with a shudder, and her teeth closed in a nervous paroxysm. "Oh!" she uttered, in abhorrence far beyond rejection; and, creeping softly by the wall to the door, with her eyes fixed warily upon him, as if he were some nightmare spider that might spring upon her, she vanished out of it and fled upstairs to her own room, where she bolted herself in.

The half-hour of self-loathing that she passed, with her burning face in her pillow, could not have been more cruel if what had happened were some shameful deed of her own. She searched her soul for cause of blame; but she could find nothing worse there than the consciousness of having suffered herself, for one inappreciable instant, to dream of her home coming back to her by the wild poetic chance which the old man's words had intimated. This point of time, fine and tenuous as it was, had been vast enough for her to paint a picture on, where she and Robert, dim figures of grateful reverence, had seemed piously to care for the declining years of their benefactor, and to comfort his childless solitude at their fireside. But the silly vision, for which she grieved and blushed, was innocent, as she felt even in the depths of her self-abasement, and the thought of it ended in the reaction through which she rose from the bed and dashed off a letter commanding Mr. Hibbard to pay the interest on the money due Mr. Everton, to the last cent, and not to accept any sort of concession from him. But the horror of his offer survived, an incredible fact, which she could not reject. His age, in asking to mate itself with her youth, had seemed to dishonor both, and had become unspeakably ugly and revolting to her. She wondered what kind of young girl could it be that could marry an old man, and what he had seen in her that made him think she could be such a girl. Nothing, she was sure; and therefore this humiliation, when she was so blameless, must be her punishment for sins from the consequence of which she had seemed to escape; for the way in which she had tortured Robert; for her flirting, as she did that first day, with Lord Rainford; for liking to be admired, and for, perhaps, trying to make people admire her. Yes, that must be it; and as soon as Helen fitted the burden to her spirit, she rose up with strength to bear it. Whatever men have contrived to persuade themselves, in those latter days, as to the relations of cause and effect in the moral world, there are yet few women who do not like to find a reason for their sufferings in their sins, and they often seem still to experience the heroic satisfaction in their penalties which nothing but the old-fashioned Christian's privity to the designs of Providence can give.

When Cornelia Root came home to tea, she knocked at Helen's door and passed in round the jamb a hand with which she produced the effect of rejecting all responsibility for the letter it conveyed. "I guess it's from Mr. Evans," she said, refusing to look in. "I don't know what's in it."

Helen was ready, in her penitence, almost to welcome the worst; but the envelope only conveyed a printed slip from the publishers of the "Saturday Afternoon," in which they thanked her for her contribution and begged to inclose their check in payment. She rapped in her turn at Miss Root's door. "Just to tell you the good news," she explained to Cornelia's inquiring face, while a laugh fluttered out of her throat, which just failed of being a sob. "They've accepted them!" She escaped again into her own room, before Cornelia could formulate that strictly truthful expression of her feelings without which she would not speak at all. She joined Helen a little later, and underwent pangs of remorse in arranging with her to call on Mr. Evans that evening and confess the authorship of the reviews preparatory to asking his candid criticism and his advice about future work. Cornelia's heart smote her in the presence of Helen's unsuspicious rejoicings; she languished for the moment when she could own that Mr. Evans had wickedly divined their secret from the first, and she found no relief, but rather an added anguish in the skillful duplicity with which he received Helen's avowal.

He was alone when they knocked at his door, for Mrs. Evans was putting their boy to bed after the usual conflict with his entreaties and stratagems. "Is it possible?" he demanded, with a radiant deceit. "Why, this is delightful, Miss Harkness. We are quite an æsthetic colony here, under Mrs. Hewitt's hospitable roof—with Miss Root's art-work and your literature and my journalism. Really!" He

deepened Cornelia's sense of nefarious complicity by the smile aside which she could not reject. "Have you written much for publication?"

"I'm afraid you must see that I haven't," said Helen, with a straightforward honesty that Cornelia felt ought to have made Mr. Evans ashamed of himself; "and I wished you to tell me just where I have failed in my work, and, if you will be so good, how I can improve it."

This seemed to Helen a perfectly simple and natural request, and she was not, perhaps, altogether without the feeling that Mr. Evans ought to be gratified at her approaching him for instruction.

"Well, there you set me rather a difficult task, Miss Harkness," he said, evasively. "We usually expect the fact that we are willing to print a contribution to suffice as criticism in its favor."

"Yes," pursued Helen; "but you want beginners to do better and better, don't you? I'm not saying it to fish up a compliment from you, but I wish really and truly that you would tell me what my faults are. Please specify something," she said, with an ingenuous sweetness which smote Cornelia to the soul, but which apparently glanced effectlessly from the editor's toughened spirit. He laughed, as if other ladies had said the like to him before. "Indeed, I shall not be hurt at anything you say!" cried Helen.

"It's a little academic," said the editor. "But that's a good fault. It had better be that than be smart."

"Oh, yes! I detest smartness in everything." She wondered just what Mr. Evans meant by academic, but she did not like to ask, and she consoled herself by reflecting that he had said it was a good fault to be academic.

"I don't know," he continued, "that it is the best plan to tell the plots and explain the characters so fully as you've done; but that can be easily remedied."

"I see," said Helen. "It destroys the reader's interest in the story."

"Yes," assented the editor, "and in the review a little. And I don't think it's best to sum up very deliberately at the end, and to balance considerations so formally."

"No?" said Helen. She had thought it *was* well, and she began to wonder why it was not.

"But that part can be easily omitted. And I shouldn't quote from the book unless I could give something very significant or characteristic. Your sentences are a little long. And it is rather late in the day to open with an essay, however brief, on the general effect and tendency of fiction. I think I should always begin directly with the book in hand, and let those ideas come in incidentally."

"Yes, to be sure," said Helen, eagerly.

Mr. Evans put down her manuscript, which he had taken up from the table, and added lightly, "I shall have to work it over a little before it goes to the printers, and then when you have it in the proof you will see what I've done, and get a better notion of what I mean than I could give you in words."

"Oh, thank you very much. That will be *so* kind of you!" exclaimed Helen. She added: "I was careful to write only on one side of the paper. I heard that the printers preferred it."

"Quite right," said Mr. Evans, with a smile at this innocence. Cornelia Root felt the irony of it, but it was simply amiable to Helen. "They do, very much. It's beautiful copy. By the way, here is the 'Afternoon' for this week, if you want to look it over. You're one of us now, you know."

"Thank you. I shall be very glad of it," said Helen, taking the paper he offered her.

Mr. Evans seemed to have all his work about him, and she thought that she ought not to keep him any longer. She said "Good-night," but Cornelia lingered a little; she could not help it; she could not rest till she knew from the editor, taken alone and defenseless, whether he thought Helen would ever be able to help herself by writing, and she told him so in as many words.

"I saw you attempting to pierce my inmost soul all the time, Miss Root," said the editor. "And I tell you frankly, you wont get the truth out of *me*. Miss Harkness is a very cultivated young lady." He bent over her MS., which he had again drawn toward him. "She possesses a neat and polished style. I could imagine that in letter-writing she would have all the charm that tradition attributes to your sex in that art. In addressing the object of her affections"—Cornelia gave a start of indignant protest and disclaimer, which had no effect upon Mr. Evans, who went smoothly on—"she must be fascinating, and I have no doubt the fashionable friends to whom she describes our humble boarding-house *ménage* think she writes delightfully. But in appealing to the general reader through the medium of the public prints, Miss Harkness seems to think it advisable to present her ideas and impressions in the desiccated form. Her review has all the fixed and immovable grace, all the cold and dignified slipperiness, of a literary exercise." He looked up, and laughed out his enjoyment of the righteous despair in Cornelia's face.

She dropped upon the corner of a chair. "She's got to do something," she said.

"Oh, no, she hasn't," returned Mr. Evans, cheerily. "She hasn't kept her secret so well as you have, Miss Root; and yesterday a fashionable friend of hers stopped her coupé at the pavement, and called me up to the window to say that she was *so* glad I was giving Miss Harkness a chance to write for "Saturday Afternoon," and was sure that I would find her very clever. She was always such a brilliant girl, and said such delightful things! Miss Kingsbury asked me if I didn't think it was dreadful, her having lost everything, and being thrown upon her own resources in this way; and I said I did; but I don't. And then Miss Kingsbury explained that, of course, she and numerous other persons of wealth and respectability would be only too glad to have Helen Harkness come and spend her days with them, but she could not bear the idea of dependence; and wasn't her trying to do something for herself splendid? And I said that I thought it was; but I don't. And Miss Kingsbury said she knew it would appeal to me, and I said that it did; but it doesn't. Why should it appeal to me, — why should I think it splendid that a healthy young woman refuses to be a loafer and a pauper? Why, under heaven, *shouldn't* she do something for herself? The town is full of young women who are *obliged* to do something for themselves. That's the kind of splendor that appeals to me, — the involuntary kind, like my own. Is it any worse for Miss Harkness to work for a living than for the tens of thousands of other girls who are doing it? You have worked for a living yourself, Miss Root. Do you want me to regard you as splendid?"

Cornelia examined her just spirit in silence for a moment. "It's different with us," she answered, "because we were brought up to work. We never expected anything else, and it isn't so much of a hardship for us as it is for a girl like her, who is used to being taken care of, and never had to do or think for herself."

"Ah, my dear Miss Root, it is the princess in exile who appeals to us both! But is she more to be praised for refusing to eat the buttered roll of others' prosperity than the peasant-maids who have never had the chance of refusing?"

"She's more to be pitied!"

"Right again, Miss Root! You are always right. By the way, why didn't you urge Miss Harkness to attempt something in art? Miss Kingsbury asked me if I couldn't get her some book to illustrate! She said that Miss Harkness's sketches were exquisite, and she asked me if I had ever seen any of them. Have you?"

"Yes," Cornelia reluctantly admitted.

"Well?"

"They're hopeless!" cried Cornelia, with an involuntary vehemence that delighted Evans.

"And you thought that, if she couldn't draw, she could write! That was quite natural."

"It was her own idea," urged Cornelia.

"And it was your idea that she should write for me! Very good, very right, very like a philanthropist!"

"Now, you know well enough, Mr. Evans," began Cornelia, "that you were perfectly free to refuse Miss Harkness's writin'; and I aint goin' to praise you up for takin' it, if that's what you're after."

"That's what I'm after; but I knew I shouldn't get it, before you told me. Who praises an editor for anything? You and Miss Kingsbury will only think I've done my duty when I've sat up till midnight putting this pretty rubbish into shape."

"Is it so bad as that?" asked Cornelia, aghast. "Why didn't you give it back to her, and tell her it was rubbish? It would have been the best for her in the end!"

"Because I have a timid and truckling spirit, Miss Root, and you know it. Because I have scarcely the heart to refuse the rubbish of ladies who tell me they have produced it in the interest of some worthy charity, or for the purpose of eking out their pin-money; and I'm naturally helpless in the presence of a lady who has written it for bread — as I am given to understand." Cornelia was silent, and the editor continued, gleefully: "A *woman* can sometimes do something without damaging others; but when a *lady* undertakes to help herself, some man has to suffer for it; and why shouldn't I be the victim? I usually devote Saturday night to working on a little play I'm trying to write, but I dare say the time will be much better employed in rewriting Miss Harkness's reviews."

He watched the travail of Miss Root's soul in her honest eyes with a smile of unrelenting enjoyment.

"Besides, I like to befriend gentility in adversity as well as you do, Miss Root. The thought that I am actually earning money, without her knowing it, for a young lady of Miss Harkness's condescension, does my mean and servile little soul more good than I can well describe."

Cornelia burst forth with a sort of groan. "Oh, it's all wrong, I know it is! But what *is* a girl fit for that's been brought up just as a lady? If there's anything under the sun that she can honestly do, without imposing upon other people and putting them to twice the trouble she takes for herself, for goodness' sake, let her do it!"

"Very just sentiments; but what is it?"

"Well, one thing it *isn't;* and that's writing for the papers, and I shall tell her so!"

"You have no right to abuse my confidence, Miss Root," said the editor, with superficial gravity, through which his laughter broke when she turned desperately upon him. "Miss Harkness's failure is my secret—if it *is* a failure. *I* supposed it was a shining success! There are very few young ladies who can get editors to write their articles for them and then let them pocket the proceeds."

"I should think," said Cornelia, "that you would be ashamed to make fun of everything the way you do. It seems as if you didn't have a morsel of compassion for the poor thing."

"Ah, there it is again! Accept her inefficiency and applaud her failure because you pity her! Do you think the ladies are ever going to do anything for themselves as long as the world is asked and expected to take that attitude? Did you tell her that she was an artist, and then work up her sketches for her? Have a morsel of compassion yourself, Miss Root! I'm going to have large masses of it. I'm going to rewrite Miss Harkness's whole review!"

His laugh followed Cornelia as she climbed the stairs in slow and heavy perplexity to her room.

Helen in her room was light-heartedly writing to Robert, and telling him that, though she had now absolutely nothing in the world, she had never felt so happy since her father died, for now she had found at last that she could do something and be of some use. She could not grieve, even for his sake, for the loss of the money paid back to Mr. Everton—the thought of it now was such a perfect horror. She said that some time she should tell him why, but not now; and she turned from the odious subject to describe her interview with Mr. Evans, who had been so frankly kind and encouraging. She had not said anything to Robert about Lord Rainford yet, and she wondered whether she ought. Some time, of course, she must do so; but she was afraid it might be difficult to make the whole affair clear to Robert at that distance. It was something that could be much better spoken than written; she resolved, at least, to leave her letter open till morning, and decide then what she should do.

She was not sleepy, but she felt a pleasant languor, such as comes after the fortunate close of a period of strong excitements, and she sat down before the fire, which was giving out its last delicious glow, to indulge her fatigue a little more luxuriously. She looked back over what had happened during the week with satisfaction, now that it was past; she was glad not only that she had paid that horrible old man his money, but that she had been right, and not, as she had sometimes feared, morbid and conceited about wishing him to be paid. She felt that she had behaved in a sensible and business-like manner; that Captain Butler's action proved this; and that all the events sustained her in her first instinctive impulse. At this safe removal in time and space, Mr. Everton's proposal did not seem so simply horrible; it began to reveal some amusing aspects; she broke into a little murmur of laughter when she thought of certain moments of perplexity for him.

As for the money, it was a little matter: it was five thousand dollars in the abstract, but in reality it was only six dollars a week; and with the prospect of literary work from Mr. Evans, and perhaps other editors, she could easily make that up—she had earned ten dollars by her pen already.

She unfolded the paper that Mr. Evans had given her, and the crepitation of its leaves sent a light shiver through her. What would the Butlers say when she sent them the next number, with her reviews marked in it? She knew from her own fine reluctance that it would surprise them disagreeably; and she fancied Jessie Butler supporting, and Mrs. Butler forgiving, while Marian Ray denounced her new attempt. But, she reflected, she would often have to disagree with Marian Ray; and whatever people said of the society gossip in the "Saturday Afternoon," it was a good literary paper. Everybody acknowledged that. She heard herself defending it to Marian, and in the rapid process of reverie it had come to her saying plainly to Marian that she saw no disgrace in writing for the newspapers, and that the only disgrace could be in writing dishonestly and vulgarly for them. She had said she had Clara Kingsbury's approval, and Marian had laughed and answered: "Oh, if she had *Clara Kingsbury's* approval!" and had retreated again to Naples; for Helen had now the newspaper quite open, and was looking for the book reviews occupying the place which hers would have the next Saturday. They were rather appallingly well written; she could see that they were indefinitely better done than hers. She wondered if they were Mr. Evans's, and she gave a little sigh of dismay, while her eye wandered idly to the next column, where a name arrested it.

The name was Fenton's, and the paragraph in which it occurred seemed to become alive and sentient under her eyes. It was a dispatch from Washington, rehearsing, with telegraphic brevity, the facts of the wreck of the *Meteor*, as furnished to the State Depart-

ment by the consul at Tahiti from the statements of the survivors.

Five days after the disaster, the French ship *Belle Paysanne*, which brought them to that port, had fallen in with an open boat containing Captain Rollins and a number of the *Meteor's* crew and passengers, who reported that Lieutenant Fenton and three others had volunteered to remain on the reef where the *Meteor* struck till the overladen boat could find land and return to them. The *Belle Paysanne* altered her course and visited the scene of the catastrophe; but the wreck had then disappeared, and there were no traces of the men left behind. A week later, however, the ship picked up another of the *Meteor's* boats with the two sailors who had remained with Lieutenant Fenton. From the narrative of these men, it seemed that the wreck had broken up the day after Captain Rollins abandoned her, and that Lieutenant Fenton, who had lingered on board after helping to launch the boat, was caught in the wreck and carried down with her. His companion, a passenger named Giffen, was rescued by the seamen; but he had been so badly bruised by the floating timbers that he died the following day.

They confirmed the statements of Captain Rollins and all the other survivors concerning the heroic behavior of Lieutenant Fenton, who had chosen to remain on the rock rather than imperil the lives of the passengers in Captain Rollins's boat, and who had been most efficient throughout the events that followed the striking of the ship. The boat in which the men were found was in a ruinous condition, and was set adrift after their rescue. A large sum of money belonging to Captain Rollins, which they had recovered from the wreck before it broke up, was restored to him.

XVII.

HELEN did not come down to her breakfast, and Cornelia Root, who was finishing hers about the time there began to be question at Miss Harkness's absence, said she would step in and see what the matter was after she got on her things. She found Helen sitting before the empty grate; the gas was burning and the bed untouched, and a thrill of terror went through her lest Helen should be sitting there dead. When, after bidding her good-morning in vain, she ventured to touch her on the shoulder, Helen looked round with a stare that, for the moment, made Cornelia repent being so bold.

"For the good Lord's sake!" cried the girl, "what *is* it, Miss Harkness?"

"Oh, nothing," said Helen. She began to laugh, and tried to hide under her hands the newspaper she had in her lap, and then, as if at her failure in this, she began to weep piteously. "Look!" she exclaimed, opening the paper and pointing to the story of the shipwreck. "He's dead! And those men killed him. Oh, I've thought it all out!"

Cornelia took the paper and, after a swift glance at the paragraph, put it aside without questioning her.

"I guess you better lie down, Miss Harkness, and try to get some rest. I'm going to have your fire made up."

She got her to bed, and then she conferred with the landlady outside the door; she ended by sacrificing her own preference for a female physician and calling in the doctor who, Mrs. Hewitt recollected hearing Miss Harkness once say, had taken care of her father.

She sent a note to Miss Kingsbury, telling her that she was afraid Miss Harkness was going to be sick, and asking her to come to see her; but word was returned that Miss Kingsbury was in New York, and would not be home till the latter part of the week. It was then too late to move the sick girl to her friend's house.

It did not need the light which Miss Kingsbury threw on her relation to Lieutenant Fenton to enable Helen's fellow-boarders to understand what had happened. Cornelia Root had understood it at once, with austere resolution not to recognize her own privity to the fact even to herself; Mrs. Evans had divined it, and talked it over with her husband, who halted between remorse for having laughed at Helen's contributions and secret question whether he would not be justifiable in using a parallel incident in his play; Mrs. Hewitt guessed it out, in a hungry inability to talk it over with anybody, and got her first real comfort out of the expansive desolation in which Miss Kingsbury confided to them all her grief for what had happened, and stated the facts as fully as she knew them.

"Well, it didn't stand to reason," said Mrs. Hewitt, "that she would care so much for a brother, and an adopted one at that."

"Oh, no!" cried Clara. "It was much more than that!"

She got a professional nurse to relieve the devotion of all Helen's volunteer nurses, and from this young woman Mrs. Hewitt at first hoped everything, but only to be the more keenly disappointed; for, so far from reporting the tenor of Helen's delirium, the nurse wholly refused to talk of her patient. She would sit at Mrs. Hewitt's own table, and blink at Mrs. Hewitt through her glasses, and never say a

word morning, noon, or night, until Mrs. Hewitt did not know what *would* become of her. Mrs. Hewitt's disgust with the nurse authorized the first full laugh which Evans had permitted himself since Helen's sickness began. It was after a favorable turn had taken place; nevertheless, Cornelia Root bent upon him a look of keen reproof.

"Oh, come now, Miss Root!" he protested, "I'm not going to stand that. I've just succeeded, after infinite pains and argument, in convincing Mrs. Evans that I didn't cause Miss Harkness's fever by laughing at her literature while I was putting it into shape that night; and I still believe that if she had died, my wife would have required me to deliver myself up to justice. But I am an innocent man, and I wont have you going round and looking as though this never would have happened if it hadn't been for me."

Cornelia opened her mouth to deny the accusation, but Evans hastily interposed. "Do you mean to say that you haven't thought—that you haven't *felt*—that I was somehow to blame for the whole thing?" She refused to answer, with a dignity that did not avail her. "Don't fall back upon the fact that I lent her the newspaper! I didn't invent the facts, at any rate; but I've suffered under the ban of public opinion quite as if I had, and now I'm going to stop it."

"What nonsense!" said Cornelia. "But if your conscience pricks you for anything, *I'm* not going to comfort you."

"Oh, it isn't *my* conscience that pricks me! It's *your* conscience and Mrs. Evans's conscience that have goaded me to desperation. I can get on very well with my own conscience."

As soon as Helen could be safely taken away, Clara had her carried to her house, where she completed her convalescence amidst every superfluity of luxury. For many weeks she remained, gathering strength and listlessly accepting service and favor that she never could repay; but at last the day came when the tide of life rose high enough in her veins to beat in feeble revolt.

"You know," she said, "this must end some time, Clara. I'm not your mother or sister. You can't keep on taking care of me, as if I belonged to you."

"You *do* belong to me, Helen, dear," cried her friend, with a rush of generous tenderness. "Don't talk of anything ending, but just stay on and on. Why shouldn't you? What would you do?"

"Ah, that's the old question!"

"I didn't mean that! I meant, why should you try to do anything?"

"I suppose, because I'm not a lily of the field, for one thing." Clara laughed gratefully for the gleam of gayety from Helen, whose sadness had been heavy on her heart. "I should be glad enough never to do anything, or even be anything again. You understand, Clara, what I've been through?" she asked.

"You hinted something once, and I could guess the rest."

"Then we wont speak of it. It's such a mercy we needn't! But you can see that all the past is swept away from me. There's nothing left; I have to begin everything new, with new ideas and new objects. I used to be ambitious about helping myself, but I'm not now; even my pride in that is broken." The tears of self-pity started to her eyes. "Yes, I would be humbly grateful if I needn't do anything. But I must. And the old question comes back, What?"

"Oh, Helen," said her friend, devoutly, "if you would only stay and be a companion to me—anything!"

Helen smiled. "To cheer you up—read to you—keep you interested—go pleasure journeys with you? Yes, I should be a gay companion."

"Well, then, my housekeeper, if you *will* insist upon usefulness,—and I don't blame you for it; I should myself. Why shouldn't you be my housekeeper? I have heard of girls trying that!"

"I should be glad to learn housekeeping of *you*, Clara. You know I don't know anything about it, and that you know everything. I used to pretend to keep house for papa, but Margaret really did it all. I must be fit for something; but I can't tell what it is, yet."

"I can't bear to hear you talk so, Helen. Why don't you try writing again? I'm sure Mr. Evans would be glad to have you."

"Don't!" cried Helen. "I couldn't think of anything I tried before—that." She touched her calamity with the word, and then struggled to get away from it with a curious effort of her broken spirit, which Clara said afterward made her think of a crippled bird trying to fly. "I'm a fearful problem, Clara. But don't worry over me any longer, now. There must be some very simple answer to me, if we take time to think it out; and I'm afraid I'm willing to take all the time you'll let me. I'll accept any sort of disguised charity at present; and if you want to start a subscription for me, Clara, you may. Only, don't let me know about it."

A thought seemed to strike Miss Kingsbury, which kept her silent for a moment. "There was a Hungarian lady here last year, who had a plan of gardening for girls—vegetable and flower gardening. I wonder if you met her."

"No," said Helen.

"She was at the Kelloggs'. She was Mrs. Kellogg's religion for the time being." Helen did not catch hopefully at the gospel of the Magyar prophetess, but looked with a rueful surprise at her friend, who went on: "Then there has been a good deal of talk about farming for women—small fruits, and poultry." She threw out the suggestion diffidently, but gathered courage when once it was projected from her. "I suppose one becomes interested in it, and gets very fond of the poor little things."

"Which, Clara—the berries or the chickens?" asked Helen, with a lifeless laugh. "I should want to eat the berries, but I can't imagine eating poultry of one's personal acquaintance."

"Oh, I meant having an affection for the chickens; you'd have to let other people eat them." She joined in Helen's laugh at the futility of her suggestions; but she added: "Well, we must think out the answer to you. There's no hurry."

"Oh, no."

That afternoon Margaret came with a heart full of proud contrition to blame herself for having been in Ireland for the past three months, and for having just learned of Helen's sickness and whereabouts. She wept over Helen's sorrows and over her wasted looks and hollow eyes, and the girl was freer to talk with her of what had happened than she had yet felt with any one else.

She told her about the shipwreck, of which Margaret had not heard before, and she showed her a scrap of paper, the cover of an official dispatch. "Here are his last words. He wrote them to me while he was standing on that rock in the middle of the sea, and they came from Washington after I was taken sick."

"Oh, Miss Helen, Miss Helen, how did you ever live to tell the tale?"

Helen did not answer. "We were engaged, and he was coming home," she said, with a sort of crazy satisfaction in the poignancy of Margaret's sympathy. She threw the burden of suffering upon her for the time, and talked with an unsparing hardness for herself. "But I deserved it—I deserved it all." Her thin hands trembled in her lap and her head shook.

"Where are you living now, Margaret?" she broke off, abruptly.

"Why, Miss Helen," answered Margaret, with a blush, "I'm living in the Port, in a house of my own."

"In a house of your own?"

"Yes, Miss Helen." Margaret hesitated. "You see, there was an old fellow on the ship, coming back, that had been out to Ireland too, and he kept talking so much about it all the way, and never leaving me a moment's peace, that I thought maybe I'd better. And so, I did—three weeks ago."

"Did what?"

"Married him, Miss Helen." Margaret seemed doubtful of the effect of the intelligence upon Helen; she hastened to add, in excuse, "He's a very quiet body, and he works at the glass-works in East Cambridge. We have a nice little house, and I should be much pleased to have you come out some day and see it, Miss Helen. The worst of it is, that there isn't enough to keep a person busy, and I'm thinking that maybe I'll take a boarder. There's a spare room. He'd like to see you, Miss Helen. I've told him a good deal about you."

"Thank you, Margaret; I will come out some day. I should like to see your husband."

"Oh, he's no great things. But he's a very quiet body."

Helen was looking at the bonnet on Margaret's head, and she answered, rather absently, "Yes." The bonnet was a combination of purple fruits and magenta flowers, caught in a net of lace, as if to protect them from the depredations of birds and insects. "Where did you get your bonnet, Margaret?"

"In Hanover street, Miss Helen," said Margaret. "I don't think it's very good; do you? I paid enough for it; but money wont buy the like of the bonnets that *you* used to make me, Miss Helen."

"You'd better let me see what I can do with this. The shape isn't bad," said Helen, critically.

"Oh, I couldn't, Miss Helen. After what I've said to you! I should feel as if I'd hinted."

"You needn't be 'under a compliment for it,' Margaret," said Helen, with a sudden inspiration. "You may pay me for making over the bonnet!"

"Oh, Miss Helen!"

"Yes. I need the money. I must work for my living now."

"How good of you!" said Clara, when she found Helen with the bonnet in her hands the next day, and learned whose it was.

"It's good *for* me," returned Helen. "Margaret pays me for doing it. Perhaps *this* is the solution."

Clara permitted herself a silence in which her imagination kindled with the idea.

"Helen," she cried, "it is splendid! Why shouldn't you do something of the sort? There's nothing disgraceful about it, and with your taste, your *genius*, you could make every bonnet a work of art—as they do those picture-dresses in London."

They talked the scheme over, and, as soon as Helen was strong enough to attempt it,

they put it in practice. Clara wanted her to set up a shop in her drawing-room; but they devolved upon something more modest in the end, and Helen took Mrs. Hewitt's parlor floor. Clara advanced the capital; a tasteful and *recherché* stock of frames and feathers and ribbons was chosen, and Helen embarked in the enterprise under the favoring smiles of a world at once fashionable and sympathetic and high-minded. It would not be easy to say just how the scheme came to final ruin. But when once a lively lady had said Miss Harkness's bonnets had so much *touch*, and another had answered, "Oh, yes, they were *all* touch," and both had then tittered in tacit recognition of a certain amateurish lack in them, it was well on the way to failure. By the time that a visiting New York lady had said Miss Harkness seemed to be quite a Boston fashion, and had been answered, "Oh, no — a Boston *passion*," she was no longer so. Clara Kingsbury wore her Harkness bonnet to the bitter end (as some one phrased it); but she was notoriously interested, and her heroic devotion counted for nothing. All Helen's gains went to pay the assistant whom she had taken from a well-known milliner's shop, with a just conviction of her own unfitness for practical details; and when her stock was exhausted, and the ladies had given away her bonnets to their second-girls, she had nothing but her debt to Clara for her pains. They cried over the failure together when they had to face it at last, and Clara inveighed against the hollowness and ingratitude of the world. But Helen took the blame upon herself.

"It was arrogant in me to suppose that I could succeed in any business without serving an apprenticeship to it — without beginning at the bottom. It was like those silly women who go on the stage, and expect to begin at the very top, over the heads of people who have faithfully worked all their lives learning to be actors. It's just!"

"That doesn't make it any the easier to bear," Clara repined.

"It does for me," said Helen. "If the things that have happened to me were not just, I *couldn't* endure them."

Clara took her in her arms, vowing that she was the best and bravest creature in the world, and that she had never done anything except suffer unmerited wrong. She would not hear any talk of the money she had advanced; she professed that if their undertaking had succeeded, she had always intended to take her share of the profits, and that she was more than willing to take her share of the loss. How little it was, compared to Helen's, who had lost time and labor, and everything but courage! She did not understand how Helen kept up.

"Because I *must*," Helen explained. "You can bear things that you *must* bear. I suppose that's what makes death endurable to those that have to live on." Clara was silent in awe of her sad wisdom, and she went on more lightly: "Besides, this hasn't been altogether a loss to me, this experience. I've learnt a good many things. I've really learnt how to make bonnets, for one thing, and I believe I can be of some little use to others as well as myself. I've got a new idea, and I'm going out to talk with Margaret about it."

"With Margaret! Oh, Helen, dear, what is it? I'm afraid ——"

"That it's something foolish? It isn't. It's only something distasteful — something very humble. It's something Miss Root suggested."

Clara was only partly comforted. "Miss Root is terribly severe. She doesn't know how to spare people's sensibilities."

"She's had to do with people who have no business to have any sensibilities — like me. I've thought it all out, Clara." A woman instinctively respects another woman who says this, and believes her; Clara listened attentively. "I've thought it all out, and I see that I haven't talent enough to be first-rate in anything. I couldn't endure to be a second-rate artist or writer; but I don't mind being a second-rate milliner; and that's what I'm going to be, if I can. And now I wont tell you anything more about my scheme till I see whether it's practicable. People will laugh, but they wont sneer; and if they pity me, I shall be glad and grateful for their pity."

Clara tried to get from her some details of her plan, but she would not give them; she would not leave her any comfort but the fact that she could not say or do anything to prevent her trying to carry out her plan.

She went out to Margaret's in the horse-cars, and walked down the little side street to the end of the row of French-roof cottages, in the last and poorest of which Margaret was so proud of living. Helen's sickness and convalescence, and her subsequent experiment in æsthetic millinery, had carried her through the summer and the early fall; the young elms along the sidewalk had dropped their last yellow leaves, and the grass in the narrow door-yards lay limp and flat after the heavy November frosts; around, the open lots stretched brown and bare, swept by an east wind that brought the salt savor of the bay rank across them. A few slatternly goats, lank and heavy-uddered, wandered over the dismal expanse, as if to crop the battered tomato-cans and old boots in which it abounded.

Margaret's house had never had more than one coat of pinkish brown paint, and it looked rather thinly clad for the season; but within, a pungent heat from the furnace, which did more than anything else to make Margaret feel that she was an American householder, struck into the parlor where she received Helen. It was curious and amusing to see how little Margaret had profited by her life in Beacon Steps, in arranging and decorating her best room. There were no evidences of the better taste to which she had been accustomed half her days; she had simply tried to make her parlor as like all the other parlors in that row as she could, with a wood-colored ingrain carpet, tan terry furniture, and a marble-topped center-table; if she had been a Protestant, she would have had a large gilt-edged Bible on this; as it was, she had an infant Jesus in wax under a glass bell.

Helen stopped her in her ceremonious preparations for making company of her.

"Margaret," she said, abruptly, "I want to come and live with you,—if you think you can trust me for my board awhile."

"Indeed, Miss Helen," said Margaret, with a splendor that was worth more than money to her, "I don't know what you mean, exactly; but if you do mean to come and live with me, there'll be no talk of board."

"Well, well," returned Helen, "we'll talk of that later; we're both pretty headstrong." Margaret deprecated this, as far as Helen was concerned, with a flattered simper. "But now I'll tell you what I want to do. You know I've been trying to set up for a fashionable milliner in Boston."

"Yes, Miss Helen," sighed Margaret.

"And I've made a failure of it. The fashionable people don't want my bonnets."

"They're a set of nasty things, Miss Helen," cried Margaret; "and the best of them isn't fit to scrub your floors for you."

Helen laughed at the unmeasured zeal of Margaret's loyalty, expressed in terms so little fit for the polite ears of those they devoted to condemnation.

"No, no, Margaret: they were quite right, and I was all wrong. I didn't know how to make bonnets when I began."

"Miss Helen, if there's been one person spoke to me on this very street about that last bonnet you done over for me, there's been a hundred! Everybody says it's the becomingest bonnet, with more real Beacon Street style to it than any they ever saw me have on!"

"Well, I'm very glad," answered Helen, patiently; "and that brings me to what I wanted to say. If I didn't know how to make bonnets before I began, I did know when I got through—perhaps by spoiling so many." Margaret sniffed a disdainful denial of the premises, and remained with inflated nostrils, while Helen went on. "And what I think is this: that if I could come out here, and take your spare room, you might tell your friends—those poor girls that sometimes waste so much on bonnets—that I could do their work for them just as well, and a great deal cheaper ——"

"*You* work for them good-for-nothing hussies, Miss Helen! *No*, indeed! It's bad enough having you work for *ladies*—if they choose to call themselves such after they throw your bonnets back on your hands,—but as for them trollops of general housework and second-girls, let them fling their money away; they're soon enough parted from it; but you shan't take a stitch for them."

"Margaret, Margaret!" cried Helen. "I'm not strong enough to talk to you, if you go on in that silly way. I haven't a cent of my own in the world, and I must work, or I must beg. The question is whether you will let me have your spare room to live and work in, or whether you will turn me out of doors."

"Oh, Miss Helen, how can you say such a thing?"

"Well, then, don't *talk* so!"

"You can have the whole house, and all that we can do for you, and you shall not pay a penny for it."

Helen rose.

"Very well, then, I shall not take it. You don't want me to have the room, and that's your way of putting me off. I understand you, Margaret. But I *did* suppose that, after all these years you'd lived with us, you *wouldn't* turn me into the streets."

She sank weakly into her chair again, and Margaret called to all the saints to witness if she did not wish to do in every particular exactly what Helen desired.

"Well, then," demanded Helen tragically, "will you let me pay you five dollars a week, and make all your bonnets for you?"

"Yes, yes! Indeed, I will, Miss Helen!"

"And never let your horrid, wicked, foolish old pride interfere with your taking the money—if I ever get it to pay you?"

Margaret solemnly promised, and Helen said:

"Let me go to the room at once, then. I'm *so* tired!"

She suffered herself to be helped upstairs to the little chamber, which Margaret had adorned in the worst taste of Limekiln Avenue, with chromos over the chimney-piece and a set of painted furniture, grained to match the oak paper on the wall. It was like the inside of an ugly box; but Helen fell upon

the clean bed and slept a sleep which carried her well through the afternoon and left her refreshed and encouraged to begin the long fight in which she forced Margaret, from one stand after another, in her determination to treat her as a lady guest. But she understood Margaret well enough to know where to hold her hand; and when Margaret sent *him* to eat his supper in the kitchen, and sat stiffly down in fresh linen cuffs and collar to pour the tea for her in the dining-room, and would not touch anything on the table herself, Helen knew better than to interfere.

When work began to come to her, she resolutely set her face against the indignant majesty with which Margaret would have treated the poor girls her customers. It was clearly Margaret's intention to make them feel that it was an honor and a privilege to have their bonnets made by her Miss Helen. At first, she remained present at their interviews, browbeating them by her haughty silence into acquiescence with every suggestion of Miss Helen's, and reducing them to a submission so abject that Helen was sure some of them ordered just the ribbons and flowers they did not want, and others bought bonnets when they had merely come to talk them over. Margaret followed to the door one hapless creature who had failed, in her confusion, to give any order, with allusions to people who wasted other people's time for nothing so cuttingly sarcastic that Helen revolted, and positively forbade her to interfere; after that she was obliged to content herself with a haughty reception and dismissal of the customers.

Helen did her best to serve the simple, stupid things cheaply and well. She knew that she saved them money, and she made their mistaken tastes her own, and in that way sometimes corrected them, without their knowing it, and launched them upon the world a little less formidable in shape and crude in color than they had intended. But she instinctively studied to obey one of the first laws of business, and that was to supply an existing demand till she had created another. She did not attempt to make her shop — for, finally, it was nothing more or less — a school of æsthetics, as she had in first attempting millinery; she advised and suggested, but she decided nothing. She put both her pride and her preferences into the pocket where she bestowed her customers' money, and kept only a conscience about giving them the material worth of it. They were a great variety of poor girls and women, beginning with the cooks and second-girls of Margaret's acquaintance, whose patronage founded Helen's prosperity, and rising through economical mothers of families to the upper ranks of seamstresses and "sales-ladies." One day there came a young colored girl when luckily Helen was alone; Margaret would never have "demeaned" herself by receiving her; but Helen received her, and in due time sent her forth resplendent in a white hat trimmed in orange and purple.

This incident of her new career seemed to give it an ultimate stamp of authenticity, and it afforded her such saddened satisfaction as could come to her through a sense of recognized usefulness. She spoke of it to Miss Kingsbury and Cornelia Root, who equally approved,—the former because she admired everything Helen did, and the latter because she found it, as Helen herself did, a final testimony to her practicality.

"It's all very well in that way," said Mr. Evans, whom Cornelia had not been able to refrain from triumphing over with a fact that refuted all his predictions of renewed failure for Helen. "So is any one who caters to a depraved popular taste, of any sort, practical. But what I want you to consider is whether there is not something immoral in allowing a savage preference for purple and orange to indulge itself. If I read my Ruskin aright, I understand that there is some sort of occult connection between a feeling for color and righteousness. Now you say that Miss Harkness allows her customers to array themselves in whatever hue of the rainbow they like best; that she daily and hourly violates her own sense of right in color for the sake of money. Don't you call that immoral?"

"What do you have anything to do for with a paper that publishes all those personals and society gossip?" demanded Cornelia in her turn.

"Oh, I'm a poor, weak, erring male man! But I've frequently been taught that, when Woman entered the arena of business, it would be in some way that would elevate and ennoble affairs. I shudder to think what will become of us when women go into politics, if they show themselves so ready in business at all the tricks of trade. But I've noticed that when ladies — I'm not speaking of women now — determine to be practical, they let no consideration stand in their way: they aim to succeed. Look at the unprincipled way they conduct their fairs for benevolent objects! What prices! What swindling lotteries of all sorts! No, your Miss Harkness is like the rest; and it appears to me that at the present moment she is pandering to a very depraved taste in millinery, and I see nothing to admire in the mere fact that she is making a living by it. Lots of people make a living by selling crooked whisky."

Cornelia Root disdained to reply. She only said:

"You talked very differently when she was lyin' sick here in the house; you couldn't pity and praise her enough, then."

Evans laughed shamelessly.

"Well, I was afraid she was going to die, and we always try to make interest with the other world by being kind to people about to go into it. But we never keep it up if they turn back."

He succeeded no better than he meant in unsettling Cornelia Root's mind in regard to Helen. He wished his wife, who usually made her own bonnets, to go out to the Port and order them of Helen, and in turn suffered much the same sort of reproach which he was fond of addressing to Cornelia. Mrs. Evans said he had never before wished her to get her bonnets in Cambridgeport, and she understood that Miss Harkness had quite all the work she could do. She had helped to take care of Helen during her sickness, and had been devotedly kind to her, like every one else in the house; but a woman likes to place her own limits to her benevolence, especially toward other women; and the husband will commit an error who attempts to extend them. She asked him why he did not wish her to get her bonnets of some of the common milliners in Hanover street, and he was unable to say why.

(To be continued.)

NIGHTS WITH UNCLE REMUS.*

BY JOEL CHANDLER HARRIS,

Author of "Uncle Remus, His Songs and Sayings," "At Teague Poteet's," etc.

VII.

AFRICAN JACK.

USUALLY, the little boy, who regarded himself as Uncle Remus's partner, was not at all pleased when he found the old man entertaining, in his simple way, any of his colored friends; but he was secretly delighted when he called one night and found Daddy Jack sitting by Uncle Remus's hearth. Daddy Jack was an object of curiosity to older people than the little boy. He was a genuine African, and for that reason he was known as African Jack, though the child had been taught to call him Daddy Jack. He was brought to Georgia in a slave-ship when he was about twenty years old, and remained upon one of the sea-islands for several years. Finally, he fell into the hands of the family of which Uncle Remus's little partner was the youngest representative, and became the trusted foreman of a plantation in the southern part of Georgia known as the Walthall Place. Once every year he was in the habit of visiting the Home Place in Middle Georgia, and it was during one of these annual visits that the little boy found him in Uncle Remus's cabin.

Daddy Jack appeared to be quite a hundred years old, but he was probably not more than eighty. He was a little dried-up old man, whose weazened, dwarfish appearance, while it was calculated to inspire awe in the minds of the superstitious, was not without its pathetic suggestions. The child had been told that the old African was a wizard, a conjurer, and a snake-charmer, but he was not afraid, for, in any event,— conjuration, witchcraft, or what not,— he was assured of the protection of Uncle Remus.

As the little boy entered the cabin, Uncle Remus smiled and nodded pleasantly, and made a place for him on a little stool upon which had been piled the odds and ends of work. Daddy Jack paid no attention to the child; his thoughts seemed to be elsewhere.

"Go en shake han's, honey, en tell Daddy Jack howdy. He laks good chilluns." Then to Daddy Jack: "Brer Jack, dish yer de chap w'at I bin tellin' you 'bout."

The little boy did as he was bid, but Daddy Jack grunted ungraciously and made no response to the salutation. He was evidently not fond of children. Uncle Remus glanced curiously at the dwarfed and withered figure, and spoke a little more emphatically.

"Brer Jack, ef you take good look at dis chap, I lay you'll see mo'n you 'speck ter see. You'll see sump'n' dat'll make you grunt wusser dan you grunted deze many long year. Go up dar, honey, whar Daddy Jack kin see you."

The child went shyly up to the old African and stood at his knee. The sorrows and perplexities of nearly a hundred years lay between them; and now, as always, the baffled eyes of age gazed into the Sphinx-like face of youth as if by this means to unravel the mysteries of the past and solve the problems of the future.

Daddy Jack took the plump, rosy hands of the little boy in his black, withered ones, and gazed into his face so long and steadily, and with such curious earnestness that the child didn't know whether to laugh or cry. Presently, the old African flung his hands to his head, and rocked his body from side to side, moaning, and mumbling, and talking to himself, while the tears ran down his face like rain.

"Ole Missy! Ole Missy! 'E come back! I bin shum dey-day, I bin shum de night! I bin yeddy 'e v'ice, I bin yeddy de sign!" *

"Ah-yi!" exclaimed Uncle Remus, into whose arms the little boy had fled; "I des know'd dat 'ud fetch 'im. Hit's bin manys de long days sence Brer Jack seed ole Miss, yit ef he aint seed 'er dat whack, den I aint settin' yer."

After awhile Daddy Jack ceased his rocking, and his moaning, and his crying, and sat gazing wistfully into the fire-place. Whatever he saw there fixed his attention, for Uncle Remus spoke to him several times, without receiving a response. Presently, however, Daddy Jack exclaimed with characteristic, but laughable irrelevance:

"I no lakky dem gal wut is bin-a stan' pidjin-toe. Wun 'e fetch pail er water on 'e head, water churray, churray. I no lakky dem gal wut tie 'e wool up wit' string; mekky him stan' ugly fer true. I bin ahx da' 'Tildy gal fer marry me, un 'e no crack 'im bre't' fer mek answer 'cep' 'e bre'k out un lahf by me werry face. Da' gal do holler un lahf un stomp 'e fut dey-dey, un dun I shum done gone pidjin-toe. Oona bin know da' 'Tildy gal?"

"I bin a-knowin' dat gal," said Uncle Remus, grimly regarding the old African. "I bin a-knowin' dat gal now gwine on sence she 'uz knee-high ter one er deze yer puddle-ducks; en I bin noticin' lately dat she mighty likely nigger."

"Enty!" exclaimed Daddy Jack, enthusically, "Enty! I did bin mek up ter da' lilly gal troo t'ick un t'in. I bin fetch 'im one fine 'possum, un mo' ez one, two, t'ree peck-a taty, un bumbye I bin fetch 'im one bag pop-co'n. Wun I bin do dat, I is fley roun' da' lilly gal so long tam, un I yeddy 'im talk wit' turrer gal. 'E do say: 'Daddy Jack fine ole man fer true.' Dun I is bin talk: 'Oona no call-a me Daddy Jack wun dem preacher man come fer marry we.' Dun da' lilly gal t'row 'e head back; 'e squeal lak filly in canebrake."

The little boy understood this rapidly-spoken lingo perfectly well, but he would have laughed anyhow, for there was more than a suggestion of the comic in the shrewd seriousness that seemed to focus itself in Daddy Jack's pinched and wrinkled face.

"She tuck de truck w'at you tuck'n fotch 'er," said Uncle Remus, with the air of one carefully and deliberately laying the basis of a judicial opinion, "en den w'en you sail in en talk bizness, den she up en gun you de flat un 'er foot en de back un 'er han', en den, atter dat, she tuck'n lahff en make spote un you."

"Enty!" assented Daddy Jack, admiringly.

"Well, den, Brer Jack, youer mighty ole, en yit hit seem lak youer mighty young; kaze a man w'at aint got no mo' speunce wid wimmen folks dan w'at you is neenter creep 'roun' yer callin' deyse'f ole. Dem kinder folks aint ole nuff, let 'lone bein' too ole. W'en de gal tuck'n lahff, Brer Jack, w'at 'uz yo' nex' move?" demanded Uncle Remus, looking down upon the shriveled old man with an air of superiority.

Daddy Jack shut his shrewd little eyes tightly and held them so, as if by that means to recall all the details of the flirtation. Then he said:

"Da' lilly gal is bin tek dem t'ing. 'E is bin say 'T'anky, t'anky.' Him eaty da' 'possum, him eaty da' pop-co'n, him roas'n da' taty. 'E do say, 'T'anky, t'anky!' Wun I

* At first glance this dialect may seem difficult to understand. It is simplicity itself. It is simpler than that of the cotton plantations, and, in some respects, is an admirable vehicle for story-telling. It recognizes no gender, "'e" standing for "he," "she," and "it," at the pleasure of the narrator. It is laconic and yet rambling; full of repetitions and abounding in elisions that give an unexpected quaintness to the simplest statements. A key to the whole vocabulary may be given in comparatively few words: "Oona" is "you," "all of you"; "churray," or "churrah," is to spill, to splash, to drop; "shum," see or saw them; "yerry," "yeddy," hear or heard; "lil," "lilly," little; "tam," time; "sem," same; "lif," live; "leaf," leave; "beer," "teer," bear, tear; "mek," "tek," make, take; "y'et," earth; "bre't," breath; "da'," the; "dey-dey," down there, right here, or right there; "enty!" aint he! isn't that so!—an exclamation of astonishment, assent, or affirmation; "wut," what. The trick of adding a vowel sound to words is not unpleasing to the ear. Thus: "I bin-a wait fer you; come-a ring-a dem bell. Wut mek-a (or mekky) you stay so?" "Yeddy," "yerry," and probably "churray" are the result of this—heard-a, yeard-a, yeddy; hear-a, year-a, yerry; chur-a, churray. When "eye" is written "y-eye," it is to be pronounced "yi." In such words as "back," "ax," *a* has the sound of *ah*. They are written "bahk," "ahx."

talk marry, 'e is bin rise 'e v'ice un squeal lak lilly pig stuck in 'e t'roat. 'E do holler: 'Hi, Daddy Jack! wut is noung gal gwan do wit' so ole man lak dis?' Un I is bin say: 'Wut noung gal gwan do wit' ole Chrismus 'cep' 'e do 'joy 'ese'f?' Un da lil gal 'e do lahff un flut 'ese'f way fum dey-dey."

"I know'd a nigger one time," said Uncle Remus, after pondering a moment, "w'at tuck a notion dat he want a bait er 'simmons, en de mo' w'at de notion tuck 'im de mo' w'at he want um, en bimeby, hit look lak he des natally erbleedz ter have um. He want de 'simmons, en dar dey is in de tree. He mouf water, en dar hang de 'simmons. Now, den, w'at do dat nigger do? W'en you en me en dish yer chile yer wants 'simmons, we goes out en shakes de tree, en ef deyer good en ripe, down dey comes, en ef deyer good en green, dar dey stays. But dish yer yuther nigger, he too smart fer dat. He des tuck'n tuck he stan' und' de tree, en he open he mouf, he did, en wait fer de 'simmons fer ter drap in dar. Dey aint none drap in yit," continued Uncle Remus, gently knocking the cold ashes out of his pipe; "en w'at's mo', dey aint none gwine ter drap in dar. Dat des zackly de way wid Brer Jack yer, 'bout marryin'; he stan' dar, he do, en he hol' bofe han's wide open en he speck de gal gwine ter drap right spang in um. Man want gal, he des got ter grab 'er—dat's w'at. Dey may squall en dey may flutter, but flutter'n' en squallin' aint done no damage yit ez I knows un, en 'taint gwine ter. Young chaps kin make great 'miration 'bout gals, but w'en dey gits ole ez I is, dey ull know dat folks is folks, en w'en it come ter bein' folks, de wimmen aint gut none de 'vantage er de men. Now dat's des de plain up en down tale I'm a tellin' un you."

This deliverance from so respectable an authority seemed to please Daddy Jack immensely. He rubbed his withered hands together, smacked his lips and chuckled. After a few restless movements, he got up and went shuffling to the door, his quick, short steps causing Uncle Remus to remark:

"De gal w'at git ole Brer Jack 'ull git a natchul pacer, sho'. He move mo' one-sideder dan ole Zip Coon, w'ich he rack up de branch all night long wid he nose p'int lak he gwine 'cross."

While the little boy was endeavoring to get Uncle Remus to explain the nature of Daddy Jack's grievances, muffled laughter was heard outside, and almost immediately 'Tildy rushed in the door. 'Tildy flung herself upon the floor and rolled and laughed until, apparently, she could laugh no more. Then she seemed to grow severely angry. She rose from the floor and flopped herself down in a chair, and glared at Uncle Remus with indignation in her eyes. As soon as she could control her inflamed feelings, she cried:

"W'at is I done ter you, Unk' Remus? 'Fo' de Lord, ef anybody wuz ter come en tole me dat you gwine ter put de Ole Boy in dat ole Affikin nigger head, I wouldn't er b'leeved um—dat I wouldn't. Unk' Remus, w'at is I done ter you?"

Uncle Remus made no direct response; but he leaned over, reached out his hand, and picked up an unfinished axe-helve that stood in the corner. Then he took the little boy by the arm, and pushed him out of his way, saying in his gentlest and most persuasive tone:

"Stan' sorter 'roun' dar, honey, kase w'en de splinters 'gin ter fly, I want you ter be out'n de way. Miss Sally never gimme 'er fergivance in de 'roun' worl' ef you 'uz ter git hurted on account er de frazzlin' er dish yer piece er timber."

Uncle Remus's movements and remarks had a wonderful effect on 'Tildy. Her anger disappeared, her eyes lost their malignant expression, and her voice fell to a conversational tone.

"Now, Unk' Remus, you oughtn't ter do me dat a-way, kaze I aint done nothin' ter you. I 'uz settin' up yon' in Aunt Tempy house, des now, runnin' on wid Riah, en yer come dat ole Affikin Jack en say you say he kin marry me ef he ketch me, en he try ter put he arm 'roun' me en kiss me."

'Tildy tossed her head and puckered her mouth at the bare remembrance of it.

"W'at wud did you gin Brer Jack?" inquired Uncle Remus, not without asperity.

"W'at I gwine tell 'im?" exclaimed 'Tildy disdainfully. "I des tuck'n up en tole 'im he foolin' wid de wrong nigger."

'Tildy would have continued her narration, but just at that moment the shuffling of feet was heard outside, and Daddy Jack came in, puffing and blowing and smiling. Evidently he had been hunting for 'Tildy in every house in the negro quarter.

"Hi!" he exclaimed, "lil gal, 'e bin skeet sem lak ma'sh hen. 'E no run no mo."

"Pick 'er up, Brer Jack," exclaimed Uncle Remus; "she's yone."

'Tildy was angry as well as frightened. She would have fled, but Daddy Jack stood near the door.

"Look yer, nigger man!" she exclaimed, "ef you come slobbun 'roun' me, I'll take one er deze yer dog-iüns en brain you wid it. I aint gwine ter have no web-foot nigger follerin' atter me. Now you des come!—I aint feard er yo' cunjun. Unk' Remus, ef

you got any intruss in dat ole Affikin ape, you better make 'im lemme 'lone. G'way fum yer, now!"

All this time Daddy Jack was slowly approaching 'Tildy, bowing and smiling, and looking quite dandified, as Uncle Remus afterward said. Just as the old African was about to lay hands upon 'Tildy, she made a rush for the door. The movement was so unexpected that Daddy Jack was upset. He fell upon Uncle Remus's shoe-bench, and then rolled off on the floor, where he lay clutching at the air, and talking so rapidly that nobody could understand a word he said. Uncle Remus lifted him to his feet with much dignity, and it soon became apparent that he was neither hurt nor angry. The little boy laughed immoderately, and he was still laughing when 'Tildy put her head in the door and exclaimed:

"Unk' Remus, I aint kilt dat ole nigger, is I? Kaze ef I got ter go ter de gallus, I want to go dar fer sump'n n'er bigger'n dat."

Uncle Remus disdained to make any reply, but Daddy Jack chuckled and patted himself on the knee as he cried:

"Come 'long, lilly gal! come 'long! I no mad. I fall down dey fer lahff. Come 'long, lilly gal, come 'long!"

'Tildy went off laughing loudly and talking to herself. After awhile Uncle Remus said:

"Honey, I speck Miss Sally lookin' und' de bed en axin' whar you is. You better leak out fum yer now, en by dis time ter-morrer night, I'll git Brer Jack all primed up, en he'll whirl in en tell you a tale."

Daddy Jack nodded assent, and the little boy ran laughing to the "big house."

VIII.

WHY THE ALLIGATOR'S BACK IS ROUGH.

THE night after the violent flirtation between Daddy Jack and 'Tildy, the latter coaxed and bribed the little boy to wait until she had finished her work about the house. After she had set things to rights in the dining-room and elsewhere, she took the child by the hand, and together they went to Uncle Remus's cabin. The old man was making a door-mat of shucks and grass and white oak splits, and Daddy Jack was dozing in the corner.

"W'at I tell you, Brer Jack?" said Uncle Remus, as 'Tildy came in. "Dat gal atter you, mon!"

"Fer de Lord sake, Unk' Remus, don't start dat ole nigger. I done promise Miss Sally dat I wont kill 'im, en I like ter be good ez my word; but ef he come foolin' 'longer me I'm des natally gwine ter onj'int 'im. Now you year me say de word."

But Daddy Jack made no demonstration. He sat with his eyes closed, and paid no attention to 'Tildy. After awhile the little boy grew restless, and presently he said:

"Daddy Jack, you know you promised to tell me a story to-night."

"He wukkin' wid it now, honey," said Uncle Remus, soothingly. "Brer Jack," he continued, "wa'n't dey sump'n' n'er 'bout ole man Yalligator?"

"Hi!" exclaimed Daddy Jack, arousing himself, "'e 'bout B'er 'Gator fer true. Oona no bin see da' B'er 'Gator?"

The child had seen one, but it was such a very little one, he hardly knew whether to claim an acquaintance with Daddy Jack's 'Gator.

"Dem all sem," continued Daddy Jack. "Big mout', pop-eye, walk on 'e belly; 'e is bin got bump, bump, bump 'pon 'e bahk, bump, bump, bump 'pon 'e tail. 'E dife 'neat' de water, 'e do lif 'pon de lan'.

"One tam Dog is bin run B'er Rabbit, tel 'e do git tire; da' Dog is bin run 'im tell him ent mos' hab no bre't' in 'e body; 'e hide 'ese'f by de crik side. 'E come close 'pon B'er 'Gator, en B'er 'Gator, 'e do say:

"'Ki, B'er Rabbit! wut dis is mek you blow so? Wut mekky you' bre't' come so?'

"'Eh-eh! B'er 'Gator, I hab bin come 'pon' trouble. Dog, 'e do run un-a run me.'

"'Wey you no fetch 'im 'long, B'er Rabbit? I is bin git fat on all da' trouble lak dem. I proud fer yeddy Dog bark, ef 'e is bin fetch-a me trouble lak dem.'

"'Wait, B'er 'Gator! Trouble come bisitin' wey you lif; 'e mekky you' side puff; 'e mekky you' bre't' come so.'

"'Gator, he do flup 'e tail un 'tretch 'ese'f, un lahff. 'E say:

"'I lak fer see dem trouble. Nuddin' no bodder me. I ketch-a dem swimp, I ketch-a dem crahb, I mekky my bed wey de sun shiün hot, un I do 'joy mese'f. I proud fer see dem trouble.'

"''E come 'pon you, B'er 'Gator, wun you bin hab you' eye shed; 'e come 'pon you fum de turrer side. Ef 'e no come 'pon you in da crik, dun 'e come 'pon you in da broom-grass.'

"'Dun I shekky um by de han', B'er Rabbit; I ahx um howdy.'

"'Eh-eh, B'er 'Gator! you bin-a lahff at me; you no lahff wun dem trouble come. Dem trouble bin ketch-a you yit.'"

Daddy Jack paused to wipe his face. He had reported the dialogue between Brother Rabbit and Brother Alligator with considerable animation, and had illustrated it as he went along with many curious inflections of

the voice, and many queer gestures of head and hands impossible to describe here, but which added picturesqueness to the story. After awhile, he went on:

"B'er Rabbit, 'e do blow un 'e do ketch um bre't'. 'E pit one year wey Dog is bin-a bark; 'e pit one eye 'pon B'er 'Gator. 'E lissen, 'e look; 'e look, 'e lissen. 'E no yeddy Dog, un 'e comforts come back. Bumbye B'er 'Gator, e' come drowsy; 'e do nod, nod, un 'e head sway down, tel ma'sh-grass tickle 'e nose, un 'e do cough sem lak 'e teer up da crik by e' root. 'E no lak dis place fer sleep at, un 'e is crawl troo da ma'sh 'pon dry lan'; 'e is mek fer da broom-grass fiel'. 'E mek 'e bed wid 'e long tail, un 'e is 'tretch 'ese'f out at 'e lenk. 'E is shed 'e y-eye, un opun 'e mout', un tek 'e nap.

"B'er Rabbit, 'e do hol' 'e y-eye 'pon B'er 'Gator. Him talk no wud; him wullup 'e cud; him stan' still. B'er 'Gator, 'e do tek 'e nap; B'er Rabbit 'e do watch. Bumbye, B'er 'Gator bre't', 'e do come *loud;* 'e is bin sno' *hard!* 'E dream lilly dream; e' wuk e' fut un shek 'e tail in 'e dream. B'er Rabbit wink 'e y-eye, un 'e do watch. B'er 'Gator, he do leaf 'e dream bahine, un 'e sleep soun'. B'er Rabbit watch lil, wait lil. Bumbye, 'e do go wey fier bu'n in da' stump, un 'e is fetch some. 'E say, 'Dis day I is mek you know dem trouble; I is mek you know dem well.' 'E hop 'roun' dey-dey, un 'e do light da' broom-grass; 'e bu'n, bu'n—bu'n, bu'n; 'e do bu'n smaht.

"B'er 'Gator, 'e is dream some mo' lilly dream. 'E do wuk 'e fut, 'e do shek 'e tail. Broom-grass bu'n, bu'n; B'er 'Gator dream. 'E dream da' sun is shiün' hot; 'e wom 'e back, 'e wom 'e belly; 'e wuk 'e fut, 'e shek 'e tail. Broom-grass bu'n high, 'e bu'n low; 'e bu'n smaht, 'e bu'n hot. Bumbye, B'er 'Gator is wek fum 'e dream; 'e smell-a da' smoke, 'e feel-a da' fier. 'E run dis way, 'e run turrer way; no diffran' wey 'e is run, dey da' smoke, dey da' fier. *Bu'n, bu'n, bu'n!* B'er 'Gator lash 'e tail, un grine 'e toof. Bumbye, 'e do roll un holler:

"'Trouble, trouble, trouble! *Trouble, trouble!*'

"B'er Rabbit, 'e is stan' pas' da' fier, un 'e do say:

"'Ki! B'er 'Gator! Wey you fer l'arn-a dis talk 'bout dem trouble?'

"B'er 'Gator, 'e lash 'e tail, 'e fair teer da' ye't',* un 'e do holler:

"'Oh, ma Lord! Trouble! *Trouble, trouble, trouble!*'

"'Shekky um by de han', B'er 'Gator. Ahx um howdy!'

"'Ow, ma Lord! *Trouble, trouble, trouble!*'

"'Lahff wit' dem trouble, B'er 'Gator, lahff wit' dem! Ahx dem is dey he'lt' bin well! You bin-a cry fer dey 'quaintun',* B'er' Gator; now you mus' beer wit' dem trouble!'

"B'er 'Gator come so mad, tel 'e mek dash troo da' broom-grass; 'e fair teer um down. 'E bin scatter da' fier wide 'part, un 'e do run un dife in da' crik fer squinch da' fier 'pon 'e bahk. 'E bahk swivel, 'e tail swivel wit' da' fier, un fum dat dey is bin stan' so. Bump, bump 'pon 'e tail; bump, bump 'pon 'e bahk, wey da' fier bu'n."

"Hit's des lak Brer Jack tell you, honey," said Uncle Remus, as Daddy Jack closed his eyes and relapsed into silence. "I done seed um wid my own eyes. En deyer mighty kuse creeturs, mon'. Dey back is all ruffed up en down ter dis day en time, en mo'n dat, you aint gwineter ketch Brer Rabbit rackin' 'roun' whar de Yallergaters is. En de Yallergaters deyse'f, w'en dey years any crackin' en rattlin' gwine on in de bushes, dey des makes a break fer de creek en splunges in."

"Enty!" exclaimed Daddy Jack, with momentary enthusiasm. "'E do tu'n go da' bahnk, un dife 'neat' da' crik. 'E bin so wom wit' da' fier, 'e mek de crik go si-z-z-z!"

Here Daddy Jack looked around and smiled. His glance fell on 'Tildy, and he seemed suddenly to remember that he had failed to be as polite as circumstances demanded.

"Come-a set nex' me, lilly gal. I gwan tell you one tale."

"Come 'long, Pinx," said 'Tildy, tossing her head disdainfully, and taking the little boy by the hand. "Come 'long, Pinx; we better be gwine. I done say I wont kill dat ole nigger man. Yit ef he start atter me dis blessid night, I lay I roust de whole plantation. Come on, honey; less go."

The little boy was not anxious to go, but Uncle Remus seconded 'Tildy's suggestion.

"Better let dat gal mosey 'long, honey, kaze she mout start in fer ter cut up some 'er capers in yer, en I hate mighty bad ter bus' up dis yer axe-helve, w'ich I'm in needs un it eve'y hour er de day."

Whereupon the two old negroes were left sitting by the hearth.

IX.

BROTHER FOX SAYS GRACE.

'TILDY, the house-girl, made such a terrible report of the carryings on of Daddy Jack that the little boy's mother thought it prudent not to allow him to visit Uncle Remus so often. The child amused himself as best he

* Tear the earth.

* Acquaintance.

could for several nights, but his playthings and picture-books finally lost their interest. He cried so hard to be allowed to go to see Uncle Remus that his mother placed him under the care of Aunt Tempy, a woman of large authority on the place, and who stood next to Uncle Remus in the confidence of her mistress. Aunt Tempy was a fat, middle-aged woman, who always wore a head-handkerchief, and kept her sleeves rolled up, displaying her plump, black arms, winter and summer. She never hesitated to exercise her authority, and the younger negroes on the place regarded her as a tyrant; but in spite of her loud voice and brusque manners, she was thoroughly good-natured, generally good-humored, and always trustworthy. Aunt Tempy and Uncle Remus were secretly jealous of each other, but they were careful never to come in conflict, and, to all appearances, the most cordial relations existed between them.

"Well de goodness knows!" exclaimed Uncle Remus, as Aunt Tempy went in with the little boy. "How you come on, Sis Tempy? De rainy season aint so mighty fur off w'en you come a-sojourneyin' in dis house. Ef I'd a-know'd you'd a-bin a-comin' I'd a-sorter steered 'roun' en bresh'd de cobwebs out'n de cornders."

"Don't min' me, Brer Remus. Luck in de house whar de cobwebs hangs low. I 'uz des a-passin'—a-passin' 'long—en Miss Sally ahx me ef I kin come fur ez de do' wid dat chile dar, but bless you, taint in my manners ter tu'n back at de do'. How you come on, Brer Remus?"

"Po'ly, Sis Tempy; en yit I aint complainin'. Pain yer, en a ketch yander, wid de cramps th'ow'd in, aint no mo' dan ole folks kin speck. How you is, Sis Tempy?"

"I thank de Lord I'm able to crawl, Brer Remus, en dat's 'bout all. Ef I wa'n't so sot in my ways, deze yer niggers would er run me 'stracted d'reckly."

Daddy Jack was sitting in the corner laughing and talking to himself, and the little boy watched him not without a feeling of awe. After awhile he said:

"Uncle Remus, wont Daddy Jack tell us a story to-night?"

"Now, den, honey," responded the old man, "we aint got ter push Brer Jack too closte; we ull des hatter creep up on 'im en ketch 'im fer er tale wence he in de humors. Sometime hoss pull, sometime he aint pull. You aint bin down yer so long, hit sorter look lak it my tu'n; kaze it done come 'cross my 'membunce dat dey wuz one time w'en Brer Wolf kotch Brer Rabbit, w'ich I aint never gun it out ter you yit."

"Brother Wolf caught Brother Rabbit, Uncle Remus?" exclaimed the little boy incredulously.

"Yasser! dat's de up en down un it, sho," responded the old man with emphasis, "en I be mighty glad ef Sis Tempy yer will 'scuze me w'iles I runs over de tale 'long wid you."

"Bless yo' soul, Brer Remus, don't pay no 'tention ter me," said Aunt Tempy, folding her fat arms upon her ample bosom, and assuming an attitude of rest and contentment. "I'm bad ez de chillun 'bout dem ole tales, 'kaze I kin des set up yer un lissen at um de whole blessid night, un a good part er de day. Yass, Lord!"

"Well, den," said Uncle Remus, "we ull des huddle up yer en see w'at 'come er Brer Rabbit w'en ole Brer Wolf kotch 'im. In dem days," he continued, looking at Daddy Jack and smiling broadly, "de creeturs wuz constant gwine a-courtin'. Ef 'twan't Miss Meadows en de gals dey wuz flyin' 'roun', hit 'uz Miss Motts. Dey wuz constant a-courtin'.. En 'twan't none er dish yer 'Howdy-do-ma'm-I-speck-I-better-be-gwine,' n'er. Hit 'uz go atter brekkus en stay twel atter supper. Brer Rabbit, he got tuck wid a-likin' fer Miss Motts, en soon one mawnin', he tuck'n slick hisse'f up, he did, en put out ter call on 'er. W'en Brer Rabbit git ter whar Miss Motts live, she done gone off some'rs.

"Some folks 'ud er sot down en wait twel Miss Motts come back, en den ag'in some folks 'ud er tuck der foot in der han' en went back; but ole Brer Rabbit, he aint de man fer ter be outdone, en he des tuck'n go in de kitchen en light he seegyar, en den he put out fer ter pay a call on Miss Meadows en de gals.

"W'en he git dar, lo en beholes, he fine Miss Motts dar, en he tipped in, ole Brer Rabbit did, en he galanted 'roun' mungs um, same lak one er deze yer town chaps w'at you see come out ter Harmony Grove meetin'-house. Dey talk en dey lahff; dey lahff en dey giggle. Bime by, 'long todes night, Brer Rabbit 'low he better be gwine. De wimmen folks dey all ax 'im fer ter stay twel atter supper, kaze he sech lively comp'ny, but Brer Rabbit fear'd some er de yuther creeturs be hidin' out fer 'im; so he tuck'n pay his 'specks, he did, en start fer home.

"He aint git fur twel he come up wid a great big basket settin' down by de side er de big road. He look up de road; he aint see nobody. He look down de road; he aint see nobody. He look befo', he look behime, he look all 'roun'; he aint see nobody. He lissen, en lissen; he aint year nothin'. He wait, en he wait; nobody aint come.

"Den, bimeby Brer Rabbit go en peep in

de basket, en it seem lak it half full er green truck. He retch he han' in, he did, en git some en put it in he mouf. Den he shet he eye en do lak he studyin' 'bout sump'n. Atter w'ile, he 'low ter hisse'f, 'Hit look lak sparrer-grass, hit feel like sparrer-grass, hit tas'e lak sparrer-grass, en I be bless ef 'taint sparrer-grass.'

"Wid dat, Brer Rabbit jump up, he did, en crack he heel tergedder, en he fetch one leap en lan' in de basket, right spang in 'mungs de sparrer-grass. Dar whar he miss he foot-in'," continued Uncle Remus, rubbing his beard meditatively, "kaze w'en he jump in 'mungs de sparrer-grass, right den en dar he jump in 'mungs ole Brer Wolf, w'ich he wer' quile up at de bottom."

"Dar now!" exclaimed Aunt Tempy, enthusiastically. "W'at I tell you? W'at make him pester t'er folks doin's? I boun' Brer Wolf nail't 'im."

"Time Brer Wolf grab 'im," continued Uncle Remus, "Brer Rabbit knowed he uz a gone case; yit he sing out, he did:

"'I des tryin' ter skeer you, Brer Wolf; I des tryin' ter skeer you. I know'd you 'uz in dar, Brer Wolf. I know'd you by de smell!' sez Brer Rabbit, sezee.

"Ole Brer Wolf grin, he did, en lick he chops, en up'n say:

"'Mighty glad you know'd me, Brer Rabbit, kaze I know'd you des time you drapt in on me. I tuck'n tell Brer Fox yistiddy dat I 'uz gwine take a nap 'longside er de road, en I boun' you 'ud come 'long en wake me up, en' sho' nuff, yer you come en yer you is,' sez Brer Wolf, sezee.

"Oh-ho, Mr. Rabbit! How you feel now?" exclaimed Aunt Tempy, her sympathies evidently with Brother Wolf.

"W'en Brer Rabbit year dis," said Uncle Remus, paying no attention to the interruption, "he 'gun ter git mighty skeer'd, en he whirl in en beg Brer Wolf fer ter please tu'n 'im loose; but dis make Brer Wolf grin wusser, en he toof look so long en shine so w'ite, en he gum look so red, dat Brer Rabbit hush up en stay still. He so skeerd dat he bref come quick, en he heart go lak flutter-mill. He chune up lak he gwine cry:

"'Whar you gwine kyar me, Brer Wolf?

"'Down by de branch, Brer Rabbit.'

"'W'at you gwine down dar fer, Brer Wolf?'

"'So I kin git some water ter clean you wid atter I done skunt you, Brer Rabbit.'

"'Please, sir, lemme go, Brer Wolf.'

"'You talk so young you make me lahff, Brer Rabbit.'

"'Dat sparrer-grass done make me sick, Brer Wolf.'

"'You ull be sicker'n dat 'fo' I git done wid you, Brer Rabbit.'

"'Whar I come fum nobody dast ter eat sick folks, Brer Wolf.'

"'Whar I come fum dey aint dast ter eat no yuther kin', Brer Rabbit.'

"Ole Mr. Rabbit wuz a-talkin', mon," said Aunt Tempy, with a chuckle that caused her to shake like a piece of jelly.

"Dey went on dis away," continued Uncle Remus, "plum twel dey git ter de branch. Brer Rabbit, he beg en cry, en cry en beg, en Brer Wolf, he 'fuse en grin, en grin en 'fuse. W'en dey come ter de branch, Brer Wolf lay Brer Rabbit down on de groun' en hilt 'im dar, en den he study how he gwine make way wid 'im. He study en he study, en w'iles he studyin' Brer Rabbit, he tuck'n study some on he own hook.

"Den w'en it seem lak Brer Wolf done fix all de 'rangerments, Brer Rabbit, he make lak he cryin' wusser en wusser; he des fa'rly blubber."

Uncle Remus gave a ludicrous imitation of Brother Rabbit's wailings.

"'Ber—ber—Brer Wooly—ooly—oolf! Is you gwine—is you gwine ter sakerfice-t me right now—ow—ow?'

"'Dat I is, Brer Rabbit; dat I is.'

"'Well, ef I blee-eedz ter be kilt, Brer Wooly—ooly—oolf, I wants ter be kilt right, en ef I blee-eedz ter be e't, I wants ter be e't ri—ight, too, now!'

"'How dat, Brer Rabbit?'

"'I want you ter show yo' p'liteness, Brer Wooly—ooly—oolf!'

"'How I gwine do dat, Brer Rabbit?'

"'I want you ter say grace, Brer Wolf, en say it quick, kaze I gittin' mighty weak.'

"'How I gwine say grace, Brer Rabbit?'

"'Fol' yo' han's und' yo' chin, Brer Wolf, en shet yo' eyes, en say: 'Bless us en bine us, en put us in crack whar de Ole Boy can't fine us.' Say it quick, Brer Wolf, kaze I failin' mighty fas'.'"

"Now aint dat des too much!" exclaimed Aunt Tempy, as delighted as the little boy was. Uncle Remus laughed knowingly and went on:

"Brer Wolf, he put up he han's, he did, en shot he eyes, en low, 'Bless us en bine us'; but he aint git no furder, kaze des time he take up he han's, Brer Rabbit fotch a wiggle, he did, en lit on he foots, en he des natally lef' a blue streak behime 'im."

"Ah-yi-ee!" exclaimed Daddy Jack, while Aunt Tempy allowed her arms to drop helplessly from her lap as she cried "Dar now!" and the little boy clapped his hands in an ecstasy of admiration.

"'Oh, I just knew Brother Rabbit would get away," the child declared.

"Dat's right, honey," said Uncle Remus. "You put yo' pennunce in Brer Rabbit en yo' wont be fur out er de way."

There was some further conversation among the negroes, but it was mostly plantation gossip. When Aunt Tempy rose to go, she said:

"Goodness knows, Brer Remus, ef dis de way you all runs on, I'm gwine ter pester you some mo'. Hit come cross me like ole times, dat it do."

"Do so, Sis Tempy, do so," said Uncle Remus, with dignified hospitality. "You allers fine a place at my h'ath. Ole times is in about all we got lef'."

"Trufe, too!" exclaimed Aunt Tempy; and with that she took the child by the hand and went out into the darkness.

X.

A GHOST STORY.

THE next time the little boy visited Uncle Remus, he persuaded 'Tildy to go with him. Daddy Jack was in his usual place, dozing and talking to himself, while Uncle Remus oiled the carriage-harness. After awhile Aunt Tempy came in.

The conversation turned on ghosts, and after some general discussion of the subject and a story or two by Daddy Jack, 'Tildy broke the silence.

"W'en it come ter tales 'bout ha'nts," said she, "I year tell er one dat'll des natally make de kinks on yo' head onquile deyse'f."

"W'at tale dat, chile?" asked Aunt Tempy.

"Unk Remus, mus' I tell it?"

"Let 'er come," said Uncle Remus.

"Well, den," said 'Tildy, rolling her eyes back and displaying her white teeth, "one time dey wuz a'Oman en a Man. Seem like dey live close ter one er n'er, en de Man he sot his eyes on de 'Oman, en de 'Oman, she des went 'long en ten' ter her bizness. Man, he keep his eyes sot on 'er. Bimeby, de 'Oman, she ten' ter her bizness so much tell she tuck'n tuck sick en die. Man, he up'n tell de folks she dead, en de folks dey come en fix 'er. Dey lay 'er out, en dey light some candles, en dey sot up wid 'er, des like folks does now; en dey put two great big roun' shiny silver dollars on 'er eyes fer ter hol' 'er eyeleds down."

In describing the silver dollars, 'Tildy joined the ends of her thumbs and fore-fingers together, and made a figure as large as a saucer.

"Dey wuz lots bigger den dollars is deze days," she continued, "en dey look mighty purty. Seem like dey wuz all de money de 'Oman got, en de folks dey put um on 'er eyeleds fer ter hol' um down. Den w'en de folks do dat dey call up de Man en take'n tell 'im dat he mus' dig a grave en bury de 'Oman, en den dey all went off 'bout der bizness.

"Well, den, de Man, he tuck'n dig de grave en make ready fer ter bury de 'Oman. He look at dat money on 'er eyeleds, en it shine mighty purty. Den he tuck it off en feel it. Hit feel mighty good, but des 'bout dat time de Man look at de 'Oman, en he see 'er eyeleds open. Look like she lookin' at 'im, en he take'n put de money whar he git it fum.

"Well, den, de Man, he take'n git a waggin en haul de 'Oman out ter de buryin'-groun', en w'en he git dar he fix ever'thing, en den he grab de money en kivver up de grave right quick. Den he go home, en put de money in a tin box en rattle it 'roun'. Hit rattle loud en hit rattle nice, but de Man, he aint feel so good. Seem like he know de 'Oman eyeled stretch wide open lookin' fer 'im. Yit he rattle de money 'roun', en hit rattle loud en hit rattle nice.

"Well, den, de Man, he take'n put de tin box w'at de money in on de mantel-shel-uf. De day go by, en de night come, en w'en night come de win' 'gun ter rise up en blow. Hit rise high, hit blow strong. Hit blow on top er de house, hit blow und' de house, hit blow 'roun' de house. Man, he feel quare. He set by de fier en lissen. Win' say '*Buzz-zoo-o-o-o-o!*' Man lissen. Win' holler en cry. Hit blow top er de house, hit blow und' de house, hit blow 'roun' de house, hit blow in de house. Man git closte up in de chimbly-jam. Win' fin' de cracks en blow in um. '*Bizzy, bizzy, buzz-zoo-o-o-o-o!*'

"Well, den, Man, he lissen, lissen, but bimeby he git tired er dis, en he low ter hisse'f dat he gwine ter bed. He tuck'n fling a fresh light'd knot in de fier, en den he jump in de bed, en quile hisse'f up en put his head und' de kivver. Win' hunt fer de cracks—*bizzy-buzz, bizzy-buzz, buzz-zoo-o-o-o-o-o!* Man keep his head und' de kivver. Light'd knot flar' up en flicker. Man aint dast ter move. Win' blow en w'issel *Phew-fee-e-e-e!* Light'd knot flicker en flar'. Man, he keep his head kivvud.

"Well, den, Man lay dar, en git skeer'der en skeer'der. He aint dast ter wink his eye skacely, en seem like he gwine ter have swamp agur. Wiles he layin' dar shakin', en de win' a blowin', en de fier flickin', he year some yuther kind er fuss. Hit mighty kuse kind er fuss. *Clinkity, clinkalinkle!* Man 'low:

"'Hey! who stealin' my money?'

"Yit he keep his head kivvud w'iles he lay en lissen. He year de win' blow, en den he year dat yuther kinder fuss—*Clinkity, clink, clinkity, clinkalinkle!* Well, den, he fling off

de kivver en sot right up in de bed. He look, he aint see nothin'. De fier flicker en flar' en de win' blow. Man go en put chain en bar 'cross de do'. Den he go back to bed, en he aint mo'n totch his head on de piller tell he year de yuther fuss—*clink, clink, clinkity, clinkalinkle!* Man rise up, he aint see nothin' 'tall. Mighty quare!

"Des 'bout time he gwine ter lay down 'gin', yer come de fuss—*clinkity, clinkalinkle.* Hit soun' like it on de mantel-shel-uf; 'let 'lone dat, hit soun' like it in de tin-box on de mantel-shel-uf; 'let 'lone dat, hit soun' like it de money in de tin box on de mantel-shel-uf. Man say:

"'Hey! rat done got in box!'

"Man look; no rat dar. He shet up de box, en set it down on de shel-uf. Time he do dat yer come de fuss—*clinkity, clinkity, clinkalinkle!* Man open de box en look at de money. Dem two silver dollars layin' in dar des like he put um. W'iles de man dun dis, look like he kin year sump'n say 'way off yander:

"'*Whar my money? Oh, gim me my money!*'

"Man, he sot de box back on de shel-uf, en time he put it down he year de money rattle—*clinkity, clinkalinkle, clink!*—en den fum way off yander sump'n say:

"'*Oh, gim me my money! I want my money!*'

"Well, den, de Man git skeer'd sho nuff, en he got er flat-iün en put on de tin box, en den he tuck'n pile all de cheers 'gin de do', en run en jump in de bed. He des know dey's a booger comin'. Time he git in bed en kivver his head, de money rattle louder, en sump'n cry way off yander:

"'*I want my money! Oh, gim me my money!*'

"Man, he shake en he shiver; money, hit clink en rattle; booger, hit holler en cry. Booger come closter, money clink louder, Man shake wusser en wusser. Money say: '*Clinkity, clinkalinkle!*' Booger cry, '*Oh, gim me my money!*' Man holler, '*Oh, Lordy, Lordy!*'

"Well, den, hit keep on dis away, tell dreckly Man year de do' open. He peep fum und' de kivver, en in walk de 'Oman w'at he done bury in de buryin'-groun'. Man shiver en shiver, win' blow en blow, money rattle en rattle, 'Oman cry en cry. '*Buzz-zoo-o-o-o-o!*' sez de win'; '*clinkalink!*' sez de box; '*Oh, gim me my money!*' sez de 'Oman; '*Oh, Lordy!*' sez de Man. 'Oman year de money, but look like she aint kin see, en she grope 'roun', en grope 'roun', en grope 'roun' wid 'er han' h'ist in de a'r des dis away."

Here 'Tildy stood up, pushed her chair back with her foot, raised her arms over her head, and leaned forward in the direction of Daddy Jack.

"Win' blow, fier flicker, money rattle, Man shake en shiver, 'Oman grope 'roun' en say, '*Gim me my money! Oh, who got my money?*'"

'Tildy advanced a few steps.

"Money look like it gwine ter t'ar de tin box all ter flinders. 'Oman grope en cry, grope en cry, tell bimeby she jump on de man en holler:

"'*You got my money!*'"

As she reached this climax, 'Tildy sprang at Daddy Jack and seized him, and for a few moments there was considerable confusion in the corner. The little boy was frightened, but the collapsed appearance of Daddy Jack convulsed him with laughter. The old African was very angry. His little eyes glistened with momentary malice, and he shook his cane threateningly at 'Tildy. The latter coolly adjusted her ear-rings, as she exclaimed:

"Dar, now! I know'd I'd git even wid de ole vilyun. Come a-callin' me pidjin-toed!"

"Better keep yo' eye on 'im, chile," said Aunt Tempy. "He 'witch you, sho."

"'Witch who? Ef he come witchin' 'roun' me, I lay, I break his back. I tell you dat, right pine-blank." *

XI.

BROTHER RABBIT AND HIS FAMOUS FOOT.

THE little boy was very glad, one night shortly after he had heard about Daddy Jack's ghosts and witches and 'Tildy's "ha'nts," to find Uncle Remus alone in his cabin. The child liked to have his venerable partner all to himself. Uncle Remus was engaged in hunting for tobacco crumbs with which to fill his pipe, and in turning his pockets, a rabbit foot dropped upon the hearth.

"Grab it, honey!" he exclaimed. "Snatch it up off'n de h'ath. In de name er goodness, don't let it git in de embers; kaze ef dat ar rabbit foot git singe, I'm a goner, sho!"

It was the hind foot of a rabbit, and a very large one at that, and the little boy examined it curiously. He was in thorough sympathy with all the superstitions of the negroes, and to him the rabbit foot appeared to be an uncanny affair. He placed it carefully on Uncle Remus's knee, and after the pipe had been filled, he asked:

"What do you carry that for, Uncle Remus?"

"Well, honey," responded the old man, grimly, "ef you want me ter make shorts

* Mr. Samuel L. Clemens heard a version of this story among the negroes of Florida, Missouri. A woman with a golden arm was buried, and the man went back afterward and got the arm. The ghost of the woman followed the man pretty much as described in the foregoing. A negro preacher of Atlanta, to whom Mr. Clemens's version was recited, corrected it as it stands here.

out'n a mighty long tale, dat ar rabbit foot is fer ter keep off boogers. W'en I hatter run er'n's fer myse'f all times er night, en take nigh cuts thoo de woods, en 'cross by de buryin'-groun', hit's monst'ous handy fer ter have dat ar rabbit foot. Keep yo' head studdy, now: mine yo' eye: I aint sayin' deyer any boogers anywhars. Brer Jack kin say w'at he mineter: I aint sayin' nothin'. But yit, ef dey wuz any, en dey come slinkin' atter me, I let you know dey'd fine out terreckly dat de ole nigger heel'd wid rabbit foot. I'ud hol' it up des dis away, en I boun' you I'd shoo um off 'n de face er de yeth. En I tell you w'at," continued Uncle Remus, seeing that the little boy was somewhat troubled, "w'en it come to dat pass dat you gotter be dodgin' 'roun' in de dark, ef you'll des holler for me, I'll loan you dish yer rabbit foot, en you'll be des ez safe ez you is w'en Miss Sally stannin' by yo' bed wid a lit can'le in 'er han'.

"Strip er red flannil tied 'roun' yo' arm'll keep off de rheumatis: stump-water 'll kyo 'spepsy: some good fer one 'zeeze,* en some good fer n'er, but de p'ints is dat dish yer rabbit foot 'll gin you good luck. De man w'at tote it mighty ap' fer ter come out right een' up w'en dey's any racket gwine on in de neighborhoods, let 'er be whar she will en w'en she may: mo' espeshually ef de man w'at got it know 'zackly w'at he got ter do. W'ite folks may laugh," Uncle Remus went on, "but w'en rabbit run 'cross de big road front er me, w'at does I do? Does I shoo at um? Does I make fer ter kill um? Dat I don't—*dat* I don't! I des squats right down in de middle er de road, en I makes a cross-mark in de san des dis away, en den I spits in it."†

Uncle Remus made a practical illustration by drawing a cross-mark in the ashes on the hearth.

"Well, but, Uncle Remus, what good does all that do?" the little boy asked.

"Lots er good, honey; bless yo' soul, lots er good. W'en rabbit crosses yo' luck, w'at you gwine do, less'n you sets down en crosses it out, right den en dar? I year talk er folks shootin' rabbit in de big road, yit I notices dat dem w'at does de shootin' aint come ter no good een'—dat w'at I notices."

"Uncle Remus," the little boy asked, after awhile, "how did people happen to find out about the rabbit's foot?"

* Disease.

† If, as some ethnologists claim, the animal-myths are relics of zoötheism, there can scarcely be a doubt that the practice here described by Uncle Remus is the survival of some sort of obeisance or genuflexion by which the negroes recognized the presence of the Rabbit, the great central figure and wonder-worker of African mythology.

"Oh, you let folks 'lone fer dat, honey. You des let um 'lone. W'at de wimmen aint up'n tell bidout anybody axin' un um, folks mighty ap' fer ter fine out fer deyse'f. De wimmen, dey does de talkin' en de flyin', en de mens, dey does de walkin' en de pryin', en betwixt en betweenst um, dey aint much dat don't come out. Ef don't come out one day it do de nex', en so she goes—Ant'ny over, Ant'ny under—up one row en down de udder, en clean acrosst de bolly-patch!"

It may be that the child didn't understand all this, but he had no doubt of its wisdom, and so he waited patiently for developments.

"Dey's a tale 'bout de rabbit foot," continued Uncle Remus, "but yo' eye look watery, like ole man Nod 'bout ter slip up behime you; en let 'lone dat, I speck Miss Sally clock clickin' fer you right now."

"Oh, no, it isn't, Uncle Remus," said the child, laughing. "Mamma said she'd make 'Tildy call me."

"Dar, now!" exclaimed the old man, indignantly, "'Tildy dis en 'Tildy dat. I dunner w'at yo' mammy dreamin' 'bout fer ter let dat nigger gal be a-holl'in' en a-bawlin' atter you all 'roun' dish yer plan'ation. She de mos' uppity nigger on de hill, en de fus' news you know dey ull all hatter make der bows en call 'er Mistiss. Ef ole Miss wuz 'live, dey wouldn't be no sech gwines on 'roun' yer. But nummine.* You des let 'er come a-cuttin' up front er my do', en I lay you'll year squallin'. Now, den," continued the old man, settling himself back in his chair, "wharbouts wuz I?"

"You said there was a tale about the rabbit foot," the little boy replied.

"So dey is, honey! so dey is!" Uncle Remus exclaimed, "but she got so many crooks en tu'ns in 'er dat I dunner but w'at I aint done gone en fergotted some un um off 'n my min'; kaze ole folks lak me knows lots mo' dan w'at dey kin 'member.

"In de days w'ence Brer Rabbit wuz sorter keepin' de neighborhoods stirred up, de yuther creeturs wuz studyin' en studyin' de whole blessid time how dey gwineter nab 'im. Dey aint had no holiday yit, kaze w'en de holiday come, dey'd go ter wuk, dey would, en juggle wid one er n'er fer ter see how dey gwine ter ketch up wid Brer Rabbit. Bimeby, w'en all der plans, en der traps, en der jugglements aint do no good, dey all 'gree, dey did, dat Brer Rabbit got some cunjerment w'at he trick um wid. Brer B'ar, he up'n 'low, he did, dat he boun' Brer Rabbit is a nat'al bawn witch; Brer Wolf say, sezee, dat he speck Brer Rabbit des in cahoots wid a witch; en Brer Fox, he vow dat Brer Rabbit got mo'

* Never mind.

luck dan smartness. Den Jedge B'ar, he drap he head one side, he did, en he ax how come Brer Rabbit got all de luck on he own side. De mo' dey ax, de mo' dey git pestered, en de mo' dey git pestered, de wuss dey worry. Day in en day out dey wuk wid dis puzzlement; let 'lone dat, dey sot up nights; en bimeby dey 'gree 'mungs deyse'f dat dey better make up wid Brer Rabbit, en see ef dey can't fine out how come he so lucky.

"W'iles all dis gwine on, ole Brer Rabbit wuz a-gallopin' 'roun' fum Funtown ter Frolicville, a-kickin' up de devilment en terrifyin' de neighborhoods. Hit keep on dis away, twel one time, endurin' de odd-come-shorts,* ole Jedge B'ar sont wud dat one er his chilluns done bin tooken wid a sickness, en he ax wont ole Miss Rabbit drap 'roun' en set up wid 'im. Ole Miss Rabbit, she say, co'se she go, en atter she fill 'er satchy full er yerbs en truck, off she put.

"I done fergit," said Uncle Remus, scratching his head gravely, "w'ich one er dem chilluns wuz ailin'. Hit mout er bin Kubs, en hit mout er bin Klibs; but no marter fer dat. W'en ole Miss Rabbit git dar, ole Miss B'ar wuz a-settin' up in de chimbly-cornder des a-dosin' en a-nussin' de young un; en all de wimmin er de neighborhoods wuz dar, a-whispun en a-talkin', des fer all de worl' lak wimmen does deze days. It uz:

"'Come right in, Sis Rabbit! I mighty proud to see you. I mighty glad you fotch yo' knittin', kaze I'm pow'ful po' comp'ny w'en my chillun sick. Des fling yo' bonnet on de bed dar. I'm dat flustrated twel I dunner w'ich een's up, skacely. Sis Wolf, han' Sis Rabbit dat rockin'-cheer dar, kaze 'taint no one step fum her house ter mine.'

"Dat de way ole Miss B'ar run on," continued Uncle Remus, "en dey set dar en dey chatter an dey clatter. Ole Brer Wolf, he 'uz settin' out on de back peazzer smokin' en noddin'. He 'ud take en draw a long whiff, he would, en den he 'ud drap off ter noddin', en let de smoke oozle out thoo he nose. Bimeby ole Sis Rabbit drap 'er knittin' in 'er lap, en sing out, sez she:

"'Law, Sis B'ar! I smells 'barker smoke,' sez she.

"Ole Sis B'ar, she jolt up de sick baby, en swap it fum one knee ter de yuther, en 'low:

"'My ole man bin smokin' 'roun' yer de whole blessid day, but soon'z dish yer chile tuck sick, I des tuck'n tole 'im, sez I, fer ter take hisse'f off in de woods whar he b'long at, sez I. Yessum! I did dat! I pities any 'oman w'at 'er ole man is fe'r'verlastin' stuck 'roun' de house w'en dey's any sickness gwine on,' sez she.

"'Ole Brer Wolf sot out dar on de back peazzer, en he shot one eye, he did, en open um 'g'in, en let de smoke oozle out'n he nose. Sis B'ar, she jolt de sick baby en swap it fum one knee ter de yuther. Dey sot dar en talk twel bimeby der confab sorter slack up. Fus news dey know Sis Rabbit drap 'er knittin' en fling up 'er han's en squall out:

"'De gracious en de goodness! Ef I aint done come traipsin off en lef' my ole man money-pus, en he got sump'n in dar w'at he wont take a purty fer, needer! I'm dat fergitful,' sez she, 'twel hit keep me mizerbul mighty nigh de whole time,' sez she.

"Brer Wolf, he lif' up he year en open he eye, en let de smoke oozle out'n he nose. Sis B'ar, she jolt de sick baby wuss en wuss, en bimeby, she up'n say, sez she:

"'I mighty glad 'taint me, dat I is,' sez she, 'bekaze ef I wuz ter lef' my ole man money-pus layin' 'roun' dat away, he'd des nat'ully rip up de planks in de flo', en t'ar all de bark offn' de trees,' sez she.

"Old Miss Rabbit, she sot dar, she did, en she rock en study, en study en rock, en she dunner w'at ter do. Ole Sis B'ar, she jolt en jolt de baby. Ole Brer Wolf, he let de 'barker smoke oozle thoo he nose, he did, en den he open bofe eyes en lay he pipe down. Wid dat, he crope down de back steps en lit out fer Brer Rabbit house. Brer Wolf got gait same lak race-hoss, en it aint take 'im long fer ter git whar he gwine. W'en he git ter Brer Rabbit house, he pull de latch-string en open de do', en w'en he do dis, one er de little Rabs wake up, en he holler out:

"'Dat you, mammy?'

"Den Brer Wolf wish he kin sing 'Bye-O-Baby,' but fo' he kin make answer, de little Rab holler out 'g'in:

"'Dat you, mammy?'

"Ole Brer Wolf know he got ter do sump'n, so he tuck'n w'isper, he did:

"'Sh-sh-sh! Go ter sleep, honey. De boogers 'll git you!' en wid dat de little Rab 'gun ter whimple, en he whimple hisse'f off ter sleep.

"Den w'en it seem lak de little Rabs, w'ich dey wuz mighty nigh forty-leven un um, is all done gone ter sleep, Brer Wolf he crope 'roun', he did, en feel on de mantel-shel-uf, en feel, en feel, twel he come ter ole Brer Rabbit money-pus. Ef he want so light wid he han'," Uncle Remus went on, glancing quizzically at the child, "he'd a knock off de pollygollic vial w'at ole Miss Rabbit put up dar. But nummine! Brer Wolf, he feel, en feel twel he come ter de money-pus, en he grab dat, he did, en he des flew'd away fum dar.

* Sometime, any time, no time. Thus: "Run fetch me de ax, en I'll wait on you one er deze odd-come-shorts."

"W'en he git out er sight en year'n', Brer Wolf look at de money-pus, en see w'at in it. Hit 'uz one er deze yer kinder money-pus wid tossle on de een' en shiny rings in de middle. Brer Wolf look in dar fer ter see w'at he kin see. In one een' dey wuz a piece er calamus-root en some collard seeds, en in de t'er een' dey wuz a great big rabbit foot. Dis make Brer Wolf feel mighty good, en he gallop off home wid de shorance * un a man w'at done foun' a gol' mine."

Here Uncle Remus paused and betrayed a disposition to drop off to sleep. The little boy, however, touched him upon the knee, and asked him what Brother Rabbit did when he found his foot was gone. Uncle Remus laughed and rubbed his eyes.

"Hit's mighty kuse 'bout Brer Rabbit, honey. He aint miss dat money-pus fer mighty long time, yit w'en he do miss it, he miss it mighty bad. He miss it so bad dat he git right-down sick, kaze he know he bleedz ter fine dat ar foot let go w'at may, let come w'at will. He study en he study, yit 'taint do no good, en he go all 'roun' 'lowin' ter hisse'f:

"'I know whar I put dat foot, yet I dunner whar I lef um; I know whar I put dat foot, yit I dunner whar I lef' um.'

"He mope en he mope 'roun'. Look lak Brer Wolf got all de luck en Brer Rabbit aint got none. Brer Wolf git fat, Brer Rabbit git lean; Brer Wolf run fas', Brer Rabbit lope heavy lak ole Sis Cow; Brer Wolf feel funny, Brer Rabbit feel po'ly. Hit keep on dis away, twel bimeby Brer Rabbit know sump'n n'er bleedz ter be done. Las' he make up he min' fer ter take a journey, en he fix up he tricks, he do, en he go en see ole Aunt Mammy-Bammy Big-Money."

"And who was old Aunt Mammy-Bammy Big-Money, Uncle Remus?" the little boy inquired.

"Ah-yi!" exclaimed Uncle Remus, in a tone of triumph, "I know'd w'en I fotch dat ole creetur name up, dey want gwine ter be no noddin' 'roun' dish yer h'ath. In dem days," he continued, "dey wuz a Witch-Rabbit, en dat was her entitlements—ole Aunt Mammy-Bammy Big-Money. She live way off in a deep, dark swamp, en ef you go dar you hatter ride some, slide some; jump some, hump some; hop some, flop some; walk some, balk some; creep some, sleep some; fly some, cry some; foller some, holler some; wade some, spade some; en ef you ain't monstus keerful you ain't git dar den. Yit Brer Rabbit he git dar atter so long a time, en he mighty nigh wo' out.

"He sot down, he did, fer ter res' hisse'f, en bimeby he see black smoke comin' outer de hole in de groun' whar de ole Witch-Rabbit stay. Smoke git blacker en blacker, en atter w'ile Brer Rabbit know de time done come fer 'im ter open up en tell w'at he want."

As Uncle Remus interpreted the dialogue, Brother Rabbit spoke in a shrill, frightened tone, while the voice of the Rabbit-Witch was hoarse and oracular:

"'Mammy-Bammy Big-Money, I needs yo' he'p.'

"'Son Riley Rabbit, why so? Son Riley Rabbit, why so?'

"'Mammy-Bammy Big-Money, I los' de foot you gim me.'

"'Oh, Riley Rabbit, why so? Son Riley Rabbit, why so?'

"'Mammy-Bammy Big-Money, my luck done gone. I put dat foot down 'pon de groun'. I lef' um dar I know not whar.'

"'De Wolf done tuck en stole yo' luck, Son Riley Rabbit, Riley. Go fine de track, go git hit back, Son Riley Rabbit, Riley.'

"Wid dat," continued Uncle Remus, "ole Aunt Mammy-Bammy Big-Money sucked all de black smoke back in de hole in de groun', and Brer Rabbit des put out fer home. W'en he git dar, w'at do he do? Do he go off in a cornder by hisse'f, en wipe he weepin' eye? Dat he don't—dat he don't. He des tuck'n wait he chance. He wait en he wait; he wait all day, he wait all night; he wait mighty nigh a mont'. He hang 'roun' Brer Wolf house; he watch en he wait.

"Bimeby, one day, Brer Rabbit git de news dat Brer Wolf des come back fum a big frolic. Brer Rabbit know he time comin', en he keep bofe eye open en bofe years h'ist up. Nex' mawnin' atter Brer Wolf git back fum de big frolic, Brer Rabbit see 'im come outer de house en go down de spring atter bucket water. Brer Rabbit, he slip up, he did, en he look in. Ole Miss Wolf, she 'uz sailin' 'roun' fryin' meat en gittin' brekkus, en dar hangin' 'cross er cheer wuz Brer Wolf wes'cut where he keep he money-pus. Brer Rabbit rush up ter do' en pant lak he mighty nigh fag out. He rush up, he did, en he sing out:

"'Mawnin', Sis Wolf, mawnin'! Brer Fox sont me atter he shavin'-brush, w'ich he keep it in dat ar money-pus w'at I loant 'im.'

"Sis Wolf, she fling up 'er han's en let um drap, en she laugh en say, sez she:

"'I 'clar' ter gracious, Brer Rabbit! You gimme sech a tu'n, dat I aint got room ter be perlite skacely.'

"But mos' 'fo' she git de wuds out'n 'er mouf, Brer Rabbit done grab de money-pus en gone!"

"Which way did he go, Uncle Remus?" the little boy asked after awhile.

* Assurance.

"Well, I tell you dis," Uncle Remus responded emphatically, "Brer Rabbit road aint lay by de spring; I boun' you dat!"

Presently Tildy put her head in the door to say that it was bed-time, and shortly afterward the child was dreaming that Daddy Jack was Mammy-Bammy Big-Money in disguise.*

* A Virginian version of this story, from an anonymous correspondent, sends Brother Rabbit on the "back track." He is compelled to retrace his footsteps for many months. The version is fragmentary, but it afforded a cue that enabled the writer to secure the outlines of the legend as given here.

PARADISE REGAINED.*

THEIR heads bent low, with tearful eyes
They left the gates of Paradise.
All love had flown, all joy was dead,
O'er all the earth foul sin had spread.

The cherub stood with fiery sword,
And as they passed he spoke this word:
"Lift up your heads and sorrowing eyes,
Your hearts shall be your paradise!"

Elizabeth Sihler.

* An old Jewish legend.

THE NEW MINISTER'S GREAT OPPORTUNITY.

BY THE AUTHOR OF "THE VILLAGE CONVICT," "ELI," ETC.

"THE minister's got a job," said Mr. Snell.

Mr. Snell had been driven in by a shower from the painting of a barn, and was now sitting, with one bedaubed overall leg crossed over the other, in Mr. Hamblin's shop.

Half a dozen other men, who had likewise found in the rain a call to leisure, looked up at him inquiringly.

"How do you mean?" said Mr. Noyes, who sat beside him, girt with a nail-pocket. "'The minister's got a job?' How do you mean?" And Mr. Noyes assumed a listener's air, and stroked his thin yellow beard.

Mr. Snell smiled, with half-shut, knowing eyes, but made no answer.

"How do you mean?" repeated Mr. Noyes; "'The minister's got a job'—of course he has—got a stiddy job. We knew that before."

"Very well," said Mr. Snell, with a placid face; "seeing 's you know so much about it, enough said. Let it rest right there."

"But," said Mr. Noyes, nervously blowing his nose; "you lay down this proposition: 'The minister's got a job.' Now I ask: what is it?"

Mr. Snell uncrossed his legs, and stooped to pick up a last, which he proceeded to scan with a shrewd, critical eye.

"Narrer foot," he said to Mr. Hamblin.

"Private last—Dr. Hunter's," said Mr. Hamblin, laying down a boot upon which he was stitching an outer sole, and rising to make a ponderous, elephantine excursion across the quaking shop to the earthen water-pitcher, from which he took a generous draught.

"Well, Brother Snell," said Mr. Noyes—they were members together of a secret organization, of which Mr. Snell was P. G. W. T. F.—"aint you going to tell us? What—is this job? That is to say, what—is it?"

Brother Snell set his thumbs firmly in the armholes of his waistcoat, surveyed the smoke-stained pictures pasted on the wall, looked keen, and softly whistled.

At last, he condescended to explain.

"Preaching Uncle Capen's funeral sermon."

There was a subdued general laugh. Even Mr. Hamblin's leathern apron shook.

Mr. Noyes, however, painfully looking down upon his beard to draw out a white hair, maintained his serious expression.

"I don't see much 'job' in that," he said; "a minister's supposed to preach a hundred and four sermons in each and every year, and there's plenty more where they come from. What's one sermon more or less, when stock costs nothing? It's like wheeling gravel from the pit."

"O. K.," said Mr. Snell; "if 'taint no

trouble, then 'taint. But seeing 's you know, suppose you specify the materials for this particular discourse."

Mr. Noyes looked a little disconcerted.

"Well," he said; "of course, I can't set here and compose a funereal discourse, offhand, without no writing-desk; but there's stock enough to make a sermon of, any time."

"Oh, come," said Mr. Snell, "don't sneak out: particularize."

"Why," said Mr. Noyes, "you've only to open the leds of your Bible, and choose a text, and then: When did this happen? Why did this happen? To who did this happen? and so forth and so on; and there's your sermon. I've heard 'em so a hunderd times."

"All right," said Mr. Snell; "I don't doubt, you know; but as for me, I for one never happened to hear of anything that Uncle Capen did but whitewash and saw wood. Now what sort of an autobiographical sermon could you make out of sawing wood?"

Whereat Leander Buffum proceeded, by that harsh, guttural noise well known to country boys, to imitate the sound of sawing through a log.

His sally was warmly greeted.

"The minister might narrate," said Mr. Blood, "what Uncle Capen said to Issachar, when Issachar told him that he charged high for sawing wood. 'See here, says Uncle Capen, 's'pos'n I do. My arms are shorter'n other folks's, and it takes me just so much longer to do it.'"

"Well," said Mr. Noyes, "I'm a fair man; always do exactly right, is the rule I go by; and I will frankly admit, now and here, that if it's a biographical discourse they want, they'll have to cut corners."

"Pré-cisély," said Mr. Snell; "and that's just what they do want."

"Well, well," said Mr. Hamblin, laboriously rising and putting his spectacles into their silver case—for it was supper-time; "joking one side, if Uncle Capen never did set the pond afire, we'd all rather take his chances to-day, I guess, than those of some smarter men."

At which Mr. Snell turned red; for he was a very smart man and had just failed, to everybody's surprise,—for there was no reason in the world why he should fail,—and had created more merriment for the public than joy among his creditors, by paying a cent and a half on the dollar.

"Come in; sit down," said Doctor Hunter, as the young minister appeared at his office door; and he tipped back in his chair, and put his feet upon a table. "What's the news?"

"Doctor," said Mr. Holt, laughing, as he laid down his hat and took an arm-chair; "you told me to come to you for any information. Now I want materials for a sermon on old Mr. Capen."

The Doctor looked at him with a half-amused expression, and then sending out a curl of blue smoke, he watched it as it rose melting into the general air.

"You don't smoke, I believe?" he said to the minister.

Holt smiled and shook his head.

The Doctor put his cigar back into his mouth, clasped one knee in his hands, and fixed his eyes in meditation on a one-eared Hippocrates looking down with a dirty face from the top of a book-case. Perhaps the Doctor was thinking of the two or three hundred complimentary visits he had been permitted to make upon Uncle Capen within ten years.

Presently a smile broke over his face.

"I must tell you, before I forget it," he said, "how Uncle Capen nursed one of my patients. Years and years ago, I had John Ellis, our postmaster now, down with a fever. One night Uncle Capen watched—you know he was spry and active till he was ninety. Every hour he was to give Ellis a little ice-water; and when the first time came, he took a table-spoonful—there was only a dim light in the room,—and poured the ice-water down Ellis's neck. Well, Ellis jumped, as much as so sick a man could, and then lifted his finger to his lips: 'Here's my mouth,' said he. 'Why, why,' said Uncle Capen, 'is that your mouth? I took that for a wrinkle in your forehead.'"

The minister laughed.

"I have heard a score of such stories to-day," he said; "there seem to be enough of them; but I can't find anything adapted to a sermon, and yet they seem to expect a detailed biography."

"Ah, that's just the trouble," said the Doctor. "But let us go into the house; my wife remembers everything that ever happens, and she can post you up on Uncle Capen, if anybody can."

So they crossed the door-yard into the house.

Mrs. Hunter was sewing; a neighbor, come to tea, was crocheting wristers for her grandson. They were both talking at once as the Doctor opened the sitting-room door.

"Since neither of you appears to be listening," he said, as they started up, "I wont apologize for interrupting. Mr. Holt is collecting facts about Uncle Capen for his funeral sermon, and I thought that my good wife could help him out, if anybody could. So I will leave him."

And the Doctor, nodding, went into the

hall for his coat and driving gloves, and, going out, disappeared about the corner of the house.

"You will really oblige me very much, Mrs. Hunter," said the minister, "—or Mrs. French, —— if you can give me any particulars about old Mr. Capen's life. His family seem to be rather sensitive, and they depend on a long, old-fashioned funeral sermon; and here I am utterly bare of facts."

"Why, yes," said Mrs. Hunter. "Of course; now ——"

"Why, yes; everybody knows all about him," said Mrs. French.

And then they laid their work down and relapsed into meditation.

"Oh!" said Mrs. Hunter, in a moment. "No, though ——"

"Why, you know," said Mrs. French, "no — I guess, on the whole ——"

"You remember," said the Doctor's wife to Mrs. French, with a faint smile, "the time he papered my east chamber — don't you — how he made the pattern come?"

And then they both laughed gently for a moment.

"Well, I have always known him," said Mrs. French. "But really, being asked so suddenly, it seems to drive everything out of my head."

"Yes," said Mrs. Hunter, "and it's odd that I can't think of exactly the thing, just at this minute; but if I do, I will run over to the parsonage this evening."

"Yes, so will I," said Mrs. French. "I know that I shall think of oceans of things just as soon as you have gone."

"Wont you stay to tea?" said Mrs. Hunter, as Holt rose to go. "The Doctor has gone; but we never count on him."

"No, I thank you," said Mr. Holt. "If I am to invent a biography, I may as well be at it."

Mrs. Hunter went with him to the door.

"I must just tell you," she said, "one of Uncle Capen's sayings. It was long ago, when I was first married, and came here. I had a young men's Bible class in Sunday-school, and Uncle Capen came into it. He always wore a cap, and sat at meetings with the boys. So, one Sunday, we had in the lesson that verse,—you know,—that if all these things should be written, even the world itself could not contain the books that should be written; and there Uncle Capen stopped me, and said he: 'I suppose that means the world as known to the Ancients.'"

HOLT put on his hat, and with a smile turned and went on his way toward the parsonage; but he remembered that he had promised to call at what the local paper termed "the late residence of the deceased," where, on the one hundredth birthday of the centenarian, according to the poet's corner:

> "Friends, neighbors, and visitors he did receive
> From early in the morning till dewy eve."

So he turned his steps in that direction.

He opened the clicking latch of the gate and rattled the knocker on the front door of the little cottage; and a tall, motherly woman of the neighborhood appeared and ushered him in.

Uncle Capen's unmarried daughter, a woman of sixty, her two brothers and their wives, and half a dozen neighbors were sitting in the tidy kitchen, where a crackling wood-fire in the stove was suggesting a hospitable cup of tea.

The minister's appearance, breaking the formal gloom, was welcomed.

"Well," said Miss Maria, "I suppose the sermon is all writ by this time. I think likely you've come down to read it to us."

"No," said Holt, "I have left the actual writing of it till I get all my facts. I thought perhaps you might have thought of something else."

"No; I told you everything there was about father yesterday," she said. "I'm sure you can't lack of things to put in; why, father lived a hundred years — and longer, too, for he was a hundred years and six days, you remember."

"You know," said Holt, "there are a great many things that are very interesting to a man's immediate friends that don't interest the public."

And he looked to Mr. Small for confirmation.

"Yes, that's so," said Mr. Small, nodding wisely.

"But, you see, father was a centenarian," said Maria, "and so that makes everything about him interesting. It's a lesson to the young, you know."

"Oh, yes, that's so," said Mr. Small, "if a man lives to be a centurion."

"Well, you all knew our good friend," said Mr. Holt. "If any of you will suggest anything, I shall be very glad to put it in."

Nobody spoke for a moment.

"There's one interesting thing," said one of the sons, a little old man, much like his father; "that is, that none of his children have ever gone meandering off; we've all remained" — he might almost have said remained seated —"all our lives, right about him."

"I will allude to that," said Mr. Holt. "I hope you have something else, for I am afraid of running short of material: you see I am a stranger here."

"Why, I hope there wont be any trouble

about it," said Maria, in sudden consternation. "I was a little afraid to give it out to so young a man as you, and I thought some of giving the preference to Father Cobb, but I didn't quite like to have it go out of the village, nor to deprive you of the opportunity; and they all assured me that you was smart. But if you're feeling nervous, perhaps we'd better have him still; he's always ready."

"Just as you like," said Holt modestly; "if he would be willing to preach the sermon, we might leave it that way, and I will add a few remarks."

But Maria's zeal for Father Cobb was a flash in the pan. He was a sickly farmer, a licensed preacher, who, when he was called upon occasionally to meet a sudden exigency, usually preached on the beheading of John the Baptist.

"I guess you've got things enough to write," said Maria consolingly; "you know how awfully a thing does drag out when you come to write it down on paper. Remember to tell how we've all staid right here."

WHEN Holt went out, he saw Mr. Small beckoning him to come to where his green wagon stood under a tree.

"I must tell you," he said, with an awkwardly repressed smile, "about a trade of Uncle Capen's. He had a little lot up our way that they wanted for a school-house, and he agreed to sell it for what it cost him, and the selectmen, knowing what it cost him,—fifty dollars,— agreed with him that way. But come to sign the deed, he called for a hundred dollars. 'How's that,' says they; 'you bought it of Captain Sam Bowen for fifty dollars.' 'Yes, but see here,' says Uncle Capen, 'it's cost me on an average five dollars a year, for the ten year I've had it, for manure and plowing and seed, and that's fifty dollars more.' 'But you've sold the garden stuff off it, and had the money,' says they. 'Yes,' says Uncle Capen, 'but that money's spent and eat up long ago!'"

The minister smiled, shook hands with Mr. Small, and went home.

THE church was crowded. Horses filled the sheds, horses were tied to the fences all up and down the street. Funerals are always popular in the country, and this one had a double element of attractiveness. The whole population of the town, having watched with a lively interest, for years back, Uncle Capen's progress to his hundredth birthday, expected now some electrical effect, analogous to an apotheosis.

In the front pews were the chief mourners, filled with the sweet intoxication of preëminence.

The opening exercises were finished, a hymn was sung:

"Life is a Span,"

and Father Cobb arose to make his introductory remarks.

He began with some reminiscences of the first time he saw Uncle Capen, some thirty years before, and spoke of viewing him even then as an aged man, and of having remarked to him that he was walking down the valley of life with one foot in the grave. He called attention to Uncle Capen's virtues, and pointed out their connection with his longevity. He had not smoked for some forty years; therefore, if the youth who were present desired to attain his age, let them not smoke. He had been a total abstainer, moreover, from his seventieth year; let them, if they would rival his longevity, follow his example. The good man closed with a feeling allusion to the relatives, in the front pew, mourning like the disciples of John the Baptist after his "beheadment." Another hymn was sung:

"A vapor brief and swiftly gone."

Then there was deep silence as the minister rose and gave out his text:

"I have been young, and now I am old."

"AT the time of the grand review in Washington," he said, "that mighty pageant that fittingly closed the drama of the war, I was a spectator, crippled then by a gun-shot wound, and unable to march. From an upper window I saw that host file by, about to record its greatest triumph by melting quietly into the general citizenship; a mighty, resistless army about to fade and leave no trace, except here and there a one-armed man, or a blue flannel jacket behind a plow. Often now, when I close my eyes, that picture rises: that gallant host, those tattered flags; and I hear the shouts that rose when my brigade, with their flaming scarfs, went trooping by. Little as I may have done, as a humble member of that army, no earthly treasure could buy from me the thought of my fellowship with it, or even the memory of that great review.

"But that display was mere tinsel show compared with the great pageant that has moved before those few men who have lived through the whole length of the past hundred years.

"Before me lies the form of a man who, though he has passed his days with no distinction but that of an honest man, has lived through some of the most remarkable events of all the ages. For a hundred years a mighty pageant has been passing before him. I would rather have lived that hundred years than any other. I am deeply touched to reflect that he who lately inhabited this cold tenement of clay

connects our generation with that of Washington. And it is impossible to speak of one whose great age draws together this assembly, without recalling events through which he lived.

"Our friend was born in this village. This town then included the adjoining towns to the north and south. The region was then more sparsely settled, although many houses standing then have disappeared. While he was sleeping peacefully in the cradle; while he was opening on the world childhood's wide, wondering eyes, those great men, whose names are our perpetual benediction, were planning for freedom from a foreign yoke. While he was passing through the happy years of early childhood, the fierce clash of arms resounded through the little strip of territory which then made up the United States. I can hardly realize that, as a child, he heard as a fresh, new, real story, of the deeds of Lexington, from the lips of men then young who had been in the fight; or listened, as one of an eager group gathered about the fireside, or in the old, now deserted taverns on the turnpike, to the story of Bunker Hill.

"And when, the yoke of tyranny thrown off, in our country and in France, Lafayette, the mere mention of whose name brings tears to the eyes of every true American, came to see the America that he loved and that loved him, he, on whose cold, rigid face I now look down, joined in one of those enthusiastic throngs that made the visit like a Roman triumph.

"But turn to the world of nature, and think of the panoramic scenes that have passed before those now impassive eyes. In our friend's boyhood, there was no practical mode of swift communication of news. In great emergencies, to be sure, some Paul Revere might flash his beacon light from a lofty tower; but news crept slowly over our hand-breadth nation, and it was months after a presidential election before the result was generally known. He lived to see the telegraph flashing swiftly about the globe, annihilating time and space and bringing the scattered nations into greater unity.

"And think, my hearers, for one moment, of the wonders of electricity. Here is a power which we name but do not know; that flashes through the sky, that shatters great trees, burns buildings, strikes men dead in the fields; and we have learned to lead it, all unseen, from our house-tops to the earth; we tame this mighty, secret, unknown power down into serving us as a daily messenger; and no man sets the limits now to the servitude that we shall yet bind it down to.

"Again, my hearers, when our friend was well advanced in life, there was still no better mode of travel between distant points than the slow, rumbling stage-coach; many who are here remember well its delays and discomforts. He saw the first tentative efforts of that mighty factor steam to transport more swiftly. He saw the first railroad built in the country; he lived to see the land covered with the iron net-work.

"And what a transition is this! Pause for a moment to consider it. How much does this imply. With the late improvements in agricultural machinery, with the cheapening of steel rails, the boundless prairie farms of the West are now brought into competition with the fields of Great Britain in supplying the Englishman's table, and seem not unlikely, within this generation, to break down the aristocratic holding of land, and so perhaps to undermine aristocracy itself."

So the preacher continued, speaking of different improvements, and lastly of the invention of daguerreotypes and photographs. He called the attention of his hearers to this almost miraculous art of indelibly fixing the expression of a countenance, and drew a lesson as to the permanent effect of our daily looks and expression on those among whom we live. He considered at length the vast amount of happiness which had been caused by bringing pictures of loved ones within the reach of all; the increase of family affection and general good feeling which must have resulted from the invention, and suggested a possible lifting of the civilization of the older nations through the constant sending home, by prosperous adopted citizens, of photographs of themselves and of their homes, and alluded to the effect which that must have had in new immigration.

Finally, he adverted to the fact that the sons of the deceased, who sat before him, had not yielded to the restless spirit of adventure, but had found "no place like home."

"But I fear," he said at last, "that the interest of my subject has made me transgress upon your patience; and with a word or two more I will close.

"When we remember what hard, trying things often arise within a single day, let us rightly estimate the patient well-doing of a man who has lived a blameless life for a hundred years. When we remember what harm, what sin, can be crowded into a single moment, let us rightly estimate the principle that kept him so close to the golden rule, not for a day, not for a decade or a generation, but for a hundred years.

"And now, as we are about to lay his deserted body in the earth, let not our perceptions be dulled by the constant repetition in this world of death and burial. At this hour

our friend is no longer aged; wrinkles and furrows, trembling limbs and snowy locks he has left behind him, and he knows, we believe, to-day, more than the wisest philosopher on earth. We may study and argue, all our lives, to discover the nature of life, or the form it takes beyond the grave; but in one moment of swift transition the righteous man may learn it all. We differ widely one from another, here, in mental power. A slight hardening of some tissue of the brain might have left a Shakspere an attorney's clerk. But, in the brighter world, no such impediments prevent, I believe, clear vision and clear expression; and differences of mind that seem world-wide here, may vanish there. When the spirit breaks its earthly prison and flies away, who can tell how bright and free the humblest of us may come to be! There may be a more varied truth than we commonly think, in the words: The last shall be first.

"Let this day be remembered. Let us think of the vast display of nature's forces which was made within the long period of our old neighbor's life; but let us also reflect upon the bright pageant that is now unrolling itself before him in a better world."

THAT evening Miss Maria and her brothers, sitting in state in the little old house, received many a caller. And the conversation was chiefly upon one theme: not the funeral sermon, although that was commended as a frank and simple biographical discourse, but the great events which had accompanied Uncle Capen's progress through this world, almost like those which Horace records in his Ode to Augustus.

"That's trew, every word," said Apollos Carver; "when Uncle Capen was a boy there wasn't not one railroad in the hull breadth of the United States, and just think: why now you can go in a Pullerman car clear'n acrost to San Francisco. My daughter lives in Oakland, just across a ferry from there."

"Well, then, there's photographing," said Captain Abel. "It doos seem amazing, as the minister said: you set down, and square yourself, and slick your hair, and stare stiddy into a funnel, and a man ducks his head under a covering, and pop! there you be, as natural as life,—if not more so. And when Uncle Capen was a young man, there wasn't nothing but portraits and minnytures, and these black-paper-and-scissors portraits—what do they call 'em? Yes, sir, all that come in under his observation."

"Yes," said one of the sons, "it's wonderful; my wife and me was took setting on a settee, in the Garden of Eden—lions and tigers and other scriptural objects in the background."

"And don't forget the telegraph," said Maria; "don't forget that."

"Trew," said Apollos, "that's another thing. I hed a message come once't from my son that lives to Taunton. We was all so sca't and faint when we see it, that we didn't none of us dast to open it, and finally the feller that druv over with it hed to open it fur us."

"What was there in it?" said Mr. Small; "sickness?—death?"

"No, he wanted his thick coat expressed up. But my wife didn't get over the shock for some time. Wonderful thing—that telegraph—here's a man standing a hundred miles off, like enough, and harpooning an idea chock right into your mind."

"Then that was a beautiful truth," said Maria: "that father and Shakspere would probably be changed round in heaven; I always said father wasn't appreciated here."

"Well," said Apollos, "'tis always so; we don't begin to realize the value of a thing tell we lose it. Now that we sort o' stand and gaze at Uncle Capen at a fair distance, as it were, he looms. If he only hedn't kep' so quiet, always, about these 'ere wonders—a man really ought, in justice to himself, to blow his own horn—jest a little. But that was a grand discourse, wasn't it, now?"

"Oh, yes," said Maria, "though I felt nervous for the young man; but when you come to think what materials he had to make a sermon out of,—why, how could he help it! And yet, I doubt not he takes all the credit to himself."

"I should really have liked to have heard Father Cobb treat the subject," said Mrs. Small, rising to go, and nodding to her husband. "'Twas a grand theme. But it was a real chance for the new minister. Such an opportunity doesn't happen not once in a lifetime."

THE next morning, after breakfast, on his way home from the post-office, the minister stepped in at Doctor Hunter's office.

The Doctor was reading a newspaper.

Holt took a chair in silence.

The Doctor laid down the paper and eyed him quizzically, and then slowly shook his head.

"I don't know about you ministers," he said. "I attended the funeral; I heard the biographical discourse; I understand it gave great satisfaction. I have reflected on it over night; and now, what I want to know is, what on earth there was in it about Uncle Capen."

The minister smiled.

"I think," he replied, "that all that I said about Uncle Capen was strictly true."

C. H. White.

LOVE POEMS BY LOUIS BARNAVAL.*

I.

Ah moments of a softer look,
  Ah hours that flew all unaware,
Ah graceful sky-swung hawks that took
  The eye with beauty's curve in air,
Ah happy grass within our nook,
  Say, were you pressed by shape more rare?
Your voice that day, my own dear maid,
Sang like the wind through a leafy glade.

II.

O loveliness of earth, O draughts delicious,
Of odors, airs, and views!
What buoyant sense of youth along the limbs
With you beside me on the grass, capricious
As the quick morning dews
Which fly before the thrush has ceased his hymns,
Before the eastern rims
Of little ponds are gladdened by the sun!
Starveling, what have I done—
That one day brings these heaps of high delight
And your face, glowing with a heavenly might?

III.

At last alone, alone where myriads throng,
Nor heed us, mighty caravanserais!
  Alone to catch the song
  That ocean sings and sighs
Where the long breaker lifts and bows farewell to sunlit skies!

Delight to run like beach-birds barefoot down
The hard, wet sand, and tear with childish glee
  The ocean's foam-fringed gown,
  And from the sad land flee
As lovers plunge from coral strands into the cool south sea!

IV.

Frail birds that feel too weak of wing
  To wander past the stormy sea
To feathery backs will catch and cling,
  But cheer their hosts with songs of glee.

So I to pinions of your faith
  Intrust my soul, nor doubt at all:
O strong heart, bear me clear of scaith,
  From windy blow, from watery fall.

V.

Even as the birds that haunt our twilight sky
  With sickle wings flecked twice in shapes of moon
Through sheets of rain their flight undaunted ply
Brave in a strength that comes they know not why,
  Nor at the lightning bolt will blench or swoon,

And as through deeper night they carve their way,
  By faith upborne upon their pinions fine,
So have I learned even to the morning's gray
On love's pied wings my heavy heart to stay
  Pillowed on gales that blow from realms divine.

VI.

An oval board, silver, great heaps of flowers;
Bright glances, tender bosoms, brilliant dresses,
Wine of four hues, a score of savory messes,
A Babel of talk that up to the ceiling towers,
Then, all at once—your name! As when the dashes
Of wind and hail are thick in stormy showers;
But through the midst a bolt of thunder crashes
And in suspense hang all the cosmic powers—

So came the name a stranger spoke in praise;
And while I forced a trembling, dull reply,
Striving to shake myself from my amaze,

A little choir of angels in a sky
Within my brain began a glorious hymn:
The sea of despond then I learned to swim.

* Selections (not consecutive) from unpublished "Love Poems by Louis Barnaval. Edited, with an introduction, by Charles de Kay."

VII.

Amber mist
Lightly kissed
By the sun of May capricious,
Yellow haze
In the maze
Leafy of the trees delicious.
Down the street
Glimpses fleet
Of a gull-wing'd yacht in motion,
Up the sky
Wild geese cry
As they near the northern ocean.

Like a vail
Smoky-pale
Cloudlets tinge the far horizon,
Fairies paint
Hills with quaint
Mimicry of autumn's foison.
Moist, at ease
Chant their glees
Timid toad and salamander,
Puffs of health
Blow by stealth,
All things to a love-tryst pander.

In my room
Hornets hum
Rousing from their wintry slumber,
Through the woods
Violet buds
Deck with blue the fallen lumber.
What surprise!
Violet eyes
Live and flash a dry heart under,
Once all sad.
Now all glad,
I can only gaze and wonder.

VIII.

The pomp of lights, the pride and mighty round
Of ladies gay against their escort somber,
The babble of tongues forever heard and drowned
In glorious music endless as the number
Of angels in the glory of the sun . . .

Heads turned my way and little hands to press
And teasing talk and looks of no, consenting,
Then from the stage the storm and quivering stress
Of Gretchen crazed and Faust in vain repenting . . .
Ah, then the hardest-hearted breast is won!

But gone is opera, gone the rows of heads,
Gone music, singers. For I see a chamber
With pretty things and one divine who beds
Herself with grief. Thought, thought, where wilt thou clamber?

Take all — songs, dames, and sights and sounds in billow —
All, all, to smooth one tossed and tear-stained pillow!

IX.

O gold-cup moon, brimm'd high with generous wine,
Pour, pour on her your wealth
Of amorous health,
On her I call, but with what folly, mine!

O thyme-steeped wind, with your fine, feathery broom
For rare new perfumes seek
Each hidden creek
And sweep them through her cool and shadowy room!

O treacherous tide, swirling along the cove,
From China spices rare
And rich silks bear
To cast them at the feet of her I love!

O fringing trees that sing to her in sleep,
Stretch, stretch your green nets wide
On every side
And seize miasmas that should near her creep!

O bashful feet and foolish, trembling hands,
Be firm, be hardy each
To aid his speech
When next her lover by his true love stands!

O stammering tongue which each warm word outstrips,
O timorous heart that now like dolphin dips,
What though ye fail to serve?
There still is nerve
For one mute passionate pleading of the lips.

TOPICS OF THE TIME.

Caucus Reform.

FOLLOWING close upon the heels of the National Civil Service Act comes the popular demand for a reform in the methods of political nominations. The leaders of the Civil Service Reform movement have for years past insisted, and it is now generally admitted, that the evils of "patronage" are closely related to the abuses by which the tricky and unscrupulous politician secures the control of his particular district or ward. The connection is not hard to trace. The art of political management, even of the lowest sort, is not to be learned in a day. Nor can the conscientious citizen who is stirred by a sincere desire to lend a hand in securing worthy nominations to offices of trust and honor accomplish his ends by casual attendance at the caucus or the primary.

Even in communities like many of the New England cities, where the traditions of the old town meeting are in a great measure preserved by a widespread sense of public duty which leads men of high standing and repute to attend and share in the party management, the caucus is fast drifting into the hands of wire-pullers and log-rollers such as have brought disgrace upon the primaries of Brooklyn and New York and the ward meetings of Boston, Philadelphia, and Baltimore.

"Practical politics," to use the cant phrase, require practice; and the skilled minority who devote their time to "running" the ward or the district will always defeat, in the long run, the honest, intelligent, and public-spirited but *disinterested* majority, however numerically powerful, for the simple reason that the former depend for their daily bread upon their successful manipulation of the nominating machine, while the moving impulse of the latter is, at best, a sense of duty, strong perhaps at fitful intervals of great public excitement, but by no means to be depended upon for the steady, persistent everyday work which success at the primary of to-day demands. As has been well said by a writer in this magazine: "The men who do and control the work of these election organizations give to it more than two or three hours in one or two evenings in each year. They give to it substantially their whole time—as the men must do who are to do so great a work, and do it so well." *

A glance at the list of officers of the Republican district associations in the city of New York alone will show the stake which the district "leader" has in his work. In 1882 nearly two-thirds of the presidents of these select and exclusive little clubs were office-holders in state or municipal departments, and each, admittedly, owed his place to the fact that he was counted on to "carry his district in his pocket."

That these salaried positions have been used in the past mainly to reward political services shows plainly enough what is expected of a district leader. He and his henchmen are bound to get and keep control of the nominating machinery of their association; and with certain definite returns at their probable disposal in event of success, it is not surprising that they seek to keep down the number of those entitled to claim a share in the allotted reward.

With the growth of the great evil of official patronage, the abuses of the primary in the form of false enrollments, fraudulent expulsions, stuffed ballots, and the like, have developed with equal pace. But the evil has about run its course, and the proverbial conservatism of the American people has at last begun to fret under what has come to be an intolerable abuse. In the very States where the farce of the caucus has been the most flagrant, the intelligent demand for measures of reform is the loudest, and public opinion seems to indicate that the people understand just where the evil lies, and have determined to check it by rational methods. No amount of reorganization, no reënrollment, nor the adoption of other measures for temporary relief, such as the bosses have relied upon in the past, will satisfy us to-day. We have at last learned that we cannot let a Tweed dispense the public offices in return for controlling this district or that committee, and then expect his henchmen to refrain from the dirty work by which alone they can secure their pay. So long as running the primary means winning a salaried office, for just so long there will be men at hand ready to carry the primary by any and every sort of fraud. They may be, and doubtless often are, in the minority. But until the caucus is protected by the most stringent penalties they will be a winning minority, and even the most severe penal enactments will not deter men from fraud and perjury while the rewards of patronage are left to tempt them.

Vicarious Benevolence.

"IF you want a thing done, do it yourself." Musty and stale seems that ancient philosophy. The corner-stone of modern civilization is a maxim that exactly reverses the ancient apothegm. "If you want a thing done, get somebody else to do it." This is the law of the large system of industry, the foundation of all the great fortunes. The power of commanding the services of others, of laying tribute on the farms and factories, the brain and the sinew of your neighbors, was never more coveted and never more effectually employed than at this day.

This modern method of commerce has been introduced, with much success, into what is called benevolence. In the olden time it was the fashion, if you saw a good work that ought to be done, to go and do it yourself. It was supposed, formerly, that the opportunity to perform a kind act was a providential indication of duty, and that the best discipline of life was gained in promptly seizing such opportunities. Even now, we find a few philanthropists who cling to this old-fashioned philosophy, and who seem bent on doing

* "The People's Problem." Albert Stickney, in this magazine, for July, 1881.

every day what good they can, with their own means and with their own hands. But the prevalent mode of benevolence is a great refinement on this old way. It seems to be the fruit of a species of altruism much more highly developed than any known to our fathers. The blessedness of giving is assumed to be the highest blessedness; we want our neighbors to enjoy this blessedness to the full. Why should we selfishly deprive them of any portion of it? If there is any giving to be done, then let us urge them to do it; so shall we most effectually promote their happiness. Thus has arisen the great system of vicarious benevolence whose line has gone out into all the earth, and whose circulars arrive by every mail.

It is beautiful to see how quickly the promptings of this new kind of charity spring into the mind when any human need arises. The first thought of most men seems to be not "How much can we do toward relieving this need?" but rather "How much can we get other people to do?" Each man begins to think of other men who can be induced to contribute; each neighborhood looks, at once, beyond its own borders to other neighborhoods upon which it may confer the blessedness of bearing its burdens. Mr. Hale's motto, "Look out and not in," finds in this habit of mind one of its most striking illustrations: for when there are contributions to be made the modern philanthropist begins at once to look out for contributors, and not to look into his own pocket at all.

If there is a church debt to pay, a hospital to build, an orphanage to found, immediately the thoughts of those who stand nearest to the project, and who are to be most deeply benefited by it, are turned to distant places, inquiring how they may obtain this good thing at the smallest possible cost to themselves. Those benevolent gentlemen who have had large experience in the work of raising church debts testify that the people who have contracted these debts and are responsible for their payment are almost always well content to sit and wait, in the expectation that other people, somewhere and somehow, will lift their burden for them.

The church that confronts a deficit in its annual budget turns instinctively to this unfailing resource. "Go to!" say the financiers; "let us arrange a lecture course; there are a number of benevolent gentlemen who go about delivering gratuitous lectures for the benefit of impecunious societies; doubtless we can impress them into the service, and it would be a pity to put ourselves out to pay these bills and thus deprive them of the privilege and pleasure of serving us for nothing." It is not alone the poor who have discovered this new way to pay old debts; those who are well-to-do often resort to it. From rich and prosperous communities applications are all the while coming to publishers of books and periodicals for gifts of their publications to incipient libraries and reading-rooms. They do not beg these books because they are unable to buy them; they do it spontaneously, because this great principle of vicarious benevolence has become so firmly rooted in their natures. In a financial point of view the advantages of this method are not always apparent; for it is evident that people often spend much more time and labor in getting others to pay their debts or perform their charities than it would cost them to earn the necessary money by their ordinary vocations; but money is of small consequence when compared with the moral and spiritual benefit conferred on those to whom they thus transfer their obligations. What a blessed day it will be when everybody sees somebody else bearing the burdens that naturally fall to him, and when nobody finds any good thing to do that he cannot get somebody else to do for him!

Seriously, however, it begins to be a question whether this double-distilled altruism is not becoming overstrained,—whether, in short, it is not turning out to be something very like rank selfishness. The disposition of multitudes to fasten their own burdens upon the shoulders of those who can hardly be called neighbors — of utter strangers, indeed — is becoming slightly exasperating. Into every great city pours a constant procession of solicitors with causes to present; and every man who has ever been detected in any sort of charity finds them always at his doors. There are colleges and schools to build or to endow, churches to aid, philanthropies of all sorts to promote. Many of these are deserving charities; not a few of them have a right to present their claims in New York and New England, for they represent causes that can obtain no adequate local support. But there is plenty of evidence that communities which are abundantly able to establish and maintain their own schools and churches, send their agents off to beg in distant places. "Of course," writes a shrewd and experienced donor, "there are two sides to this question. Some colleges in the West and South must be founded and sustained by people at a distance. But, in some cases, I am inclined to think that ten thousand dollars subscribed for any given work by the people in the locality would be worth more to the community than a hundred thousand dollars got from a distance. Is it not part of the work that educated men ought to do in connection with the colleges they are planting, to stimulate and develop the grace of liberality among the people of their own neighborhood?" It is surely a question whether communities, as well as individuals, may not be permanently injured by the formation of a mendicant habit; and whether the awakening of local pride and of a disposition to support their own institutions and take care of themselves would not be an immense gain to the people of some localities.

One thing is certain: this business of vicarious benevolence is seriously overdone. A great amount of money has been gathered in the East during the last fifty years by all sorts of solicitors; but the onset of this army is becoming so overpowering that there is great danger of a reaction which shall dry up these streams of benevolence altogether. It makes little difference whether the goose that laid the golden egg is killed outright or worried to death.

Vagrant Parsons.

THE children of light are not yet so wise in their generation as they might be; if they were, ministerial vagrants would not abound and flourish as they do. It is evident that a good share of the saints yet deserve, if they do not covet, the appellation of "the Lord's silly people." The way in which churches here and there are victimized by clerical adventurers argues ill for the discretion of church authorities.

We are frequently hearing of questionable characters who have suddenly come from nobody knows where, and have hoisted themselves into vacant pulpits, where, for awhile, they subsist, feeding the flock with such moldy fodder as they can manage to scrape together, borrowing all the money they can, often robbing the weak and unwary of that which money cannot restore, and finally going away, usually in some haste, leaving the churches thus possessed and debauched in the condition of the boy in the New Testament out of whom the demon was cast.

Many of these ministerial tramps have no ministerial standing, and make no distinct claim of any; they usually pretend to be connected with some religious body not well known in the neighborhoods where they are operating, but they show no papers; their only credentials are a glib tongue, a sanctimonious tone, and a brazen face. Almost always they make great pretensions to orthodoxy, and their notions of conduct are apt to be extremely rigid. By these professions they gain the confidence of the more austere among the church officers, and contrive to secure a hearing.

Worldly-minded people are inclined to say that any church which suffers an unknown man, bringing no credentials and vouched for by nobody, to vault into its pulpit and to gain access as a clergyman to the homes of its people is unfit to be the custodian of any important trust, and cannot too soon be rent asunder and blotted out. Extinction is, indeed, the just penalty for such stupid infidelity. But in the infliction of this penalty precious interests suffer and innocent persons are injured. THE CENTURY goes to many readers in those distant parishes which the ministerial adventurers generally infest. Let them lay to heart this admonition. Let them impress upon all those who have the care of these churches the danger of harboring such persons. Let them see to it that a stringent rule is adopted in every church, by which no man shall be suffered to stand one moment in its pulpit unless he can give a clear account of himself and present to its officers ample and unquestionable evidence, indorsed by persons well known to them, of his good standing in the ministry.

The official lists of clergymen published by the various denominations ought to guarantee the good standing of all whose names are found in them. Certainly, a man who cannot show his name in one of these official lists ought not to be employed by a church until he can clearly explain why it is not in any of them. But, unfortunately, the presence of a name in one of these ministerial rolls is not always conclusive evidence that the person bearing it has a right to be recognized as a minister of the gospel. Ecclesiastical bodies are sometimes extremely careless in admitting ministers to their fellowship; the vilest men sometimes get in on the flimsiest credentials. A few years ago a man who had figured in a disgusting scandal, and who had been summarily expelled from the ministry of his own denomination, appeared at the doors of a respectable ecclesiastical body in the North-west and sought admission. It had been but four or five years since he was driven out of the pulpit, and the details of his villainy had been in all the newspapers, East and West; but with unblushing effrontery he undertook to reinstate himself in the ministry of another denomination. He had no papers, save an honorary degree of master of arts conferred on him before his downfall by a too-confiding college, and some similar documents, but he contrived to get an invitation to preach before the body. His fluency and fervor captivated his hearers, and in a burst of confidence they admitted him to their membership and put his name upon their roll. Armed with this certificate he was soon standing as a candidate in the pulpit of one of the leading churches of the West. Here again his smooth tongue won him many adherents, and it was by a mere accident that his true character was discovered in time to prevent the church from calling him to its pastorate. The indecent haste with which this notorious fellow was admitted to membership in a dignified ecclesiastical body, and thus duly accredited as a preacher of the gospel, seems incredible; but the story is an instance, not so rare as it ought to be, of the way things are sometimes done in religious assemblies.

Before us lies a formal confession, by a Presbytery at the West, of the manner in which it placed upon its roll the name of a man almost equally notorious, whose credentials were equally unsatisfactory. There is call for far sharper scrutiny into the character of candidates for ministerial fellowship than some of the ecclesiastical bodies are wont to exercise. Their doctrinal beliefs are apt to be carefully looked into; any variation from the creed of the church is speedily discovered and not readily forgiven; but the question whether the candidate has a good character and a clean record has been asked with much less urgency.

There seems to be no way of insuring the churches against wicked men and deceivers, but if the denominations would exercise proper care in keeping the names of disreputable men out of their ministerial lists, and if the local churches would rigidly refuse to have any dealings with men whose names do not appear in the latest of these lists, the path of the ministerial vagrant would be much more thorny than he now finds it.

OPEN LETTERS.

What is the New Theology?

THE arrival of a new theology is currently reported, and many have been running to and fro with tidings about it, but without greatly increasing our knowledge of its form or content. At last a man has come who seems to know what it is not, which, when you are studying theology, is the first thing you want to know, and also what it is, which is the last thing you are likely to find out. Mr. T. T. Munger's book of ser-

mons on "The Freedom of Faith," * with the prefatory essay, in which he undertakes to answer the question proposed above, is the most complete and intelligible exposition yet offered of that new philosophy of Christianity which seems to be emerging from the present chaos of mingled dogmatism and doubt.

Of formal theology very little will be found, however, in this suggestive and inspiring book. Somebody should send it, at once, to Mr. Matthew Arnold; for it is a book of literature rather than of dogma, a book that eschews the method of the system-makers and sets forth Christianity in terms of life, instead of giving us the results of an analysis by which life is destroyed. As literature, these sermons of Mr. Munger's will prove a delight to all who find pleasure in clear, sinewy, musical, picturesque English speech; their art is as exquisite as that of Newman; it is a strong saying, but I do not fear contradiction when I say that there is no more perfect English in any recent volumes of discourses or essays.

It must not be supposed that, in avoiding the method of a formal logic, Mr. Munger has lapsed into looseness or inconsequence of thought, albeit that criticism is sure to overtake him. A new philosophy often seems *no* philosophy to those whose thoughts have been run in the molds of one that is older. The explanations which it offers are unintelligible to those who will not occupy its point of view, and they therefore pronounce it misty and incoherent. It is common to hear the most clear and cogent reasonings condemned as loose and inconsistent, simply because they do not consist with the theories of those who condemn them. The man who stands in the fog sees the objects near him with tolerable clearness, but his neighbor, who stands a little way off, appears to him to be enveloped in a mist far denser than that which surrounds him. And when he hears his neighbor speak with some confidence of things visible, he cries: "Nonsense! I can see none of those things! And that man cannot see them. Just look at the density of the fog bank that encompasses him!" This fable teaches a lesson that may as well be learned by those who are always accusing their neighbors of being in a fog. If, therefore, any one should say that Mr. Munger's method lacks coherency, it will not be true. His book gives us, indeed, a theory of the Christian religion broad, self-consistent, and harmonious; a doctrine that glorifies the Scripture from which it is drawn, that spreads the light of its large interpretation over the facts of nature and the events of history, and that finds in the axioms of morality stepping-stones instead of stumbling-blocks.

I wish I had time to tell in this place something more definite about this book. The introductory essay upon the new theology, to which I have referred, is likely to be accepted, by most of those who are regarded as being identified with that phase of modern thought which is so described, as a most judicious and sufficient statement of the lines on which it is moving and the spirit by which it is governed. If it shall be so accepted, both by the confessors and the critics of the new theology, it ought to do something toward steadying the movements of the more rash among the former, and also toward reassuring the more timid among the latter. "With the noisy, thoughtless shouters for the new because it seems to be new, and with the sullen, obstinate shouters for the old because it is old, these pages," says the author, "have little to do. There is, however," he continues, "a large class of earnest, reflecting minds, who recognize a certain development of doctrine, a transfer of emphasis, a change of temper, a widened habit of thought, a broader research, that justify the use of some term by which to designate it."

This essay, and the volume which it introduces, give to this spirit and tendency a calm and fair expression. The new theology, as Mr. Munger understands it, does not propose to do without clear statements; nor does it part with the historic faith of the church; nor does it reject any of the doctrines that have been regarded as distinctly evangelical, as the Trinity, the Incarnation, the Atonement, the Resurrection, the Judgment, Retribution, and Salvation by faith, although it explains some of these by a new philosophy; nor is it iconoclastic in its temper; nor does it incline to any breach with the old churches. Its peculiarity, as he interprets it, consists in "claiming for itself a somewhat larger and broader use of the reason than has been accorded to theology"; "it seeks to interpret the Scriptures in a more natural way," and "to replace an excessive individuality by a truer view of the solidarity of the race"; it "recognizes a new relation to natural science"; it "offers a contrast to the old in claiming for itself a wider study of men"; and it consents to the necessity of a restatement of the doctrine of retribution. All this is reasoned with the broadest candor and the nicest discrimination. I should think that the fears of the most anxious defenders of the old theology would be somewhat chastened as they read this temperate, reverent, and spiritually luminous account of what the new theology means to be. Surely the very essence of the gospel is here; no precious element is wanting; and the insight of faith, and the purity of sentiment, and the heroism of purpose that shine from every chapter of this noble book will commend themselves to ingenuous and devout men of all creeds.

Washington Gladden.

American Holidays.

It may be difficult to say just why we are not a holiday people, or just why we should be one. But the fact remains. We are not. At least, when we compare that portion of the New World peopled from New England as a center with the Old World in this respect, and on gala days note the agility with which the average American shrivels into slippers and dressing gown behind the morning newspaper, and the corresponding agility with which his transatlantic neighbor glides into his good clothes and goes to church, or takes his family to meet his friend's family at the public resort, or bestirs himself at home to fulfill the strictly social duties of the season.

We are a people of commonplace habits. We have a strong eye for going ahead, and a very suspicious side glance at recreation. We drive things pretty hard. Vacations we are apt to regard as effeminate inventions for clergymen and invalids. Nor do we seem to have much of a genius for using our vaca-

tions when we get them. The man who has spent the whole week shut up in a counting-room, lies abed Sunday morning, and gets up late to putter with the furnace or regulate the clocks, or to figure up stray accounts in a ledger which he brought home under his arm the night before, and then takes a nap after dinner, and goes to church with his wife in the evening — what matters it to him that there are millions of cubic feet of oxygen outside for just such lungs as his, and a clean five miles awaiting just such a pair of legs as he has been twisting under a high desk for six days? Or another, a trifle more rational though hardly less prosaic, adopts the *rôle* of the sportsman. *He* looks with scorn upon the domestic ledger-worm and regulator of clocks. *He* thirsts for Nature. So he packs his ammunition, selects his flies, and starts for the wilderness. Sometimes he takes with him the family photographs, and he has been known even to leave his post-office address behind; but this is purely phenomenal. As a rule, he exhibits a manly and sturdy disregard of all such sentimentality, and declares that it is an essential part of his recreation to forget, for the time being, that he is either a father or a husband. To be sure, it may be no part of his wife's recreation to have him forget it; and she may be as weary as he of the monotony of the "common round" and the sameness of the landscape from the nursery window.

But, to illustrate more broadly, we shall select the typical, unworldly, good, old-fashioned sort of American. As all such are said to spring from New England, we will locate him there, in the neighborhood of Plymouth Rock. He has not many holidays. His ancestors came here, indeed, it would seem, for a perpetual holiday; but they had seen so much Popish abuse of holidays abroad, that they concluded to celebrate none except the Sabbath and Thanksgiving Day. Later on, as things progressed, and the good old-fashioned sort of American found himself possessed of a country, he added the Fourth of July, Washington's Birthday, and, in some quarters, the anniversary of the Battle of Bunker Hill. But still he clings to but one day as the annual holiday of the nation; the one religious festival of the people; the *holy* day *par excellence*; the only day when, from the White House and from every executive mansion in every sovereign State, there is issued a solemn command for all people to suspend labor, to thank God, and to rejoice. And how is this American holiday uniformly observed? By eating turkey!

Now, in all seriousness, how shall we account for this — in one view amusing, but in another and on the whole grave — aspect of American life? To what causes shall we refer this difference between the New World and the Old; between the mirthful, merry-making, social genius of other countries, and the somber, severe, and prosaic genius of our own holidays?

The most obvious answer — and one which suggests the whole solution — is furnished by our history, a history written with a pen of iron upon tables of flint. It opens with a chapter of stern discipline; with the toughening and even — we might say — callousing hardships of colonial times; with a people isolated from their fatherland and all its associations, and compelled to bend their energies, on a dreary coast, with a severe climate, and in a savage wilderness, to the one occupation of wresting a living from the soil and defending their homes from plunder. It has been developed ever since with this birthmark upon its features, this spirit of somber earnestness animating every page.

As a result of these conditions, what we read, written over every point of the prospect, is the one great word *business*. The average American thinks of little more and cares for nothing less than "business." It is the charmed noun which comes to his awakening intelligence at morn; the "open sesame" which guides his way at noon; the "combination" with which he locks his safe at night. It is his talisman and phylactery, his fetich, his watchword, his countersign, his shibboleth. Ask him what the Creator was engaged with during the first six days, and he will probably answer, in all good faith, "Business." Inquire what he proposes to do with his boy, and he will probably reply: "Put him into business, of course." Indeed, so impressed have we become with the far-reaching power of our word, that we have erected it into a kind of synonym for all worthiness. When a man is in earnest about anything, is sincere, goes to the point, and shows that he means to win his way and succeed, our average American calls attention to it by dryly remarking, "That man 'means business.'" What would our vocabulary do without the word? It intrudes even where it is least legitimate. It creeps from the market to the studio, the laboratory, the library, and the pulpit. It asserts its influence over art, science, literature, and religion.

In our chase after the Almighty Dollar, the individual is pushed to the utmost. Every faculty must be strained to the point of snapping, and every moment devoted without reserve. And, withal, there is such a sense of uncertainty about every position gained, of half ownership in every object earned, of feverish desire to make assurance doubly sure, to accomplish great results in a moment, to adopt fictitious means, short cuts, risks, speculations, ventures — in short, so much brain wear, solicitude, and uneasiness as can leave neither time nor taste for anything but "affairs," and must either wear out the machine prematurely, or, at best, leave it in the end nothing but a machine in the place of a man — an apparatus for working, in the place of a soul for living.

In this condition of affairs it is important for Americans to keep as young as possible by saving as much time as they can for recreation, even at the risk of not growing quite so rich. Let us add a suggestion to American philanthropists: Endow amusements! So far, we fear our social scientists and benevolent benefactors have bestowed their efforts too exclusively upon the hospital and asylum side of society, or, when they have pushed out beyond the limits of hygiene and sanitary regulations, have been too ready to stop with establishing reading-rooms, workingmen's clubs, holly-tree inns, and free lyceum lecture courses. Let us do no less than we are doing for the sick people and the bad people, but — in the name of all that is humane — let us have a larger thought also for the blue people, that neglected class who may have learned how to think, and been "reformed" and "cultured" from head to foot, but who have never learned one accomplishment, indispensable to a liberal education, — how to laugh!

We repeat, then, for the eyes of philanthropists, public benefactors, and social economists — not to mention any readers of a patronizing disposition who may be thinking of making their wills and casting about them for an "object": Endow amusements; back up talent in its efforts to brush off the rust from the jaded and stupid folk; found institutions for the promotion of mirth; establish anti-dyspeptic schools and societies for the suppression of bile; encourage lyceum amusement courses in the towns, and build and support a *Théâtre Américain* in every city. In short, take this whole matter of cheering the people — just as you have taken the whole matter of moralizing them — out of the hands of private traffic and into the hands of public benevolence.

Charles W. Ward.

Did "Abolition" Abolish?

In the old days before the war, it used to be a favorite feature of the annual programme of the Boston Abolitionists to use opprobrious language concerning eminent persons lately deceased, out of the pale of their very exclusive communion, especially when such persons were held in peculiar love or veneration. "We are nothing if not critical," Mr. Phillips used to say, in the gayety of his heart, on those occasions, by way of explanation to any whose feelings happened to be incidentally lacerated; adding (with an attitude), "O slavery, slavery, wilt thou not suffer us to bury our dead in silence?" All which used to be received with unbounded delight by the queer people on the platform and with violent indignation by the crowd, thus insuring much talk in the newspapers and a large attendance at the next annual meeting, and promoting the cause of universal liberty.

It is pleasant to learn from Mr. Oliver Johnson's open letter in The Century for May, that the peculiar taste that used to characterize his little party no longer survives in its survivors. He is reluctantly "constrained" by my article, "A Good Fight Finished," to say evil things about my father, "concerning which, in charity to the dead, he would gladly be silent." He does not "protest too much." But for this assurance, it might have been inferred, from the fact that, immediately upon my father's death, he had hastened to say the same things, with such publicity as he could command, and have them sent to the surviving children, that the ancient propensity of his society was not wholly extinct in his bosom. But we recognize with pleasure the mellowing influence of age, so that the very things which only two years ago Mr. Johnson rushed forward to say, with alacrity, over a recent grave, he now repeats reluctantly, being forced thereto by my article of last March.

On the one point on which the controversy mainly turned, between Christian antislavery men and the so-called abolitionists, happily there is controversy no longer. Says Mr. Johnson, in The Century, concerning his old associates: "Their definition of slavery [slave-holding] was *elastic*." Exactly so. It was the very accusation that Dr. Bacon used to bring against them, that they loved to operate with an "elastic" definition of the main word. They "*resolved*, that by slave-holding we mean" slave-holding *and* something more, but were unable to stick to their resolutions. The "elastic" word, stretched to cover more than it meant, was always springing back, in spite of them and without their being aware of it, to its proper, current, and habitual meaning. It was through the practice of operating with "elastic definitions," so that their words meant sometimes one thing and sometimes another, that that incapacity of perceiving the scope of their own arguments was generated, which is illustrated anew in Mr. Johnson's confession of an "elastic definition." He supposes that he "confesses and avoids"; but really confesses without avoiding.

The distinct allegations which Mr. Johnson makes against my father's sixty years of blameless, unselfish service to liberty and humanity are briefly disposed of. From his boyhood Dr. Bacon took an ardent and philanthropic interest in the project of a colony of free colored men in Africa that should grow into a nation; and to this enterprise he gave generously of his counsels and his prayers, his scanty means, and his unpaid labors. In the code of morals established at Mr. Garrison's printing-office, this was the blackest of crimes. But there is far less need of apologizing for the hearts that devised and promoted a scheme so full of noble promise than of apologizing for the code which condemned them.

There is no further accusation except this: That during sixty years of consistent devotion to the cause of human rights, there were two occasions on which Dr. Bacon did *not* make a public address — at least, so far as Mr. Oliver Johnson is informed. How striking the tribute to his memory, that a half-century of hostile scrutiny can find nothing with which to reproach him but two speeches which Mr. Johnson thinks he ought to have made, but which he did not make, so far as Mr. Johnson has learned!

But the public are less concerned, after all, with the biographical question than with the historical one. We want to take precaution against that "fraud upon history" of which Mr. Johnson is apprehensive, and which consists, he thinks, in denying that the characteristic tenets and operations of the knot of Garrison abolitionists had any effective share in delivering the country from slavery.

What were these tenets? I will not state them in my own language, lest I should be again accused of "caricature." It would be unjust to state them in the language, possibly hasty or irresponsible, of a speech or an editorial article. I regret not to have at hand a file of the "Liberator" from which to choose among the annual ethico-political deliverances of Mr. Garrison's society. But I am so happy as to have come, just now, upon an old newspaper slip containing, not the heated discussions, but the calm, statesmanlike results of deliberation, at a county abolitionist meeting in Massachusetts in 1848, from which I transcribe some representative resolutions:

"3. *Resolved*, That the religion of Essex County, and of the country generally, that expels and excommunicates its members for heresies about infant baptism, while it fellowships as godly Christians the enslavers of infants in the South and the butchers of infants in Mexico, is a compound of folly and depravity that finds no parallel in the history of the darkest periods of the past.

"4. *Resolved*, That to sustain such a religion by supporting its priesthood, or attending its Sunday and other performances, or lending it any countenance

more than should be given to gambling-houses or houses of ill-fame, is to rivet faster the chains of the slave, to oppose the progress of truth and humanity, and to encourage an order of things more to be dreaded than open atheism.

"5. *Resolved*, That the constitution and union of these States were, and still are, a plundering and piratical conspiracy against the rights of man.

"6. *Resolved*, That any enlightened man who voluntarily supports this government by voting or taking office under it, has no moral principle that would deter him from becoming a pirate on the high seas, whenever a favorable opportunity should present."

I might produce language more violent from the manifestoes of that noisy little party. But we do not want an extreme case, only a typical one.

We may disburden our minds of fears of a "fraud on history." There is no real danger that that court will make any mistake on the question whether slavery was at last abolished by ferocious non-resistants and disunionists, such as wrote these resolutions; or whether the work was done by sober, conscientious, church-going, voting, union-loving, sedition-and-secession-hating "pirates"; was accomplished, as I said last March, "in pursuance of principles which Mr. Garrison abhorred, by measures which he denounced, and under the leadership of men who had been the objects of his incessant and calumnious vituperation."

Leonard Woolsey Bacon.

BRIC-À-BRAC.

"When Twilight Comes."

RONDEAU.

WHEN twilight comes and nature stills
The hum that haunts the dales and hills,
Dim shadows deepen and combine,
And Heaven with its crystal wine
The cups of thirsty roses fills.

Blithe birds with music-burdened bills
Hush for a space their tender trills,
And seek their homes in tree and vine
When twilight comes.

Soft melody the silence thrills,
Played by the nymphs along the rills;
And where the dew-kist grasses twine,
The toads and crickets tattoo fine
Drums to the fife of whip-poor-wills,
When twilight comes.

Frank Dempster Sherman.

Silence.

FULL many were the words we said
We neither cared to say,
And many were the hours that fled
While we threw words away.
O lips misused! O time misspent!
Without one word of what we meant:

At last deep silence o'er us fell,
And though at first we sought,
Unwittingly, to break its spell,
Yet was that silence fraught
With meaning more than words can hold,
And in that silence all was told.

George A. Hibbard.

He Came to Pay.

(AFTER "THE AGED STRANGER," BY BRET HARTE.)

THE editor sat with his head in his hands
And his elbows at rest on his knees;
He was tired of the ever-increasing demands
On his time, and he panted for ease.
The clamor for copy was scorned with a sneer,
And he sighed in the lowest of tones:

"Wont somebody come with a dollar to cheer
The heart of Emanuel Jones?"

Just then on the stair-way a footstep was heard
And a rap-a-tap loud at the door,
And the flickering hope that had long been deferred
Blazed up like a beacon once more;
And there entered a man with a cynical smile
That was fringed with a stubble of red,
Who remarked, as he tilted a sorry old tile
To the back of an average head:

"I have come here to pay"—Here the editor cried:
"You're as welcome as flowers in spring!
Sit down in this easy arm-chair by my side
And excuse me awhile till I bring
A lemonade dashed with a little old wine
And a dozen cigars of the best. * * *
Ah! Here we are! This, I assure you, is fine;
Help yourself, most desirable guest."

The visitor drank with a relish, and smoked
Till his face wore a satisfied glow,
And the editor, beaming with merriment, joked
In a joyous, spontaneous flow;
And then, when the stock of refreshments was gone,
His guest took occasion to say,
In accents distorted somewhat by a yawn,
"My errand up here is to pay—"

But the generous scribe, with a wave of the hand,
Put a stop to the speech of his guest,
And brought in a melon, the finest the land
Ever bore on its generous breast;
And the visitor, wearing a singular grin,
Seized the heaviest half of the fruit,
And the juice, as it ran in a stream from his chin,
Washed the mud of the pike from his boot.

Then, mopping his face on a favorite sheet
Which the scribe had laid carefully by,
The visitor lazily rose to his feet
With the dreariest kind of a sigh,
And he said, as the editor sought his address
In his books to discover his due:
"I came here to pay—my respects to the press
And to borrow a dollar of you!"

Parmenas Mix.

The Author of "The Lion and the Lamb."

[EXTRACT from a note from the publisher of "The Lion and the Lamb," an anonymous novel which has achieved a great success, to Henderson Lloyd, the author of the book.]

"Your novel has sold so well that I think it will be of advantage to you to have the authorship known. It need not be directly announced, but might be allowed to leak out in the usual way. This would be a great relief to me, as I am besieged by inquiries."

[A note from Mr. Lloyd to his publisher.]

"MY DEAR MR. SPARROW: On no account can I allow myself to be known as the author of 'The Lion and the Lamb.' I would not for the world have the originals of some of the characters know that I had drawn them, and there are other reasons why I wish the authorship of the book kept a profound secret.

"I am delighted at the success of the book, and I am very much obliged to you for the handsome check sent so much in advance of the ordinary time of payment."

[From a note from Mr. W. R. Dean to his friend Arthur Fread.]

"I have just finished your book, 'The Lion and the Lamb.' It is a most capital story. My daughter has seized on it, and I have no doubt that she will sit up the greater part of the night to finish it. I knew it to be yours before I had read twenty pages. No one but the author of 'Calderon's Mount' could have written it. It ought to make your fortune, and I sincerely hope it will."

[From Mr. Fread to Mr. Dean.]

"What an astute fellow you are to find out so soon that I wrote 'The Lion and the Lamb.' What shall I do with the fortune that it is going to bring me? Will you join me in buying a silver mine in New Mexico? Or do you think it will be better to purchase a pretty place near the city, where Mrs. Fread and I can settle down in ease and comfort?"

[From Miss Nellie Ford to her uncle.]

"Why, in the name of common sense, dear Uncle Fred, didn't you put your name to 'The Lion and the Lamb?' Everybody is reading it, and everybody is just wild over it. Of course, I knew you wrote it as soon as I got to Aunt Margery. I just screamed when she began her conversation with the lay-reader. It was almost word for word as we heard it. If there are to be any new editions, and there must be lots of them, please have your name put to it."

[To Miss Nellie Ford, from her Uncle Fred.]

"MY DEAR NELLIE: There are reasons, and very weighty ones, why I do not wish to announce myself as the author of 'The Lion and the Lamb,' and you need not, therefore, expect to see my name on any future editions of the book. But I promise you one thing—whatever money I get from it I will divide with you."

[From Miss Nellie Ford to Miss Virginia Webb, Vice-President of the Rockford Archery and Lawn Tennis Club.]

"DEAR JENNIE: What do you think? Uncle Fred wrote 'The Lion and the Lamb,' but he has reasons why he does not wish to announce himself as the author. I tell this to you because you like the book so much, and I am dreadfully proud that my uncle wrote it. But you must not say a word of it to anybody. He promised to divide the profits with me, but he was precious careful not to say he would give me half. I expect I shall get about the one ten-thousandth part, which will buy me several pairs of gloves, if the book sells, as it certainly must. Uncle Fred could not afford to do more than that, for he needs all the money he can get."

[Extract from private conversations held by Miss Virginia Webb with each member of the Archery and Lawn Tennis Club.]

"Nellie Ford's Uncle Fred wrote 'The Lion and the Lamb.'"

[From a note from Miss Harriet Crenshaw, of New Upton, to Mrs. Dr. Brown, in the same village.]

"So you told the ladies of the Sewing Society, when my name was mentioned in connection with the authorship of 'The Lion and the Lamb,' that I could not possibly have written the book. I suppose you have devoted so much time to the reading and study of my serial stories, and shorter tales, that you are perfectly acquainted with my style, and can, therefore, decide whether or not this or that book, published anonymously, is mine. Perhaps you think I cannot write well enough to be the author of 'The Lion and the Lamb.' But there will come a day, Mrs. Brown, when you will be sorry that you rendered yourself so conspicuous by making the statements you have made."

[A remark by Mrs. Dr. Brown to Mrs. French, the minister's wife.]

"I suspect Harriet Crenshaw did write 'The Lion and the Lamb,' but I'm not going to let her know that I think so, for she is stuck up enough already."

[From Mr. Sparrow, the publisher, to Mr. Henderson Lloyd.]

"I now think it will be well carefully to preserve the secret of the authorship of your book. There is a general impression that Talbot wrote it, and that is helping the sale immensely."

[Remark of Mr. Lloyd on reading the above.]

"Confound Talbot!"

[From a conversation between Mr. Lloyd and a friend at the Folio Club.]

FRIEND.—"Look here, Lloyd, how is it that you can afford to put on the style that you've been showing lately, actually driving out of town with your own horse? Why, I've been pegging away for twenty years, and haven't been able to keep a horse yet. Have you been making any fortunate literary ventures?"

MR. LLOYD.—(Clapping his friend on the shoulder.) "Don't you know, old boy, that there are other ways of making money, and better ways, too, than by literary ventures? I admit that I have been engaged in a speculation, or something which resembles a speculation, which has turned out very well."

[A remark made by a member of the Folio Club to several other members in the smoking-room.]

"Have you heard about Lloyd, the fellow who writes for the magazines? He is gambling, and going to the dogs as fast as he can."

[Statement made by the wife of the minister of New Upton to various members of her husband's congregation.]

"Harriet Crenshaw wrote 'The Lion and the Lamb.'"

[Letter from a leading novelist, published in a morning paper.]

MR. EDITOR — Dear Sir: I beg you will do me the favor to allow me to state in your columns, over my signature, that I am not the author of the recently published novel, 'The Lion and the Lamb.' The respect which I deem is due from myself to my own work will not allow me to withhold my name from anything I may write for publication.

B. WILLIAM TALBOT.

[Part of a conversation held by several leading literary men at the Folio Club.]

ONE LITERARY MAN. — "What do you think of Talbot's letter in 'The Trident?'"

ANOTHER LITERARY MAN. — "It is as plain as daylight that he believes his name to be of as much advantage to his books as anything else that is printed on their pages."

THIRD SPEAKER. — "Well, then, should we not let the public see that we have the same feeling?"

THE REST. — "Most assuredly."

THIRD SPEAKER (*continuing*). — "There is no knowing how far our names have been associated with this book, and should we not, like Talbot, deny the authorship of it?"

THE OTHERS. — "We should, and we will."

[Thereupon each one writes a note to a public journal, and, in the course of a few days, all the denials appear.]

[The substance of long letters received from half a dozen ladies of acknowledged literary reputation by the literary editor of a metropolitan paper.]

"Please state somewhere in your department that I did not write 'The Lion and the Lamb.' I do not wish it supposed that I am obliged to resort to the subterfuge of anonymousness to obtain readers for my books."

[A widely published letter from Belle Virginia Huck, of Minnesota.]

"I wish to declare to the people of America, and to the whole world, that I wrote 'The Lion and the Lamb,' and that any other person pretending to have written it is an outrageous liar, and states what is not the case. I began the story when I was a young girl, in August, 1879, and the work was cut short, one month afterward, by my marriage with Colonel Binder. When that was all over I went to work again with the book, which is a record of my own heart-throbs and tears of despair as well as happier moments. I am now going to write another book, which I think will be even better than the first one."

[Extract from a note of an ex-editor, now traveling in the far East.]

"I have seen with much surprise a letter in an American newspaper from a Miss Huck, in which she states that she is the author of 'The Lion and the Lamb.' This is a falsehood, or an hallucination. I wrote the book the year before I came out here. It is founded upon facts connected with my boyhood and youth. Several of my friends in America, to whom I have read portions of the manuscript, will substantiate this statement."

[Soliloquy of Mr. Henderson Lloyd, when he has read the published denials of contemporary authors.]

"Confound it! I believe I am the only prominent novelist, male or female, who has not denied the authorship of 'The Lion and the Lamb.' Who could have expected that they would act in this unhandsome way. There isn't one of them who might not be proud to have the credit of it. But I am bound to keep up the incognito, and it wont do for me to be left standing alone. I, also, will deny it."

[He writes to the editor of "The Trident."]

"Please include my name among those of the persons who have declined to allow themselves to be connected with the authorship of 'The Lion and the Lamb.'"

[Portion of an entry in the diary of Miss Harriet Crenshaw.]

"I am sure I never had so much cause for feeling ashamed of myself as I have now. Without any fault of my own, so far as I can see, the authorship of a book which I never wrote has been attributed to me, and actuated partly by a feeling of pique, and partly, I am afraid, by vanity, I have allowed compliments upon the book to be paid to me. I did not say I wrote it, but I acted very much as a person would who had written it. These compliments are increasing every day, and I am now actually ashamed to admit that I am not the author. Of course, the truth will come out some time, and then how shall I feel? I ought to assert positively the truth; but, although this would have been easy to do at first, it would be very difficult now, and I fear I have not the courage for it. I never felt so dreadful in my life."

[From a letter from Mr. Sparrow to a brother publisher, retired from business, and now resident in Germany.]

"Last night I had a very novel and interesting experience. I gave an evening reception, and my guests were, all of them, men and women in the literary line whose names have been connected with the authorship of 'The Lion and the Lamb,' a copy of which I mailed to you, and which has proved a fortunate venture for me. There has been great curiosity to know who wrote the book, and it has been attributed to nearly every person who is supposed capable of writing it. The real author keeps extremely shady, and has, indeed, publicly denied any connection with it. Some prominent writers have declined to have the authorship of the book fastened upon them, and a good many others, not so prominent, have been anxious for the honor. My little joke was to introduce each guest to the others as the author of the book; and the result was very funny, some denying it as if it were a crime, others accepting the honor in the most barefaced way, while the majority resorted to the dodge of appearing to tell a falsehood without actually doing so. On the whole, the lyin' was most lambentable. (Excuse me for spelling out the pun, but I know you like all labor-saving processes.) How they did pitch into me when they had a chance to do so! It was the jolliest evening I have had for a long time."

[Result of the above entertainment on the public mind.]

After the matter had been pretty generally talked about in literary circles, it came to be believed by nearly every one, excepting Mr. Henderson Lloyd, that Mr. Sparrow himself was the author of the book, and therefore that worthy publisher not only received the greater part of the profit, but all the credit of the work.

Frank R. Stockton.

Chacun à Son Goût.

WHEN Strephon sees a blushing cheek
In sweet conceits his soul doth speak;
And with a soft esthetic sigh
He would he were a butterfly.

Perchance with less poetic grace,
I, bending o'er a blushing face
Coyly concealed behind a fan,
Am quite content to be a man.

Walter Learned.

Just a Love-Letter.

"'Miss Blank—at Blank.' Jemima, let it go!"
—*Dobson.*

NEW YORK, July 20, 1883.

DEAR GIRL:

The town goes on as though
It thought you still were in it;
The gilded cage seems scarce to know
That it has lost its linnet.
The people come, the people pass;
The clock keeps on a-ticking;
And through the basement plots of grass
Persistent weeds are pricking.

I thought 'twould never come—the Spring—
Since you had left the city;
But on the snow-drifts lingering
At last the skies took pity.
Then Summer's yellow warmed the sun,
Daily decreasing distance—
I really don't know how 'twas done
Without your kind assistance.

Aunt Van, of course, still holds the fort:
I've paid the call of duty;
She gave me one small glass of port—
'Twas '34 and fruity.
The furniture was draped in gloom
Of linen brown and wrinkled;
I smelt in spots about the room
The pungent camphor sprinkled.

I sat upon the sofa where
You sat and dropped your thimble—
You know—you said you didn't care;
But I was nobly nimble.
On hands and knees I dropped, and tried
To—well, I tried to miss it:
You slipped your hand down by your side—
You knew I meant to kiss it!

Aunt Van, I fear we put to shame
Propriety and precision;
But, praised be Love, that kiss just came
Beyond your line of vision.
Dear maiden aunt! the kiss, more sweet
Because 'tis surreptitious,
You never stretched a hand to meet,
So dimpled, dear, delicious.

I sought the Park last Saturday;
I found the Drive deserted;
The water-trough beside the way
Sad and superfluous spurted.
I stood where Humboldt guards the gate,
Bronze, bumptious, stained, and streaky—
There sat a sparrow on his pate,
A sparrow chirp and cheeky.

Ten months ago! Ten months ago!—
It seems a happy second,
Against a life-time lone and slow,
By Love's wild time-piece reckoned—
You smiled, by Aunt's protecting side,
Where thick the drags were massing,
On one young man who didn't ride,
But stood and watched you passing.

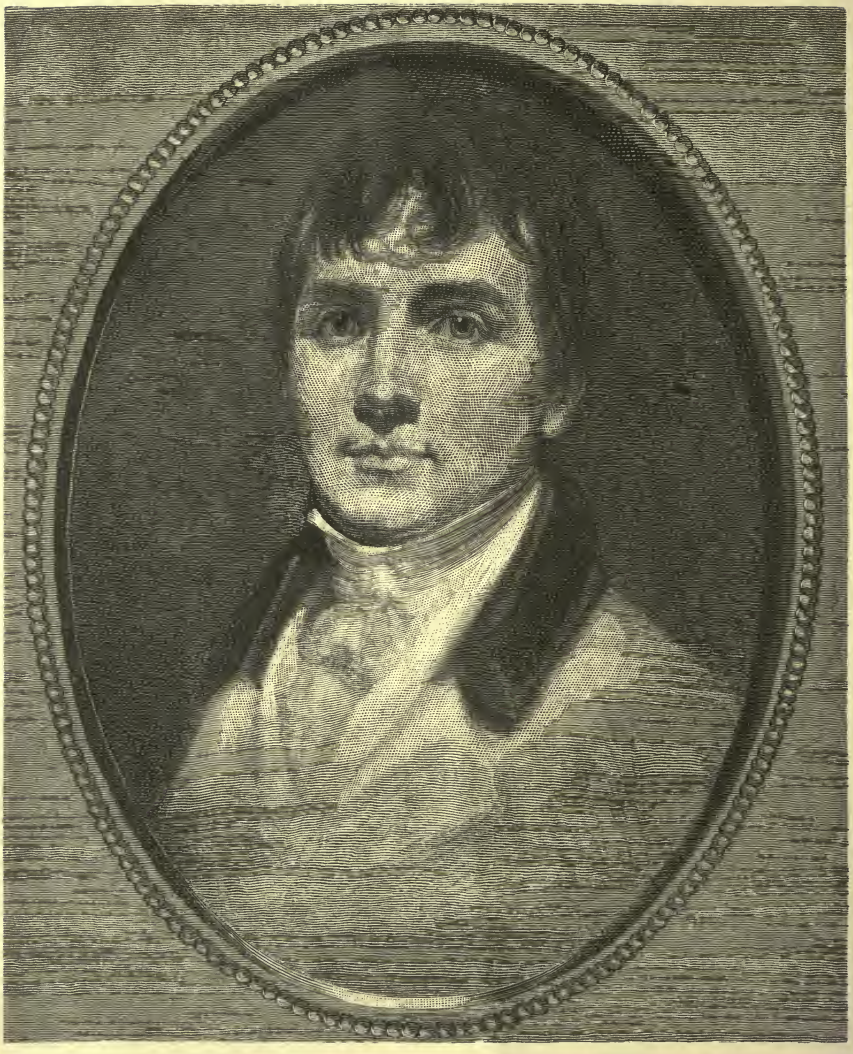
I haunt Purssell's—to his amaze—
Not that I care to eat there,
But for the dear clandestine days
When we two had to meet there.
Oh, blessèd is that baker's bake,
Past cavil and past question:
I ate a bun for your sweet sake,
And memory helped digestion.

The Norths are at their Newport ranch;
Van Brunt has gone to Venice;
Loomis invites me to the Branch,
And lures me with lawn tennis.
O bustling barracks by the sea!
O spiles, canals, and islands!
Your varied charms are naught to me—
My heart is in the Highlands!

My paper trembles in the breeze
That all too faintly flutters
Among the dusty city trees,
And through my half-closed shutters:
A northern captive in the town,
Its native vigor deadened,
I hope that, as it wandered down,
Your dear pale cheek it reddened.

I'll write no more! A *vis-à-vis*
In halcyon vacation
Will sure afford a much more free
Mode of communication.
I'm tantalized and cribbed and checked
In making love by letter:
I know a style more brief, direct—
And generally better!

H. C. Bunner.



Robert Burns

THE CENTURY MAGAZINE.

VOL. XXVI. SEPTEMBER, 1883. NO. 5.

CAPE COD.

THE most striking feature of the New England coast-line is Cape Cod. Standing far out, lonesome, into the ocean, it gives, from the map, the impression of a sand-bar. In looking at other sea-coast reaches, the imagination flies at once to a sheltered inland: to village streets and peaceful farms and bush-fringed ponds and wild flowers; but looking at this weird projection, it seems impossible to conjure up an inland.

There are wastes, in fact, along this stretch of sea-board. The farthest town has not a farm, and the soil of its gardens is brought in the holds of vessels. Nothing could give a stronger impression of desolation than the wild sea of shifting sand-hills lying open to the Atlantic on the outer coast of Provincetown, and the sand-hills on the harbor side, which crowd two miles of houses to the water. The open plain between Provincetown and Truro is wild and barren; its vegetation is for the most part little more than moss; although in favored spots is seen the mock-cranberry's red-berried creeping vine and some recent plantations of pine, all making headway.

When the Pilgrims entered Cape Cod harbor, this stretch of country was all covered with soil, and bore a forest growth of oak and pine. Woods and soil, like the Indians, have given way before civilization, and, under the white man's rule, sand has beaten in and swamped the vegetation. Even now, in Provincetown, one can see the process of desolation going on. In every violent gale, the looser sand is drifted about, and after the storm is over, here and there peep out the tops of newly submerged bushes.

All through the Cape, too, are barren stretches of "old fields," crossed by decayed rail fences or stone walls gray with moss: such fields as are seen through the whole of eastern Massachusetts. The last generation of farmers beggars the land and leaves it. It is hard to realize now that Eastham was once the granary of Massachusetts Bay and Plymouth; that the sandy tip of the Cape was covered with trees; that the "old fields" once waved with substantial crops. Nevertheless, such are the facts.

With all the grandeur of wildness that has seized upon a great part of the outer coast, from Provincetown to Chatham, speaking in every line of storms, of surf, of wrecks, of bodies heaved up by the sea, a quiet inland beauty nestles still in the shelter of Cape Cod. There are woods and farms; there are elm trees overhanging village streets; there are blue ponds and still, dark flumes and wild flowers.

Two hundred and sixty years ago, and more, the *Mayflower* anchored in Cape Cod harbor, off what is now Provincetown. Although the settlement of the Pilgrims was finally made at Plymouth, it was at Cape Cod that the first birth and the first death occurred, and that the famous compact of government was signed. It was on Cape Cod that a party under Miles Standish made the first excursion inland, tracked Indians through the woods, laid hold on corn, rifled a wigwam and, with that delicacy which always characterized their captain, explored an Indian grave.

Carried by steam, to-day, through the whole length of the Cape, in cars of the latest pattern, raising our eyes from the last novel to look upon stretches of open country, it is hard to frame a vision of Cape Cod as it was when the Pilgrims landed. Shut your eyes to the sand-hills, to all the neglected acres white with daisies or gay with golden-rod; clothe

[Copyright, 1883, by THE CENTURY CO. All rights reserved.]

the seventy miles of curving peninsula, except the broad salt-marshes, with forest trees; think of the numberless bays and ponds and streams that light up the country still; picture here and there an Indian clearing, a cluster of wigwams, and a sachem with his followers; fill the woods with deer and wolves and foxes, and you see Cape Cod as it lay on that November morning when the plunge of the *Mayflower's* anchor broke the stillness.

Soon after the settlement at Plymouth, a trading-house, the foundations of which may still be traced, was built at Manomet, now known as Monument, near the head of Buzzard's Bay; but the first settlement, properly speaking, on Cape Cod, was made at Sandwich. "April 3, 1637," say the Plymouth records, "it is also agreed by the court that these ten men of Saugus [naming them] shall have liberty to view a place to sit down, and have land sufficient for three-score families."

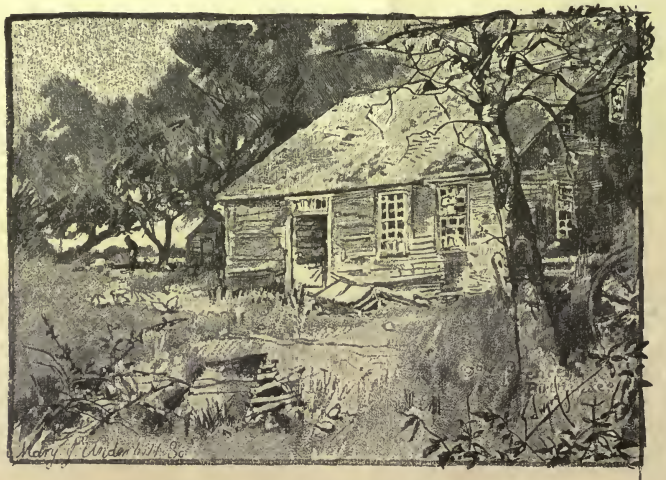
In view of the later history of Cape Cod, there is an amusing ring in this liberty to "sit down," granted to the nucleus of a people who in their growth have shown a constant desire to do anything but sit down; who have disclosed, on the contrary, a most determined disposition "the ocean's depths to sound, or pierce to either pole"; who hang Calcutta hats upon their hat-trees; whose parlors give out a sandal-wood perfume from the islands of the Pacific. If there was any one form of words that was to prove peculiarly inappropriate to the settlement of Cape Cod, it was this of a liberty to "sit down."

Soon after this settlement was begun, two commissioners were sent from Plymouth, directed to "go to Sandwich, with all convenient speed [which was probably about three miles an hour], and set forth the bounds of the lands granted there." Their names lend a certain flavor of romance: Miles Standish and John Alden. When they came to settle the titles of Sandwich, the eventful deputation to settle the title to Priscilla, if any such there was, had long since taken place. We can hardly think, without a smile, of these two heroes, all unconscious of the poetic halo that was to gather about their names, peacefully working together in the unromantic task of running boundary lines, parceling upland and salt-marsh.

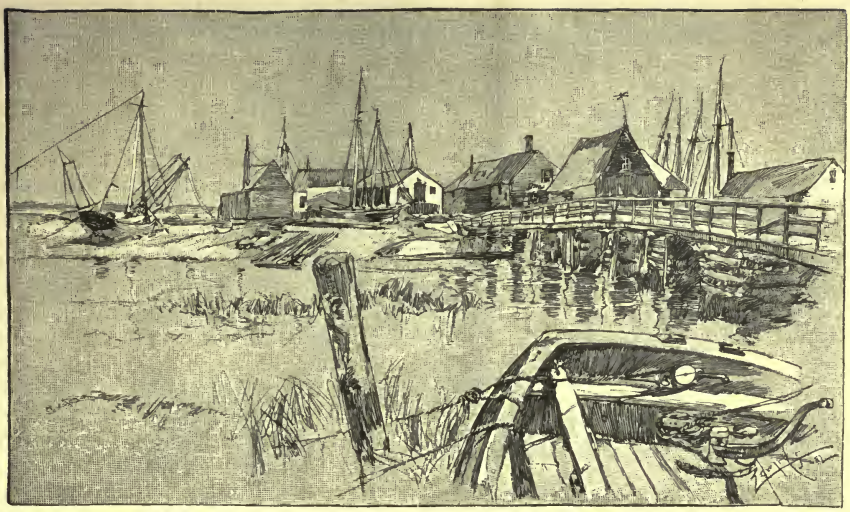
The mention here of the two famous suitors reminds me of two bachelor settlers — such they seem to have been — whose lot was less romantic. They had undertaken to "sit down" in Sandwich, and had begun to clear allotments. They presumed to be "disorderly" by "keeping house alone," and for this they were arraigned at Plymouth. Poor Pilgrims! Who knows their story! Perhaps they had dutifully tried to win for themselves two humble Priscillas, and, through John Aldens of their own, had failed. Nevertheless, the rigid views of the colony could not allow them, as bread in the desert, even this pale joy of keeping house alone.

The settlement at Sandwich was quickly followed by others, at Barnstable, at Yarmouth, and lower down the Cape. Eastham was settled by a colony from Plymouth, headed by Thomas Prince, for many years governor, whose descendants live there still. The question of a general removal from Plymouth to Eastham was seriously debated.

Many interesting historical associations are connected with the different towns. In the scattered village of East Sandwich stands, on a little rise of ground, a large, bare building,



GOVERNOR THOMAS PRINCE'S BIRTHPLACE.



WELLFLEET ANCIENT WHARVES.

which, from its absolute plainness, you would know, if you took it for a house of worship at all, to be a Friends' meeting-house. This building dates only from the beginning of the present century, but it stands in the place of an older structure, and the society is of long standing. The Sandwich monthly meeting has been said to be the oldest in the country. The surnames which prevail in the neighborhood figure in the ancient court records of the Plymouth colony,—for this was a marked locality in the early struggle for religious liberty.

Nicholas Upsall was a member of the Boston church. When he was far advanced in years, he was, for outspoken disapproval of the persecution of the Quakers, fined twenty pounds and banished. His choice of a retreat being limited, he came to Plymouth; but he was now viewed as a Quaker, and it was illegal in the Plymouth colony to entertain him. Nevertheless, a man who was returning to Cape Cod took the old man in his convoy to Sandwich. Here he must have been harbored, for we find an order of the General Court to John Newland of that town, forbidding any further meetings at his house tending "to the disturbance of the public worship of God," and a direction that Nicholas Upsall, the "instigator" of this trouble, "be carried out of the government by Tristan Hull, who brought him." Upsall seems to have sown some seed, for, shortly after this, a number of persons were punished for encouraging what were called "Quaker" movements. In 1658, a large number of citizens of Sandwich were fined for expressing sympathy, in one way or another, with Quaker views, and feeling ran so high in the town against the strictness of the colony, that the town constable could not, or perhaps would not, perform the duties of his office, and a sort of metropolitan police, in the form of a special marshal, was appointed by the Plymouth government to fill his place. In Barnstable and Yarmouth, too, the local officer was superseded.

Barlow, the marshal set over Sandwich, had no morbid delicacy. When he had a fine to levy upon the goods of a Quaker, he would select for seizure the article least to be spared, as the family kettle. An Indian charged with theft justified himself by precedent: "I have done," he said, "only as you do by the Quakers."

There was a long contest between Barlow, backed by the Plymouth government, on the one hand, and public opinion in Sandwich on the other, with many amusing features. How natural and human it makes the life of those early days, to read of the superseded constable's prosecution for "railing" at the marshal who supplanted him!

Perhaps, in the features of the settlements on Cape Cod, including their absolute freedom from the witchcraft mania, the curious inquirer may seek for a certain clew to traits that have marked Cape Cod in later times. Her genius has been practical. The strongest characteristics of her people have been a common-sense sagacity and a capacity for affairs. Perhaps it is that very enthusiastic temperament which, in other sections, led to extreme and fanatical convictions in religion, that has unfolded itself, in later times, in the imaginative literature of Massachusetts.

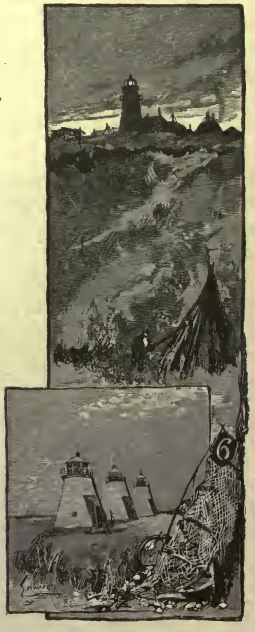
One of the most curious buildings of Cape Cod stands in East Sandwich. It is a blockhouse, built in 1644. It is now the parlor of

AN OLD INHABITANT.

a dwelling-house, and its neat and peaceful interior, cheered by a cabinet organ, is in strange contrast with the thought of Pilgrims, in peaked hats, standing guard against possible forays of Indians.

Next below Sandwich lies the scattered village of West Barnstable, anciently called "Great Marshes," from the vast sweep of salt-marsh, rich in suggestive beauty, which makes far out to Barnstable Bay. From the road that rises to the southward to cross the Cape, you look on woods and farms, on bits of swamp, green in the hottest summer, on the great marshes and the bay. The meeting-house, high up the hill, is nearly one hundred and seventy years old, being one of the oldest in the State. It takes the place of an earlier structure, and the church which worships in it has a history. In the early part of the seventeenth century, Henry Jacob, a clergyman of the Church of England, wrote against the English Congregationalists then in exile. Shortly after, he went to Leyden, where he met with John Robinson, and, influenced probably by him, changed his views. On his return to England he took the lead in the establishment, in 1616, of an Independent Church, of which, for eight years, he was the pastor. He was succeeded by John Lathrop. Another eight years the congregation worshiped in secret in London, but it was finally discovered, by the bishop's pursuivant, at the house of one Humphrey Barnet, in Blackfriars. Forty-two persons were apprehended, and the prisoners were held for some two years. Mr. Lathrop, the pastor, was detained longest, and it was only after the death of his wife, on the intercession of his children, that he was released, on condition of leaving the kingdom. He came to New England with thirty of his people, and settled at Scituate; but in 1639, with a majority of the members of the church, he emigrated to Great Marshes, and so began the settlement of Barnstable. "This circumstance," says Palfrey, the historian of New England, himself a native of the town, "makes the first church in Barnstable the representative of the first Congregational church established in England, unless, which perhaps was the fact, the church of John Robinson, now surviving in that of Plymouth, was organized on Congregational principles before he left the mother country for Holland." "Another interesting fact," he adds, "connected with that primitive English Congregational church which still survives in our church at Great Marshes, is that from its bosom also proceeded the first English Baptist church: so that it is further entitled to the eminent rank of parent of the now very numerous churches of that denomination both in England and America."

Among those who came with Lathrop from Scituate to Barnstable were the famous James Cudworth and Isaac Robinson, a son of the



HIGHLAND LIGHT, NORTH TRURO, AND NAUSETT LIGHT, EASTHAM.

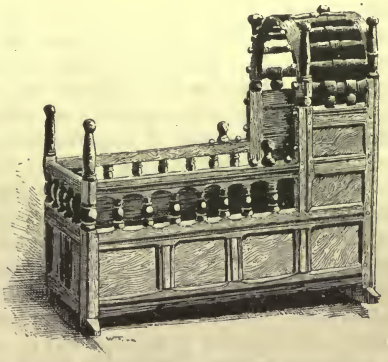
OLD HALLETT HOUSE, OSTERVILLE.

great Leyden pastor. Robinson was deputed by the General Court to attend, with others, the meetings of the Quakers, and to endeavor to convince them of their errors. He went, and in the end became convinced that there should be no persecution of them, and for his open defense of their right to religious freedom was disfranchised. He subsequently settled in Falmouth, and built the first house in that town. Descendants through him of the famous Leyden pastor live there to this day.

Half way down the hill, between the church and the railway, stands a large square house (formerly the parsonage), the birthplace of Chief-Justice Shaw, whose father was the minister of the parish. A quarter of a mile from there, on the road to Barnstable, is the site of the Otis mansion, where Colonel James Otis lived, and his son, the patriot Otis,— "the soul of the Revolution," the elder Adams calls him,— was born.

This unnoticed hamlet is, therefore, the seat of a church which is the representative of the earliest or the second of the English Congregational churches, and the parent of another great denomination; it has also given the country one of its loftiest statesmen and one of its greatest judges. Other men of mark have sprung from the town of Barnstable: Governor Hinckley, Nymphas Marston, and Samuel A. Otis, member of Congress from this district and the father of Harrison Gray Otis; Solicitor-General Davis, and Mr. Palfrey, the historian, among others.

One of the most interesting relics of Pilgrim days upon Cape Cod is a cradle which has descended in a prominent family in Yarmouth, and is now in possession of Mr. Henry C. Thacher. Anthony Thacher came to New England in 1635, with a wife and several children, and with a young nephew, who became the ancestor of the judges George and Peter Oxenbridge Thacher. He landed at Newbury, and, to continue his journey, took passage by sea; but the nephew, having a presentiment of danger, could not be per-



THE THACHER CRADLE.

THE OLD MILL.

suaded to go by water, and made his way by land. The vessel was wrecked off Cape Ann on what is known as Thacher's Island, and Mr. Thacher and his wife alone were saved, their children being drowned before their eyes. This cradle, which had held the youngest, was washed ashore, with a worked broadcloth covering, which has also been preserved.

The records of Brewster give a striking illustration of the exposed situation of Cape Cod in case of war. During the war of 1812, a British man-of-war, the *Spencer*, appeared there, and exacted four thousand dollars as the condition of sparing the town and the valuable salt-works.

The feeling at Boston and Philadelphia as to tea, in 1775, ran high upon Cape Cod. A vessel loaded with tea went ashore at Provincetown, and for some service or other a Wellfleet man received and undertook to sell a chest or two of tea, saying that, as it had not paid duty, there was no harm in his accepting it. Public spirit has always been strong upon Cape Cod, and the general indignation rose to such a pitch that he finally felt obliged to present a written apology in town-meeting. "I had no intention," he says, "to injure the liberties of my country."

In February, 1774, Truro discussed, at a town-meeting, the conduct of some of its citizens who had bought small quantities of teas from what had been cast ashore at Provincetown, and on their making acknowledgment they were "excused" on account of extenuating circumstances. "And though we have the mortification," say the resolutions, passed unanimously, "to own that some persons among us have been weak enough to be led astray by noted rescinders from all good resolutions, we cannot, in justice to ourselves, omit making public the fact that no person in this town could be prevailed upon to accept the infamous employment of transporting the tea saved out of the Messrs. Clarks' brigantine from Cape Cod to the vessel, but that the repeated solicitations of the owners were refused, notwithstanding liberal promises of a large reward, and notwithstanding we had several vessels here unemployed." Somebody in Truro knew how to write vigorous English.

The little town which showed such spirit on the tea question, displayed an ingenuity equal to it on another occasion, during the Revolution. A British fleet appeared off-shore; the town was defenseless, except for a few militia, and the enemy seemed about to land. So the Cape Cod Yankees hit upon a device. There were sand-hills then, as now, along the coast; and the handful of militia-men, taking position behind an inner one, kept marching over it, and, hidden by a hill in front, back again, around and over the first elevation again, thus making a procession of theatrical length. The enemy seem to have been fairly cheated, for they sailed away without attempting to land.

The first glance at the map suggests the

question of cutting a ship-canal across the Cape. The "back of Cape Cod" is full of terrors in bad weather, and the circuit, with head-winds, is always tedious. In fact, the narrowness of the Cape at the head of Buzzard's Bay has afforded food for speculation from early times. The Plymouth colonists utilized this strip of land for a portage or carry when they set up their trading-post at Manomet. It was put to this use again in the war of 1812.

OLD MILL AT BREWSTER, FROM THE STAGE.

More than a hundred years ago the project of a ship-canal was seriously discussed. Very recently a corporation, not composed, we ought to state, of Cape Cod men, undertook the work. The route surveyed was about seven miles in length. An army of Italian laborers was brought on from New York, and digging was begun; but the enterprise suddenly collapsed, and the sons of Rome were left there, penniless, to shake their fists and utter Italian threats, and the town of Sandwich found itself obliged to feed the unfortunate men and send them back to New York. The project has lately been revived.

Long ago, the tempting narrowness of the isthmus gave rise in the mind of some local genius to a singular proposition. In those days, wolves made serious havoc. It would seem that Cape Cod was subject to visitations from the main-land. And so, in 1717, it was proposed to build a high fence from "Picket Cliff," on the north side of the Cape, to Wareham, to keep wolves from coming into the county; but the lower towns, finding, perhaps, in the activity of the Sandwich farmers already a sufficient bulwark, were lukewarm, and the scheme fell through. The discussion of it, however, disclosed a certain lack of a spirit of self-denial in some of the outside towns. They objected to the fence, not wishing, they said, "all the wolves to be shut out of the county upon their limits." So, in one way and another, by the project of a ship-canal or a wolf-fence, the main-land has, from the earliest time, trembled under a perpetual menace of being cut off from Cape Cod.

The question of cutting the Cape at Eastham was once debated. It was thought, however, that the channel would be likely to be closed by the action of the sea, which often shows a mind of its own with regard to geography. The ocean, in fact, is constantly making changes in the shores of the Cape. Stage Harbor is entered by a narrow opening in a long tongue of sand. This opening has been changing its location. It was formerly in Eastham; but being of a roving disposition,

VILLAGE STREET.

as befits a Cape Cod institution, it has gradually moved to the south, and is now in the town of Orleans.

In many places on the more exposed coast-line, the shores are slowly washing away. Where there are woods immediately on the bluff, trees are often seen lying along the beach, with their uptorn roots exposed in the bank where they were undermined in a winter's gale. Sometimes, on the other hand, a storm makes beach, by throwing thousands of tons of sand upon a low stretch of coast and burying out of sight the marsh-bank.

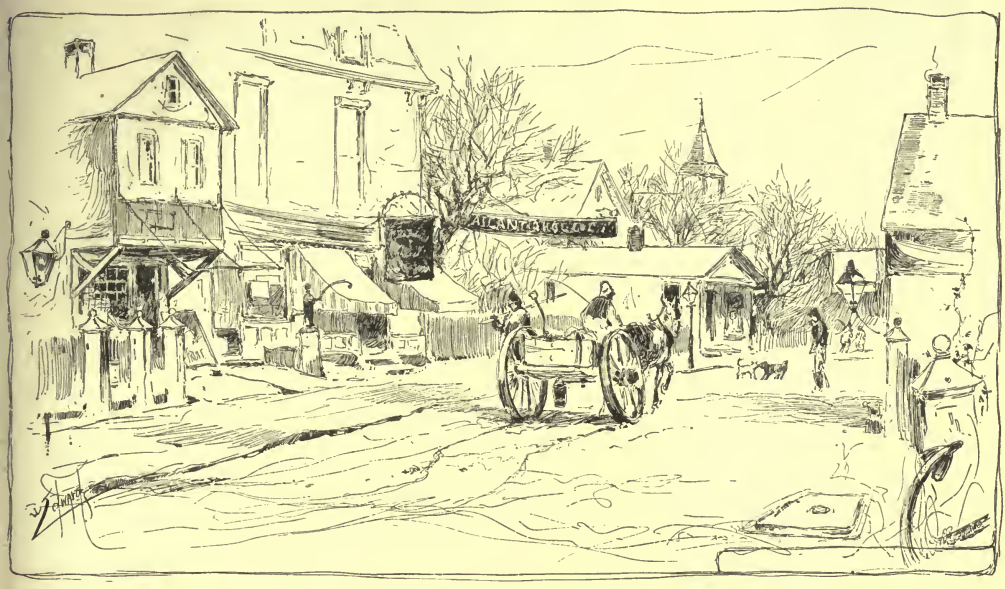
In Eastham, large stumps may be discovered nearly a mile from land, and ancient peat-meadows now lie under water. At another place in that town is a peat-meadow which was buried in remote times by sand, but has been washed out again by the waves, and fuel has been taken from it.

While there is much barren country on Cape Cod, there are in tillage, including hay lands of all kinds, eleven thousand acres, and of woodland there are some thirty thousand acres. There is good land in almost every section, and in many places there is productive soil. Even in Truro there is good farming, and in the upper towns fine crops are often raised. On the inner side of the Cape, the soil is generally better than on the outer; but there are some marked instances of profitable farming on the outer shore. The lighter soil is warm, and being free from stones it is easily worked, and there are many crops which flourish in it. The yield of English hay, by the last State census, was four thousand one hundred and seventy tons from three thousand eight hundred and fifteen acres.

It has been proposed, at different times, to dike-in the vast salt-marshes and convert them into dry land. The soil is deep and rich, and there is little doubt that, if they could be so protected, heavy crops of English hay or of grain could be raised upon them, and, as they are level and of great extent, they could, by coöperation, be tilled by machinery, like prairie farms of the West. If other avenues of activity were not freely open, it is more than likely that these meadows would be reclaimed.

The great feature in Cape Cod agriculture is cranberry raising. No other part of the country can compete with the Cape in this. Everywhere lie the cranberry meadows, or bogs, as they are properly called. They form one of the most characteristic features of the landscape. You see them from the car windows, spreading out over level acres, or skirting, with varying width, the running streams; you see them in winding valleys, far below the carriage road; you come upon them suddenly in the woods,—strangely trim, rectangular clearings, darkly shut in by a dense swamp growth. The culture of the cranberry has been reduced to a science. A swamp is cleared of its wild growth of trees and bushes and leveled like a floor; six inches of clear sand are carted on, to cover the heavy bog soil; numerous trenches for the flow of water are cut; a dike is thrown up about the field, and a brook is turned to run through it, with gates, so that the land can be "flowed" in spring to kill insects, and in the fall for protection from frost. Vines are set out at regular intervals, and spreading, they mat the ground. It costs on the average perhaps $400 an acre to transform a rough swamp into a cranberry meadow in bearing condition. One marsh in Barnstable cost $30,000. The profits, however, are large. One meadow, of two or three acres, has repaid six weeks' annual labor with $1000 a year for twenty years. Another, of half an acre, belonging to Mr. Emulous Small, of Harwichport, an expert in this culture, has yielded ninety-eight barrels in one season. A meadow of sixteen acres, at Marston's Mills, netted in one year $8000, and another of forty-eight acres, at Newtown, in Barnstable, has yielded in one season, within a year or two, forty-two hundred barrels, netting a profit of eighty per cent. There are probably on Cape Cod some thirteen hundred acres of cranberry meadows, from a few rods to fifty acres in size, and the acreage is constantly increasing. The whole

crop is from thirty to forty-five thousand barrels, worth from $250,000 to $300,000 on the ground. The picking time is an era in the year. Schools are often closed, and the boys and girls, with many of their elders, turn to gathering the crop; rakes are seldom used, for fear of damage to the berries, which are best picked by hand. The price of picking is not included in the figures given above, and on the whole a substantial amount of ready money is distributed in a thousand tiny rivulets from this industry.



COMMERCIAL STREET, PROVINCETOWN.

There is more forest on Cape Cod, it is said, than there was fifty years ago. Extensive tracts that once were tilled have been left to run to wood, their former names still clinging to them. You will hear of a piece of woodland known as the "Thomas" field or "West New Field." A farmer dies; his sons have all left home to follow the seas, to keep store in Boston, or to practice law in San Francisco. The first year, the fields are neglected: withered stubble of the year before alone remains to tell of cultivation. Another year, a feeble crop of grass comes stealing in; another summer, unless the land is fated to remain as an "old field," you will see miniature pitch-pines all over it; another summer yet, and they are bushes; and before you can realize it, the whole field is rejoicing in a vigorous growth. Even in many of the roads you hardly leave the woods. It seems as if a chief business on Cape Cod from the time of Noah had been the making of roads. The village streets and the county highways are often wide; but there are numberless wagon roads that began existence merely as unofficial cart-paths, and by stealthy inroads gradually found favor and wound into the affections of the public until they gained recognition. They are very narrow often, and the trees meet overhead. Sometimes you are tempted to pursue such a way until it turns out a "blind road," and you can go no further, and can with difficulty turn back. In some of them it is the rarest thing — we might almost say illegal — for two vehicles to meet; if there is a meeting, it takes a certain Yankee planning sometimes to effect an interchange of position. But a man who has passed a score of years or more in riding up and down high-rolling waves thinks nothing of urging a wagon, loaded with cord-wood or oysters, up the steepest bank, or of driving over saplings six feet high, to make a circuit.

In many places, the woods run along the coast to the very edge of the sandy bluff. For many miles upon the southern shore, in Osterville and Cotuit, and on the headlands of Mashpee, for example, one can stroll through the pine woods on an August day and enjoy the fragrance and the dense shade, listening all the while to the steady breaking of waves upon the beach.

A wood-packet runs regularly from Cotuit to Nantucket. It is quite common for the crews of coasting vessels hauled up in the winter to turn to felling wood; in this, as in everything else, is seen a mingling of rural

THE TOWN-CRIER.

and maritime pursuits. Every mariner knows something of farming, and every farmer is more or less of a sailor. They tell of an action against a town for injuries from a defect in a highway, in which the distance of a certain hole in the road from the traveled path was in question. A town officer had fixed the distance by actual measurement, and the only evidence for the plaintiff was that of a man who simply gave his judgment. Nobody could guess how the plaintiff's counsel would get around the evidence of the town officer. But he was undaunted. "Gentlemen of the jury," he said, "both witnesses are honest; one of them is mistaken—which is it? You all know how liable we are, in ciphering or in measuring, to make a mistake of calculation; my good friend, the selectman, probably laid down his foot-rule one time more or less than he thought, and so he is mistaken; but my witness, gentlemen, did not put his trust on any foot-rule: he knew better. As you all know, he has cut more cord-wood than any other man in Barnstable County, and he can measure by his eye infallibly. About his accuracy, therefore, there can be no possible question. The selectman may be wrong; my witness can't be."

The natural ponds of the Cape are among its chief charms. You come upon them everywhere. The smaller ones are much alike, except as nature loves to give to each some shy, peculiar grace. They lie for the most part in an amphitheater, and have neither inlet nor outlet. The bottom and the shore are commonly of white sand, and the water is as clear as crystal and singularly pure.

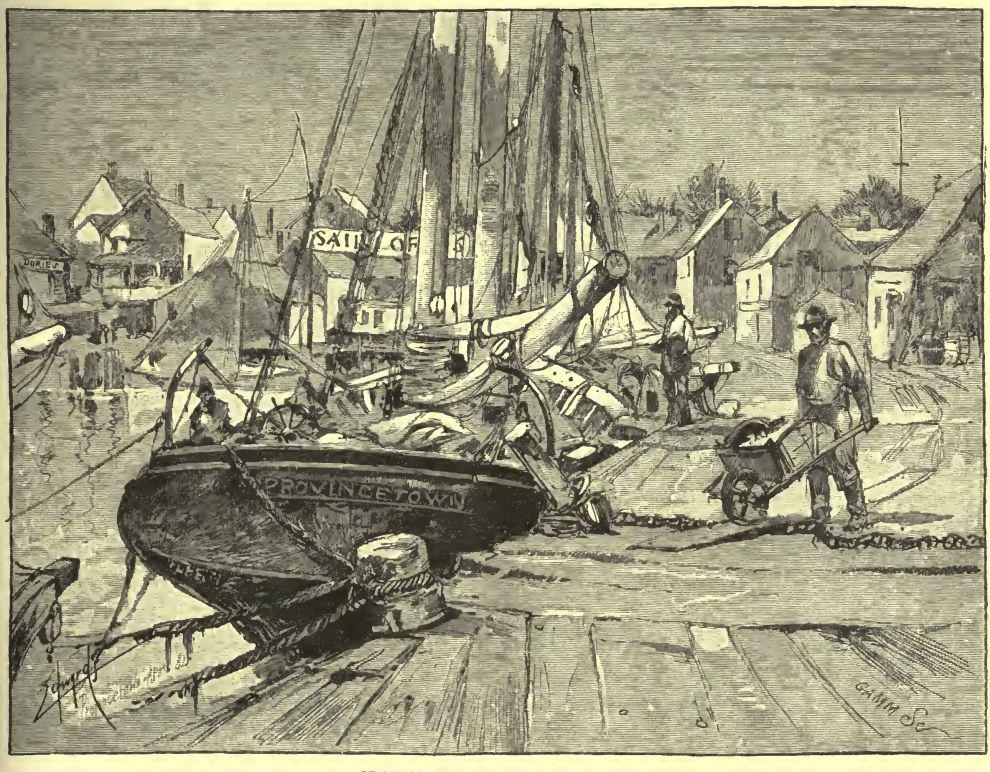
These ponds are, of course, spring-fed, and there must be an overflow through the loose upper soil by percolation. Many of them are wooded all about and to the very beach, and the trees throw out long branches over the water, and fling their shadows far on its surface. Others are surrounded by pastures divided from each other by rail fences, which project out to deep water to keep the cows of different farms separate. Often a farm-house, with its barn and sheds, stands on the bank above the pond.

There is no rocky coast upon Cape Cod. The powerful swirl of waves into worn granite race-ways is unknown. Instead of rocks, there are long sand beaches curving as far as the eye can reach, cut, every few miles, by the opening of some little bay or harbor. There are no perils on a bold rocky shore equal to those of Peaked Hill Bars off the white Provincetown sand-hills, seizing vessels in their sunken traps and holding them there to beat in pieces. There is not a mile of coast from Provincetown to Chatham that has not stories to tell of shipwreck. In fact, the history of the whole coast line, inner and outer, of Cape Cod would be a history of disasters, from the time when the pirate ship *Whidah* was driven ashore in a gale, a century ago, and more than a hundred bodies were washed up on the beach.

The number of birds on Cape Cod is very great, and among them are many rare ones for the North, such as the black skimmer, or shear-water, and the Maryland yellow-throat. Mr. H. E. Chase, who spends his summers at Hyannisport, has himself counted a hundred and eighteen varieties, and has shot and stuffed a good many of the more interesting.

The prairie warbler is often met in the pine woods. It is so bold that one can sit within a few feet of it, while it hunts for its food like the chickadees, often head down, clinging to some twig, now and then pausing to chirp. At dusk, the night-heron wings its

way out over the salt-marshes to relieve the kingfisher, who has been sounding his rattle all day long from some favorite post; and as the deeper shadows gather, whip-poor-wills



CENTRAL WHARF, PROVINCETOWN.

and owls come out from the deepest recesses of the woods.

Among the most common birds are the meadow-lark or marsh quail, the sharp-tailed finch, the red-wing blackbird, the grassfinch, the green heron, the tern or mackerel-gull, and the shore birds. They are all independent of the woods. From the peculiar position of Cape Cod, and the equalizing effect necessarily produced on the climate by the ceaseless sweep of ocean breezes, many stragglers of northern and southern species, never seen in other parts of Massachusetts, find their way here, and some which usually pass further south have even been known to winter here.

Birds which follow the shore in their migrations consult the nature of the coast. In Eastern Massachusetts, more plainly than anywhere else, is seen the change from the low, sandy shore which marks the South to the high and rocky coast-line of the North. Such a change is sure to be noticed by birds on their migrations, for on the character of the coast depends their food. Cape Cod is, therefore, particularly fitted for a resting-place of the thousands of shore birds on their southward journey, and acts, moreover, as a barrier to Southern species wandering North in the late summer. Some years ago, a great white heron was shot near Yarmouth, and the least-bittern has been shot at Chatham.

The winter is so much milder on Cape Cod than further North, that the Wilson's snipe sometimes stay all winter around the upper, fresh portions of the marshes. Snowy owls are probably more abundant during the winter on Cape Cod, Martha's Vineyard, and Nantucket, than in any other places of the same area in New England. Monomoy Island also seems to be a favorite winter resort for this owl. Hawk-owls are sometimes seen along the shore, where they often alight in the beach-grass or sea-weed. The Carolina or turtle-dove is common on the Cape, and flocks of from half a dozen to twenty may often be seen in the fields of stubble. Its nest has been found in a grove of stunted pines on the edge of the Great Marshes in Barnstable. Eagles are quite often seen on the Cape.

There may still be found between Buzzard's Bay and Provincetown the mink, rabbit, fox, raccoon, and deer. There are miles of woodland, unfenced and dotted over with ponds, where the deer still roam, and when pursued,

usually escape by taking to the water. Cape Cod was one of the best Indian hunting grounds. Numberless arrowheads have been picked up on the narrowest parts, where large game was probably intercepted, and flocks of sea-birds were shot at while crossing at points which are still found to be preferred by them.

The occupation of the people of Cape Cod is chiefly maritime. Some of the towns have given their attention mainly to foreign voyages, others to coasting, others to banks fishing.

Three or four years ago a case was tried at Barnstable, in which a lawyer from a distance was concerned. Talking over the prospect of a verdict, he said that with a rural jury, who knew nothing of the world beyond their own door-yards, of course he could not expect a very intelligent consideration of the case. Some one took pains to inquire who the jurymen were, and it turned out that eleven of the twelve had been either all over the world, or pretty nearly all over their own country, as masters of vessels, or in some business of responsibility, and that the twelfth was a substantial farmer.

In view of such juries as these, it seems almost a pity that the people of Cape Cod do not show a litigious spirit and improve their opportunity. In fact, the courts have hardly business enough for exercise. Although there is wealth there, the little county having a valuation of sixteen millions, and although there is a boundless field for disputes in claims under the cranberry-flowage statutes and in fishing and beach privileges, there is in fact no litigation of any account. There are well-to-do populous villages on the Cape which probably have not furnished a lawsuit for twenty years. The population of the county is thirty thousand, and there are only five practicing lawyers. Perhaps a general familiarity with the world has had its influence in imparting a certain good-humored tact in settling controversies.

A characteristic story is told of a jury case at Barnstable. A man was tried for a violent assault. In argument, his counsel, who was from an inland county, alluded to the fact that the injured person had not called a doctor to wounds which he had described as serious, and based the defense very largely upon this. He saw no possible answer to his argument. But he did not know his ground. Judge Marston, the district attorney, afterward attorney-general of the State, was born and bred upon Cape Cod of a family of Barnstable lawyers, and he had his ready answer. "Gentlemen," he said, "you have heard the plausible argument of my ingenious young legal friend, who has come from a distant city to enlighten your benighted understandings, and you see through his sophistry. You all know Captain ——, the father of the victim of this assault; you know what our young friend, with all his learning, has plainly never discovered, that a man is not master of a ship for thirty years without learning how to deal with wounds, and you know well that there is no doctor on Cape Cod who can heal cuts and bruises better than the captain can. Why should he have sent for a doctor?"

The mariner's habit of thought appears in everything. A few years ago, the school committee in one of the towns decided on a change of geographies, and the superintendent of schools was besieged by publishers' agents. One of them called upon him and undertook to explain the features of his book. "I don't think you need to tell me anything about geography," said the superintendent, who was an old sea-captain, "but I will teach you something. Here is a picture of what you call a smack fishing for mackerel, and you've got her on the port tack, with sheets hauled aft, making about seven knots an hour. Now, in a mackerel boat they keep the kit on the port side, and she lays off to fish on the starboard tack, with the sheets off, the peak of the foresail slacked down, and the tiller lashed hard down." Not long after, the publishers wrote and asked him for a correct drawing, and he had a rough sketch made by a sailor who had a knack with the pencil, and sent it to them.

No one who travels through Cape Cod and visits the people in their houses can fail to notice an almost universal thrift and comfort. No other section of the State, perhaps, shows more general independence and average prosperity. There are large villages, with streets of handsome houses and bearing signs of wealth. But, to a considerable extent, the houses are in hamlets, or stand apart in lonely situations. To city people they often seem forbidding. You see a cottage, with an L extravagantly long, standing by itself upon a hill-side, by a pond, or near the beach. The outside, very likely, has never been painted; but if you enter, you are pretty sure to find substantial comfort. And if you find a welcome, it is no more than you have a right to expect in the little county which, in King Philip's war, invited to its hospitality the people of three whole towns exposed to Indian ravages. And it is a barren house that does not display some foreign treasures. No mean museum could be filled from the houses of Cape Cod. Everywhere, too, you see signs of familiarity with the sea. There are often great foreign shells on the gate-

posts, or rows of shells up a front path; a wide-doored barn with haymows will have a cod-fish weather vane; from a key left in the door of a blacksmith's shop will dangle a shell, instead of a billet of wood. Occasionally, you will see a hen-yard fenced about with a seine.

MARSHES (EVENING).

Even the men whose work lies ashore have all been more or less at sea, and can steer and reef on a pinch. A man was hurried off a farm awhile ago to fill a gap on a coaster. He had the easy berth, and through all the heavy weather that prevailed he merely stood and hauled on deck. But when the voyage was over, and the vessel swung at anchor in the home port, and there was occasion for some one to go to the foretop masthead, the farmer, with a twinkle in his eye, seized the ratlines and went up like a cat. He had shrewdly kept dark as to his seamanship.

The history of Cape Cod has, of course, been closely interwoven with the fate of the Indians. The titles of lands are based upon grants from them. The prices, of course, were very small. One of the early deeds runs as follows:

"AUGUST 26, 1644.

"These presents witness that I, Serunk, Indian, now dwelling at South Sea, do sell and make over unto the town of Barnstable all the sd. lands and meadows lying betwixt the bounds of Sandwich and the bounds of Prexit and other Indians, in consideration of four coats and three axes. In witness I have hereunto set my hand, the day and year above written.

"The mark of + Serunk.

ANTHONY ANNABLE,
HENRY COBB,
THOMAS ALLEN,
JOHN SMITH,
LAURENCE WILLIS,
THOMAS DIMOCK,
Witnesses."

There is, however, evidence of a certain fairness of dealing, in the friendly relations which subsisted between the two races on Cape Cod even through King Philip's war. We have spoken of an old block-house, built in 1644. There were, nevertheless, no Indian forays on the Cape, and the tribes that lived there seem to have been well disposed to the white men.

The Indians figure prominently in legislation. It was forbidden to furnish them with firearms; for it had been "found by experience that the Indians, who are naturally perfidious, are abundantly more Insolent and Proud when they are furnished with English Arms." Even so dignified a man as Mr. Leverich, the minister of Sandwich, was brought before the court for lending a gun to an Indian.

It appears that there were, even in those early days, evasions of law; for complaint being made that certain persons provided Indians with guns upon the pretense that they were their servants, it was forbidden for the future to hire Indians and furnish them with arms, an exception being made in favor of such as "have been servants for divers years, and are in a good measure civilized and approved of by the Governor and assistants." It was forbidden to sell wine or strong water to an Indian, except in case of illness. It was also unlawful to sell Indians boats or casks. Idle children of the Indians were to be bound out to service. Indians, "especially young men," were to work out their debts. Indian captives were in some cases to be sold; a runaway Indian servant was to be returned and whipped; it was unlawful for an Indian to remove from one place to another without a written permit. These provisions present the aborigines in Plymouth

Colony in the position of a subject race at an early day.

There were, however, humane provisions in their favor. An act of 1643, reciting that it has been held unlawful "from our first beginning" to purchase or hire land from the natives without the magistrates' consent, prescribes a penalty for making such purchases without permission. And in 1663 it was enacted "that no man shall make any particular use of any Indian's land without leave of the court." In 1659 is a curiously suggestive provision standing incomplete upon the records:

> "The Court understanding that some, in an underhand way, have given unto the Indians money or goods for their lands formerly purchased according to order of Court by the magistrates, thereby insinuating as if they had dealt unjustly with them, it is enacted by the Court that some course be taken with those whom we understand——"

Were their tender consciences disturbed about these purchases?

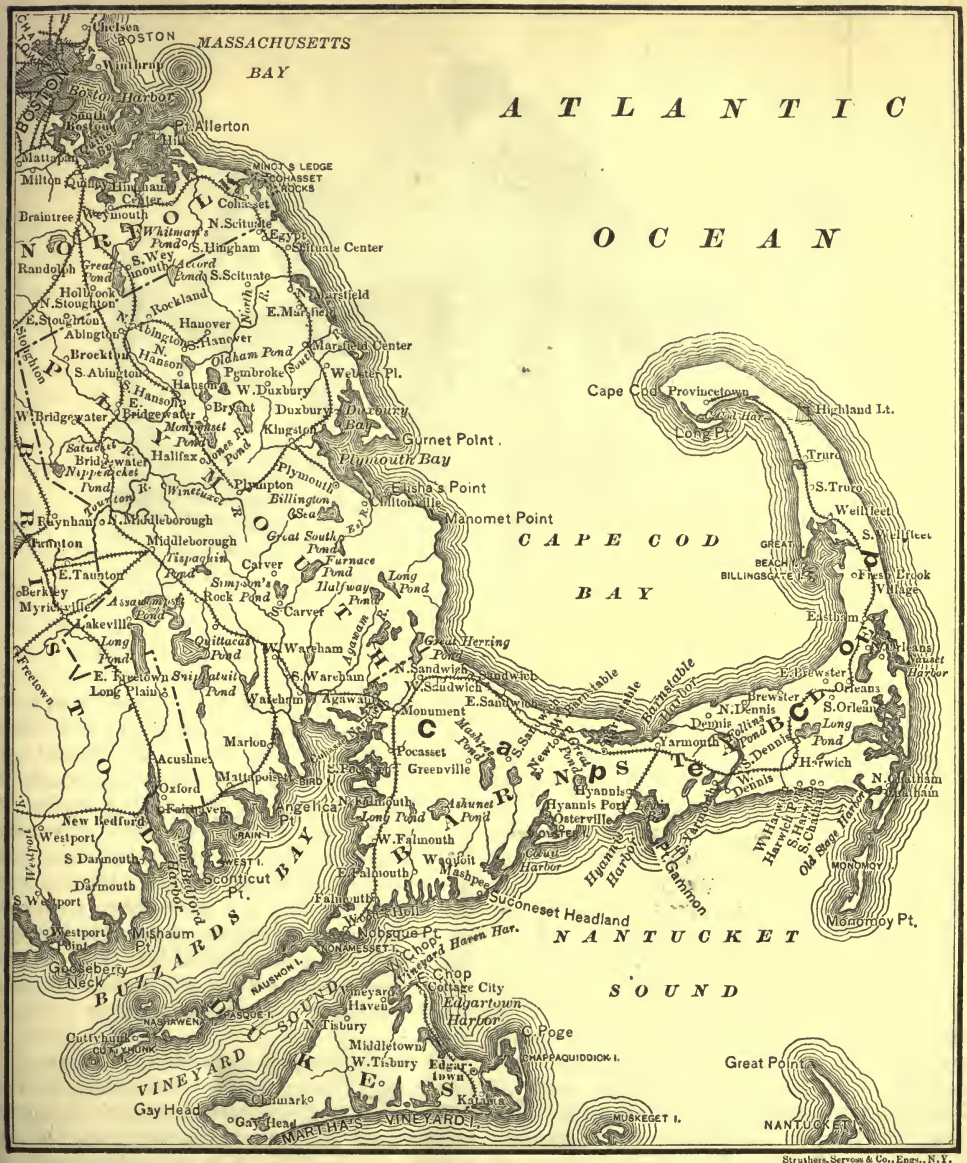
The only Indian settlement now remaining on Cape Cod is that of Massipaug, or Mashpee. Richard Bourne, a leading man in Sandwich, stirred, probably, by the efforts of Eliot, began to labor for the improvement of the Indians here at a very early day. Through his influence, a deed of what is now the township of Mashpee was secured, and the land was set aside for a reservation. The deed is still in existence. Somewhat shorn from time to time, this territory has continued to be a home for the descendants of the Indians. Within a few years, it has become incorporated as a town, and the inhabitants now stand on precisely the footing of other citizens of Massachusetts. In 1880, Mashpee cast a unanimous vote for Garfield.

The Indians have been held in guardianship, in one form or another, until very recently. In later years, the inhabitants of Mashpee have improved their condition greatly, particularly since the introduction of the cranberry culture has given importance to their lands and brought money into the town.

There are now probably none of unmixed blood among them, although Indian names remain, and many of the people have a strongly marked Indian appearance. The names of Pocknet and Attaquin are unmistakable. Intermarriage with other races has been very common among them. Some of the Hessians who were captured in the Revolution came to Suconeset, in Mashpee, to oversee salt-works there, and married Indian girls; and their descendants may still be met with. The names of Hush (Hirsch) and De Grass came from this source. We have talked with an old seaman who, in his boyhood, knew the Hessian Louis Hirsch, who married here.

Beyond the western point of Suconeset headland, looking off to the light-ship on the Shoals and to the shining bluffs of Martha's Vineyard, lies, on the sea, a tract of neglected land called the "MacGrego Farm." It is encircled by a dike, now overgrown and not more than three feet in height, although originally six feet high. On the eastern side, where the cart-road runs, is an opening in the wall, and inside this are a few fruit-trees, now grown wild, and a bit of sward, which plainly mark the former seat of a dwelling. The "MacGrego Farm" has a story. Among the prisoners captured in the Revolution was a young fellow named MacGregor, the son of an English clergyman, who, after getting a classical education, ran away from home, from love of adventure, and shipped on an English privateer. Being captured, he was held as a prisoner until the close of the war, and on regaining his freedom he came from Boston, with some of the Hessians, to look after salt-works on this shore, in the interest of Boston merchants. Among the Indians was an orphan girl of sixteen, tall and good-looking, called Mercy Moses. The late Captain Peter Lewis, of Waquoit, a very intelligent man, who knew both her and Thomas MacGregor in their later years, said that when advanced in age Mercy was as straight as an arrow. Some persons now living at Mashpee also knew her, among them Deacon Matthias Amos and his wife, who, before her marriage, taught school near Mercy's wigwam.

Mercy Moses had inherited this tract of which we have spoken and another parcel of land upon the sea, on Suconeset headland. Thomas MacGregor succumbed to the charms of the Indian girl, and married her, and they made their home upon the "MacGrego Farm," as it came to be called. He was a man of great bodily strength and activity; his farming was celebrated all through the region, and people used to come from other places to see his crops. About 1812, we are told, the farm was flooded by an unusual tide. Probably it was in 1815, when the tides, helped by a tremendous gale, rose so high in Buzzard's Bay as nearly to overflow the isthmus and make the Cape for the time an island, lodged a schooner in the woods, and set a sloop down like a foundling — a perfectly natural foundling for Cape Cod — before the door of a house. Although the tide did not flow so high in the Vineyard Sound, the MacGrego farm, low lying, was flooded; and, for fear of another deluge, MacGregor threw up, by his own labor, a dike six feet in height around the whole forty acres.



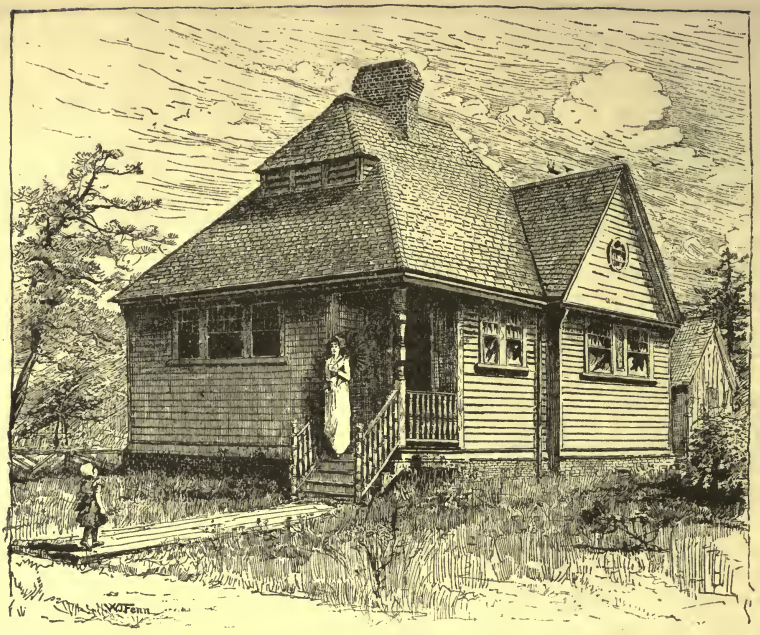
MAP OF CAPE COD.

Although he staid at Mashpee all his days, and built a barn for his cattle, he himself lived in a wigwam to the day of his death. The neighboring ministers (who were probably all college-bred men) used to visit him.

Mercy MacGregor survived her husband, and died about forty years ago. The land has lately been reclaimed by her heirs, who, to make out their title, had to go back a hundred and twenty years, and prove that she was the daughter of one Jude Moses and so the sister of one Samuel Jude Moses, from whom, in different branches, they were descended.

One of the most interesting things with regard to the relations between the whites and the Indians is the occasional appearance, to this day, in the Massachusetts law reports, among street-widening cases and controversies turning on steam and electricity, of suits relating to Indian titles.

The descendants of the Indians have fallen into the sea-faring ways of their white neighbors, and you will find in almost every house in Mashpee a man who can tell you of voyages. It is worth while to have a chat with Solomon Attaquin, who keeps the excellent



THE LIBRARY AT OSTERVILLE.

inn in Mashpee village, and to visit Deacon Matthias Amos, one of the leading men and a good story-teller, and hear this descendant of King Philip give the dramatic story of how he first heard of the late war, by the capture, in the spring of 1861, by the cruiser *John C. Calhoun*, of a whaler of which he was first mate, and of his romantic escape with his crew from New Orleans, by the connivance of a domesticated Southerner from Cape Cod.

Like all the rest of the New England coast, Cape Cod is becoming familiar with the aspect of the summer visitor. Where only a dozen years ago the beaches lay deserted, now the poles of sketching umbrellas are planted in the sand, and the red roofs of English cottages peep out between pitch-pines along the bluffs. For many years a number of Boston families have had summer-houses at Cotuit, and more recently city people have been establishing themselves on Buzzard's Bay, at Wood's Hole (which has attempted to become fine by changing its honest seaboard name to Wood's Holl), at Waquoit, at Osterville, and at Hyannis Port, and summer-boarders find their way to the lower towns. The bluffs of the Indian town of Mashpee have not yet been invaded.

While this current of city visitors disturbs to some extent the natural charm of simplicity of the villages, still the people of the Cape, already familiar with the outside world, are not disturbed as most communities would be; and there is every year a growing market for garden produce, and a good deal of work is brought, in one way or other, to those who need it. Osterville has gained a benefit from the summer colony in a public library, erected partly by home effort, but at the instance and largely by the generosity of Mr. W. L. Garrison of Boston, a son of the great reformer, aided by others who have summer cottages there.

One of the chief attractions in summer of the shore of Cape Cod, both on Buzzard's Bay and on the outer southern coast, is the exquisite climate, not particularly bracing, but cool, and remarkably equable. The prevailing breeze is from the south-west, from off the Vineyard Sound, and the harshness of east winds is seldom felt. The water, too, is warmer by some twenty degrees than at Swampscott or Manchester, for example, and the sea-bathing, on that account, attracts a good many people. And although in landscape this region has nothing like the richness of the Beverly shore, it has, nevertheless, not a little rural beauty, with a wild, peculiar charm that is all its own.

A WOMAN'S REASON.*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

XVIII.

THE world of fashion, on whose bonnets Helen had experimented in learning her business, accepted the hearsay of her success in a humbler way with self-satisfaction, and attributed far greater things to her than she achieved. It understood that she was making money, and several fictions in regard to the sums she had amassed had a ready currency. The world intended to look her up, when it had time; it was neither hard-hearted nor indifferent, but it was preoccupied. There were ladies who meant almost every day to drive out and see Helen; there were others who refrained because they fancied she would rather not have them come; but all were unfeignedly glad that the poor thing had found something at last that she *could* do. Her experiment in æsthetic millinery had thrown a great deal of light on her former endeavors; people said there was hardly anything she had *not* tried. In fine, they practically left her acquaintance and her memory in the keeping of Clara Kingsbury, who remained faithful to both, and perhaps did the best thing for them in rather hushing them up. She was herself a little sensitive about Helen's first experiment, and she was aware that many people held her indirectly responsible for the enthusiasm with which they had encouraged it. She always answered inquiries about Helen in an elusive way; she generalized her, and passed her over as quickly as possible, so that really the world had it to say that, so far from having dropped Helen, she had dropped herself. It was certainly not to blame for having heard nothing of her health, which began to break some six months after she had established herself at Margaret's. She had worked very hard, for she had incurred expenses during her fever at Mrs. Hewitt's, for which she was still in debt to Clara Kingsbury, and she had cherished the secret determination to reimburse her for all her losses through her. She had not earned enough to do this, but she had worn herself thin and pale by the time the advancing spring made it a year since she had heard of Robert's death. Her friend wished her to give up and go down to her cottage with her; but Helen refused to do more than spare herself a little, and she was still at Margaret's when the Butlers and Rays arrived from Europe.

They had been abroad longer than they had intended, because Captain Butler had continued in feeble health; but now they had come home to stay, as Marian wrote from London before they sailed. They were all going to be in Beverly together till Ray could decide whether to buy or to build in Boston, and Marian said that the first thing must be an indefinite visit from Helen. There was a tone of peremptory hospitality in her letter which made Helen, in spite of her affection for them, dread the return of her old friends. She was much more comfortable with Clara Kingsbury, who had become the friend of her adversity, who realized it, and took it seriously; and she could see that it was still a freakish piece of willfulness to the Butlers. Marian somehow treated her as if she were a little girl, and rather an absurd little girl. She knew that she could right herself against Marian's assumptions of sincerity and wisdom but she shrank weakly from the effort, and she foresaw that she should not have the physical strength to make it.

In fact, she yielded at once when Marian drove out to Cambridgeport and took possession of her. She was not even to be allowed to wait till they were settled at Beverly, but was to go down with them; and Marian came down from the hotel where they were stopping for the day to fetch her.

Marian had always been large and blonde. She now showed a tendency to stoutness; she was very English in dress, and she had the effect of feeling as if she looked very English. In fact, she had visited so much at great English houses that she was experiencing the difficulty, which sometimes besets American sojourners in England, of distinguishing herself from the aristocracy, or at least the landed gentry. The illusion shortly yields to American air, but it is very perfect while it lasts.

Marian had a nurse for her little boy, and she called this nurse by her surname; she was quite English in her intonation, and

she was, at the same time, perfectly honest and unaffected in these novel phases, and as thoroughly good and kind-hearted as ever. But her handsome bulk and her airs of a large, strange world made Helen feel undersized and provincial; in spite of all she could do, and in spite of her accurate knowledge of just what Marian Ray was and had always been, her friend made her feel provincial. She had been almost two years out of society, and for the last six months her relations had been with inferior people. She asked herself if she might not really have retrograded in mind and manners, and she gladly escaped from Marian to the others; to the exuberant welcome of the younger girls; to the pitying tenderness of Mrs. Butler; to the quiet and cordial simplicity of Ray,—his quiet seemed to have been intensified by absence. But what went most to her heart was Captain Butler's tremulous fondness, and the painful sense that the others were watching, whether they would or not, for the effect of his broken health upon her. He brightened at meeting Helen; they said afterward that he had not seemed for a long time so much like himself; and they left him to entertain her while they made a show of busying themselves about other affairs. It was probably an indulgence they had agreed to grant his impatience. He kept her little, worn hands in his, and looked at her forefinger, roughened with the needle, and deeply tinted with the stuffs in which she worked, and it seemed to be this sight that suggested his words:

"I managed very badly for you, my dear! If it hadn't been for my hesitation when I first doubted that rascal, I could have made terms for you with the creditors. I don't wonder you would never accept help from me! It's very good of you to come to us now."

"Oh, Captain Butler, you break my heart! Did you think *that* was the reason? I only wished to help myself. Indeed, indeed, that was all. I wouldn't have accepted any provision from the creditors."

"You need never have known it. That could have been arranged," said Captain Butler.

"It's been a mercy, the work—my only mercy!" cried the girl. "*Oh*, Captain Butler!" She caught her hands away and hid her face in them, and let the black wave of her sorrow go over her once more. When it was past, she lifted her dim eyes to those of the old man. "Did you read about it—all about it?"

"Yes, my dear, and many a night I've lain awake and thought about it!"

"Did you ever think that he might still be alive—that perhaps those men came away and left him, and he escaped somehow? Don't tell me that you did, if you never did!"

The old man remained silent.

"Then they must have killed him—to get that money——"

"No; probably they told the truth. It might very well have happened as they said," pleaded Captain Butler.

"Ah, you know it couldn't!"

Again his hopeless silence assented, and Helen said, with a long, deep sigh:

"That is all. You know how I must have felt. There is no use talking of it. I only wanted to see you and speak of it just once, because I knew you would know. Thank you!" she said, with a wandering pitifulness that forced a groan from her old friend's lips.

"For crushing your last hope, Helen?"

"Ah! it is better not to have false hopes."

She stole her hands back into his, and after awhile she began to tell him quietly of her life, and what she had done and expected to do; and he gave her the comfort of his fatherly praise, in which there was no surprise or foolish admiration, such as afflicted her in most people's knowledge of her efforts.

"I don't have to work very hard," she explained, in answer to a question of his; "not harder than I wish; and I have got to working at last as other people do who earn their living, without thinking at all that it's I that am doing it. That's a comfort—a great comfort. And I know my trade, and I'm sure that I do good work. Do you remember when I told you that I should be a milliner if I were ever left to take care of myself?"

"I remember, Helen."

They were both silent; then she said, with a light sigh:

"I'm only feeling a little fagged now."

"You must stay with us, Helen," began Captain Butler.

"I shall be glad enough to stay awhile," she answered, evasively, and in her own mind she had already fixed the term.

It was inevitable, perhaps, that she should extend the term. The summer was a vacant time, at best, and she could let the luxury of Captain Butler's house flatter her feeble health into strength again without such a bad conscience as she would have had if she felt that she was spoiling her future, or if she had got back her strength very rapidly. The family did not see many people, and only saw them in a quiet informal way in which Helen could share. The world, with which she had never had any quarrel, took her back kindly enough; it discreetly suppressed its curiosity; it spoke of bonnets and ribbons in her presence with a freedom that was wiser and politer than an avoidance of such topics would have been;

it sent her invitations to little luncheons and low teas, and accepted her excuses gracefully, and always renewed the invitations, just as if she had come.

The old affection enfolded and enfeebled her. It was quite as bad as she had feared. She said to herself sometimes that it would be better to break off at once and go back to Margaret's; but she did not do so. The thought of the little wooden house baking beside the dust of Limekiln avenue and her own low chamber gathering heat and mosquitoes from day to day under the slope of the slated mansard opposed itself to the actuality of the Butler cottage, with its wide verandas that looked seaward through cool breaks of foliage on the lawn dropping smoothly to the bowlders on the beach; with its orderly succession of delicate meals; with the pretty chintzed and muslined room in which she seemed to drowse her life away, safe from the harms that had hunted her so long; and she felt how easy it would be to accept indefinitely the fond hospitality that claimed her. She said that she must not; but in the meantime she did. She had the soft, feline preference for sunny exposures and snug corners which is to blame for so much frailty of purpose, or so much purposeless frailty in women; and now she was further weakened by ill-health. She stayed on and on, in spite of the feeling that they all regarded her as a poor, broken thing, who could no longer be the ideal of the young girls, or the equal friend of Marian.

Mrs. Ray was much preoccupied with her baby, with the house that Ray had decided to build, with the friends abroad from whom she heard, and to whom she wrote. She carried with her an impression of wealth, an odor of opulence, which accorded well with her affluent personality; she accepted her lot of rich woman with a robust satisfaction which would have been vulgar, except for her incorruptible good-heartedness. She never talked of money, but she was a living expression of large expenditure; and in discussing the plans of her new house with Helen, she had an unconsciousness of cost, as related to questions of convenience or beauty, which went further to plunge Helen into hopeless poverty than any boast of riches could have done. Her manner was none the less effective for her assumption that Helen was equally able to pay for such a house. She was not planning altogether for her own comfort and splendor, though these were duly provided for; but she was looking after the well-being of everybody in her household, and she was as willing to lavish upon the servants' quarters as her own.

"I think it's barbaric," she said, "to make those poor creatures, because they do our work, pass their days in holes in the ground and coops under the roof, and I'm determined that they shall be decently housed, with me at least. I'm making the architect work out this idea—it was something I talked over—with—" she added, with the effect of feeling it absurd to shrink from saying it—"Lord Rainford."

They both continued quietly looking at the plan, but the word had been spoken, and they no longer talked of the servants' quarters in Marian's house. Helen leaned back in her chair, with her listless hands in her lap, and Marian took up the work she had laid down before unfolding the plan.

"When did you see him last?" asked Helen.

"Oh, he came to see us off at Liverpool," returned Marian.

"Was he—well?"

"Yes, as well as he usually is. I believe he's never very strong, though he's never in a bad way. He's much better than he used to be."

Helen was silent. Then she began, as if involuntarily, "Marian"—and stopped.

"Well?"

She was forced to go on.

"Did you know ——"

"He told Ned. Now, Helen," she added quickly, "I promised Ned not to open this subject with you!"

"You haven't," returned Helen, with quiet sadness. "*I* opened it. I knew that we should have to speak of it some time. I feel that I was not to blame, and I have never felt sorry for anything but his—disappointment."

"He never blamed you. He understood just how it happened, and how he had mistaken you. He is the soul of delicate appreciation."

"Yes, I know that."

"And his only trouble was that he should have forced you to say that you were engaged."

"Yes."

"And I don't believe that any of us grieved more sincerely for you than he did."

"Oh, I believe it."

"Well," said Marian, breaking her needle in expression of her resolution, "I wont talk with you about Lord Rainford, Helen; for I can only talk with you in one way about him, and I promised Ned not to do that!"

"What way?" asked Helen.

"You know!"

"Now," cried Helen, "you must tell me all about it! If I didn't believe that I had suffered as much as he, I couldn't forgive

myself. How did he find out about—about —Robert?" She whispered the last word.

"We told him!"

"And he was sorry for me—he ——"

"Yes."

"How kind he is!"

"Yes, he is kind," said Marian. "He's a good deal changed since he was here." Helen looked the interest which she did not otherwise express, and Marian continued: "He's giving up a good many of his wild, Utopian ideas about democracy, and all that kind of thing. You know at one time—before he first came out to America—he thought of dividing up his estates among the laborers on them."

"What a strange idea!"

"Yes. But there was some legal obstacle to that,—I don't know what,—and now he's devoting himself to making his people comfortable in the station where he finds them. He conforms a great deal more than he used to, in every way. I think his acquaintance with America did him good: he saw what a humbug democracy and equality really were. He must have seen that *nobody* practically believed in them; and we must say this for the English, that they're too honest to get any pleasure merely from the names of things. He must have found that people here were just as anxious about position and all that sort of thing as they are in England."

"He seemed very much puzzled by it," said Helen. "I couldn't understand why."

"Because he was very sincere; the English are all sincerer than we are. They accept rank and royalty, and carry it out in good faith; and we accept democracy, and then shirk the consequences. That's what Ned says. I wonder that the Englishmen who have been here, or seen us running after titles abroad, can keep from laughing in our faces! And I *don't* wonder that Lord Rainford was cured of his fancies in America. Why, he actually, at one time, was a sort of republican!"

"A very curious sort," said Helen. "He said that Americans were all commoners."

Marian paused.

"Did he say that? Well," she added, with heroic resolution, "I suppose we are."

"I don't think so," said Helen. "Or at least, it wasn't delicate of him to say so."

"I don't believe he meant anything by it. He gave us to understand—or Ray, at least —that he particularly admired you for your courage in earning your own living, and being no more ashamed of your work than if you were noble."

"Yes," said Helen, thoughtfully; "I suppose it might be natural for him, if he had those notions, to idealize us here, just as it would be for one of us to idealize them: it would be his romance."

"Certainly," said Marian, with eager assent, as if this mood ought to be encouraged in Helen, "that is just the way."

"And perhaps," Helen went on, "it would have been better for me if I had been such a girl as he supposed—trying to help myself because I respected work, and all that. But I wasn't."

"Of course not."

"I was merely doing it because I couldn't bear to be a burden to any one; and I've never had any higher motive."

"And I'm sure it's high enough," said Marian, "and crazy enough, to suit any one," she added. "He would like it all the better when he found out what it really was; especially now that his own ideas have changed a little."

"He was an aristocrat at heart all the time," returned Helen. "If I had been born to work for my living, like the poor girls whom I make bonnets for ——"

"It would have been another thing, quite. We're all inconsistent. I don't deny it. There's no merit in working for a living, whatever disgrace there is in not doing it. You don't find your Bridgets and Norahs, or your Sadies and Mamies so very superior to human weakness that you wish the rest of us to form ourselves on the pattern of working-girls."

"Oh, no," said Helen, with humorous sadness. "They're poor silly things, most of them, and as full of prejudice and exclusiveness as any one. I've never seen distinctions in society so awful as the distinction between shop-girls and parlor-girls. Their differences seem such a burlesque of ours that, sometimes, I can hardly help laughing at the whole thing. I supposed once that all work-people were on a level; but really I had no idea of inequality till I came down to them. I dare say," she added, "Lord Rainford's experience in coming down to *us* must have been something like it. But it didn't make it any pleasanter to have him suggest his surprise. And I don't know that I need feel particularly flattered at his singling me out for praise because I choose to help myself rather than be wholly dependent—I've always been partly so. It isn't a thing, as you say, that I deserve the least credit for."

"I never said that about you," protested Marian, "and I do think it's a credit to you —or would be, if there were any necessity for it."

"Any necessity for it?"

"I *will* speak now," cried Marian, "hospitable or inhospitable; and I don't see how it

has anything to do with it." Helen understood perfectly that these enigmatical sentences were the report, so far as they went, of some discussion between Marian and her husband, and that she was now about to break some promise she had made him out of half-conviction. "Do you expect, Helen Harkness, to go back to that horrid shanty, and spend the rest of your life in making servants' bonnets?"

"Yes — till I have learnt how to do better work."

"Well, then, I think it's a shame!" Helen drew herself up, but Marian did not quail. "I think that you might have had some little consideration for us — for all your friends — if you had none for yourself. Why should it have been any more disgraceful to accept help from papa — from your father's old friend, who felt toward you just as he does toward his own children — than to take up such work as that? If it comes to that, why shouldn't you be dependent upon us, as well as dependent on them?"

"I'm *not* dependent on them," said Helen, "and you have no right to say such a thing, Marian." But she felt herself physically unable to cope with Marian's misrepresentation, or the no-reasons with which she supported it.

"I say it for your good, and to let you see how it appears to others. It will kill you to go back there. I can't bear to think of it."

"It wont kill me," answered Helen, sadly; "but I shouldn't be frightened by that if it were true. Why do you think I should be so anxious to live?"

"Helen!"

"Yes, seriously. What is there left for me in this world?"

"There's everything — if you would see it so."

"Everything?"

"Helen," said Marian, dropping her hands, with the sewing in them, into her lap, "you force me to break one of the most solemn promises I ever made in my life. But I don't care; if I can do any good by it, I will break it. And I want you to understand that I speak entirely on my own responsibility, and quite against Ned's advice and orders. We saw a great deal of Lord Rainford while we were in England, and everything we saw made us like him more and more."

Helen feebly put herself on the defensive, but without saying anything, and Marian continued:

"He's very greatly improved, in every way. He's better, and he's better-looking."

"I thought him improved the last time he was here," said Helen, impartially.

"He's the kind of man who doesn't show to advantage out of his own surroundings," returned Marian, pursuing her apparent advantage. "We visited him at one of his places, in the country — an old house, of the fifteenth century, that kings and queens had slept in, and that had been in his family almost as long as it had been built. You never saw such a place, Helen! There wasn't much of a park, but there were groups and avenues of beautiful old trees all about, and lawns so fine and close that it seemed as if they had been woven and laid down there just for our visit; ivy all over the front of the house — and such gardens, with peaches, and pears, and roses trained along their high walls — just like Tennyson's poems; and an exquisite *keeping* about everything that I never could make you understand unless you had been there. But everything was so fit, that you felt as if that low English sky was part of the place and the arrangement of the clouds had been studied for it. There wasn't a jar or a hitch in anything, and Lord Rainford himself came in in such a way that you would have thought he was as much a guest as ourselves."

"Yes," assented Helen. "I suppose they've brought the art of all that to perfection."

"It isn't an art with them; it's nature — second nature. This was only one of his places, — the smallest of them, — but there wasn't the least effect of ownership about him; and it wasn't from him, you may be sure, that we found out the good he was doing!"

"No; I could imagine that. He must find a great happiness in it. I'm glad ——"

"Oh, he didn't seem very happy. Not that he made any parade of melancholy. But you can tell whether such a man is happy or not without his saying so, or looking so, even."

Helen was silent, and Marian made a bold push.

"You know what I mean, Helen, perfectly well. He didn't speak to me about it, but he told Ned everything, and Ned told me; and I don't believe he's forgotten you, or ever will."

"He had better, then," said Helen, with a momentary firmness. "He must."

"Didn't you tell him that if you were not engaged? ——"

"Oh, did he say that? Then don't talk to me of his delicacy, Marian! It was shameful to repeat it."

"What nonsense! Mightn't he say it, if he were asking Ned whether he thought you really would have cared for him if you hadn't been?"

"Did he ask that?"

"I don't know. But if he had, would it have been anything so very strange? Not

half so strange as your saying it if you didn't mean it. Why did you say it, Helen?"

"You know well enough, Marian. Because I felt sorry for him; because I had to say something. Did Ned—did Mr. Ray encourage him to think that I meant ——"

"Of *course*, he didn't. He never ventured a word about it. He seems to think, like all the rest of us, *except* me, that you're a very peculiar kind of porcelain, with none of the flaws of common clay, and I can't persuade him you're a girl like other girls. But if you come to the common sense of the matter, I don't see why Lord Rainford shouldn't have supposed you meant what you said, and that when it was all over ——"

"Marian!"

"Why he shouldn't have begun to have some hopes again. I'm speaking for your good, Helen, and I'm going to speak plainly. I *don't* see why you shouldn't marry him now! If you have no pity for yourself, if you *prefer* to go on with the wretched life you've planned, I don't see why you shouldn't have a little compassion for him. You're spoiling his life as well as your own."

Helen had to struggle from under the crushing weight of this charge by an effort that resulted in something like levity.

"Oh, I don't know that it's spoiling his life. He seemed to care for me as an element of social and political reform, and wanted to marry me because I illustrated a theory. Perhaps, if you told him I didn't really illustrate it, he would be quite willing to accept the situation!"

She left Marian where she was sitting, and the subject—for that day. But the next week Ray went off to town by a train earlier than usual one morning, and Marian went restlessly about the house. The moment she found herself alone with Helen, she began, abruptly:

"Helen, I wont have you thinking it's the same thing, my talking to you the other day about Lord Rainford, as it would be if Robert Fenton had lived."

"No," said Helen, recognizing the fact that it had seemed so to her.

"I wish to talk as if he never had lived."

"You can't do that!"

"Yes, I can; for now it *is* the same, so far as Lord Rainford is concerned. If you said anything to make him believe that it would have been different, if you had not been engaged, then you owe him another chance. If you ever did or said anything to encourage him ——"

"Encourage him!"

"Without knowing it—but you can't deny that he might have thought you encouraged him deliberately that first day ——"

"No," said Helen, with a guilty sense that did not suffer her to protest against Marian's cruelty in going back to that.

"Then I say you *must* listen to him. Helen, I'm speaking entirely for your good. I didn't like him at first, either; but now I know how nice he really is, I *do* want you to reconsider! You would be happy with him; he would make any woman happy, and he would be simply in heaven with you. And you're adapted to the life you would lead in England. You could be fashionable or unfashionable, just as you liked; and if you wanted to be useful, to do good, and that sort of thing, you'd have every chance in the world. You'd be a great success, Helen, in every way. I do *want* America to be well represented over there! And don't you see what a great thing his offering himself to you is? It's almost unprecedented! I hardly know any other American girl who hasn't been married for her money in Europe; they're *always* married for their money, even by cheap little Continental counts and barons; and for an English lord to marry a *poor* American girl, why, it's like an American man marrying a woman of rank, and that *never* was heard of! I want you to look at it on all sides, Helen; and that's the reason I'm almost perjuring myself in talking to you of it at all. I did promise Ned so solemnly; but if I didn't speak now, I shouldn't have another chance before—"

She suddenly stopped herself, and Helen, who had been borne down by her tide of words, lifted her head again: "Before what, Marian?"

"Before he comes!" cried Marian, hysterically. "He's coming here to-day!"

Helen rose.

"Then I must go," she said, quietly. "It would be indelicate, it would be indecent, for me to be here. I wonder, Marian, you could set such a trap for me."

Marian forgave the offensive charge to Helen's excitement. "Trap," she repeated. "Do you call it a trap, when I might have let him come without saying a word to you? I *wanted* to do it! And I should have had a perfectly good excuse; for we didn't know ourselves that he was coming, till this morning. He wrote us from New York, and he started for Boston last night. I didn't even know he was in the country—indeed, I didn't!" she added, beginning to quail, woman as she was, under the awfulness of the reproach in Helen's eyes. "We couldn't tell him not to come! How could we tell him not to come? There wasn't even time!"

"Yes," said Helen, brokenly, "I know. I don't blame you. But you see that I can't stay."

"No, I don't," retorted Marian. "I don't see anything of the kind."

"It would be shameful—it would be a trap for *him*."

"He's a man, and he'll never dream of such a thing; he's a gentleman, and he *wont* think so!"

"But *I* shall," returned Helen, definitively. "It will look as if I had been waiting for him here; as if I wished to see him. It leaves me no freedom; it binds me hand and foot. If he spoke to me again, what *could* I say? Don't you see, Marian?"

"No, I don't," said Marian. But she denied with her lips only.

"No matter; it's quite time I was back with Margaret. I will get ready, and go up to Boston at once."

"Helen! And when he's crossed the ocean to see you?"

"If he's done that, it's all the more reason why I shouldn't see him. He had no right to come. It was very presumptuous: it was unfeeling."

"You encouraged him to believe that if you had not been engaged to Robert Fenton you would have accepted him. What was he to think? Perhaps he felt that, as a gentleman, he was *bound* to come."

Helen panted, breathless. "I must go away," was all she could say at last.

"Oh, very well!" cried Marian. "You see how awkward you make it for us."

"I know. I'm very sorry. But I can't help it. How soon do you expect him?"

"Ned went up to Boston to meet him. I don't know which train they'll be down on," returned Marian, coldly.

"Then there isn't a moment to be lost," said Helen, hurrying to the door. "Will you let Jerry take me to the station?" she asked, formally.

"Oh, certainly," replied Marian, with equal state. A few minutes later Mrs. Butler came to Helen's room, her gentle eyes full of sympathetic trouble. "Marian is feeling terribly. *Must* you go, dear?"

"Why, yes, Mrs. Butler. Don't you see that I must?" returned Helen, without desisting from her packing, while Mrs. Butler sank upon a chair near the trunk.

"Yes, of course; Marian sees it, too; if you are fully resolved not—to give him any hope. But she thought—we all thought—that perhaps—Helen, dear, I don't wish to pry into your affairs; I have no right——"

"Oh, Mrs. Butler!" cried Helen, dropping an armful of clothes chaotically into her trunk, in order that she might give the tears, with which she was bedewing them, free course upon Mrs. Butler's neck, "you have all the right in the world. Say anything you please to me; ask anything! How should I take it wrong?"

"There's nothing I wish to ask, dear. If you're quite firm—if your mind is *entirely* made up—there's nothing to say. I wouldn't urge you to anything. But we all have such a regard for him that if you should —— It seemed such a fortunate way out of all your struggles and sorrows——"

"And Robert? Do *you* ask me to forget him, Mrs. Butler, so soon?"

"Oh, no, my dear! I should be the last to do that! But wives lose their husbands and husbands their wives, and marry again. They don't forget their dead; but in this world we can't live for the dead; we must live for the living. Don't look at it as if it were forgetting him or betraying him in any way. As long as you live, you *must* understand that—he can be nothing to you!"

"Oh, I *do* understand it," sobbed the girl. "My heart has ached it all out, long ago, and night and day I know it. And that's what makes me wish I were dead, too."

Mrs. Butler ignored this outburst. "And this young man is so good—and he is so true to you——"

"Oh, is that the reason I should be untrue to myself?"

"No, dear, it isn't any question of that. It's merely a question of examining yourself about it, of making sure of your own mind when you see him again. The children are all romantic about it because it's a title, and they like to think of a splendid marriage for you; but if it were only that, I should be very sorry. I've seen enough of splendid marriages, and I know what risks American girls take when they marry out of their own country and their own kind of thinking and living. But this isn't the same thing, Helen—indeed, it isn't. He likes you *because* you're American and *because* you're poor; and the last thing he thinks of is his title. No, dear. If he were some penniless young American, he couldn't be any better or simpler. Mr. Butler and I agreed about that."

"Captain Butler!" cried Helen, with the tragedy of *Et tu, Brute*, in her tones, and the effect of preparing to fall with dignity.

"Yes. He says he never saw any young man whom he liked better. They formed quite a friendship. He was very sweet and filial with Mr. Butler; and was always making him talk about you!"

A throe of some kind passed through Helen, and the arm round Mrs. Butler's neck tightened convulsively.

"I never approved," continued the elder lady, "of what people call marrying for a

home; but I thought — we all thought — that if, when you saw him again, you felt a little differently about everything, it would be such an easy way out of all your difficulties. We approve — all of us —of your spirit, Helen; we quite understand how you shouldn't wish to be dependent, and we admire your courage and self-respect, and all that; but we *don't* like to see you working so hard — wearing your pretty young life away, wasting your best days in toil and sorrow."

"Oh, Mrs. Butler! the sorrow was sent, I don't know why; but the work was sent to save me. If it were not for that, I should have gone mad long ago!"

"But couldn't anything else save you, Helen? That's what we want you to ask yourself. Can't you let the sunlight come back to you? ——"

"No, no!" cried Helen, with hysterical self-pity; "I must dwell in the valley of the shadow of death all my life. There is no escape for me. I'm one of those poor things that I used to wonder at — people always in black, always losing friends, always carrying gloom and discouragement to every one. You must let me go. Let me go back to my work and my poverty. I will never leave it again. Don't ask me. Indeed, indeed, it can't be; it mustn't be! For pity's sake, don't speak of it any more!"

Mrs. Butler rose and pressed the girl to her heart in a motherly embrace. "I wont, dear," she said, and went out of the room.

Helen heard her encounter some one who had just come up the stairs, at the head of which a briefly murmured colloquy took place, and she heard in Jessie Butler's penetrating whisper, "Will she stay? Will she accept him? Is she going to be Lady Rainford? Oh, I hope ——"

"Hush, Jessie!" came in Mrs. Butler's whisper; and then there was a scurry of feet along the matting and a confusion of suppressed gayety, as if the girls were running off to talk it over among themselves.

Helen would not make allowance for the innocent romance it was to them. She saw it only as a family conspiracy that the Butlers ought all to have been ashamed of, and she began again to pack her trunk, with a degree of hauteur which, perhaps, never before attended such a task. Her head was in a whirl, but she worked furiously for a half hour, when she found herself faint, and was forced to lie down. She would have liked to ring and ask for a biscuit and a glass of wine, but she would not; she could not consent to add the slightest thing to that burden of obligation toward the Butlers, which she now found so odious, and on which they had so obviously counted to control her action and force her will.

She lay on the bed, growing more and more bitter against them, and quite helpless to rise. She heard a carriage grate up to the door on the gravel outside, and she flung a shawl over her head to shut out the voices of Ray and Lord Rainford; she felt that if she heard them she must shriek; and she cried to herself that she was trapped, trapped, trapped!

Some one knocked lightly at her door, and Marian entered in answer to a reckless invitation from the pillow. It seemed an intolerable piece of effrontery, and Helen wondered that Marian was able to put on that air of cold indifference in proposing to ask her to come down and meet Lord Rainford before he had been in the house ten minutes.

"Helen," said Marian, in a stiff tone of offense, "Mrs. Wilson is here, and wants you to come over and take lunch with her. I couldn't do less than promise to give you her message. Shall I say that you're lying down with a headache?"

"Oh, not at all, Marian," said Helen; "there's nothing the matter with me. I'm perfectly well. Please tell Mrs. Wilson that I shall be very glad to come, and that I'll be down directly."

She was already twisting up her hair before the glass with a vigor of which she could not have believed herself capable. But the idea of flight, of escape, inspired her; in that moment she could have fought her way through overwhelming odds of Butlers; her lax nerves were turned to steel. "Marian," she said, "I will ask Mrs. Wilson to drive me to the station this afternoon, and I'll be very glad if you can send my trunk there."

"Oh, certainly," said Marian.

"I know I'm making it horrid for you," added Helen, beginning to relent a little, now that she felt herself safe, "but I can't help it. I must go, and I must go at once. But Mrs. Wilson is such a kind old thing, and she's asked me so often, and I can easily make her understand that I must come now or not at all, and if she knows that you're expecting other people your letting me go to her for lunch the last day wont seem strange."

"Oh, not at all," said Marian, with a slight laugh, whose hollowness was lost upon Helen.

Mrs. Butler said she was to come and visit them as soon as they got back to town; she kissed her as lovingly as ever, and the Captain was affectionately acquiescent; but the young girls were mystified, and Marian was cold. Helen tried to make it up to her by redoubled warmth in parting; but this was not to be done, and as soon as she was out of the

house she began to feel how ungracious she had been to Marian, who had certainly done everything she could, and had behaved very honorably and candidly. In the undercurrent of revery which ran along evenly with Mrs. Wilson's chat, she atoned to Marian with fond excuses and explanations, and presently she found herself looking at the affair from the Butlers' point of view. It did not then appear so monstrous; she even relented so far as to imagine herself, for their sake and for Lord Rainford's, consenting to what seemed so right and fit to them. She saw herself, in pensively luxurious fancy, the lady of all that splendid circumstance at which Marian had hinted, moving vaguely on through years of gentle beneficence and usefulness, chivalrously attended in her inalienable sadness by her husband's patient and forbearing devotion; giving him, as she could from a heart never his, and now broken, respect and honor that might warm before her early death to something like tenderness. It was a picture that had often been painted in romance, and it satisfied her present mood as well as if its false drawing and impossible color were true to any human life that had ever been or could be.

By the time she reached Mrs. Wilson's cottage Ray drove up to the Butlers', and met the surmise of his wife and sister-in-law with monosyllabic evasion till he could be alone with Marian. "I didn't bring him," he explained then, "because the more I thought of it, the less I liked our seeming to trap Helen into meeting him."

"Oh, indeed!" said Marian. "That was her own word!"

"Then you told her? I might have expected that. Well, it was quite right. What did she say?"

"Everything unpleasant that she very well could. You would have thought that really we had taken the most unfair advantage of her, and had placed her where she couldn't say no, if she wished."

"I could see how it might look that way to her," said Ray, "and that's what I was afraid of. It was extremely awkward every way. We couldn't very well tell him not to come, and we couldn't very well tell her to go: the only thing I was clear of was, that we must tell her that he was coming, and let her decide upon her own course."

"That's what I did, and she decided very quickly — she's gone."

Ray looked worried: "It's tantamount to turning her out-of-doors, I suppose; and yet I don't know what else we could have done. Well! I might as well have brought him straight here, and saved myself all the diplomacy of getting old Wilson to take him home for the night."

Marian did not for the present ask what was the diplomacy which Ray had used. "Mr. Wilson!" she shrieked. "You got *Mr. Wilson* to take him home for the night?"

"Yes," returned her husband, quietly. "What is so very remarkable about my getting *Wilson* to do it?"

She did not answer, but burst from her door with a cry for Mrs. Butler that brought all her sisters also. "Mother, Lord Rainford has gone home with Mr. Wilson!"

Mrs. Butler was dumb with sensation that silenced all her daughters but Jessie. This young lady, not hitherto noted in the family for her piety, recognized a divine intention in the accident: "*I* call it a special Providence!" she exclaimed, ecstatically.

"What is it all about?" inquired Ray.

"Oh, nothing," replied his wife. "Nothing at all! Merely that Helen was in such haste to get away that she accepted an invitation to lunch with Mrs. Wilson, and has just driven over there with her. I suppose she'll accuse us of having plotted with the Wilsons to 'trap' her, as she calls it."

"Marian!" said Mrs. Butler, with grave reproach.

"I don't care, mother!" retorted Marian, with tears of vexation in her eyes. "Can't you see that she'll accept him over there, and that I shall be cheated out of having brought them together, when I had set my heart on it so much? I didn't suppose Helen Harkness *could* be such a goose, after all she's been through!"

"My dear," said her mother, "I don't wish you to speak so of Helen; and as for her accepting him — Children," she broke off to the younger girls, "run away!" and they obeyed as if they had really been children. "Edward," she resumed, "how in the world *did* you contrive with Lord Rainford?"

"Well, Mrs. Butler," said Ray, "with men, there was only one way. He had told me so much, you know, that I could take certain things for granted, and I made a clean breast of it at last, on the way home. I told him she was here, and that I thought it wasn't quite fair bringing him into the house without giving her some chance to protest — or escape."

"It was terrible," said Mrs. Butler, "but I see that you had to do it. Go on."

"And he quite agreed with me that it wouldn't be fair to either of them. I don't know that I should have spoken if I had not seen old Wilson in the car. I asked him if he wouldn't give Rainford a bed for the night; and he was only too glad. That's all. I told

him he could walk over here this evening, and meet her on equal terms."

"That wont be necessary now," said Marian, bitterly. "I congratulate you on the success of your diplomacy, Ned!"

"Perhaps it *is* providential, as Jessie says," murmured Mrs. Butler.

"Oh, *very* providential!" cried Marian. "It's as if it had all been arranged by the providence of the theater. I *hate* it! Instead of taking place romantically and prettily, among her old friends, she's obliged it to take place farcically, by a vulgar accident, where there can be nothing pleasant about it."

"Why, Marian," said her mother. "Do you think she will accept him?"

"Accept him? Of *course*, she will! She is dying to do it,—I could see that all the time, and I could hardly have patience with her for not seeing it herself. She's old enough."

"Well, never mind about that," said Ray, authoritatively. "We have done what we all saw to be right, and we must let the consequences take care of themselves."

"Oh, it's very easy to say that," cried Marian. "But for my part, I'm sorry I did right."

"Well, your doing wrong in this case wouldn't have helped. My doing right alone was enough to put everything at sixes and sevens."

XIX.

A SERIES of trivial chances brought Helen and Lord Rainford together alone, before she could get away from the Wilsons' after lunch. The first train for town did not start till three, and it was impossible that she should shut herself up in her room and avoid him until that time. In fact, she found that there was nothing in his mere presence that forced her to any such defensive measure, while there was much in the fatal character of the situation, as there is in every inevitable contingency, to calm if not to console her; and the sense of security that came from meeting him by accident, where she was perfectly free to say no, and could not seem by the remotest possible implication to have invited an advance from him, disposed her in his favor. They met certainly with open surprise, but their surprise was not apparently greater than that of the Wilsons' in bringing their guests together; and when Mr. Wilson explained that he owed the pleasure of Lord Rainford's company for the night to a domestic exigency at the Butlers', Helen divined that Ray's thoughtfulness had given her this chance of escape, and wondered if Lord Rainford was privy to it. But he was listening with his head down to Mrs. Wilson's explanation of the chance that had given them the pleasure of Miss Harkness's company; she wondered if he were wondering whether she knew that he was coming and had fled on that account; but it was impossible to guess from anything he said or looked, and she began to believe that Ray had not told him she was with them. With impartial curiosity she took note of the fact that his full-grown beard had unquestionably improved his chin; it appeared almost as if something had been done for his shoulders; certainly his neck was not so long; or else she had become used to these traits, and they did not affect her so much as formerly. More than once during the lunch she thought him handsome; it was when his face lighted up in saying something pleasant about seeing America again. He pretended that even twenty-four hours of American air had made another man of him. Mr. Wilson said that he did not know that there had been any American air for a week, and Lord Rainford said that he did not mind the heat; he believed he rather liked it.

"But you certainly haven't got it to complain of here," he added.

"Oh, no, it's always cool on the North Shore," Mrs. Wilson explained. "We shall not let you go home this afternoon, Miss Harkness," she turned to say to Helen; "you would certainly perish in Cambridge."

"Port," added Helen, with inflexible conscience; she never permitted herself or any one else the flattering pretense that she lived in Old Cambridge. "You must," she continued, quietly. "I've made all my preparations." This fact was final with a woman, and Mrs. Wilson could only make a murmur of distress, and beg her at least to go by a later train; but Helen was firm also about the train; she said her trunk would be at the station, and she must go then. If she had her formless intention that this should be discouraging to Lord Rainford, she could see no such effect in him; he remained unmoved, and she began to question whether, at sight of her, he might not have lost whatever illusion he had cherished concerning her. She said to herself that she knew she had changed, that she had grown older and thinner, and plainer every way. If this were so, it was best; she hoped — with a pang — that it was so. She ought to have thought of it before; it might have saved her from giving Marian pain. Of course. he had entirely ceased to care for her.

After lunch, Mr. Wilson betrayed signs of heaviness, which obliged his wife to the confession that nothing could keep Mr. Wilson awake after lunch. She sent him away for

his nap, and she was going to lead her guests down over the lawn for a look at the sea from the rocks by the shore, when a servant came with some inexorable demand upon her.

"You know the way, Miss Harkness," she said. "Take Lord Rainford down there, and I will be with you in a moment."

She hurried away with the maid, and Helen descended the piazza steps and sauntered past the beds of foliage-plants across the grass with her charge. He did not leave her in a moment's doubt of his mind or purpose after they were beyond hearing.

"Do you know why I have come back?" he asked, abruptly, and striving to catch the eyes she averted.

"How should I?—" she began, but he spared her the sin of even an insinuated ignorance.

"I came back for you," he said, with a straightforward sincerity that shamed her out of all evasion.

"Then I am sorry for that," she replied, frankly, "for you had better have forgotten me."

"That wasn't possible. I couldn't have forgotten you when I knew you were not free; how could I forget you now? For the last year my life has been a count of days, hours, minutes. If I have come too soon, tell me, and I will go away till you let me come again. I can wait!"

He spoke with the strength but not the vehemence of his passion, and she stayed her fluttered nerves against his quiet. If it were to be reasonably talked over, and dismissed like any other impossibility, it would be very simple; she liked him for making it so easy; she felt humbly grateful to him; she imagined that she could reconcile him to his fate.

"You must forgive me," he added; "if what I say is painful, I will spend my life in atoning for it."

"There is nothing to forgive on *my* part. If you can have patience with me."

"Patience?"

"Oh, I don't mean what you think!"

"I hope I haven't seemed impatient. I couldn't excuse myself if I had. No one could have respected, revered your bereavement more than I; and if I thought that I had sinned against it in coming now ——"

"No—no—"

"It seemed to me that I had a kind of warrant—permission—in something you said—something, nothing—that took away all hope and then became my hope ——"

"Oh," she trembled, "what *did* I say?"

"Nothing," he said, "if you remember nothing. I abide by what you say now."

She was thrilled with an æsthetic delight in his forbearance and with a generous longing to recognize it. "I know what you mean, and I blame myself more than any words can say for letting you suppose— It was my culpable weakness— I only meant to save you —to spare you all I could!" A dismay came into his face that she could not endure to see. "Oh, *don't* look so! Did you—did you really come back on account of that?"

"I misunderstood you—I see. Not perhaps at first; but afterward. I came back because I thought you told me that, if you had been free, you might have answered me differently then."

"Yes, that's what the words *said;* but not what they *meant!*" She silently grieved for him, walking a little apart, and not daring to lift her eyes to his face. He would not speak, and she had perforce to go on. "*Why* did you ever care for me?" she implored at last, rushing desperately at the question, as if there might be escape on that side.

"Why?" he echoed.

"Surely the first time we met—what was there to make you even endure me?"

"Endure?" He seemed to reflect. "I don't think you were to blame. But it never was a question of that. You—you were my fancy. I can't tell you better than that. And you have always been so. It isn't for what you did; it isn't for what you said."

It seemed hopeless. They walked on, and they only ceased from walking because they had reached the brink of the rocks beyond which lay the sea. She stood there looking on its glassy levels, which shivered against the rocks at her feet in impulses that were like her own feeble and broken purposes. In a certain way life was past with her; there could be no more of what had been, no longer the romantic tenderness, the heroic vision of love; but there could be honor, faith, affection. The sense of this passed vaguely through her heart, and exhaled at her lips in a long, hopeless sigh.

At the light sound, he spoke again. "But I didn't come back to make good any claim upon you. I came to see you again because I must, and because it seemed as if I had the privilege of speaking once more to you. But perhaps I haven't."

"Oh, certainly, you have that!" she weakly assented.

"I don't urge you to anything. I only tell you again that I love you, and that I believe I always shall. But I don't ask your answer now or at any given time. I can wait your will, and I can abide by it then, whatever your answer is."

A heavy weight was on her tongue, which hindered her from making her answer "No."

A ship lagging by in the offing as if it panted with full sails for every breath of the light breeze, the whole spectacle of the sea, intimated a reproach, poignant as fleeting and intangible. She felt herself drifting beyond her own control, and any keeping would be better than none; she longed for rest, for shelter; she no longer cared for escape. There was no reason why she should refuse the love offered her. She could not doubt its truth; its constancy even charmed her a little; she was a little in love—pensively, reluctantly—with a love for herself so steadfast, so patient, so magnanimous. The sense of her own insufficiency to herself, the conviction that, after all and at the very most, she was a half success, only even in the sordid and humiliating endeavor which was the alternative, unnerved her.

"Oh, what shall I say?" she asked herself; and then looked up in terror lest she had uttered the words. But she had not. He met her inquiring glance only with a look of sympathy, in which perhaps the hope suggested by her hesitation was beginning to dawn. She appealed to him against himself.

"I wish you had not come back. You have made a great mistake."

His countenance fell again.

"A mistake?"

"Yes, you are mistaken in me. I'm not at all what you think me. If I were that, I shouldn't be here, now, begging you for mercy. If I were not so foolish, so fickle-minded, that no words can describe me, *he* would never have left me; he would have been alive and with me. Oh!" she cried, "I can't let any one else trust me or believe in me for an instant. It isn't as if I were bereft in any common way; it's as if I had killed him!"

Lord Rainford remained so little moved by this assumption of guilt that she added, "Ah, I see you wont believe me!"

"No," he said. "I understood something of that from Ray; and if I hoped only to be your friend—if I knew I was never to see you again—I should still say that you were wrong in blaming yourself now; that you were right then in wishing to make sure of yourself before you married him. It would have been unjust to him to have done less."

"Oh, does it seem so to you?" she implored. "That was the way it seemed to me then."

"And it ought always to seem so. If you've made it my privilege to speak to you of this matter—"

"Oh, yes, yes!"

"Then I say that I think what you did in that matter ought to be your greatest consolation now. It may be one of those eccentricities which people have found in my way of thinking, but I can't feel less reverently toward marriage than that."

He had never seemed so noble, so lovable even, as at that moment. Her heart turned toward him in a fervent acceptance of the comfort, the support he offered her; it thanked him and rejoiced in him; but it was heavy again with her former dismay when he said, "I don't urge you to any decision. Remember I am always yours, whether you refuse me or not."

She perceived then that it was not really a question of her and Robert, but of her and Lord Rainford, and that the decision to which he did not urge her must rest finally with her. If she could have been taken from herself without her own consent, passively, negatively, it would have been another affair.

She gathered herself together as best she could. "I am acting very weakly, very wrongly. I've no excuse but that this is all a surprise to me. I didn't know you were in this country. I didn't dream of ever meeting you again, till three hours ago, when Mrs. Ray told me you were coming. Then I ran away from her to avoid meeting you. Yes, I had better be frank! It seemed horrible to me that I should meet you in her house; you could never have believed that I hadn't wished to meet you."

"That's what I should be glad to believe, if I could. But I saw—I agreed with Ray—that it might not be leaving you quite free in every way; and so I was glad to accept his suggestion that I should come here first till something could be arranged—till you could be told."

"That was like Mr. Ray," interrupted Helen. "I see how it has all happened; and oh, I'm so sorry it's happened."

The young man turned pale. But he answered courageously, "I'm not. I must know whether there is any hope for me; I must know it from you."

"Yes," she assented, moved by his courage.

"And I should not have gone away without at least making sure that there is none, and that is all I ask you now."

"But if I can't tell you? I must wait—I must think. You must give me time."

"Did I seem to be impatient?" he asked, with exquisite deference and protest.

"No. It must have been my own impatience—I don't know what; and you mustn't try to see me again—unless—" A deep blush dyed her face. She had put some paces between them, with a sort of nervous dread that he might offer his hand in parting. She now said, abruptly, "Good-bye," and turned

and ran up toward the house, leaving him on the rocks by the sea.

Mrs. Wilson met her half-way across the lawn. "I was coming to join you," she began.

"Lord Rainford is there," said Helen.

"Mrs Wilson, I find that I must see Mrs. Ray again before I go to town. Could you let them drive me across, and then to the station?"

"Why, certainly," said Mrs. Wilson in the national terms of acquiescence.

(To be continued.)

A MUSK-OX HUNT.

For about twelve months during 1879 and '80, I was traveling by sledge in the arctic regions with a party of twenty persons. During that time we depended for our food, as well as for that of our forty-two dogs, upon the game of the country, twice traversed by us, stretching from the waters of North Hudson's Bay to the Arctic Ocean. The design of subsisting for so long a time upon the game of those bleak, dreary regions entailed a great variety of hunting adventures. And to describe one of the incidents of a hunt after musk-oxen, or musk-sheep as they are sometimes called, is the object of this article.

Our route led us from the northernmost point of Hudson's Bay directly to the nearest available point on Back's Great Fish River, which empties into the Arctic Ocean just south of the large island known as King William's Land, on which island and adjacent mainland Sir John Franklin's party of over a hundred British seamen perished in 1848–49, and whose sad fate it was the object of this expedition, as far as possible, to determine. This route lay directly across country. The bulk of authorities on Arctic sledging, both white and native, bore against long overland sledge journeys, an opinion to which they often gave practical illustration by unnecessary detours to follow salt-water ice or sinuous water-courses. Our course, therefore, had never been traveled by either white men or natives, and the latter, who formed an important element of the expedition, advised against it. The Indians of the north, as I found them, are loath to enter a totally unknown country. They knew almost nothing of the game of the region, so they said, but believed that musk-oxen would be found, and if they proved to be plentiful they were willing to undertake the journey. Accordingly, a preliminary reconnaissance as far as Wager River was made by me in January, 1879, and although no musk-oxen were actually seen, we found abundant traces of them. These facts overcame the objections of the natives, who now readily consented to accompany us. Our party was well armed with the finest breech-loaders and magazine guns, and carried an ample supply of fixed ammunition. The hunting force of the party consisted of four full-grown Eskimo men, and three Eskimo boys, ranging from twelve to eighteen, and the four white men.

We left North Hudson's Bay on the first day of April, 1879, and by the 8th of the month were, according to our natives, in what they termed the musk-ox country, the locality in which they had been accustomed to hunt these huge monsters during winter trips from the sea-coast, where the natives live the greater part of the year. But the musk-cattle of the Arctic are so sparsely distributed that they form only a small part of the game necessary to furnish these northern nomads with their yearly supplies, and they place very little reliance upon them. The annual musk-ox hunt, however, is looked forward to with much interest, and is long in advance the burden of their conversation, while housed in their little snow huts. It is in the sport and excitement of the chase that they find the greatest reward, and not in the meat secured nor in the half-worthless robes that are thus obtained. These robes are almost of no value to them unless they be near some trading station or whale-ships wintering in the ice. To us, however, their huge carcasses were, as food for our three teams of dogs, of great importance compared with that of the reindeer or any other game that we would be likely to fall in with.

On April 9th, we came upon a large trail of musk-cattle. The sign was tolerably old, some six or seven days at least; but one of the peculiarities of the animals is that they will travel very slowly when undisturbed and in a good grazing country, and this same herd, so the Eskimos believed, was not far off; they tried to persuade me with all the vehemence of savage logic to remain a day or two in the vicinity and hunt them, but the larder was still too full to warrant any such delay, and we pushed on.

Again, on the 13th, we came upon the fresh trail of a large herd of these cattle, and I had the hardest work imaginable, persuading these natives to pass on without following it up. The Eskimos have far more excitability in the presence of game or its sign than any other race of people I have encountered, not even excepting the various Indian tribes of our great Western plains.

Before we had fairly gone into camp on the 22d,—and by going into camp on an arctic sledge journey is meant the building of peculiarly constructed domes of snow, or snow-houses, the unharnessing of the dogs, et cetera, —a most furious gale of wind arose, which raged so terribly for five days that even the natives found it prudent not to stay out of the snow-huts for any considerable time; and this enforced idleness reduced our commissary to an alarming minimum. We managed, however, to get away by the 28th, the storm even then only slightly abating, and after traveling nineteen miles in a north-north-west direction we went into camp, the weather somewhat better, but the larder in a reduced condition. Shortly after camping, Ik-queé-sik, my Netschilluk Eskimo guide, who had absented himself while the *igloos*, or snow-houses, were being built, came running excitedly into the village from a distant high hill, the perspiration in huge drops streaming down his brown and dirty face, and with my army signal telescope, full drawn, under one arm. While gasping for breath, he reported that he had seen a herd of eight or ten musk-oxen about four or five miles to the northward, slowly grazing along to the west, and evidently unaware of danger. Everything was put aside, and every Eskimo, man, woman, and child, was soon at the top of a high hill near by, and a dozen dirty and eager natives were clamoring to look through the telescope. We were not long in coming to the decision that the next day should be devoted to securing as many as possible of the long-haired monsters, Ik-queé-sik's discovery having been made too late to risk an attack so near nightfall.

Our dogs, that had been loosened from their harnesses, were now secured to the overturned sledges and to other heavy materials, to prevent their scampering after the game should they scent them in the night, as their ravenous appetites would undoubtedly prompt them to do; while around each animal's nose was closely wound a muzzle of seal or walrus-line thongs, to prevent the usual concert of prolonged howls.

The following morning a heavy drifting fog threatened to spoil our sport and lose us our coveted meat, but we managed to get away soon after eight o'clock, having a party of eleven rifles, with two Eskimo women, two light sledges, and all the dogs. At that hour the great thick clouds seemed to be lifting, but shortly after starting the fog settled down upon us again. After some two or three hours of wandering around in the drifting mist, guiding our movements as much as possible by the direction of the wind, which we had previously determined, we came plump upon the trail, apparently not over ten minutes old, of some six or seven of the animals. Great fears were entertained by the experienced hunters that the musk-oxen had heard our approach, and were now probably "doing their level best" to escape. The sledges were immediately stopped and the dogs rapidly unhitched from them, from one to three or four being given to each of the eleven men and boys, white or native, that were present, who, taking their harnesses in their left hands or tying them in slip-nooses around their waists, started without delay upon the trail, leaving the two sledges and a few of the poorer dogs in charge of the Innuit women, who had come along for that purpose, and who would follow on the trail with the empty sledges as soon as firing was heard. The dogs, many of them old musk-ox hunters, and with appetites doubly sharpened by hard work and a constantly diminishing ration, tugged like mad at their seal-skin harness lines, as they half buried their eager noses in the tumbled snow of the trail, and hurried their human companions along at a flying rate that threatened a broken limb or neck at each of the rough gorges and jutting precipices of the broken, stony hill-land, where the exciting chase was going on. The rapidity with which an agile native hunter can run when thus attached to two or three excited dogs is astonishing. Whenever a steep valley was encountered the Eskimos would slide down on their feet, in a sitting posture, throwing the loose snow to their sides like escaping steam from a hissing locomotive, until the bottom was reached; then, quick as thought, they would throw themselves at full length upon the snow, and the wild, excited brutes would drag them up the other side, where, regaining their feet, they would run on at a constantly accelerating gait, their guns in the meantime being held in the right hand or tightly lashed upon the back.

We had hardly gone a mile in this harum-scarum chase before it became evident that the musk-oxen were but a short distance ahead on the keen run, and the foremost hunters began loosening their dogs to bring the oxen to bay as soon as possible; and then, for the first time, these intelligent creatures gave tongue

ON THE TRAIL.

in deep, long baying, as they shot forward like arrows, and disappeared over the crests of the hills amidst a perfect bewilderment of flying snow and fluttering harness traces. The discord of shouts and howlings told us plainly that some of the animals had been brought to bay not far distant, and we soon heard a rapid series of sharp reports from the breech-loaders and magazine guns of the advanced hunters. We white men arrived just in time to see the final struggle. The oxen presented a most formidable-looking appearance, with their rumps firmly wedged together, a complete circle of swaying horns presented to the front, with great blood-shot eyeballs glaring like red-hot shot amidst the escaping steam from their panting nostrils, and pawing and plunging at the circle of furious dogs that encompassed them. The rapid blazing of magazine guns right in their faces—so close, often, as to burn their long, shaggy hair—added to the striking scene. Woe to the over-zealous dog that was unlucky enough to get his harness line under the hoofs of a charging and infuriated musk-ox; for they will follow up a leash along the ground with a rapidity and certainty that would do credit to a tight-rope performer, and either paw the poor creature to death or fling him high in the air with their horns.

Although we tired and panting white men rested where the first victims fell, Too-loó-ah, my best hunter,—an agile, wiry young Iwillik Eskimo of about twenty-six, with the pluck and endurance of a blooded horse,—and half the dogs pressed onward after the scattered remnants of the herd, and succeeded in killing two more after a hard run for three miles. The last one he would probably not have overtaken if the swiftest dog,

Parseneuk, had not chased him to the edge of a steep precipice. Here a second's hesitation gave the dog a chance to fasten on the ox's heels, and the next second Parseneuk was making an involuntary aërial ascent, which scenes) showed plainly the fights and quarrels in which they had figured. Parseneuk, as a favorite, had been raised and fed in the *igloo*, under the fostering protection of the old squaw, and, being saved the necessity of

AT BAY.

was hardly finished before Too-loó-ah had put three shots from his Winchester carbine into the brute's neck and head, whereupon the two animals came to earth together,—Parseneuk on the soft snow at the bottom of the twenty-foot precipice, fortunately unhurt. Parseneuk was a trim-built animal that I had secured from the Kinnepetoo Eskimos who inhabit the shores of Chesterfield Inlet, being one of the very few tribes of the great Eskimo family, from the Straits of Belle Isle to those of Behring Sea, who live away from the sea-coasts. They subsist principally upon the flesh of the reindeer, and their dogs are adepts in hunting these fleet animals, Parseneuk being particularly swift and intelligent as a hunter. He had been the favorite in the Kinnepetoo family from whom he was purchased, and I had to appease several of them with presents, as indirect damages to their affections. He had a beautiful head, with sleek muzzle and fox-like nose, while his pointed ears peered cunningly forth in strange contrast with the many other dogs that I have met, whose broken and mutilated ears (usually restored in illustrations of Arctic combating for his daily bread, thus preserved his ears.

The chase finished, the half-famished dogs received all they could eat,—their first full feast in over three weeks,—and after loading the two sledges with the remaining meat and a few of the finer robes as mementos and trophies, we returned to our morning's camp, a distance of five or six miles, which we traveled slowly enough, our over-fed dogs hardly noticing the most vigorous applications of the well-applied whip.

The Eskimos with whom I was brought in contact never hunt the musk-oxen without a plentiful supply of well-trained dogs; for, with their help, the hunters are almost certain of securing the whole herd, unless the animals are apprised of the approach, as they were in our encounter with them. When the flying herd has been brought to bay in their circle of defense by the dogs, the Eskimo hunters approach within five or six feet and make sure of every shot that is fired, as a wounded animal is somewhat dangerous, and extremely liable to stampede the herd. A band of these brutes when once stampeded

are much harder to bring to bay the second time; but it may be well to mention that if the hunt is properly managed, such stampedes are extremely rare. When the circle of cattle is first approached, the hunters take care to dispatch first the active and aggressive bulls, conformably to a general hunting maxim followed in all parts of the world. As their members fall, one at a time, the musk-oxen persist in their singular mode of defense, presenting their ugly-looking horns toward as many points of the compass as their remaining numbers will allow. When but two are left, these, with rumps together, will continue the unequal battle; and even the last "forlorn hope" will back up against the largest pile of his dead comrades, or against a large rock or snow-bank, and defy his pursuers, dogs and hunters, until his death. While the calves are too young and feeble to take their places in ranks, which, in general, is about the first eight or nine months of their existence, they occupy the interior space formed by the defensive circle; but when their elders have perished in their defense, with an instinct born of the species, they will form in the same order and show fight.

The calves are born about the month of May in this portion of the country, and have the same dirty-brown, awkward, ugly-looking appearance as the buffalo calves of the Plains. They can be readily captured alive by the Eskimo dogs, if the hunters be near to prevent their being immediately killed by these ravenous animals; but, in these inhospitable regions, it is impossible to furnish them with proper nourishment to sustain life until they can be transferred to a vessel, which, moreover, can only escape from here during the autumn months; consequently, there are no cases on record, I believe, where these most curious animals have been exhibited in the temperate zones. The natives told me they had kept calves alive for a few days, but they sank so rapidly they killed them for food.

Before the Eskimo hunters were provided with the fire-arms of civilization, procured in trade with the Hudson's Bay Company or American whale ships, they used the bow and arrow, or the lance, dashing fearlessly past the brutes as they buried the sharpened bone lance-head deep in some vital part. In the olden times, one of their tests of manly courage was for the hunter to pass within the circle of animals and return, backward and forward, killing one of the oxen at each passage. Of such feats, the old gray-haired men of the tribes still boast.

One old Iwillik Innuit,—so I was told by his tribe, and they are not given to vain boasting,—while traveling with dogs and sledge from one village to another, during his younger days, came suddenly and unexpectedly upon a couple of musk-oxen that had strayed far from their usual haunts. Unhitching his dogs from the sledge, he soon brought the oxen to bay. His only weapon was a "snow-knife," a kind of long-bladed butcher knife which they use to cut the blocks of snow in constructing their houses. Nothing daunted, however, he courageously attacked them, and in a few minutes had secured both.

The danger from these formidable and ferocious-looking brutes is undoubtedly more apparent than real, judging from the few accidents that occur. The dogs are frequently killed by being tossed in the air or pawed to death as already described. The musk-bulls are prevented from following up a dog's trailing harness line by attaching a toggle noose where the trace joins the harness at the root of the dog's tail when the traces are separated from the dogs before they are slipped for the chase; also a sure way is to fold the trace into a "bundle noose" until it rests on the dog's back. The trained Eskimo dog never barks in the presence of game until liberated from his master's hands.

The musk-ox of the Arctic is only about two-thirds the size of the bison or American buffalo, but in appearance he is nearly as large, owing to the immense heavy coat of long hair that covers him down below the knees, as if he were carrying a load of black brush. As his generic name *(Ovibos moschatus)* imports, he seems to form a connection between the ox and the sheep. His peculiar covering makes him look like a huge ram, to which his horns add much of similarity. In fact, this covering partakes of the character of both wool and hair. First, there is a dense coat of blackish-brown hair like that on the hump, shoulders, and fore-legs of the buffalo, which extends over the whole body, and is, I believe, never shed. Below this, there is an under-coating of soft, light brown wool, which is invisible through the first, unless parted by the hands, and which is shed annually. This seems to be a true wool and of the finest texture. A Mr. Pennant, an English gentleman, gives an instance of a man of his, of the name of Jeremy, having woven from this inner fleece of the musk-ox a pair of stockings which were as fine as any of the best silk stockings.

During the summer months, just after this fleece is shed, it is still found matted into the long black hair, and is only prevented from falling to the ground by this interweaving process. The short hair on their foreheads is very often found matted into little balls or

small lumps with ordinary dirt, showing unmistakably that they use their head and horns in tearing up the earth. This they have been seen to do when closely pressed and brought to bay; but they are so seldom hunted that

The native bow is usually made of two or three sections of musk-ox horn, tipped with the shorter horn of the reindeer, the whole being firmly lashed with braid made from the sinews on the superficial dorsal muscles

THE ATTACK.

we may suppose their head and horns are used in removing the snow from the mossy patches where they graze in the winter time. Their horns, from their peculiar shape, would certainly make excellent snow-shovels.

The shape of these weapons of defense is certainly most peculiar. Starting from the median line of the forehead, at which point the horns are joined base to base, they present a thick flat plate, or shield, of corrugated horn almost a foot in width. As these flat shields circle around the eyes about four inches from them, the outer edges are gradually incurvated until about half way between the eyes and nostrils a perfect horn is formed. From here it tapers, curling upward near its extremity with a jauntiness worthy of a Limerick hook. To the natives of the north, these horns afford many implements of the chase and household utensils. They thoroughly understand the well-known principle of steaming the horn in order to render it soft while it is being worked.

of the reindeer, a cluster of these braids about as thick as a man's middle finger running the length of the back of the bow to give it strength and elasticity. I found the Eskimo of King William's Land and vicinity using copper stripped from Sir John Franklin's ships to rivet their bows together. The Eskimo bow is not in any way equal to the Indian bow, seldom being effective at over forty or fifty yards with such game as the reindeer. Except as children's playthings, bows have entirely disappeared, wherever intercourse with the Hudson's Bay Company or American whalers has placed fire-arms in the hands of the natives; and this includes the whole of the great Eskimo family (or Innuits, as they should be properly called), except those stretched along the shores of the Arctic Ocean from about King William's Land on the east to the farthest point reached by American whalers from the Pacific on the west.

A camp is always picked near a lake which the Eskimos know, by certain signs,

MUSK-OX.

has not yet frozen to the bottom. This fact is ascertained by placing their pug noses in close proximity to the upper surface, when the peculiar hues indicate the presence or absence of water. While the most of the party are building their little huts of snow for the night's encampment, some one takes the ice-scoop and chisel, fares out on the lake, and selects a place for his operations. He then digs a hole with the chisel about a foot in diameter, and nearly the same depth, by repeated vertical strokes, and when the chopped ice or débris thus formed commences choking this instrument, it is removed with the ice-scoop; and this alternation of cutting and removal is kept up until the water is reached, at from four to eight or ten feet below. This digging requires far more dexterity than one would at first glance suppose. The amateur finds it impossible to keep it from rapidly narrowing to a point long before the water is reached. Moreover, if the débris be too freely chopped, it becomes reduced to a sort of ice-dust, which will pack in so firmly toward the finishing of the water-hole that the edge of the scoop cannot be wedged under it with its limited play of action. The children and old women of the village may draw many a meal of goodly sized salmon through this avenue, and this necessitates that the hole should be of fair size throughout. One of the most annoying events of my sledge journey was, after a long and unsuccessful attempt to catch something at one of these water-holes, to find myself suddenly at one end and a big salmon at the other of a strong fish-line, separated by an ice-hole through which neither of us could pass.

The range of musk-cattle is quite extensive. They occupy the extreme northern shores of Greenland on both the east and the west

MUSK-COW.

coasts as far as they have been explored; and these two ranges are probably connected around the northernmost point of this great polar continent. They occur on both sides of Smith Sound, and in general frequent arctic America from latitude 60° to 79° north, and from longitude 67° 30′ west almost to the Pacific coast. It is, however, in the great stretch of hilly country lying between North Hudson's Bay and its estuaries on the south and east, and the Arctic Ocean with its intricate channels on the north and west, that these animals are found in the largest herds and greatest numbers. Captain Hall, in his sledge journey from Repulse Bay to King William's Land, in 1869, killed 79 musk-oxen, whose hides alone weighed 873 pounds. Dr. Rae, the celebrated Scotch explorer of this region of the Arctic, also secured large numbers of them. The musk-ox occurs fossilized at Eschscholtz Bay on the north-west coast; and fossil oxen found in different sections of the United States, and which closely resemble the musk-ox, have been described by Dr. Leidy in the Smithsonian Institution's reports. These were clothed in a long fleece, and roamed through the Mississippi Valley just before the great drift period. Fossil musk-oxen exist in Siberia and northern Europe; but their living descendants, of which one species is known, are now strictly confined to the arctic region of the Western continent.

The musk-ox derives its name from the peculiar odor which it emits, and which to a greater or less extent also pervades the meat of the animal. In the younger animals, however, it is much milder, and with the calves I have never been able to discern it at all. Much of this odor can be obviated by dressing the animal as soon as killed, especially

if it is cold weather; and this rule may be said to be more or less general with all animals and birds having disagreeable odors peculiar to their kind.

I have said the robes are almost worthless to the natives except for purposes of traffic. They are sometimes used to spread on the snow-bed, as the first layer of skins, in order to protect the snow from the heat of the body; but even here they are not nearly so serviceable as the robe of the reindeer, owing to the facility with which the snow can be removed from the latter by a few strokes of a stick. The Ookjoolik or Ooqueesik-Salik Eskimos, of Hayes River, who are not armed, and consequently can procure but few reindeer (whose hide is the universal arctic clothing), often make long boot-leggings and gloves of musk-ox fur; and this gives them a peculiarly wild and savage appearance that contrasts strangely with other natives. The almost total absence of wood in their country — the little they get being obtained by barter with distant and more fortunate tribes — forces them to use the skin of the musk-ox for sledging. The ears and fore-legs of the skin being lashed almost together, a sledge-like front is obtained, and the articles to be transported are loaded on the trailing body behind. Over lakes, rivers, and flat plains it is equal to wood, but in very uneven ground its pliability is dangerous to fragile loads.

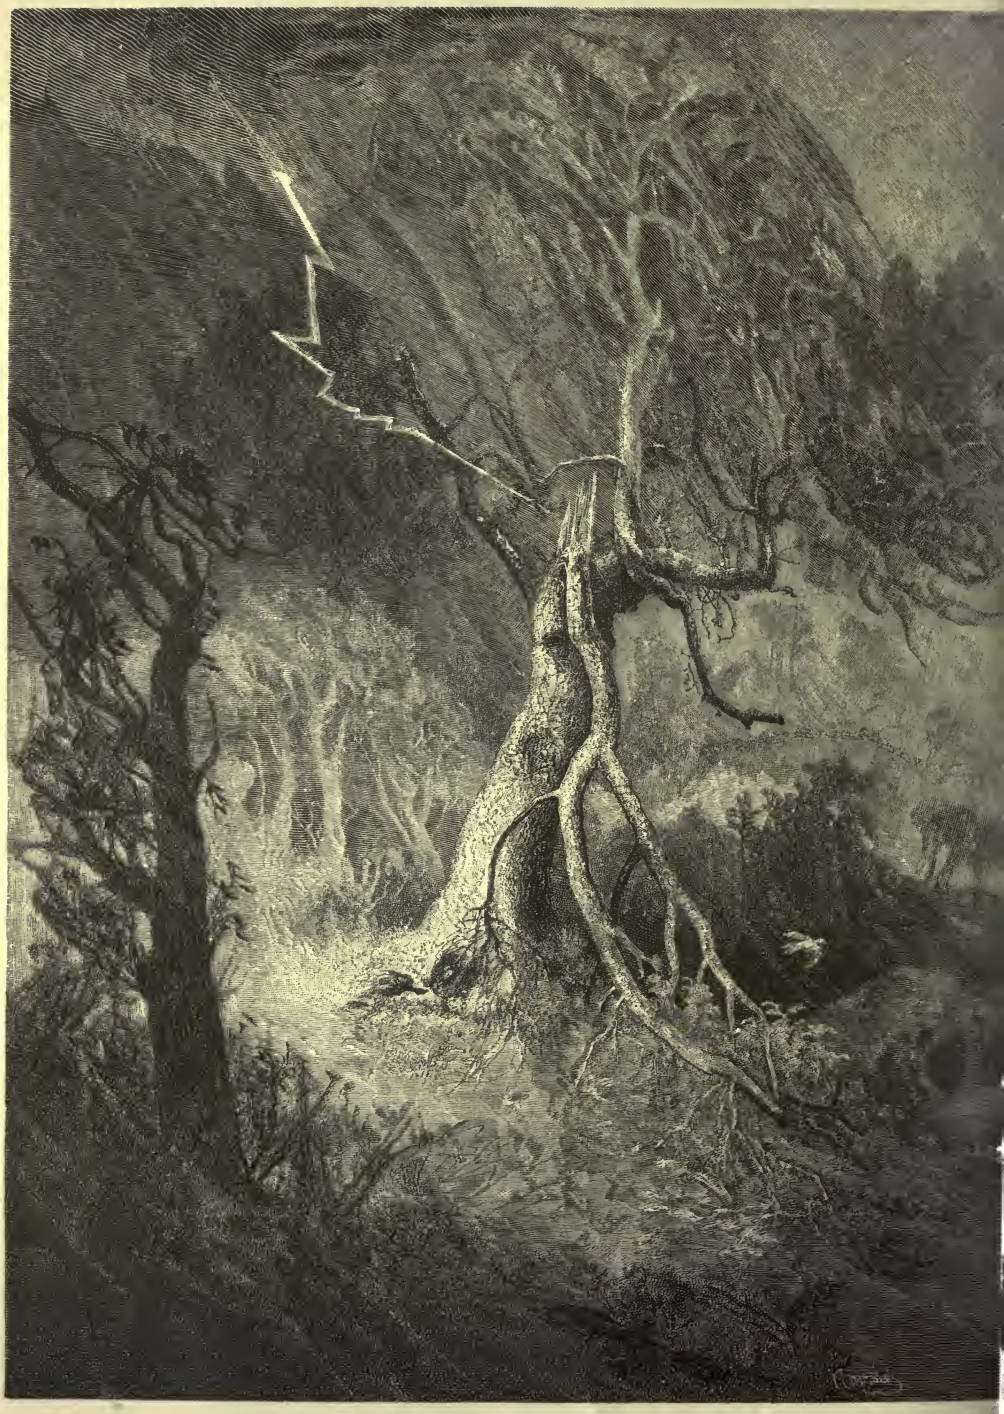
When closely pressed, the musk-oxen do not hesitate to throw themselves from the steepest and deepest precipices; and the natives speak of occasions where they have secured them in this manner without wasting powder or lead, finding them dead at the foot of the descent. Sir James Clarke Ross had a personal observation of this kind in one of his arctic expeditions.

McClintock once saw a cow on Melville Island, in the Parry archipelago, which was of a pure white color, an albino sort of deviation that is known to occur among the buffalo of the plains at rare intervals. She was, however, accompanied by a black calf. This Melville Island is abundantly peopled with these oxen, not less than one hundred and fourteen being shot within a year by the crews of two ships wintering there. When inhabiting islands, they do not seem to cross from one to another, as the reindeer constantly do when the channel is frozen over, and even confine their annual migrations to very limited areas. Different writers disagree as to whether they can be called migratory in the strict sense of the word. If white men are hunting them without dogs, they may station themselves about a herd, close in to seventy or eighty yards, and then, by picking off the restless ones first, so bewilder the remainder that, with fair luck, they may secure them all. There are several instances of such methods being tolerably successful. When the temperature reaches the extremes of the bitter winter weather, as from —60° to —70° Fahrenheit, the musk-oxen and reindeer herds can be located, at from six to seven miles distance, by the cloud of moisture which hangs over them, formed by their condensing breath, and from favorable heights at even fifteen to twenty miles. Even at these extreme distances, the native hunters claim that they can discern the difference between musk-oxen and reindeer by some varying peculiarities of their vapors.

I remember being one of a party of six — five Innuits besides myself — that chased on the fresh trail of a small herd of musk-oxen from about nine o'clock in the morning until nightfall, which was four in the afternoon. We went at a gait which would be called a good round "dog-trot" for the whole time, except one small rest of five minutes. This is much easier than one would imagine, with a couple of dogs harnessed to you to tow you along; yet I confess I was completely fagged out after this little run of not less than forty or fifty miles, and in a fine condition to believe many stories of endurance while on hunting chases that I had heard them tell. The thermometer at camp registered 65° below zero, yet there was no suffering from the still cold during such exercise, and in fact, at times, I felt uncomfortably warm.

One of their peculiarities which I have noticed is that when slightly wounded, if they have been knocked over upon their sides, they seem perfectly powerless to rise, either from fear or the peculiar formation of their legs. Two of the animals we shot on the 29th of April received each a broken shoulder and were knocked on their sides. The native men, women, and boys sat upon their heaving sides, evidently enjoying the cruel sport; and all the white men participated for a mere second, rather to please their savage allies, until I requested them to dispatch the brutes, which they did by a well-directed heart thrust with a snow-knife. My natives spoke of this occurrence as a rather common incident of the musk-ox battle-field.

Frederick Schwatka.



A TRAGEDY OF A NEST.

(ORIGINAL ENGRAVING BY ELBRIDGE KINGSLEY.)

THE TRAGEDIES OF THE NESTS.

THE life of the birds, especially of our migratory song-birds, is a series of adventures and of hair-breadth escapes by flood and field. Very few of them probably die a natural death or even live out half their appointed days. The home instinct is strong in birds as it is in most creatures; and I am convinced that every spring a large number of those which have survived the Southern campaign return to their old haunts to breed. A Connecticut farmer took me out under his porch one April day and showed me a phœbe bird's nest six stories high. The same bird had no doubt returned year after year; and, as there was room for only one nest upon her favorite shelf, she had each season reared a new superstructure upon the old as a foundation. I have heard of a white robin — an albino — that nested several years in succession in the suburbs of a Maryland city. A sparrow with a very marked peculiarity of song I have heard several seasons in my own locality. But the birds do not all live to return to their old haunts: the bobolinks and starlings run a gauntlet of fire from the Hudson to the Savannah, and the robins and meadow-larks and other song-birds are shot by boys and pot-hunters in great numbers,— to say nothing of their danger from hawks and owls. But, of those that do return, what perils beset their nests, even in the most favored localities! The cabins of the early settlers, when the country was swarming with hostile Indians, were not surrounded by such dangers. The tender households of the birds are not only exposed to hostile Indians in the shape of cats and collectors, but to numerous murderous and blood-thirsty animals, against whom they have no defense but concealment. They lead the darkest kind of pioneer life, even in our gardens and orchards and under the walls of our houses. Not a day or a night passes, from the time the eggs are laid till the young are flown, when the chances are not greatly in favor of the nest being rifled and its contents devoured,— by owls, skunks, minks, and coons at night, and by crows, jays, squirrels, weasels, snakes, and rats during the day. Infancy, we say, is hedged about by many perils; but the infancy of birds is cradled and pillowed in peril. An old Michigan settler told me that the first six children that were born to him died; malaria and teething invariably carried them off when they had reached a certain age; but other children were born, the country improved, and by and by the babies weathered the critical period, and the next six lived and grew up. The birds, too, would no doubt persevere six times and twice six times, if the season were long enough, and finally rear their family, but the waning summer cuts them short, and but few species have the heart and strength to make even the third trial.

My neighborhood on the Hudson is perhaps exceptionally unfavorable as a breeding haunt for birds, owing to the abundance of fish-crows and of red squirrels; and the past season seems to have been a black-letter one, even for this place, for at least nine nests out of every ten that I observed during the spring and summer of 1881 failed of their proper issue. From the first nest I noted, which was that of a bluebird,— built (very imprudently I thought at the time) in a squirrel hole in a decayed apple-tree, about the last of April, and which came to naught, even the mother-bird, I suspect, perishing by a violent death,— to the last, which was that of a snow-bird, observed in August, deftly concealed in a mossy bank by the side of a road that skirted a wood, where the tall thimble blackberries grew in abundance, and from which the last young one was taken when it was about half grown by some nocturnal walker or daylight prowler,— some untoward fate seemed hovering about them. It was a season of calamities, of violent deaths, of pillage and massacre, among our feathered neighbors. For the first time, I noticed that the orioles were not safe in their strong pendent nests. Three broods were started in the apple-trees, only a few yards from the house, where, for several previous seasons, the birds had nested without molestation; but this time the young were all destroyed when about half grown. Their chirping and chattering, which was so noticeable one day, suddenly ceased the next. The nests were probably plundered at night, and doubtless by the little red screech-owl, which I know is a denizen of these old orchards, living in the deeper cavities of the trees. The owl could alight upon the top of the nest, and easily thrust his murderous claw down into its long pocket and seize the young and draw them forth. The tragedy of one of the nests was heightened, or at least made more palpable, by one of the half-fledged birds, either in its attempt to escape or while in the clutches of the enemy, being caught and entangled in one of the horse-hairs by

which the nest was stayed and held to the limb above. There it hung bruised and dead, gibbeted to its own cradle. This nest was the theater of another little tragedy later in the season. Some time in August a bluebird, indulging its propensity to peep and pry into holes and crevices, alighted upon it and probably inspected the interior; but by some unlucky move it got its wing entangled in this same fatal horse-hair. Its efforts to free itself appeared only to result in its being more securely and hopelessly bound; and there it perished; and there its form, dried and embalmed by the summer heats, was yet hanging in September, the outspread wings and plumage showing nearly as bright as in life.

Before the advent of civilization in this country, the oriole probably built a much deeper nest than it usually does at present. When now it builds in remote trees and along the borders of the woods, its nest, I have noticed, is long and gourd-shaped; but in orchards and near dwellings it is only a deep cup or pouch. It shortens it up in proportion as the danger lessens. Probably a succession of disastrous years, like the present one, would cause it to lengthen it again beyond the reach of owl's talons or jay-bird's beak.

The first song-sparrow's nest I observed the past season was in a field under a fragment of a board, the board being raised from the ground a couple of inches by two poles. It had its full complement of eggs, and probably sent forth a brood of young birds, though as to this I cannot speak positively, as I neglected to observe it further. It was well sheltered and concealed, and was not easily come at by any of its natural enemies, save snakes and weasels. But concealment often avails little. In May, a song-sparrow, that had evidently met with disaster earlier in the season, built its nest in a thick mass of woodbine against the side of my house, about fifteen feet from the ground. Perhaps it took the hint from its cousin, the English sparrow. The nest was admirably placed, protected from the storms by the overhanging eaves and from all eyes by the thick screen of leaves. Only by patiently watching the suspicious bird, as she lingered near with food in her beak, did I discover its whereabouts. That brood is safe, I thought, beyond doubt. But it was not: the nest was pillaged one night, either by an owl, or else by a rat that had climbed into the vine, seeking an entrance to the house. The mother-bird, after reflecting upon her ill luck about a week, seemed to resolve to try a different system of tactics and to throw all appearances of concealment aside. She built a nest a few yards from the house beside the drive, upon a smooth piece of greensward. There was not a weed or a shrub or anything whatever to conceal it or mark its site. The structure was completed and incubation had begun before I discovered what was going on. "Well, well," I said, looking down upon the bird almost at my feet, "this is going to the other extreme indeed; now, the cats will have you." The desperate little bird sat there day after day, looking like a brown leaf pressed down in the short green grass. As the weather grew hot, her position became very trying. It was no longer a question of keeping the eggs warm, but of keeping them from roasting. The sun had no mercy on her, and she fairly panted in the middle of the day. In such an emergency, the male robin has been known to perch above the sitting female and shade her with his outstretched wings. But in this case there was no perch for the male bird, had he been disposed to make a sunshade of himself. I thought to lend a hand in this direction myself, and so stuck a leafy twig beside the nest. This was probably an unwise interference; it guided disaster to the spot; the nest was broken up, and the mother-bird probably was caught, as I never saw her afterward.

For several summers past a pair of kingbirds have reared, unmolested, a brood of young in an apple-tree, only a few yards from the house; but, during the present season, disaster overtook them also. The nest was completed, the eggs laid, and incubation had just begun, when, one morning about sunrise, I heard loud cries of distress and alarm proceed from the old apple-tree. Looking out of the window I saw a crow, which I knew to be a fish-crow, perched upon the edge of the nest hastily bolting the eggs. The parent birds, usually so ready for the attack, seemed overcome with grief and alarm. They fluttered about in the most helpless and bewildered manner, and it was not till the robber fled on my approach that they recovered themselves and charged upon him. The crow scurried away with upturned, threatening head, the furious kingbirds fairly upon his back. The pair lingered around their desecrated nest for several days, almost silent, and saddened by their loss, and then disappeared. They probably made another trial elsewhere.

The fish-crow fishes only when it has destroyed all the eggs and young birds it can find. It is the most despicable thief and robber among our feathered creatures. From May to August, it is gorged with the fledgelings of the nest. It is fortunate that its range is so limited. In size it is smaller than the common crow, and is a much less noble and dignified bird. Its caw is weak and feminine

—a sort of split and abortive caw, and stamps it the sneak-thief it is. This crow is common farther south, but is not found in this State, so far as I have observed, except in the valley of the Hudson.

The past season a pair of them built a nest in a Norway spruce that stood amid a dense growth of other ornamental trees near a large unoccupied country house. They sat down amid plenty. The wolf established himself in the fold. The many birds—robins, thrushes, finches, vireos, pewees—that seek the vicinity of dwellings (especially of these large country residences with their many trees and park-like grounds), for the greater safety of their eggs and young, were the easy and convenient victims of these robbers. They plundered right and left, and were not disturbed till their young were nearly fledged, when some boys, who had long before marked them as their prize, rifled the nest.

The song-birds nearly all build low; their cradle is not upon the tree-top. It is only birds of prey that fear danger from below more than from above and that seek the higher branches for their nests. A line five feet from the ground would run above more than half the nests, and one ten feet would bound more than three-fourths of them. It is only the oriole and the wood pewee that, as a rule, go higher than this. The crows and jays and other enemies of the birds have learned to explore this belt pretty thoroughly. But the leaves and the protective coloring of most nests baffle them as effectually, no doubt, as they do the professional oölogist. The nest of the red-eyed vireo is one of the most artfully placed in the wood. It is just beyond the point where the eye naturally pauses in its search, namely, on the extreme end of the lowest branch of the tree, usually four or five feet from the ground. One looks up and down and through the tree,—shoots his eye-beams into it as he might discharge his gun at some game hidden there, but the drooping tip of that low horizontal branch—who would think of pointing his piece just there? If a crow or other marauder were to alight upon the branch or upon those above it, the nest would be screened from him by the large leaf that usually forms a canopy immediately above it. The nest-hunter, standing at the foot of the tree and looking straight before him, might discover it easily, were it not for its soft, neutral gray tint which blends so thoroughly with the trunks and branches of trees. Indeed, I think there is no nest in the woods—no arboreal nest—so well concealed. The last one I saw was pendant from the end of a low branch of a maple, that nearly grazed the clapboards of an unused hay-barn in a remote backwoods clearing. I peeped through a crack and saw the old birds feed the nearly fledged young within a few inches of my face. And yet the cow-bird finds this nest and drops her parasitical egg in it. Her tactics in this as in other cases are probably to watch the movements of the parent bird. She may often be seen searching anxiously through the trees or bushes for a suitable nest, yet she may still oftener be seen perched upon some good point of observation watching the birds as they come and go about her. There is no doubt that, in many cases, the cow-bird makes room for her own illegitimate egg in the nest by removing one of the bird's own. A lady, living in the suburbs of an eastern city, one morning heard cries of distress from a pair of house-wrens that had a nest in a honeysuckle on her front porch. On looking out of the window, she beheld this little comedy—comedy from her point of view, but no doubt grim tragedy from the point of view of the wrens: a cow-bird with a wren's egg in its beak running rapidly along the walk, with the outraged wrens forming a procession behind it, screaming, scolding, and gesticulating as only these voluble little birds can. The cow-bird had probably been surprised in the act of violating the nest, and the wrens were giving her a piece of their minds.

Every cow-bird is reared at the expense of two or more song-birds. For every one of these dusky little pedestrians there amid the grazing cattle there are two or more sparrows, or vireos, or warblers, the less. It is a big price to pay—two larks for a bunting—two sovereigns for a shilling; but nature does not hesitate occasionally to contradict herself in just this way.

I noted but two warblers' nests the past season, one of the black-throated blue-back and one of the redstart,—the latter built in an apple-tree but a few yards from a little rustic summer-house where I idle away many summer days. The lively little birds, darting and flashing about, attracted my attention for a week before I discovered their nest. They probably built it by working early in the morning, before I appeared upon the scene, as I never saw them with material in their beaks. Guessing from their movements that the nest was in a large maple that stood near by, I climbed the tree and explored it thoroughly, looking especially in the forks of the branches, as the authorities say these birds build in a fork. But no nest could I find. Indeed, how can one by searching find a bird's nest? I overshot the mark; the nest was much nearer me, almost under my very nose, and I discovered it, not by searching,

but by a casual glance of the eye, while thinking of other matters. The bird was just settling upon it as I looked up from my book and caught her in the act. The nest was built near the end of a long, knotty, horizontal branch of an apple-tree, but effectually hidden by the grouping of the leaves; it had three eggs, one of which proved to be barren. The two young birds grew apace, and were out of the nest early in the second week; but something caught one of them the first night. The other probably grew to maturity, as it disappeared from the vicinity with its parents after some days.

The blue-back's nest was scarcely a foot from the ground, in a little bush situated in a low, dense wood of hemlock and beech and maple,—a deep, massive, elaborate structure, in which the sitting bird sank till her beak and tail alone were visible above the brim. It was a misty, chilly day when I chanced to find the nest, and the mother-bird knew instinctively that it was not prudent to leave her four half incubated eggs uncovered and exposed for a moment. When I sat down near the nest she grew very uneasy, and after trying in vain to decoy me away by suddenly dropping from the branches and dragging herself over the ground as if mortally wounded, she approached and timidly and half doubtingly covered her eggs within two yards of where I sat. I disturbed her several times, to note her ways. There came to be something almost appealing in her looks and manner, and she would keep her place on her precious eggs till my outstretched hand was within a few feet of her. Finally, I covered the cavity of the nest with a dry leaf. This she did not remove with her beak, but thrust her head deftly beneath it and shook it off upon the ground. Many of her sympathizing neighbors, attracted by her alarm-note, came and had a peep at the intruder and then flew away, but the male bird did not appear upon the scene. The final history of this nest I am unable to give, as I did not again visit it till late in the season, when, of course, it was empty.

Years pass without my finding a brown-thrasher's nest; it is not a nest you are likely to stumble upon in your walk; it is hidden as a miser hides his gold and watched as jealously. The male pours out his rich and triumphant song from the tallest tree he can find, and fairly challenges you to come and look for his treasures in his vicinity. But you will not find them if you go. The nest is somewhere on the outer circle of his song; he is never so imprudent as to take up his stand very near it. The one I found the past season was thirty or forty rods from the point where the male was wont to indulge in his brilliant recitative. It was in an open field under a low ground-juniper. My dog disturbed the sitting bird as I was passing near. The nest could be seen only by lifting up and parting away the branches. All the arts of concealment had been carefully studied. It was the last place you would think of looking, and, if you did look, nothing was visible but the dense green circle of the low-spreading juniper. When you approached, the bird would keep her place till you had begun to stir the branches, when she would start out, and, just skimming the ground, make a bright brown line to the near fence and bushes. I confidently expected that this nest would escape molestation, but it did not. Its discovery by myself and dog probably opened the door of ill luck, for one day, not long afterward, when I peeped in upon it, it was empty. The proud song of the male had ceased from his accustomed tree, and the pair were seen no more in that vicinity.

The phœbe bird is a wise architect, and perhaps enjoys as great an immunity from danger, both in its person and its nest, as any other bird. Its modest ashen-gray suit is the color of the rocks where it builds, and the moss of which it makes such free use gives to its nest the look of a natural growth or accretion. But when it comes into the barn or under the shed to build, as it so frequently does, the moss is rather out of place. Doubtless in time the bird will take the hint, and, when she builds in such places, will leave the moss out. I noted but two nests the past season: one in a barn failed of issue, on account of the rats, I suspect, though the little owl may have been the depredator; the other, in the woods, sent forth three young. This latter nest was most charmingly and ingeniously placed. I discovered it while in quest of pond-lilies in a long, deep, level stretch of water in the woods. A large tree had blown over at the edge of the water, and its dense mass of upturned roots, with the black, peaty soil filling the interstices, was like the fragment of a wall several feet high, rising from the edge of the languid current. In a niche in this earthy wall, and visible and accessible only from the water, a phœbe had built her nest and reared her brood. I paddled my boat up and came alongside ready to take the family aboard. The young, nearly ready to fly, were quite undisturbed by my presence, having probably been assured that no danger need be apprehended from that side. It was not a likely place for minks, or they would not have been so secure.

I noted but one nest of the wood pewee, and that, too, like so many other nests, failed of issue. It was saddled upon a small dry

limb of a plane-tree that stood by the roadside, about forty feet from the ground. Every day for nearly a week as I passed by I saw the sitting bird upon the nest. Then one morning she was not in her place, and on examination the nest proved to be empty—robbed, I had no doubt, by the red squirrels, as they were very abundant in its vicinity and appeared to make a clean sweep of every nest. The wood pewee builds an exquisite nest, shaped and finished as if cast in a mold. It is modeled without and within with equal neatness and art, like the nest of the humming-bird and the little gray gnatcatcher. The material is much more refractory than that used by either of these birds, being, in the present case, dry, fine cedar twigs; but these were bound into a shape as rounded and compact as could be molded out of the most plastic material. Indeed, the nest of this bird looks precisely like a large, lichen-covered, cup-shaped excrescence of the limb upon which it is placed. And the bird, while sitting, seems entirely at her ease. Most birds seem to make very hard work of incubation. It is a kind of martyrdom which appears to tax all their powers of endurance. They have such a fixed, rigid, predetermined look, pressed down into the nest and as motionless as if made of cast-iron. But the wood pewee is an exception. It is largely visible above the rim of the nest. Its attitude is easy and graceful; it moves its head this way and that, and seems to take note of whatever goes on about it; and if its neighbor were to drop in for a little social chat, it could doubtless do its part. In fact, it makes light and easy work of what, to most other birds, is such a serious and engrossing matter. If it does not look like play with her, it at least looks like leisure and quiet contemplation.

There is no nest-builder that suffers more from crows and squirrels and other enemies than the wood-thrush. It builds as openly and unsuspiciously as if it thought all the world as honest as itself. Its favorite place is the fork of a sapling, eight or ten feet from the ground, where it falls an easy prey to every nest-robber that comes prowling through the woods and groves. It is not a bird that skulks and hides like the cat-bird, the brown-thrasher, the chat, or the cheewink, and its nest is not concealed with the same art as theirs. Our thrushes are all frank, open-mannered birds; but the veery and the hermit build upon the ground, where they at least escape the crows, owls, and jays, and stand a better chance to be overlooked by the red squirrel and weasel also; while the robin seeks the protection of dwellings and out-buildings. For years I have not known the nest of a wood-thrush to succeed. The past season I observed but two, both apparently a second attempt, as the season was well advanced, and both failures. In one case, the nest was placed in a branch that an apple-tree, standing near a dwelling, held out over the highway. The structure was barely ten feet above the middle of the road, and would just escape a passing load of hay. It was made conspicuous by the use of a large fragment of newspaper in its foundation—an unsafe material to build upon in most cases. Whatever else the press may guard, this particular newspaper did not guard this nest from harm. It saw the egg and probably the chick, but not the fledgeling. A murderous deed was committed above the public highway, but whether in the open day or under cover of darkness I have no means of knowing. The frisky red squirrel was doubtless the culprit. The other nest was in a maple sapling, within a few yards of the little rustic summer-house already referred to. The first attempt of the season, I suspect, had failed in a more secluded place under the hill; so the pair had come up nearer the house for protection. The male sang in the trees near by for several days before I chanced to see the nest. The very morning I think it was finished, I saw a red squirrel exploring a tree but a few yards away; he probably knew what the singing meant as well as I did. I did not see the inside of the nest, for it was almost instantly deserted, the female having probably laid a single egg, which the squirrel had devoured.

If I were a bird, in building my nest I should follow the example of the bobolink, placing it in the midst of a broad meadow, where there was no grass, or flower, or growth unlike another to mark its site. I judge that the bobolink escapes the dangers to which I have adverted as few or no other birds do. Unless the mowers come along at an earlier date than she has anticipated, that is, before July 1st, or a skunk goes nosing through the grass, which is unusual, she is as safe as bird well can be in the great open of nature. She selects the most monotonous and uniform place she can find amid the daisies or the timothy and clover, and places her simple structure upon the ground in the midst of it. There is no concealment, except as the great conceals the little, as the desert conceals the pebble, as the myriad conceals the unit. You may find the nest once, if your course chances to lead you across it and your eye is quick enough to note the silent brown bird as she darts swiftly away; but step three paces in the wrong direction, and your search will

probably be fruitless. My friend and I found a nest by accident one day, and then lost it again one minute afterward. I moved away a few yards to be sure of the mother-bird, charging my friend not to stir from his tracks. When I returned, he had moved two paces, he said (he had really moved four), and we spent a half hour stooping over the daisies and the buttercups, looking for the lost clew. We grew desperate, and fairly felt the ground over with our hands, but without avail. I marked the spot with a bush, and came the next day, and, with the bush as a center, moved about it in slowly increasing circles, covering, I thought, nearly every inch of ground with my feet and laying hold of it with all the visual power I could command, till my patience was exhausted and I gave up, baffled. I began to doubt the ability of the parent birds themselves to find it, and so secreted myself and watched. After much delay, the male bird appeared with food in his beak, and satisfying himself that the coast was clear, dropped into the grass which I had trodden down in my search. Fastening my eye upon a particular meadow-lily, I walked straight to the spot, bent down and gazed long and intently into the grass. Finally my eye separated the nest and its young from its surroundings. My foot had barely missed them in my search, but by how much they had escaped my eye I could not tell. Probably not by distance at all, but simply by unrecognition. They were virtually invisible. The dark gray and yellowish brown dry grass and stubble of the meadow-bottom were exactly copied in the color of the half-fledged young. More than that, they hugged the nest so closely and formed such a compact mass, that though there were five of them, they preserved the unit of expression,—no single head or form was defined; they were one, and that one was without shape or color, and not separable, except by closest scrutiny, from the one of the meadow-bottom. That nest prospered, as bobolinks' nests doubtless generally do; for, notwithstanding the enormous slaughter of the birds during their fall migrations by southern sportsmen, the bobolink appears to hold its own, and its music does not diminish in our northern meadows.

Birds with whom the struggle for life is the sharpest seem to be more prolific than those whose nest and young are exposed to fewer dangers. The robin, the sparrows, the pewees, etc., will rear, or make the attempt to rear, two and sometimes three broods in a season; but the bobolink, the oriole, the kingbird, the goldfinch, the cedar-bird, the birds of prey, and the woodpeckers, that build in safe retreats in the trunks of trees, have usually but a single brood. If the bobolink reared two broods, our meadows would swarm with them.

I noted three nests of the cedar-bird the past August in a single orchard, all productive, but all with one or more unfruitful eggs in them. The cedar-bird is the most silent of our birds, having but a single fine note, so far as I have observed, but its manners are very expressive at times. No bird known to me is capable of expressing so much silent alarm while on the nest as this bird. As you ascend the tree and draw near it, it depresses its plumage and crest, stretches up its neck, and becomes the very picture of fear. Other birds, under like circumstances, hardly change their expression at all till they launch into the air, when by their voice they express anger rather than alarm.

I have referred to the red squirrel as a destroyer of the eggs and young of birds. I think the mischief it does in this respect can hardly be overestimated. Nearly all birds look upon it as their enemy and attack and annoy it when it appears near their breeding haunts. Thus, I have seen the pewee, the cuckoo, the robin, and the wood-thrush pursuing it with angry voice and gestures. If you wish the birds to breed and thrive in your orchard and groves, kill every red squirrel that infests the place; kill every weasel also. The weasel is a subtle and arch enemy of the birds. It climbs trees and explores them with great ease and nimbleness. I have seen it do so on several occasions. One day during the past summer my attention was arrested by the angry notes of a pair of brown-thrashers that were flitting from bush to bush along an old stone row in a remote field. Presently I saw what it was that excited them—three large, red weasels or ermines coming along the stone wall and leisurely and half playfully exploring every tree that stood near it. They had probably robbed the thrashers. They would go up the trees with great ease and glide serpent-like out upon the main branches. When they descended the tree they were unable to come straight down, like a squirrel, but went around it spirally. How boldly they thrust their heads out of the wall and eyed me and sniffed me, as I drew near,—their round, thin ears, their prominent, glistening, bead-like eyes, and the curving, snake-like motions of the head and neck being very noticeable. They looked like blood-suckers and egg-suckers. They suggested something extremely remorseless and cruel. One could understand the alarm of the rats when they discover one of these fearless, subtle, and circumventing creatures threading their holes. To flee must

be like trying to escape death itself. I was one day standing in the woods upon a flat stone, in what at certain seasons was the bed of a stream, when one of these weasels came undulating along and ran under the stone upon which I was standing. As I remained motionless, he thrust out his wedge-shaped head and turned it back above the stone as if half in mind to seize my foot; then he drew back, and presently went his way. These weasels often hunt in packs like the British stoat. When I was a boy, my father one day armed me with an old musket and sent me to shoot chipmunks around the corn. While watching the squirrels, a troop of weasels tried to cross a bar-way where I sat, and were so bent on doing it that I fired at them, boy-like, simply to thwart their purpose. One of the weasels was disabled by my shot, but the troop was not discouraged, and, after making several feints to cross, one of them seized the wounded one and bore it over, and the pack disappeared in the wall on the other side.

WILL NEW YORK BE THE FINAL WORLD METROPOLIS?

As a mathematical and mechanical prodigy, the great Roebling Bridge, connecting Brooklyn with New York, is eclipsed by its philosophic aspect, as a vital artery, and a bond of more strength than cables and trussed beams of steel. It is a nerve of conscious identity between the two sides of the double city, not only as the eye follows the ceaseless thrill of movement and the imagination is grasped by the expressive continuity, but especially as the crossing populations grow habituated to the indivisible expanse of city beneath and around on every side, within which the glimpses of a boundary river show like partial seams in an almost seamless whole. With this imposing specimen of the spontaneous evolution and integration of a great metropolis before every eye, it may be hoped that a somewhat novel treatment of the great New York question, on general and vital principles, may meet with thoughtful appreciation. The statistical evidences might have been revised to a later date; but the totals, and the illustrative effect for which they are used, would still have been, to all intents and purposes, the same.

The metropolis is the chief organ through which both expression and effect are given to the genius and character of a nation. It is the brain, from which the nerves of public intelligence and impulse spread to every extremity, and to which the minor centers and ganglia are unconsciously subsidiary. It is the heart, whose pulsations gather and redistribute the vital currency from and to the remotest veinlets. It is the alimentary center where the national wealth is digested, mobilized, and infused into the circulation to nourish every fiber of the system. There can no more be two such vital systems and centers in a nation than in an individual. No such *lusus naturæ* was ever long preserved. As in the individual, so in the whole, the singleness of such organs is the unity of the being, and their size and vigor are the measure of its vitality and power.

History is little more than the history of capital cities. "Paris is France." Blot out from English annals all that was originated or consummated in London, and what have you left? Rome was the ultimate focus of vital force in the ancient world. No people ever successfully organized and maintained itself with a plurality of capitals. A second capital rent the Roman empire in twain. Babylon culminated on the ruins of Nineveh.

In our own young country, the organism is not yet perfectly defined. More than one quasi metropolis aspires to be the vital center. Arguments have been constructed from plausible data in favor of each of these expectant capitals. Dubious opinion in most minds, perhaps, halting between such arguments, has questioned whether any one city were destined to metropolitan supremacy in America. But, despite the force of rival pretensions, our glimpse of national physiology instructs us that there must be one and only one center of the continental nationality tested and consolidated by the war for the Union. Assuming, as a first principle in political philosophy, that national being is organic and analogous to the individual organism,—inevitably developing, if not developed from, one central sensorium,—it follows that every local movement from partial causes, however powerful, must merge at length in a common vortex of national force and motion, a metropolis commensurate with the future of the American republic. The greater the complexity of genius and the exuberance of vitality exhibited in so many Titanic rivals, all so unlike, the more majestic, simply, the center to which they must all prove tributary at last. The sys-

tem must have a sun outweighing the sum of its parts, and necessarily can have but one.

The physiological and cosmical analogies will not be equally satisfactory to all minds. A more mechanical argument, however, leads to the same result. As a permanent equilibrium between any two or more rival centers is morally impossible, it follows that some one of them must sooner or later gain an advantage in mass and momentum that will tend thereafter on every occasion to augment itself. For an illustration of the tendency, take the centralization at New York of the vast commercial developments of the third quarter of our century, such as the gold and silver product of the Pacific States, the railway and telegraph systems of the continent, or the multiplying lines of transatlantic steam-ships. A number of powerful causes have coöperated in each of these centralizations, but a single sufficient cause may be found in the determining attraction of the superior mass and magnitude of affairs at this point. The presence of a superior bulk of business and capital at a certain point insures better equipment and larger opportunity there for important transactions, and thus of itself furnishes a controlling motive to draw such transactions together. Every new addition attracted to the controlling mass goes to make the motive and the certainty still stronger for the next, and so on, until the tendency becomes a necessity, fixed beyond all power on earth to change. It is true that, during the earlier development of the country, new conditions are liable to arise of sufficient power to reverse the relative rank of its leading cities. One pound may overbalance two, if it can acquire a double leverage. The Erie Canal gave such a leverage to the city of New York against the once preponderant city of Philadelphia; and so the minor mass overcame the greater and became the greater. It is conceivable that the like might happen again, in a country so young and vast as ours, and with such inscrutable possibilities yet in reserve. But it is certain that such oscillations must come to an end at length. There must be some point really strongest on the whole, and that point cannot fail to discover itself sooner or later. Thenceforward, the tendency of things to converge to that point increases by geometrical ratio, until the overpowering solarity of the accumulation precludes even the initiation of any counterbalancing movement.

While the rival provincial centers are testing their possibilities, and thus determining the true national center, the country itself is involved in an analogous process, on the scale of ages and the world, slowly developing a super-organization of the commonwealth of man. Organic centralization or headship is the necessary consummation of every grade of life, by which it reaches and passes to the plane above it — from individual being to that of family; to that of society and party; to that of nationality; to that, yet unperfected, of the world. The past inchoate stages of world-organization, provisional, partly abortive, but every time progressive, stand out boldly in the historical retrospect, mainly three: Babylon, Rome, London. While national centers, once fixed, however crudely, by the natural maturing of national organization, have never been (naturally) displaced as such, the immaturity of the world itself, as well as the direction and destination of its grand advance, is indicated by the successive westward removals of its imperial head-quarters. There remains but one possible further stage and stopping-place to be made. A glance at the course of metropolitan development in the past will throw light upon its future method, direction, and final goal.

Capitals were primarily of military origin, from which a political development naturally proceeded. This primitive politico-military motive was directly opposite in its requirements to the later commercial motive of metropolitan growths. It shunned the then barren sea, from which the dangers of piracy and invasion came earlier than the blessings of commerce. Consequently, civilization at first centered and fortified itself on the richest inland plains or in natural strongholds.

The rise of commerce at length brought a new influence to bear on the location of capitals, modifying but not overcoming the effect of the politico-military motive. They cautiously approached the sea, seeking an outlet by navigable rivers, but keeping at a defensible distance from their mouths. Examples: Rome on the Tiber; London on the Thames; Paris on the Seine; Vienna on the Danube; St. Petersburg on the Neva; etc. Tyre and Venice, purely commercial capitals, inaugurated, or rather foreshadowed, the commercial era, and temporarily anticipated the possibility, which was long in becoming realized, of great sea-coast cities. Not until the modern epoch of international security under international law could commerce build her peaceful capitals, for the congress of nations, on the ocean harbors of Liverpool and Havre, Boston and New York.

This radical change brings into the modern metropolitan re-organization of mankind new powers and resources immensely transcending the old. And it is a very potent conjunction, in our own horoscope, that the pure product of these novel powers (hardly even yet permitted free course in Europe) is to be first

realized in the New World; and that, far more freely, rapidly, and perfectly than will be possible at best under the primitive malformations and misplacements of national centers, and among the irreconcilable fragments into which the past ages of violence have broken up the Old World. It would seem to pass all bounds of moderation, if we could venture here to forecast and apply the ratio of this one advantage in the American future over all the progress of the past.

Providence never before laid out a nation on a scale that was more than petty in comparison with the continental, climatic, and oceanic frame of the American republic. Never before in history has there been a movement of men that was not petty and cramped in comparison with the outpouring of all races into this vast national frame-work. Never before was there any possible fusion of such diversities of national genius as we see commingling here in a general reunion of human elements dispersed ever since Babel. In short, there has never been a possibility before of a nation so vast and coherent, so complex and coalescent, so vigorous and pacific, so free and orderly, so universal in resources and faculty, and so miraculously progressive in population, wealth, and every element of power. Our infant stature is already that of the greatest nations before us. They have filled their measures at a limit of growth where we are only beginning, and must henceforth overflow into the limitless channels of our destiny. Every probability in both hemispheres conspires to sustain for an indefinite future our past marvelous ratio of growth. What, then, is the rank of the destined metropolis—for one it must have, as surely as a man must have a head on his shoulders—of such a nation? Attraction is proportioned to mass, in the social as well as physical universe; and the center of this unexampled mass must be a center of unexampled attraction for the commerce and resources of the world. That America is the great nation of the future,—for the world's circuit is now completed with America,—and that consequently the American metropolis must be the great city of the future, we might here take for granted without further discussion, and proceed to the question of its place and formation.

Looking at the latter question without a particle of local pride or partiality, we could with equal interest trace the probability of our present leading city being outstripped in the race by either of its quite as honorable and amiable rivals. Nor do we find conclusive argument in the group of local conditions for the development of a great city here, although it must be admitted that, as a whole, they are nowhere else matched in history or geography. As yet, this only shows that, since greater cities certainly have arisen under inferior natural conditions to these, greater cities may again. The points of greatest promise have not always become the sites of the greatest cities, on the coasts either of America or of Europe.

Nor yet is there conclusive argument in the coincidence of this unparalleled group of natural conditions with present actual pre-eminence. The Old World has left many of its once imperial centers literally buried in the track of its westward-moving vortex. To-day, we are told that Damascus, to which of all cities the hyperbole "Eternal" seemed fittest, after looking on the rise and extinction of Nineveh, Babylon, Thebes, Tyre, Palmyra, and a host of more modern capitals, in a lifetime of four thousand years, is at last bleeding to death from that stupendous cut, the Suez Canal.* Perhaps no prescience less than that which described the doom of those cities, by the prophets, ages before the currents of change that should drain their existence became conceivable to man, could certainly forecast the destiny of any of the lusty germs now swelling in this continent. Nevertheless, we have here scientific elements for calculating the position of the world's future center with the highest moral certainty.

Whatever political cataclysms and transformations may be in store, the North American continent is certainly occupied and organized commercially, at least, for an æon to come, by one English-speaking commonwealth. Into this, it is equally certain, the excess of the Old World's vitality, crowded to the verge of Europe, must continue to overflow as now, with enormous expansion of liberated force, until the massing of power on both sides the Atlantic will become at no distant day equal.

Thus the world's weight must continue to accumulate on one side of the globe, in two masses facing each other across the comparatively narrow Atlantic, with the vast breadths of Asia and the Pacific Ocean, respectively, behind them. These great distances, amounting to two-thirds the earth's circumference, must forever keep the back of the Old World toward the east, and that of the New World

* "Concerning Damascus: * * * they have heard evil tidings; they are faint-hearted; there is sorrow on the sea; it cannot be quiet. Damascus is waxed feeble and turneth herself to flee. * * * How is the city of praise not left!"—JEREMIAH, xlix. 23–25. Isaiah declares: "Damascus is taken away from being a city, and it shall be a ruinous heap." This prophecy certainly defers the end of the world at least one more century yet.

toward the west, with their faces toward and near each other,—perpetuating the mutual transatlantic attraction which now focuses all great lines of movement, from both ways, in the direction of London and New York.

It is plain, therefore, that the world's center must be on one or the other Atlantic seaboard, until the Asiatic leads the van of progress, and Peking or Shanghai overshadows London and New York!

For it is manifestly impossible for the location of the American metropolis to be controlled in any degree by the American center of population. It must, by the nature of commerce, be on the sea-board, at any rate. But if there were no such consideration as seaboard, it must still be drawn to the eastward border, as now, by the powerful attraction of the European mass. These two causes will still determine it to our eastern coast, after the world's center itself shall have crossed the Atlantic, viz.: the sea-port necessity, and the still decisive force which Europe, as an inferior, must continue to exert; just as the present inferior influence of America would make it impossible to transfer the power of London, say, to Constantinople, even if the latter were the center of gravity of the Old World.

On which sea-board, the European or the American, the great center must rest at last, is another easy question. Its solution has been anticipated, in the vastly superior capacity and adaptation of the new continent, the plethora of the old, and the expansiveness of liberated forces. It is, simply, as the case of a boiler crowded to the limit of its strength and then put in connection with another of ten times its size. If it is a question which boiler will contain most steam after a few minutes, it is equally a question whether the weight of the world will ever be west of the Atlantic or not.

Having, then, approximately determined the longitude of the future cosmetropolis, let us see what data we have for computing its latitude.

The temperate belt on which the imperial cities of the past have formed a line is a condition too intelligible, as well as invariable, to be disregarded in laying plans of this sort for the future. And yet a very prominent New York merchant and publicist, in contributing his quota of opinion for this article, said that, unless certain extraordinary measures were adopted by New York, the bulk of Western and Southern commerce would soon find its way to the magnificent harbors of the James River and the Mississippi. Why it has never yet begun to do so he failed to explain, and from a point of view so narrow it would be impossible to see. But any one who has been much engaged in business at the South can give a reason deeper than slavery or yellow fever. The testimony of such a witness (to the writer) is that no man who goes to the South, of however energetic race, persists in a course of urgent enterprise and hard work long after he finds himself able to delegate his drudgery and "take it easy." As a rule, there can be no such thing in a Southern climate as a hard-working proprietor in command of large resources and affairs.

Such is climate on the southward, depressing the dynamic or human factor in progress. On the north, again, it braces the personal force, but wars against the material conditions. Midway, on the latitude of New York, Philadelphia, and Baltimore, we have to contend, right and left, with both difficulties; and the inequable peculiarity of our Atlantic coast climate gives formidable effect, even here, to heat and cold by turns. North of this median line the latter adversary looms up so abruptly, in the obstruction of commerce by ice and snow, as to exclude the New England ports from the range of our inquiry. South of it there is no port where the energy of the dominant (northern) races of the modern world can hold its own. We find the magic belt narrowed for us to the measure of a moderate day's ride, with no port on either side exempt at once from the visitations of ice and pestilent or depressing heat. Of the three cities on the belt, Philadelphia and Baltimore, by their inland positions, suffer perceptible disadvantage from both heat and ice. New York alone — standing out to the ocean on a southward-looking coast, while open straight to the north as far as Canada, through the channels of the Hudson and Lake Champlain, and divided by many waters into strips of island and peninsula — enjoys a bracing and temperate climate throughout the year, where all the wholesome rigor of the north is free to stimulate her energies but forbidden to bar her gates. It is a singular, even an astonishing, position; like nothing else, altogether, in the preparations of Nature for Man.

And yet this decisive condition is but one of many, equally remarkable and peculiar — a combination of manifest design before which we can scarce but stand in awe. In all the conditions of both foreign and interior communication, the port of New York excels all others, not only on our own coast, but on the globe. Impressive as are the evidences of providential design in the laying out of this continent for the final scene of human development, the plan of its natural outlet and *entrepôt* at New York is in every respect

commensurate and continuous with the rest. Believer and skeptic must agree, in view of the now visible destiny of the country, that this spot seems as if planned at the creation for the ultimate center of the world. Its harbor is beyond comparison or even conceivable improvement in every requisite for such a purpose: size and depth abundant for all the shipping of the world at once; unbroken shelter, perfected by vestibule harbors covering both its narrow gate-ways as with double doors; accessibility by a few minutes' steaming from the open Atlantic; absolute freedom at once from depressing heat and obstructing ice; and a land site practically unlimited for the diversified requirements of a high civilization, penetrated in every direction by navigable avenues conducting fleets from all oceans direct to the doors of merchants, manufacturers, and lines of transportation, on a hundred miles, if need be, of maritime water-front.

Again: looking inland, we find ourselves at the natural outlet and inlet, the great auricle and ventricle, where the channels of internal circulation meet to carry the pulsations of commerce to and from every part of the continent. The natural and the artificial conformations of these interior channels are equally remarkable.

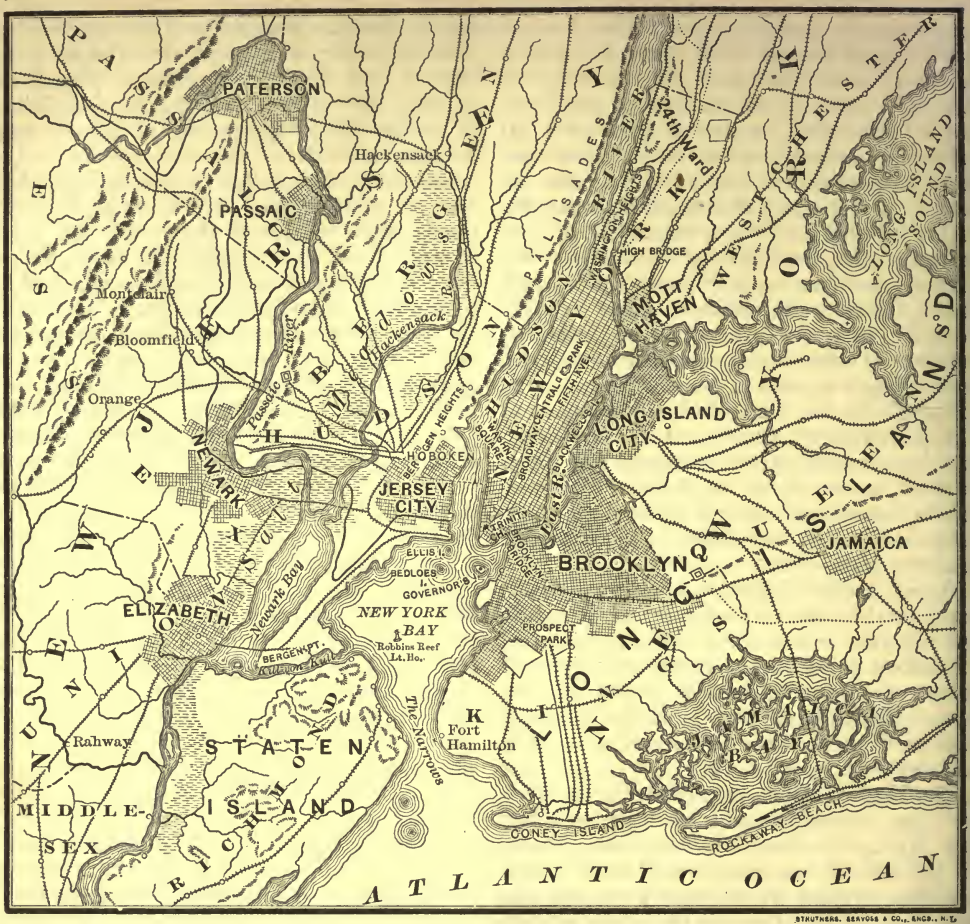
The Hudson River, the chain of great lakes, and the Mississippi with its huge branches, lack by nature but two short links, almost ready-made, of one commercial water-course sweeping around from South to North and from West to East, through the whole latitude and two-thirds of the longitude of the United States, draining the larger and richer part of its area with a navigable course of five or six thousand miles, and finding its main outlet at the harbor of New York. The eastern link lacking to this stupendous natural circuit was completed but fifty years since by the Erie Canal, and here is the commercial delta it has created at its mouth: the present city and dependencies of New York, already more than twice the size of its late superior, and equal in population to all four of its rivals (if such they may be called) rolled into one.

And now, on a similar yet still grander scale,—the young railway system of the continent, the growth of yesterday as it were,—debouches a hundred thousand miles of traffic through a thousand trains a day at this center.

We have insensibly slid from natural prearrangements to accomplished results which have taken their places also among the fundamental and controlling conditions of the future. A certain mass and momentum attained assure their own increase in a geometrical ratio thenceforward. From the records of the United States Treasury, for twenty-five years ending June 30, 1877, it appears that the value of imports and domestic exports at New York in that period was nearly 13,000 millions of dollars ($12,884,760,669); against 1245 millions, or less than *one-tenth* as much, at the second largest port, that of Boston; 938 millions at Philadelphia; 839 millions at Baltimore; and a total at all these and other ports of the United States, great and small, except New York, of 9000 millions ($9,006,074,676), or less than three-fourths as much as the port of New York alone: showing a true solar preponderance of the central mass over the aggregate of all other parts of the system.

If we take only the seven recent years (1871–77) during which the public negligence characteristic of New York was made the most of by a vehement development of rival energies and advantages, we find no material difference in the result. The imports and domestic exports at New York from 1871 to 1877, inclusive, exceeded four and three-quarter billions ($4,752,525,134); while those of all the other ports of the United States combined fell considerably short of three and three-quarter billions ($3,690,134,001); and those of the second port (Boston), although raised forty per cent. or more above any previous septennate, were only twelve per cent. of the amount at New York. Or again, by comparing the last twenty-five years* among themselves, we find the preponderance of New York on the whole to have been constantly increasing through considerable fluctuations. The first five of these years showed a far lower relative amount of commerce at New York, and that too in the lately much contested matter of exports, than any subsequent portion of the twenty-five. These statistics, however, relate only to merchandise, and fall very far short of showing the true relative importance of the commercial metropolis. It is computed that, including financial operations, seven-eighths of the foreign commerce of the country is transacted through New York. The entire circulation of capital, currency, and exchange has its vortex in Wall street. It is the money market of the whole country, determining all values and movements, and holding all other financial systems in a provincial and subordinate relation. Here, and not in mere material or numerical bulk, we come upon the true and indivisible metropolitan character. The continental heart is here visibly struggling into shape from formless mass, clearing its monstrous mouths and arteries, and pouring

* [These figures are brought down to 1877,—the first draft of the article having been prepared in 1878.—ED.]



MAP OF NEW YORK CITY AND VICINITY.

back and forth deeper and richer tides of active wealth from day to day. Nor is the cerebral development on a less gigantic scale. The magnetic sensorium, the New York telegraph office, radiates 250,000 miles of intelligential nerves to ten thousand minor centers in America and to every city of the civilized world. It is probably safe to put the postal and telegraphic correspondence of New York City at three or four times the aggregate of all the other ports of the United States.

Restricted space permits but such close selection and brief statement of cardinal points, in the argument on the main question, as have now been presented. Discussion and elaboration must be left for others or for a broader opportunity. A like apology should preface our cursory survey of the internal features of the future cosmetropolis.

The city thus established and firmly assured in its metropolitan character will continue to grow in every practicable direction, as water will find its level in any number of connected vessels. A circle of about fifteen miles radius from the center of Manhattan Island will reach as far as will be convenient for average business purposes under such conditions as we can now anticipate. This will make an area of about seven hundred square miles, large enough to give the city free choice in the direction and character of its growth, which will, of course, be more or less irregular and capricious. A site so spacious, even if one-half be neglected and one-seventh be water, will still have an occupied area double that of London, and sufficient by reason of its singular adaptations for many times the business of that city.

The foregoing map is divided by the Hudson River into two parts, east and west, each exhibiting a marked character of its own. Looking at the obvious physical aspects, we observe that the foreground of the western division is profusely channeled with navigable waters and water-power courses, and overlaid with a congeries of terminating railroads. Within this semicircle there is a mile of railroad per square mile of territory. A strip of its eastern water-front, three

miles long, is the actual meridian line where the wheels of continental railway traffic meet the keels of ocean steam-ships. Of the one hundred thousand miles of North American railway lines, but a small fraction fails to connect with the steam-ship fleets at this wharf line.

A vast defect seems to condemn some ten thousand acres in the foreground as an impracticable morass. But "this effect defective comes by cause," and for good cause, equally with the waste of waters, to which so inordinate space seems to be surrendered. The extensive tide-water flats, redeemed from overflow, are destined to play an important part in the future of the cosmetropolis. They will furnish the cheap and level ground needed for railway sidings, for long wharves on deep-water frontage, and for the yards and buildings required for the storage and handling of bulky commodities and raw materials. Back of these marshes lie two of the most important manufacturing centers of America, Newark and Paterson, so closely joined to New York by business relations and swift railway communications as to be virtually workshops of the great city. Finally, in the rear of all this apparatus of commerce and manufactures, in the west and north of the semicircle, there rises a romantic region, cleft by deep rivers and ravines, and terraced with magnificent heights, tier above tier, overlooking the central city and all its white brood of suburban towns as far as the ocean horizon.

Turning now to the other division of our map, east of the Hudson, we find it unbroken by the arduous heights or broad water-ways of the western section. There is not a sign of water-power. There are no wide spaces of cheap and vacant land like the marshy flats between Bergen Heights and the Passaic. Everything is adapted by nature to the brisk circulation of air, drainage, and traffic,—for continuous streets and close building. Not a circumstance is wanting for the model site of a compact city, the densest massing of life and business with the closest economy of time and strength. The narrow water-way of the East River, which intersects the eastern semicircle, has in fact assisted to widen rather than contract the city's growth. New York and Brooklyn and adjacent Long Island, and the Westchester peninsula, as united by bridges and steam transit, form one city site as much as the two banks of the Seine at Paris or of the Thames at London, and are certain to become municipally united.

The two divisions thus topographically contrasted are also geographically separated by a river over a mile wide, while politically they are as far apart as two States, of opposite temper and traditions, can fix them. Yet their inseparability as one interwoven commercial growth is plainly manifest at this early stage. Each division, with its subdivisions, is complemental and harmonious with the others.

The pivot of the whole development is on the eastern side, at the lower end of Manhattan Island. Here is the permanent financial center. It will not move, for all the world seeks it where it is. Wall street will preserve its character as long as the cosmetropolis endures. Banking, exchange, stocks, insurance, capital and merchandise brokerage, speculation, and financial and commercial agencies from all parts of the world, will circle around Trinity Church until its walls crumble. Offices of railroad and mining companies, of steam and other shipping, of telegraphs, of staple imports and exports (stores and warehouses crowded into the distance and for the greater part on the Jersey flats) next center closest around the financial hub, attended by manufacturing and miscellaneous corporations, lawyers without number, brokers, courts, newspapers, and, farther up, the importers of foreign and agents of domestic manufactures. The physiognomy of this part of the city is fixed, and will only become more pronounced in time by the crowding out of small manufacturing concerns and warehouses for the storage of heavy products. The jobbing trade will continue its march up town, and perhaps halt around the Hudson River Tunnel Depot to be opened near Washington Square. The retail dry-goods trade, following the tide of fashionable life, will go northward until stopped or turned by the corner of Central Park.

After finance and foreign commerce, fashionable trade and society will eventually be the chief features of the central city. The centralization of true metropolitan commerce, which is to make lower New York the London of the future, will make upper New York its Paris. Exclusive society in New York can scarcely be said to have any fixed and distinct habitat at present. It is in transitionary lodgings, looking about, as it were; ready poised to take wing for some choice new quarter, well walled from vulgar intrusion. Where that quarter is to be, however, can hardly be a question. One suitable spot remains, and that is at once so beautiful, so isolated, and so admirably adapted, that one is almost constrained to believe that the susceptibilities of sublimated snobbery are not beneath the Providence that cares for the sparrow. Four or five square miles have been laid out by Nature on the peninsular upper extremity of the island, between the Hudson and the Harlem, at an elevation of from

fifty to a hundred feet above plebeian street grades, expressly for the "court" quarter of New York's future aristocracy. It is a ridge about a mile wide, with abrupt sides and a broad top; overlooking at once, on either hand, the magnificence of the Hudson beneath the Palisades, and the romantic nooks of the Harlem and Spuyten Duyvil, with the glittering reaches of Long Island Sound; swept by the purest airs from land and sea; almost self-drained, and drained again of drainage at its base; inaccessible, in short, to the odors of the common world, to the heavy wheels of commerce, and to the enterprise of speculative builders.

As if all this were not enough, the opposite shores on every hand are all of the same sort, and waiting to be united in one by suspension bridges from height to height, anchored in the ready-built rocks. In fact, the city has already one of the most magnificent bridges in the world, spanning the Harlem from bluff to bluff—the famous "High Bridge" of the Croton Aqueduct. Whenever wanted, an upper story can be built at small expense on this massive structure, and roofed with a fine level road-way from Washington Heights to the villa-crowned hills of the Twenty-fourth Ward. The earliest wholly new bridge to be called for in this quarter will perhaps be the already chartered suspension bridge across the Hudson from Washington Heights to the Palisades. This will—not soon, but surely—connect the magnificent boulevards now building on each of the opposite heights in a continuous drive of fifteen miles, which, for eminence of prospect, luxurious convenience, and picturesque variety, can never be matched in the neighborhood of any other great city on the globe. The elevated railways through the north-western quarter of the island bring this region at once into practicability, and some coming wave of prosperity will sweep an overflowing wealth into splendid piles and rows along the sightly heights.

The plainly marked locality of fashionable life as plainly determines that of fashionable trade. Retailing will retain its present base on the central avenues leading up to the Park, preëminently the Fifth, and will culminate either about the lower end at Fifty-ninth street, or possibly on the western (Eighth-avenue) side of so agreeable a drive as that by way of St. Nicholas avenue and the Park from the upper ten thousand homes to the shopping quarter.

For the great middle class, of reasonable tastes and aspirations, whom choice or convenience will retain in the close city, broad provision is made on all sides of the Central Park; but it is derogatory to the prospects of the city to suppose that any of the insular space will long remain cheap. As a brake on the progressive expensiveness of the center, however, the continued distribution of population on both sides of the East River throughout its whole length is plainly secured by the admirable counterpoise of the new steam transits north and east respectively. Brooklyn has long been simply the habitable quarter of New York nearest to business and cheapest for residence. The New York elevated railways, which would have thrown that quarter into the distance, are opportunely balanced by prospective Brooklyn steam transit over the great suspension bridge, recently completed, at James's slip, and the prospective Blackwell's Island bridge. This will put progressively cheaper city homes and lighter taxation within five, ten, fifteen, and twenty minutes from business, and secure the continued preference of a large population, of moderate city tastes. Brooklyn has already more than half a million inhabitants. It has ample room for unlimited growth over the level fields of Long Island stretching out eastward, and can spread southward ten miles to the sea if need be.

A cluster of cities with an aggregate population of nearly a third of a million has already grown up on the New Jersey arms and affluents of our metropolitan harbor. More foreign goods are now landed in Jersey City and Hoboken than in any other place in the United States, except New York. Paterson is one of the greatest silk factories of the world. It makes nearly all the sewing silks and two-thirds of the colored silk dress goods and ribbons sold in this country, and is besides eminent in the building of locomotives and machinery. Newark is a swarming hive of industry, with 135,000 inhabitants. It is the special seat of gold jewelry, leather, small hardware, and thread manufacture. Of the whole west side congeries of cities, it is the natural and actual nucleus,—stretching its gas-lighted streets in every direction, to Elizabeth, to Orange, to Bloomfield and Montclair, and seven miles along the Passaic on both sides. Newark is a city of a special character, quite the antipodes of Paterson or any other mill city. Instead of machine tenders, it is full of skilled artisans, and hence it is and always will be the home of the finer mechanical arts. At Elizabethport, sewing machines for half the world are made. The anthracite coal of eastern Pennsylvania is the best fuel, ton for ton, in the world. It naturally seeks tide-water at this point, coming down from the mountains to the sea by easy descending grades, in long trains, with great economy of motive power.

The cost of this coal at Paterson or Newark is only about half its cost in the New England manufacturing towns.

The west side of our future cosmetropolis is provided not only with unlimited water-fronts for commerce, and immense level spaces for factories, warehouses, and railway tracks and yards, but it has lofty plateaus and ridges overlooking all the busy haunts of labor and commerce, and admirably adapted for residence quarters. Between the Hudson and Hackensack rivers rise the Palisades—precipitous walls on the east, steep slopes on the west, and on the top a broad table-land. Mountain-high at its northern extremity, this singular formation descends gradually as you follow its crest until it meets tide-water opposite Staten Island. Its lower end is covered with a village-like growth, belonging partly to Jersey City, partly to Hoboken, and partly to petty municipalities. Forty thousand people now live upon this lofty ridge. The number will increase to two hundred thousand, perhaps to half a million, with the growth of the metropolis and the now assured construction of the Palisades railroad, running from Jersey City the whole length of the ridge. At the upper end of the Palisades, the country is still nearly all forest. The Palisades railway, connecting with the new ferry of the West Shore Company, will reach the heights by an easy grade through Opdyke's Gorge, and run northerly along the summit to Alpine (opposite Yonkers), at such a distance west from the cliffs as not to disturb their seclusion and repose. The few villa residents established here are the pioneers of thousands who will soon convert the whole plateau into a park and a garden. Like an island in the atmosphere, hung in all its sylvan wildness over the crowded roofs and ways of men, the scenery of this outlook is simply amazing. Not that it is vaster in extent than may be seen from other summits, but that it groups features of grandeur so diverse and opposite, such a range of the boldest contrasts, from the largest scale of man and civilization back to the monstrous forms of chaos, all right under an eye poised in mid-air. You toss a pebble out and watch it fall, down, down, until it approaches the topmast of some gallant ship in the busy but here noiseless port below. There is the ocean far out on one hand, and the measureless magnificence of scenery stretching westward to the Ramapo mountains on the other, and between are the great rivers converging into the wonderful harbor of New York, with their countless fleets and shining sails and bustling steam flotilla,—all down, almost plumb down, it seems, beneath your eyrie crag. And still around you, in this weird altitude, is a world above a world, of green groves, lawns, and the homes of happy people.

Between the meadows of the Hackensack and the valley of the Passaic is another ridge less lofty, already dotted with villages. Still further west rises the Orange Mountain. On the approaching slopes gleam the pretty towns of Orange and Bloomfield, where thirty thousand people find pleasant homes, with flowers, gardens, lawns, and shaded streets, and city comforts of water, gas, and street railroads. On its spreading base sits Montclair. The terraced ascent from tide-water at Newark to the green crest of Montclair, faces the sunrise with a land-rise of six hundred feet in six miles. To a spectator on the heights, the emerald sea comes up in a succession of long rollers crested with foam of cities and flecked with gleams from a hundred thousand roofs. The luxuriant verdure rolls half up the vertical rock face of its western wall, the "Wat-Chung," or First Mountain,—aboriginally and historically so called, although we fancy the ultimate designation of its commanding brow will naturally be that we have assumed for it—Montclair Heights.

From this grand gallery of the metropolitan amphitheater, at any point in its eight miles' length, the level eye strikes through the clear upper air far over the towered heights of the Hudson and Brooklyn shores to the clouds that blend with the ocean horizon. The lowered glance falls through crystal depths far down to a bottom overspread with great and minor cities; with populous villages; with the homes and works of over two millions of people; with a maze of broad rivers, harbors, and fleets; with smoke-traced lines of transportation converging from all the continent; and with a world of luxuriant scenery besides, in which all this commercial magnificence looks scattered and obscure.

Space is wanting here to complete the circuit of the great city's beautiful suburbs—to speak of more distant New Jersey towns like Plainfield, Westfield, Rahway, and many others, essential parts, all of them, of the life of the metropolis, and bound to it by the daily passage to and from New York of half their populations. Space also is wanting to speak of Staten Island, that picturesque combination of highlands, forests, and sea, rimmed round with villages and destined to be covered with suburban homes; or to describe the summer towns by the ocean, which make almost a continuous line of hotels and cottages for forty miles out of the city on the Atlantic coasts and the shores of the Sound.

We have barely sketched the ground plan of the future cosmetropolis and its suburbs.

Two millions of people now live within its natural limits. It is not rash to predict that, long before another century passes, its population will surpass that of London, and that it will be the unrivaled center of finance and commerce, of luxury and fashion, of art and literature — the heart and brain, in a word — of the civilized world.

William C. Conant.

AT CASTLE HILL, NEWPORT, R. I.

An isle that swims a galaxy of isles,
Like flowers afloat upon the breast of ocean,
O'er whose horizon many an island piles
Its rocks of fleece, and cape by cape beguiles
The view with lands in soft, continuous motion.

An island whence are isles and isles descried,
Green, brown as moorland, fringed with sea-weed yellow
Whereto there flame by night across the tide
The eyes of islands that must lonely bide
Till darkness falls before they greet their fellow.

And into isles a charm the land divides
Whenso the white scales of that serpent quiver
The sun abhors; coil upon coil it slides
Up from the sea, and through the hollow glides,
And moats the hill-tops with a ghostly river.

An isle whose fiords are islanded again,
Whose lakes, where cardinals flash and lilies cluster,
Have isles the fragrant iris loves to stain
With purple eyes wherein the eye is fain
To note small islands black and gold of luster.

The very moon along the eastern wave
Glows like an island of clear brass, and wonder
Falls with the twilight to behold her pave
The bay with islets bright as tides that lave
The sun when he with all his pomp goes under.

Foregather still to isles the wind-worn trees,
Their verdures differing from swamp and dry land;
The flocks of sheep that crop the perfumed leas
Bunch into isles, and, hark! upon the breeze—
The clang of wild geese from their feathery island!

And there be hours when unseen crystal hands
Pour from on high upon the isles an ichor,
Balm for dull eyes; when, as at stroke of wands,
Specters will start, faces of lonesome strands
Leap to the view athwart the salty liquor.

Ah, every man and woman of the maze
Is but an island, ringed by waves abysmal;
And though they yearn, and though they go their ways,
And woo and wed, seldom the chosen gaze
True-eyed, by night, across the waters dismal.

Charles de Kay.

INDIAN WAR IN THE COLONIES.*

BY EDWARD EGGLESTON.

FALLING CREEK, VA. SITE OF THE FIRST IRON-WORKS, DESTROYED IN THE MASSACRE OF 1622.

I.

THE EARLIER INDIAN WARS.

THE Virginia colony, in its early struggle with want, was saved from complete overthrow at the hands of the savages by the address of Captain John Smith, by the imperviousness of English armor to arrow-shots, and by the frightful detonations of matchlock guns and small cannon. After the marriage of Pocahontas there ensued an era of good feeling in which the confederated tribes of the Virginia peninsulas found it better to trade with white men than to fight them. Meantime, English religionists cultivated a sentimental enthusiasm about the Indians, founding a school and devising other things for the wild men as laudable in aim as they were impossible of execution. The eager pioneers, feeling secure and intent on opening ground for growing tobacco, planted their cabins farther and farther apart along the inviting river-banks. They traded with the savages for corn, and hired them to shoot with English fowling-pieces the great bronze-breasted wild turkeys, the innumerable pigeons,—whose flight by millions sometimes obscured the sky and was thought an omen of evil,—and the water-fowl that gathered in countless flocks upon the bays and tributaries of the James River. These Indian hunters lived in the houses of their employers, penetrated the mystery of European habits, and became expert

with fire-arms, so that the dread of the white man's magic charms and deadly thunderbolts wore away. Even the implacable old Opechancanough, who had come to the leadership on the death of Powhatan, seemed to be friendly. He accepted a house from the manager of the college lands, and found no end of delight in locking and unlocking the door. The savages entered freely the isolated and unfortified cabins of the settlers without so much as knocking; they ate from the planters' supplies, and slept wrapped in skins or blankets before the wide-open fire-places. The former hardships of the colonists were fast sinking into that happy oblivion which peace and prosperity bring.

But in 1622, on the 22d of March (Old Style), in the middle of the day, while the men were afield, the Indians fell upon the women and children in the houses and the men who worked unarmed abroad, killing the settlers with their own axes, hatchets, hoes, and knives, hacking and disfiguring their dead bodies, and then, fortunately, pausing to pillage and burn the dwellings. The unutterable outrages on living and dead, so familiar in the history of Indian massacres from that time to this, appeared in this first onslaught. The plan had been well laid to exterminate or drive away every Englishman from the coast. One Indian of those dwelling among white men and under missionary influence was touched with compassion. As he lay upon the floor the night before the massacre, he received from a companion the authoritative command of his tribe to kill the master of the house in which he lived: but he rose and whispered a warning to his benefactor, who carried the tidings across the water into Jamestown, so that the authorities were able to check the Indians after three hundred and forty-seven Europeans had been slain. The savages had not quite lost their fear of the English; they turned back from every show of force, even from an empty gun in the hand of a woman.

One-twelfth of the whole colony had fallen, almost within a single hour. The Virginia planters had no countrymen on this side of the sea except the remote handful of famine-stricken pilgrims beyond Cape Cod; and this destructive blow appalled the colonists, and there was talk of fleeing to the eastern shore of the Chesapeake for security. But, under prudent leadership, the settlers were drawn together into the stronger places and made to present a compact and undaunted front. They built palisaded houses and carried their arms in the field and to church. A savage ferocity, born of resentment and terror, showed itself, and the white men did not scruple to treat a perfidious foe with shameless bad faith. How else could English soldiers, in cumbrous armor, ever come up with bowmen so fleet of foot and so light of baggage? Affecting to make peace, the English appointed the 23d of July, 1623, as a day on which to fall simultaneously upon the unsuspecting Indian villages, slaughtering the people, burning the wigwams, and cutting up the growing maize, so as to leave the savages to a winter of misery and starvation. Another attack was made in 1624, when eight hundred Pamunkeys and other Indians made a brave stand for two days, but were at length beaten by the odds of fire-arms and defensive armor.

In 1644, twenty-two years after this first massacre, when Opechancanough was shriveled and palsied with age, unable to stand on his feet or to open his eyelids without help, he was borne on a litter to command in a new attack. The Indians, hearing that there was civil strife in England, and having seen a battle between a king's ship and a parliament ship in the James River, thought it a good opportunity to make a clean sweep of the English. Five hundred were killed in two days, but the arrival of the governor with an armed force put the savages to flight. Opechancanough was afterward taken and carried into Jamestown, where a soldier appointed to guard him shot the unmollified centenarian, to whom were attributed so many woes.

Very different in origin and outcome from the Virginia war was the beginning of sorrows in New England. The Dutch purchased the Connecticut River country from the powerful Pequots, who had recently expelled the tribes formerly seated on its banks. Thereupon English settlers brought back the former owners, gave them the protection of an English fort, and from them acquired a rival title. This inflamed the jealousy of the Pequots, some of whom made themselves amends by killing the unarmed crew of a trading boat from Virginia. The allies of the Pequots on Block Island also slew John Oldham, trading thither from Massachusetts.

Captain Endecott, afterward governor of Massachusetts, commanded the force sent out in 1636, with orders to bring these Indians to reason by putting to death all their able-bodied men. Endecott was very brave in chopping down May-poles, banishing churchmen, and hanging Quakers, but he was not so well suited to contend with Indians. On Block Island, he burned the combustible wigwams and cut to pieces seven canoes, but the nimble savages retreated to hiding-places according to their wont. Flushed with triumph, Captain Endecott then sailed to "Pequot Harbor"—now known as the mouth of the Thames River—in Connecticut. Here the

Pequots outwitted him by keeping negotiations open until they could remove their families and household stuff. The English at length "beat up the drums" as a challenge to battle, giving fair warning to the fleet savages to get out of the way before the guns were discharged. The Pequots shot off some arrows and then ran away under fire. Endecott returned to Boston without losing a man or impairing the enemy's strength. The handful of settlers on the Connecticut, and the little garrison under Lieutenant Lion Gardiner at the mouth of that river, were left to endure as best they might the fury which this expedition had provoked. The insolence of the emboldened and enraged Pequots now passed all bounds. They made raids on the Connecticut settlers, killed and captured straggling soldiers from the fort at Saybrook, torturing every hapless white man that fell into their hands, and repeating within hearing of the garrison the cries, groans, prayers, and distressful ejaculations uttered by those whom they had tormented, mimicking and deriding their agonies, and wearing head-bands made of the fingers and toes of their victims.

In May, 1637, John Mason, who had won the favor of Fairfax in the war in the Netherlands, was given command of a little company drawn from the yet feeble Connecticut settlements, with the addition of twenty Massachusetts men under Captain Underhill. Mason was ordered to attack the Indians at Pequot Harbor, and his officers, impatient to return to their imperiled families, voted to obey the orders. But Mason, seeing the futility of this, appealed to higher authority by asking the chaplain to inquire the mind of the Lord. After a prayerful vigil, Chaplain Stone decided that Captain Mason was right, and the expedition sailed eastward. The deluded Pequots thereupon gave themselves over to feasting and to making preparations for a raid on the settlements, while Mason came about and assailed them on an unexpected side.

No more daring and brilliant surprise was seen in early colonial warfare than that accomplished by this forlorn hope of seventy-five. The Indian allies of the English fell back with terror as the troops approached in the night the strongholds of the dreaded chief, Sassacus. After an exhausting march, the Connecticut men slept a few hours at what is now called Porter's Rocks, and then at day-break surrounded the palisaded village at Mystic, where the barbarians, wearied with their revelry, were all asleep. In the first onset Mason hit upon the dreadful expedient of setting the wigwams afire. In less than two hours, five or six hundred men, women, and children had perished. They were shot down off the palisades, whither they climbed to escape the heat; those who essayed to break through the lines were put to the sword; those who succeeded in passing the English fell by the tomahawks of the Indian allies in the rear; and many, in mad desperation, threw themselves into the flames. A whole community was destroyed at a blow. So heart-rending were the cries of victims in the fire, so ghastly the aspect of the dead and dying about the fort, that the younger soldiers, unhardened by cruel scenes, were touched with compassion and horror; and it was necessary afterward to cite the massacre of the Canaanites, and David's "saws and harrows of iron," to justify this slaughter.

In the war which followed, the powerful Pequot tribe was obliterated. Fugitives were pursued toward the confines of New Netherland, and numbers of the doomed tribe were slain not only by the troops of Connecticut and Massachusetts, but by the neighboring savages, who were always ready to engage on the winning side and had many reasons for hating the Pequots. Trophies of heads and hands were sent to Boston, Hartford, and Windsor, as good-will offerings from the neighboring tribes to the English. Those of the enemy who obtained mercy when the sword was weary with the disgusting slaughter were either sold away to the consuming slavery of the West Indies, reduced to servitude in the colonies, or divided between the Narragansetts and Mohegans, and New England had peace for nearly forty years.

In Maryland, a conflict with the tribes broke out about the time of the close of the Pequot war in Connecticut. The first contest with the Susquehannas seems to have dragged its indecisive course through thirteen years, and when peace was made with this tribe there was still trouble from some of the bands on the eastern peninsula. The records are so defective that we are only able to see occurrences in a sort of historic twilight; the Indian wars appear to be without beginning or end. We catch a dim vision of the gallant figure of Colonel Cornwayleys, "the guardian genius of the colony," as, at a later period, we hear of the exploits of Colonel Ninian Beale. We are able to conjecture something of the distresses of the infant colony during a prolonged Indian war, to which were superadded religious dissensions, insubordination, and more than one revolution. Meanwhile, Virginia was never free for many years at a time from the scourge, and in 1656 her troops suffered a bitter defeat near the present site of Richmond, at a brook which still bears the name of Bloody Run.

During the prevalence of these wars in the

BLOODY RUN, RICHMOND, VA. SCENE OF THE BATTLE WITH THE RECHAHECRIANS.

Chesapeake country, the heedless and unscrupulous Kieft, who bore rule over the Dutch colony, provoked a conflict with the Raritans in 1640. Three years later, he took advantage of the distressed state of some Indians who were huddled near a brewery at Pavonia in mortal terror of the Mohawks, to fall upon their camp in cold blood, in order to avenge the death of two Dutchmen murdered by certain savages some years before. This dastardly onslaught led the Long Island and the North River clans to make common cause, and as many as eleven tribes were soon in arms against the colonists of New Netherlands. In the extreme distress produced by this war, many New Amsterdam people took refuge in Patroon van Rensselaer's colony at Fort Orange, now Albany, while all who could get away fled back to Holland. The Indians suffered even more severely. Underhill, one of the commanders at the Pequot fort, who had a "sufficient light from the Word of God for the proceedings" on that occasion, had afterward fallen into disgrace and church censure in Boston on account of licentious behavior and betaken himself to the Dutch territory, where such offenses were less regarded; and now in the employ of the New Amsterdam government repeated the Connecticut tactics of burning a whole village at once By one means and another sixteen hundred Indians perished before the war was ended. A peace was at last made by the intervention of the Iroquois in 1645 New Netherlands had suffered the annihilation of its out-settlements and an almost complete depopulation of its little capital in this attempt to "put a bit into the mouths of the heathen."

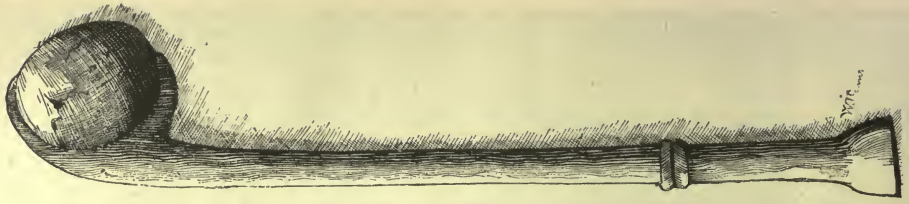
Ten years later, while seven hundred men from the Hudson were waging bloodless war for the subjugation of the Swedes on the Delaware, the Indians entered the very streets of New Amsterdam and committed outrages in retaliation for the killing of a squaw who had been shot while stealing peaches. The Staten Island and New Jersey settlements were ravaged. Again, in 1658, after many irritations on both sides, the rashness of some

PORTER'S ROCKS, MYSTIC, CONN.

settlers at Esopus on the Hudson brought on a conflict, in which many colonists were killed and ten burned at the stake in plain sight of the fort.

In 1675, there came upon the thriving New England colonies that struggle between Indian ferocity and English endurance known as King Philip's war. Philip's father was Massasoit, the ally of the Pilgrims. His son and successor, Alexander—so called by the English— had been rudely put under arrest by the Plymouth authorities on suspicion of hostile intentions. Soon after his release he died, some thought of grief and humiliation. Philip, who succeeded his brother, was a typical Indian chief, arrogant and cringing by turns. It pleased his inordinate vanity to plot against the English, though he shrank from the actual collision, which appears to have been brought about at last, as so many Indian massacres have been, by the impetuous valor of the young warriors,—members of that fierce democracy known in the western tribes at the present time as "the soldiers' lodge,"—a body which often carries the day against wiser counsel when war is in the making. But Philip's arrogance, matched by that of the General Court at Plymouth, rendered the collision inevitable sooner or later.

Had those in authority at Plymouth and Boston appreciated the immense advance in power which the Indians had made in acquiring the use of the white man's weapons, they might have found means to avoid a conflict which presently brought upon them, in addition to Philip's Wampanoags, the Nipmucks of the Massachusetts middle country, the populous clans of the Connecticut valley, the powerful Narragansetts of the coast south of Cape Cod, and after awhile the Tarranteens of the East. Little acquainted



INDIAN WAR-CLUB. (FROM THE ORIGINAL IN THE MASSACHUSETTS HISTORICAL SOCIETY'S CABINET.)

with Indian warfare, the white men fell into one ambush after another and suffered surprise after surprise. Marching in close order, the strength of a party was easily reckoned and its ranks readily cut to pieces by the skulking foe. "Our men," says Gookins, "could see no enemy to shoot at, but yet felt their bullets out of the thick bushes." For a long time there was little but disasters of sudden massacre and overwhelming defeat, of families slain, hamlets in flames, and women and children carried into captivity. The Puritans sought to placate an angry deity by fasting and humiliations, and by laws against such abominations as the wearing of long hair by men and the wearing of short hair and too many ribbons by women. Young people were forbidden to drive together, and God was to be pleased by a renewed persecution of the Quakers. But, in spite of these reforms, Captain Hutchinson and sixteen men were cut off by an ambush near Brookfield; Captain Beers was slain with twenty of his men while on his way to Hadley; Captain Lathrop, attempting to reach Hadley a week later, was cut off with almost his whole troop of about a hundred men. Northfield and Deerfield were abandoned to be burned by the savages, and a considerable part of Springfield was destroyed. What seems now to have been a rather impolitic attack on the Narragansett stronghold resulted in a victory, purchased by a loss so great that the slender military force of the colonies was staggered by it. The scattering far and near of the enraged warriors of this powerful tribe, homeless and famine-stricken in a bitter winter, only aggravated the sorrows of New England. In midwinter, Lancaster was destroyed and forty of its people slain and captured. The daring enemy penetrated to within twenty miles of Boston, and assailed Medfield and Weymouth. Almost the whole of the old colony of Plymouth was laid waste, Warwick in Rhode Island was destroyed, and Providence was partly burned. Pierce and his whole party of fifty fell by an ambuscade, Wadsworth and a like number were cut off in the same way; and so numerous and disheartening were the disasters, that the total depopulation of Massachusetts colony began to be feared.

But, however inferior the colonists might be to the Indians in the skill needed for a forest war, it was soon shown in New England, as elsewhere, that civilization has superior staying quality. The infuriated savages at length exhausted themselves by the very energy of their attacks. Having no stores or resources, and no efficient organization, they could not hold together. As spring advanced, the Indians scattered in small hunting and fishing parties to avoid perishing. The Connecticut River tribes grew weary of wandering from place to place in hunger and continual terror of the persevering colonists, and Philip became unpopular as the author of their wretchedness; the Mohawks showed hostility to Philip, and the Nipmucks were overawed by the now successful white men. Philip and his immediate band doggedly returned eastward to their old haunt at Mount Hope. Here the first real frontier warrior of New England, Benjamin Church, at the head of a motley troop, was beating the savages at their own game of skulking, ambuscade, and surprise. The war was virtually ended in August, 1676, when Philip, seeking to make a timely escape from a swamp, as he had often done before, was killed by one of his own Indians who had deserted to Church's party. Vengeance was wreaked upon his dead body, which was quartered and hung upon trees. One of his hands was delivered to the man who killed him, to be carried round for a penny peep-show, and his head was taken into Plymouth on a public thanksgiving day, and stuck upon a gibbet after the barbarous fashion of that time. "God sent them the head of a leviathan for a thanksgiving feast," brags Cotton Mather, who, some years afterward, robbed the head of its jaw-bone, which he carried to Boston as a relic.

Never were thanksgivings more sincere than those offered in Plymouth and Massachusetts. Upward of two thousand Indians had been slain, the greater part of those who remained alive had been sold into West Indian slavery, and the danger to the colony had passed away. But never were public rejoicings more deeply tinged with regrets. The out-settlements were ruined; six hundred dwellings were in ashes; the accumula-

KING PHILIP'S SAMP-BOWL AND LOCK OF GUN WITH WHICH HE WAS KILLED. (FROM THE CABINET OF THE MASSACHUSETTS HISTORICAL SOCIETY, BY PERMISSION.)

tions of years had been wasted; and worst of all, the flower of Massachusetts' manhood — one-eleventh of all her able-bodied men — had been cut off untimely. Every family in the colony was in mourning.

The disasters of the war with Philip alarmed the more southern colonies and perhaps aggravated the severities of the Marylanders and Virginians in the difficulties on their own frontiers in 1676. The fierce Susquehannas, who had often and for long years together troubled the exposed settlements, were again at war with Maryland and with the Five Nations at the same time. The Virginians of the "northern neck" naturally sympathized with their neighbors across the Potomac, and aided them against the Susquehannas by a party under Colonel John Washington, ancestor of him who commanded the forces of the United Colonies a hundred years later. The English colonists, under the rash lead of John Washington and others, perfidiously put to death chiefs who were sent out of a beleaguered Indian fort to sue for peace, and thus brought upon the Virginia frontiers the Susquehannas, in addition to their other enemies, the Doegs. Sir William Berkeley justly rebuked the commanders for this foolish perfidy; but the corruptions of Berkeley's despotic administration had lost him his early popularity, and since he was known to have a profitable interest in the Indian trade, and

TURTLE-SHELL RATTLES OF INDIAN MAKE. (FROM THE NEW YORK STATE CABINET OF NATURAL HISTORY.)

to be therefore averse to hostilities, his arguments in behalf of peace were not heard. The forts he built on the frontier were burdensome and of no use, except to favorites and perhaps to the old governor himself, who had almost lost human feeling in the transmutation of his passions into a senile avarice and vindictiveness. The people "at the heads of the rivers," as the frontiersmen above tide-water were called, saw themselves left exposed to the continual incursions of the savages in order that a clandestine Indian trade might not be interrupted. There was no printing-press, and few dared speak their thoughts in conversation; but certain tart proverbs passed from mouth to mouth, as that "No bullets could pierce beaver skins," and "Rebels' forfeitures would

OUTACITE, A CHIEF OF THE CHEROKEES. (FROM AN OLD PRINT.)

be loyal inheritances." For the old governor, intent only on heaping up wealth from the Indian trade, and ready to make profit by the forfeiture of the estates of those who should be stung by accumulated grievances to break into rebellion, refused even to allow the frontiersmen to go against the Indians at their own charge. But three hundred of these put themselves under a gifted young orator and captain, one Nathaniel Bacon, the most romantic figure of his time, who wrung a commission from Berkeley by threats, and then attacked and defeated the savages, utterly destroying one fortified Indian village. On his return, he found himself outlawed by a proclamation of the governor; but he drove Berkeley to the eastern shore of the Chesapeake, and made himself famous as a premature patriot who sought to throw off the abuses of colonial government a hundred years before the time. "Bacon's Rebellion," as it was afterward called, was cut short by the sickness and death of the young leader; but the severe punishment he inflicted on the Indians was followed by a long peace to the Virginia border.

In 1680, the southern settlements of Carolina, yet in their infancy, were almost ruined by a war with the Westoes. In 1711, the Tuscaroras, encouraged by factious dissensions and intrigues among the North Carolina settlers, ravaged the borders of that colony, seizing and torturing to death Lawson, the accomplished surveyor-general of the province, and committing ingenious outrages and hideous practical jokes on those who fell victims to their fury. Through the intervention of Governor Spotswood of Virginia, peace was made with a fragment of the tribe led by the chief, Tom Blunt. The main body of the Tuscaroras, assisted by some volunteers from the Five Nations, maintained the war for two seasons; but they were finally beaten by the North Carolinians, with the help of militia from South Carolina and Virginia and of some South Carolina Indians. Such as survived the war and escaped capture retreated through the back country of Virginia and Pennsylvania to New York, joining the kindred Iroquois Five Nations, which thenceforward took the name of the Six Nations.

But having once tasted victory, Indians do not easily stay their hands. The Yamassees, who helped to subdue the Tuscaroras in this war of 1713, and who made a pretty penny out of it by the sale, in Charleston, of hundreds of captives to be carried as slaves to the West Indies, were soon afterward seduced by the Spanish in Florida to attack the settlements in South Carolina Indeed, every Indian tribe from Florida to Cape Fear River was drawn into this destructive conspiracy. In no Indian war had the odds against the European settlers been so fearful. Six or seven thousand warlike savages were under arms against a province whose enrolled militia counted but twelve hundred men. Even Charleston was in danger from an enemy so formidable, and each citizen was obliged to do guard duty every third night. Governor Craven gathered an army that included every man who could be of service; even trusty negroes were in its ranks. Appreciating the desperate extremity of risk, he marched with the utmost caution until, at length, he brought the Indians to a stand at a place called Saltcatchers, where, with the fate of the colony staked on a single cast, he fought and defeated the Indians, and delivered South Carolina from obliteration But wandering scalping parties still inflicted outrages on the border until the Yamassees were finally beaten and driven off in 1718.

The history of the other Indian wars belongs to the story of that intercolonial struggle that drove France out of North America. Of this long conflict, the later Indian wars were but incidents.

II.

OCCASIONS OF INDIAN WAR.

NOTHING can be more erroneous than the popular notion that a neglect on the part of the colonists to purchase the lands on which they settled lay at the root of the ever recurring difficulty with the Indians. It was not always easy to acquire a sound and per-

petual land title from tribes who knew no such thing as ownership in severalty, nor any definite national boundaries, who rather occupied than appropriated land, and whose occupation was rarely of very ancient date. The only limit of savage migration or occasional wanderings was the fear of enemies. Until white men had educated the Indians to more definite notions, the payments for land probably seemed to them a kind of peace-offering, such as one migrating tribe might send to a powerful next neighbor, rather than an equivalent for that which they had never thought themselves to possess as a vendible article. Much has been said of Penn's purchases, but long before Penn's time the custom of purchasing the land prevailed, nearly all of the territory settled in Virginia, New England, New York, the Jerseys, Maryland, and Carolina having been purchased by treaty from the Indians. In many cases, at first, individual settlers paid the Indians a gun, a few yards of duffel cloth, a Stroudwater blanket, or some other trifles, for what land they could occupy; so that many good land titles in the older settlements have no other starting-point than "Indian rights." To prevent fraud upon the Indians, the minimum price was fixed by a Delaware court, in 1681, at one match-coat (a sort of blanket to be thrown over the shoulders) for six hundred acres of land, and above that at two match-coats; and, in the same year, we find one Brimble paying for six hundred acres three match-coats, twelve bottles of drink, and four double-handfuls of powder and shot. The low prices are not surprising, if we consider that there was yet nearly half a planet of virtually unoccupied land. The twenty-two thousand acres of New York City, included in Manhattan Island, only brought the Indian proprietors about twenty-four dollars in the year 1626; a township in Maine was purchased for a hogshead of corn and thirty pumpkins; and an extensive tract in Woodbury, Connecticut, was long called Kettletown, from the fact that it was bought for a brass kettle.

The land having no great value, boundaries were not accurately marked. The first land bought by the Swedes on the Delaware was described as "included between six trees." A tract on the Hudson river is defined as running back "two days' travel into the country," and a certain body of land in Connecticut was to extend "about a musket-shot" beyond a certain stream; while the land between two creeks was sold to Penn "backward as far as a man can ride in two days with a horse." Such doubtful and ambiguous grants were often sources of irritation between the Indians and the colonists. In the case of the famous "walking purchase," the unscrupulous sons of William Penn defrauded the Delaware tribe out of about four hundred thousand acres by hiring the fastest walkers in the province to make the longest possible pedestrian journey, on a prepared path, in the day and a half stipulated by the treaty, and then running a cross-line at a false angle.

It is not surprising that the Indians, having parted with their hunting-ground, perhaps for an anker of brandy and a few Stroudwater blankets or match-coats, with some hoes and hatchets, to which may have been added a number of handfuls of powder and shot, a few little looking-glasses and perhaps a hundred jew's-harps, should rue the sale as the years went on. The perishable articles were worn out and forgotten, and even the jew's-harp lost its charm when the Indian saw the white men growing rich on land that he had thrown away. The instability of the "Indian giver" is a proverb in America to this day. Notions of property were confused among the half-communistic tribesmen; whatever one could get and keep was his own until it had to be yielded to a stronger claimant or to some ancient and inflexible custom. If the purchased land was not at once occupied by settlers, the Indians who still hunted on it thought that it should be bought over again, and did not like the bringing forth of treaties and deeds signed with the totems of their chiefs and forefathers. Writing, complained one chief, had done the Indians much harm. King Philip was wont to claim and receive fresh payments for land ceded by his father on the ground that the boundaries had not been rightly understood.

Differences in modes of living caused many annoyances on both sides. The hogs which roamed at large ate up the clams on which the sea-coast Indians depended, and the indignant squaws pleased themselves by calling a pig a "dirty cut-throat." The cattle of the white men easily found their way into the unfenced fields of the Indians, and the latter sometimes revenged themselves by killing a trespassing cow or horse. To prevent such losses and consequent quarrels, laws were made in several colonies, obliging the town or neighborhood to help the Indian to fence his corn or to pay for the damages done. Sometimes neighboring Indians were conciliated by plowing their land for them. The sale of rum was a great grievance to the savages, who were rarely able to resist the seductions of the keg, but who always repented with bitterness when the debauch was ended and the winter's hoard of furs was foolishly expended. At such times, they

laid up a store of hatred against the trader who had fattened on their folly. Still more deadly was the hostility awakened by the dealers in Indian slaves, who bought the captives taken from one tribe by another or kidnapped in cold blood by white men, and sold them into slavery in the sugar islands. Laws were enacted against this traffic in Virginia, and Archdale, the humane Quaker governor, gave a temporary check to the trade in Carolina in 1695, but the large sales of Indians at the close of the Tuscarora war, in 1713, showed that the market was still open.

English notions of law and justice were often incomprehensible to savages. The colonists brought with them that hearty contempt for all aliens and pagans that belonged to their island ancestors, and they were quite unable to understand the Indian view of judicial and international concerns. The colonial authorities were wont to persuade the tribes to subject themselves to the English sovereign as became heathens. Unaccustomed to obey their own chiefs, the savages did not for a moment understand this ceremony in the English sense. The Massachusetts authorities perceived this in Philip's case, and represented to Plymouth that Philip had not meant to subject himself to the old colony in reality. Philip, who was proud and arrogant when he was not mean and cringing, seems to have been quite puffed up by the royal titles and functions which the first English colonists, in their inability to understand the real nature of a head sachem's office, were accustomed to attribute to him. His father had been extremely poor, as most of the sachems were; but the sale of lands probably increased Philip's revenues, and he adorned his coat and buskins lavishly with wampum wrought "in pleasant wild works and a broad belt of the same," and his whole accouterment was accounted worth at least twenty pounds, a large amount in that time. He came to adopt the pompous notions of his own dignity which the settlers had conferred upon him. After he secured a secretary from among the backslidden mission pupils, he subscribed himself "King Philip, His Majesty P: P," the last P, "writ large," being his mark; and as his irritation against white men increased, he called himself the brother of King Charles, refusing haughtily to treat with anybody less royal than himself.

But Plymouth harshly exacted submission; and, throughout the war, the Indians were accounted rebels guilty of high treason. So the Yamassees in South Carolina were said to have "thrown off their allegiance,"—an allegiance no more real than that of a tribe of Carolina beavers might have been. Ceremonies were cheap and were always pleasing to savages. The Cherokees, in 1730, at the suggestion of Sir Alexander Cumming, sent a deputation of seven chiefs to London with a crown, four scalps of their enemies, and five painted eagles' tails, all of which they solemnly laid at the feet of George II., in the presence of his "beloved men," as they styled the king's councillors. To them, this was a ceremony which meant no more than the transferring of their friendship from France to England.

The colonial courts assumed to hold jurisdiction over the Indians in some cases, and they often stretched their authority very imprudently. Their administration of justice to the Indians was usually fair, though the methods were inexplicable and contemptible to a savage. One Plaistowe was condemned in Massachusetts, in 1631, to repay double for corn he had taken from the Indians, to pay £5, and to lose his right to the title "Mr."; while his accomplices of lower rank were sentenced to be whipped. Two Indians, having assaulted some persons in Dorchester, in 1632, were sentenced to be put in the bilboes, and their own sachem was required to beat them. The Narragansetts were highly pleased with the severity of English justice when three white men who had killed and robbed an Indian, in 1638, were executed at Plymouth. But many of the criminal proceedings in the colonies were beyond the comprehension of an Indian. For example: Five Indians who seized a little vessel at Newfoundland, in 1726, were tried in Boston and hanged,—the court not finding a way to acquit them or to administer a lighter punishment, because the offense was technically piracy under English law. The savages probably never had the consolation of knowing that they were victims to the nicety of the Anglo-Saxon mind, which made a wide difference between the capturing of a cart in the road and the making prize of a boat on the water.

Among the Indians, there was a merciful provision for the prevention of endless vendettas by the payment of a ransom for the life of a homicide. It might have saved a destructive war in New Netherland if the Dutch had accepted a sufficiently heavy fine for such an offense, or had paid one in the case of the murder of an Indian by men who could not be detected. In Massachusetts, the son of a chief, Mattoonas, was accused and convicted of the murder of a white man. He was not only hanged, but his head was cut off and stuck upon a pole, where it remained for years, the colonists probably not suspecting the effect of such an exhibition on the Indians.

Naturally enough, the father of the young man thus used for a solemn example is said in Philip's war to have been "an old, malicious villain, who was the first that did any mischief within Massachusetts colony." The lust for inflicting justice upon offenders was the weakness of the Puritans, and, in a less degree, of the other English colonists. The trial at Plymouth of the men accused of the murder of Sassamon was a direct interference with Indian jurisdiction. Sassamon, an educated Indian, had betrayed Philip's plans for an attack on the settlement, and had, perhaps, made his information as important as he could. He was afterward found slain, no doubt by command of the chief and his council, in the secret and sudden Indian fashion. Three Indians were hanged for this crime, and the principal must have been guilty, for the body of Sassamon, who had been long dead, bled afresh when the accused murderer touched it, as such corpses had a way of doing at that day. Since Sassamon's death was no doubt a judicial execution, Philip had a show of reason when he declared that the English "had nothing to do with hanging Indians." It was an impolitic affront at a critical moment.

There were also forces at work among the Indians which have been rarely understood by white men, and least of all by officials. Rivalry with another chief will often force a head chief into hostile actions that he may retain his leadership. War of some sort is indispensable to the happiness of a young Indian, who is not a man until he has won reputation with his tomahawk. The savage nature pines for the excitement of slaughter; the Indian is held in contempt by the tribe until he is a warrior, and the very maidens often repel the advances of a man who has taken no scalps.

The Indian suffered much from unscrupulous fur-buyers. The cunning of Jacob, though low enough, was a step higher on the ladder of ascending civilization than the violence of Esau, but Esau could not easily restrain a disposition to repay the over-reaching craft of the trading brother with a knock on the head. It was in the very nature of a trader to defraud a savage, and equally in the very nature of a savage to settle the account in his own surprising way. When Major Waldron, at an outbreak of Indians in Maine, fell into the hands of his infuriated customers, they reminded him of a trader's easy mode of thrusting one hand into the scales for a pound weight. Having cut off the poor old major's fingers, they demanded: "Waldo! does your hand weigh a pound now?" Traders were often the earliest victims of Indian wars; ninety of them were cut off at the outbreak of the Yamassees in Carolina.

The rule of tribal retaliation, by which any man in a colony or tribe was liable to be slain for what a fellow-tribesman had done, seemed one of perfect equity to the Indian. A Susquehanna chief expressed the principle by an easy formula: "One pays for another." In 1626, an Indian was robbed of his peltries and killed by some Dutch farm-servants, who had waylaid him near a lonely pond of water, the site of which is now among the great warehouses of New York. His little nephew, who saw the deed, was bound by ancient custom and family duty to avenge upon some other Dutchman a crime of which the actual perpetrators could not be found. Fifteen years later, an honest old wheelwright, one Claes Smits, built himself a house and shop on the lonely, wooded road that skirted the shores of the East River, where now the wharves are crowded with ships. The grown-up nephew of the Indian long ago slain, with an Indian's inability to forget, settled the ancient score by one day killing with his hatchet the harmless and unsuspecting Claes and pillaging his house. The young man then returned to the bosom of his tribe with the approval of his own conscience and the applause of all good and brave Indians.

This incident was one of the chain of events that brought on Kieft's war, and in it we see the root of the whole difficulty: the standards of right and wrong, and the methods of righting a wrong, were so widely different and yet so tenaciously held on each side that collisions were unavoidable. Some jolly tars, ashore in Maine, as the easiest way of finding out whether the oft-told story were true that Indians can swim from their birth, tossed a chief's baby into the water. The mother saved the child by diving for it, but the baby died soon after, and the tribe wiped away the affront by tomahawking settlers all up and down the coast. This principle of vicarious atonement was the source of many wars. Since all white men were not saints, there would necessarily be provocations which could be revenged on honest people. The women and children of Carolina in their frontier cabins were made to pay with their lives for rash shots fired by Virginia rangers, and for the wantonness of young English officers at Fort George, who violated the wives of absent Cherokee hunters. When six Susquehanna chiefs had been treacherously killed by Virginians, the tribe proceeded to slay just sixty white men—ten for one, in view of the difference of rank; then they explained that the account was mathematically square, and demanded peace from the governor of Virginia.

To other occasions for hostility the thought-

ARMS IN THE FIRST HALF OF THE SEVENTEENTH CENTURY. (FROM "HEWITT'S ARMOR," BY PERMISSION.)

ful student of history will feel obliged to add the disinterested efforts of white men to Christianize and civilize the savages. Old superstition, however slumberous and passive, quickens into fanaticism when it is attacked. In the case of the Indians, the jealousy of the powwows and chiefs, who saw their influence melting away, was added to the natural religious antagonism. The outrageous treatment of the dead body of the kindly philanthropist, Thorpe, in Virginia, goes to show that Opechancanough and his men felt the Indian aversion to a new religion. Massasoit tried to stipulate with the Pilgrims that no effort should ever be made to change the religion of the Wampanoags; and his son Philip saw with chagrin the towns of "praying Indians" quite drawn away from their allegiance to the sachems, and in his interview with Rhode Islanders, a week before the outbreak, he made the proselyting of his men a matter of complaint.

It is not more natural for acid to react upon alkali than for civilization — especially a half-civilization — to fall out with savagery. In the case of the long peace between Penn's colony and the Delawares, the circumstances were exceptional. The Delawares had been subjected by the all-conquering Iroquois and compelled to "put on the petticoat." Gallatin has well said that, since the Quaker and the Delaware were both forbidden to take

up arms, they alike had motives to avoid a collision. Penn was not more just in buying land than others had been before him; but he was as sagacious in his plans for winning the favor of the Indians as he was adroit in insinuating himself at the royal court. He advised his agent to treat the savages with gravity: "They like not to be smiled upon." On the other hand, the grave proprietary made the Indians happy by sitting on the ground with them, eating their roasted corn, and showing his agility in one of their jumping matches.

III.

INDIAN MODES OF WARFARE.

Lion Gardiner, to prove the force of Indian projectiles, sent to Boston a rib of one of his men, who had been transfixed and killed by an arrow which broke the bone on the side opposite to that at which it had entered. But in a fight in the open ground, the Indian arrows were of little avail against men in corselets and head-pieces; the soldiers even dodged the approaching missiles and then calmly picked them up. The Indians, however, began very early to secure fire-arms, and they were always ready to pay a high price for the best guns. Every effort was made by the English colonial authorities to restrict the supply of arms and ammunition sold to the Indians. The French, sure of their ascendancy, pursued a bolder course, and even sent gunsmiths to keep the pieces of their savage allies in repair.

Fire-arms added greatly to the effectiveness of Indian warfare, but the Indian's strategy did not change its essential character. To win by crafty device, by sudden surprise, and by unlooked-for perfidy, and to strike terror by ferocious cruelty, were principles of war grained in the very nature of the American savage. For the most part, Indian war was an ingenious system of assassination. A company of braves painted, as the first Dutch parson at Albany expressed it, to "look like the devil himself," and carrying no rations but a slender supply of meal of parched maize, would creep for days through swamps and thickets, stepping each in the track of his predecessor, to surprise and put to fire and hatchet some unsuspecting hamlet of peaceful settlers. If compelled to fight with armed troops, it was not in pitched battle, but rather by ambuscade and perhaps with feigned retreat. The more ingenious the trick, the greater the glory. Piskaret, the Algonkin, whose very name was a terror to the Five Nations, approached alone a village of the Iroquois, with his snow-shoes reversed, and then, hiding in a wood-pile, entered the cabins night after night, and killed some of the enemy, returning each time to his place of concealment in the midst of enraged foes, who sent runners out to find him. The Catawbas planted, point upward, arrow-tips poisoned with rattlesnake's venom in the path down which their barefoot foes were sure to come in pursuit of them. Innumerable devices were resorted to for firing the garrison houses into which the settlers fled for defense, and even more ingenious tricks were played to decoy the defenders into the open field. In a Virginia fort, a young man eagerly loaded his gun to shoot a wild turkey, whose note he heard not far away; but the famous frontiersman, Hughs, promised him the turkey and went out himself, coming back with the scalp of an Indian who had imitated the note of the bird to decoy some one from the fort.

To analyze Indian warfare too closely would make these pages intolerable. Not only men, but sometimes women, and in rarer instances even children, were subjected to long-drawn deviltries of torment that cause the wildest imaginings of mediæval theologians and poets to seem tame. The Indian warrior deemed cruelty a virtue, and sometimes trained himself in boyhood for a warrior's career by exercising his inhumanity on the animals captured in the chase. On his own part, the brave was prepared to suffer the most extreme torments with the sublimest fortitude, provoking his enemies and inflicting on himself additional torture by way of ostentation. The women evinced as much fortitude in suffering and as much ferocity in inflicting pain as the men. This superfluous diabolism of savage nature vented itself on the dead by ghastly and grotesque mutilations. The frequent cannibalism in the northern tribes arose, no doubt, from a fondness for punishing an enemy after death, though it had a religious significance in some tribes, and was often a resort to satisfy hunger in war time. A Mohegan is said to have broiled and eaten a piece of Philip's body, probably with some notion of increasing his own strength. Acts of cruelty to the living and outrages on the dead were meant, like the painting of the warrior's face, to excite the enemy's fear, and consequently may be said to have had a legitimate place in Indian warfare.

IV.

THE COLONISTS' METHODS OF WAR.

For forest warfare, the Indian way of fighting, by ambuscade and surprise and with much individual independence, was certainly

more effective than a more orderly method would have been. The savages had an advantage, at the outset of a war, in the mobility of their villages and the smallness of their property stake. They always knew where to find the white man; but the latter could not always strike an enemy whose village might take flight in a night, leaving little behind but bare poles and the embers of yesterday's fires. It was only when the stubborn self-conceit of the English settlers had been overcome by many disasters, and when lessons in forest strategy had been learned from the enemy, that the settlers became equal to their foes. By the time of the outbreak of Philip's war, in 1675, the colonists had begun to see the folly of poking Indians out of a thicket with a pike, and the pikemen in the train-bands were required to be otherwise armed. But even so late as this some of the colonial troops were encumbered with the matchlock gun and the required "two fathoms of match," though the Indians all had the newer and better flint-lock or "snaphance." The cumbrous defensive armor of the English survived its usefulness. While the Indians shot only arrows, men in armor were tolerably safe, though for the most part rather harmless. The sixty coats of mail sent to Virginia by Lord St. John, in 1622, were probably of more service than the "old cast arms, unfit for modern use," which King James sent from the Tower. In the first year of the Pequot war, men "completely armed" with corselets, muskets, bandaliers for powder, portable rests from which to shoot, and swords, "did much daunt" the Indians, if we may believe the boastful Underhill; but, in fact, the nimble savages got out of the way, and laughed at the clumsy English methods. "We could not come at them in our armor," says Winthrop.

But out of the exigency comes the man. In the first rude onset of Philip's war, while yet social standing and even opinions about infant baptism went for much in the appointment of officers, and while the Massachusetts men were following orthodox leaders into fatal ambuscades and ineffective engagements, there appeared in Plymouth colony the first born Indian fighter of New England, of a type so often seen upon the frontiers since that time. Benjamin Church was not of any great figure in religious or civil affairs, and he was often treated with shabby neglect by the magnates of the Massachusetts General Court, but he could penetrate the device of an Indian before it was executed. With a keen relish for personal adventure and a hearty love of brave men, he drew around him a motley company of devoted followers, who could enter a thicket as nimbly and silently as the most agile barbarian. Notwithstanding his inconspicuous rank, he was the most striking figure in Philip's war, and he afterward became the terror of the savages and the chief protector of the settlements in the tedious and sanguinary conflicts with the Indians of Maine and New Hampshire. He was always vigilant and never for a moment timid or irresolute. When he had entered a swamp, he took care to come out by another road, for fear of being waylaid. He marched with scattered ranks as the Indians did, that his strength might not be easily discovered, and that his whole force might not be cut off in an ambuscade. In his excursions against the savages of the coast of Maine, he first used in war the swift whale-boat, providing five good oars and fifteen or twenty paddles to each boat, and five bars that might be quickly inserted in leathern staples on the gunwales, so that the boat could be lifted over the rocks at a bad landing. "The want of small things prevents the completing of great actions," he said, with the admirable terseness of a man of deeds. He rested by day and rowed by night, and, in order not to give alarm, his rule was never to attack an Indian with a gun who could be reached with a tomahawk. Very careful of his soldiers, and possessing the qualities of a natural leader of men, he never lacked recruits for a new foray against the enemy. Having captured a party of Indians, he would perhaps select a young prisoner, promise him life and liberty and adopt him into his corps. Such captives soon became attached to him, and readily conducted him to their old friends, whom they treacherously entrapped by giving preconcerted signals, such as the wolf's bark, the owl's hoot, and those other well-known sounds of the forest which were the Indian pass-words. Though never actually cruel, he was not above tying prisoners to the stake and getting a small fire ready in order to extort secrets. Like many others of his class, he showed a grotesque humor. When seventeen malingerers, wishing to escape a hard expedition, complained of incipient small-pox, he secured a house already infected, and ordered them into it; but a sudden recovery saved them. One of the boldest of all his hazardous undertakings was the adventuring of himself alone, and against all warning, in the hostile camp of Awashonks, a squaw sachem and an ally of Philip, whose band he persuaded to surrender to the authorities of Plymouth, in spite of certain warriors who wished to kill him out of hand. When, after innumerable perils, this man with a charmed life made a hasty visit to his wife, near the close of Philip's war, the poor woman fainted for joy at

seeing him alive; and before she had time to recover breath, Church received intelligence of Philip's hiding-place, and was away on that hurried expedition which closed the great sachem's career. The capture of the chief, Annawon, soon after, in its antique single-handed daring, reminds one of a passage from the Book of Judges, or a Homeric story; and the picturesqueness of Church's figure is enhanced by his standing against the background of old New England primness and rigidity.

The disaster of Philip's war made the authorities willing to accept such help as offered. Piratical privateers threw themselves into the congenial fray, one of them agreeing to take his pay in captives and plunder. This is he of whom it is told that in battle he took off his wig and hung it on a tree in order to fight with more enjoyment; whereupon the Indians, seeing a scalp handled in this inconsiderate way, detected witchcraft and fled. Some of these pirates had a dog trained in their ways which would fetch them five or six pigs a day from Philip's own herds.

The mounted troops in this war with Philip wore back, breast, and head pieces, and buff-coats; but defensive armor seems to have disappeared soon afterward; one does not hear of it in the Eastern wars. The success of the Indians in ravaging the frontiers in the winter, when the white men were helpless from the snow, led to the purchase of snow-shoes for the troops in 1704. It had taken nearly a century to evolve the light-armed scout, with flint-lock gun, moccasins, and show-shoes, from his ancestor with pike and corselet, matchlock and gun-rest.

V.

PERSONAL ADVENTURES.

THE crafty ingenuity and bold decision that come of desperate perils lend a curious flavor of romance to the history of people in primitive conditions. The hanging of a hat on a stick to draw the fire of a hidden foe was so common in the Indian wars as to become trite. One "friend Indian" in New England, hiding behind the roots of a fallen tree, bored a port-hole in the earth that clung to the roots, and so saved himself by picking off the foe. If the old narratives of the Indian wars were not so dry, one could fancy himself reading Cooper when he comes upon the scout clad in vest and cap of green leaves that he might observe the savages from the bushes without detection. In 1694, when Oyster River suffered so severely, Thomas Bickford sent his family out in a boat from the rear of his fortified house, he alone remaining. By frequently changing his hat and coat, and by appearing sometimes without a hat, and then without a coat, and then without either, putting himself through all possible permutations of costume, giving orders in a loud voice to imaginary soldiers here and there, and rejecting with scorn all propositions for surrender, he convinced the enemy that his house was too strongly garrisoned to be attacked with any hope of success.

The strenuous persistency of the savage warrior got into the white men after years of conflict. "Let me kill one more before I die," cried a young fellow wounded in a battle between Indians in canoes and the crew of a shallop on the coast of Maine; but death came on too swiftly for him to take another aim. So, after Lovewell's famous fight in Maine, one of the mortally wounded that had to be left behind asked that his gun might be charged, so that when the Indians should come to scalp him he might have the satisfaction of killing one more before he could be dispatched.

The women of those times developed a readiness and courage as remarkable as that of the men. The Swedish women near the site of Philadelphia, while boiling soap, were warned that the Indians were coming. They took refuge, soap and all, in the fortified church, blew the conch-shell horns to alarm the men, and when the Indians tried to undermine the building ladled the scalding soap upon them, and so saved themselves from destruction until their husbands arrived. The renowned Hannah Bradley, of Haverhill, in Massachusetts, who had more than her share of captivities and adventures, killed an Indian who was rushing into the open gate of her husband's garrison, by throwing boiling soap upon him; and when the savages came to capture her a third time, she saved herself by shooting the foremost one dead. In 1676, the battle which Talcott was fighting in defense of Hadley was decided by the promptness of the women, who loaded with small shot and nails a cannon that had just arrived from Boston and conveyed it to the defenders; these discharged it, to the dismay and rout of the savages. A story is told of a maid-servant in Dorchester who defeated an Indian single-handed by the use of a musket and a shovelful of live coals. A young girl in Maine shut a door and held it, and thirteen women and children had time to reach a block-house while the Indians were chopping down the door and knocking down, though they did not kill, its defender. Twelve years after Bickford's ingenious defense of his house at Oyster River,

some women at the same place imitated it. There being no men in the garrison, they fired an alarm, loosened their hair to appear like men, and used their guns so briskly that the savages fled. In 1712, Esther Jones saved Heard's garrison, in the township of Dover, in New Hampshire, by mounting guard and calling so loudly and confidently as to make the Indians believe that help was at hand. The stalwart Experience Bogarth, of Dunkard's Creek, in Pennsylvania, in a hand-to-hand fight in a door-way, in which two white men were killed, slew three Indians with an ax.

VI.

DEFENSE OF THE FRONTIER.

FORTIFICATIONS more or less elaborate were built in all the earlier and all the frontier settlements. The Pilgrims, with six cannon on the roof of their church, were not the only ones that made the house of worship a sanctuary from the savage. Fortified churches stood convenient to the water in some places in the middle colonies, that the cedar canoes of the settlers might reach them quickly in case of danger; and in all the colonies it was the custom to have a part or all of the men come to church on Sunday with arms in their hands. In many neighborhoods, houses were palisaded or inclosed with a wall of heavy, well-fitted logs, as a garrison for neighborhood resort in time of danger. Some of these houses were of stone or of brick, and we hear of one roof in Pennsylvania covered with lead. It was once proposed to inclose twenty towns of Massachusetts by a stockade, eight feet high, from the Charles to the Concord River. One of the early settlements on the James River and that part of Manhattan Island below Wall street were thus protected. The people of Milford, in Connecticut, inclosed with palisades their whole town plot in 1645, and the foiled Indians taunted them by shouting: "White men all same as pigs!" Among curious devices for defense was that of Lion Gardiner at Saybrook. He drove long nails "as sharp as awl-blades" through some old doors, and then placed these on the ground, so that the Pequots seeking to set fire to the redoubt trod on the nail-points in the dark.

During Bacon's war in Virginia, the widely scattered backwoodsmen above tide-water were compelled to bring the smaller families into the houses of those who were stronger, where palisades and redoubts were built; while strong companies of armed laborers, moving from place to place, did the work on the farms in succession, with sentinels always on the lookout. No man stirred out of doors unarmed. In Maryland, three guns in succession were to be fired in case of alarm. On hearing the three guns, each plantation fired a new alarm, and help was dispatched in the direction of the first signal heard. The custom of firing three guns was apparently brought from England, as it was used in several of the colonies. In all the Southern colonies, the freemen were enrolled and trained and required to carry arms on going abroad. As late as the middle of the eighteenth century, arms were carried to church in South Carolina, and it was during this period of peril that the habit of carrying fire-arms became a fixed one. Among the isolated planters of the South, companies of half-savage woodsmen were employed as "rangers" to protect the frontiers.

Among the devices for defense, the keeping of fierce dogs was a common one; these dogs were sometimes used to track the foe, a custom suggested, no doubt, by the use of blood-hounds in England, in the seventeenth century, to follow the trail of moss-troopers, and on the Scottish border to pursue cattle thieves. The Indians had a horror of mastiffs; some of these were killed at their request just before the first Virginia massacre. At the destruction of the early Dutch settlement on the Delaware, the savages did not feel safe until they had shot the solitary mastiff with twenty-five arrows, though the dog was securely chained. In Massachusetts, dogs for the pursuit of Indians were regularly kept and used with the sanction of the authorities. A South Carolina planter, named Donovan, provided himself with a kennel of mastiffs, which he trained to seek, kill, and devour the savages, like veritable beasts of prey.

Here and there, settlers maintained themselves by courage and good fortune in remote and isolated situations, though the settlements were usually made so that a combination of several families for defense was possible. The terror suffered by households in the more exposed places was often extreme and continual. Men might have been seen creeping along the trails with guns on the make-ready, expecting a war-whoop from behind every clump of bushes; women scanned even the dark corners of their own cabins for a skulking foe. Sometimes in the dead of night a courier would tap at a back window and whisper "Indians," whereupon old and young would rise swiftly, and, gathering in the dark a few needful articles, hurry away in dead silence to the fort. In the Appalachian region of Pennsylvania and Maryland, the dogs were trained never to bark without a command.

NDIAN WARRIOR OF FLORIDA IN THE SIXTEENTH CENTURY. (FROM LE MOYNE'S ORIGINAL DRAWING IN THE BRITISH MUSEUM.)

The colonists often acquired a fortunate insen-sibility to imminent peril; the people of one exposed settlement in New Hampshire are found making merry together over "water-melons and flip" on the eve of an assault from the Indians.

VII.

CAPTIVITY IN THE WILDERNESS.

But the deepest tragedy of colonial life lay in captivity. For the last hundred years of the colonial period, in particular, the captivity of men and especially of women and little chil-dren became a household theme; there were few who had not some friend or acquaintance who had been lost in the impenetrable mys-tery of the wilderness, tomahawked by the way-side, tortured to death, adopted into a savage tribe, ransomed by friends, or sold into slavery in Canada. Every father on the long frontier looked upon his children with insecurity. Melancholy tales of captivity were the favorite fireside stories, and books of captivity came to be preferred even in New England to the weightiest sermons, and to take a place on the shelf beside the esteemed almanac. Mrs. Rowlandson, the wife of a minister at Lancaster, was carried away in the sacking of that place during Philip's war, and her narrative passed through many editions, as did that of the Rev. John Williams, the "Redeemed Captive," of Deerfield, who was carried off in 1704, and formed one of that long procession of captives sold into Canada, of whom I shall have occasion to speak in a future paper. The chapter of Indian captivities is too long and too har-rowing to be entered upon here, except in so far as it throws light on human character and development in the colonial era. The pen falters at the outset of any attempt to mass and generalize sufferings, the recital of which served to harden the resentment of the colonists into implacable hatred. These sor-rows fell most heavily upon women, who were obliged to travel half starved and with little clothing, under heavy burdens, through a win-try wilderness, until death seemed better than life. In many cases they saw their exhausted children dashed against trees or rocks. The women taken by northern and middle tribes were generally, though not always, saved from those worst forms of outrage, common enough now on the Western frontier, by a notion the Indians had that such offenses would render them unlucky. If pursued, the captives were generally slain, and every attempt at escape was visited, in case of recapture, by a linger-

ing and horrible death. Occasional torments of a milder type were the lot of many prisoners. The Indians were fond of dancing, and nothing made a dance so exhilarating as to have a prisoner in the midst. The dancers would kick him, or throw him into the air and let him fall flat on his back on the ground; or some shriveled hag would shovel hot embers into his bosom, while the rest would cry: "What a brave thing our old grandmother has done!" John Gyles, during his six years' captivity, learned to fly to a swamp whenever a dance was in preparation. Peter Williamson, a Pennsylvanian, was tortured every now and then for the diversion of his captors, with threats that if he cried out he would be put to death. In one case, where a child was just about to be roasted alive to satisfy the hunger of a party of captors, some Catholic Mohawks bought it for a gun.

Nothing can be more pathetic than the farewells of the wife of the Deerfield minister, Williams. She confessed to her husband that she must soon faint from exhaustion, and of course be dispatched by the tomahawk. Her words "justified God," says the stern Puritan husband in his account. A little while later she fell in wading through an icy river, and the fatal blow of the hatchet was given. One morning, during this march, another Deerfield matron came to bid her minister good-bye; she was sick, and knew that her strength would fail that day. She calmly quoted Scripture like a true disciple of such an iron-side pastor, and was soon after lying dead in the path.

Now and then there were refreshing instances of compassion for captives on the part of squaws and even of warriors. Some of the prisoners taken in later wars experienced a good deal of kindness; it seems probable that the Jesuits had softened the character of Indian captivity among their converts. Running the gauntlet at St. Francis appears to have become a mere ceremony of tapping on the shoulder, a faint shadow of the old barbarity. It is a curious instance of kindness mingled with cruelty, that the inhuman band which laid Deerfield waste brought letters from captives already domesticated in the tribe, which they took pains to hang up in a bag by the road-side so that the settlers should get them. In one notable instance gratitude was shown. Church having released two Indian women and some children at Androscoggin, in Maine, the Indians afterward set free two old white women and five children at York. And let the Indian woman be remembered who brought back the lad Timothy Abbot to Andover, because she pitied his mother.

VIII.

ESCAPE, RESCUE, AND RETURN OF CAPTIVES.

STORIES of marvelous and ingenious escapes were the romance of the colonies, and such

adventures date back to the earliest Indian war in Virginia, where a man and his wife, who had been spared in the wholesale slaughter, found their opportunity while the Indians were dancing for joy over the acquisition of a white man's boat that had drifted ashore. These captives got into a canoe, and soon afterward surprised their friends in the settlements, who had believed them to be dead. Very like this was the escape of Anthony Bracket and his wife in Maine. They were left to follow on after their captors, who were eager to reach a plundering party in time to share in the spoil. Bracket's wife found a broken bark canoe, which she mended with a needle and thread; the whole family then put to sea in this rickety craft, and at length reached Black Point, where they got on board a vessel. A little lad of eleven years named Eames, taken in Philip's war, made his way thirty miles or more to the settlements. Two sons of the famous Hannah Bradley, previously mentioned, effected an ingenious escape, lying all the first day in a hollow log and using their provisions to make friends with the dogs that had tracked them. They journeyed in extreme peril and suffering for nine days, and one of them fell down with exhaustion just as they were entering a white settlement. A young girl in Massachusetts, after three weeks of captivity, made a bridle of bark, and catching a horse, rode all night through the woods to Concord. Mrs. Dean, taken at Oyster River in 1694, was left, with her daughter, in charge of an old Indian while the rest finished their work of destruction. The old fellow asked his prisoner what would cure a pain in his head. She recommended him to drink some rum taken from her house. This put him to sleep, and the woman and child got away. Another down-east captive with the fitting name of Toogood, while his captor during an attack on a settlement was disentangling a piece of string with which to tie him, jerked the Indian's gun from under his arm, and leveling it at his head got safely away.

Escaping captives endured extreme hardships. One Bard, taken in Pennsylvania, lived nine days on a few buds and four snakes. Mrs. Inglis, captured in the valley of Virginia, escaped in company with a German woman from a place far down the Ohio River. After narrowly avoiding discovery and recapture, they succeeded in ascending the south bank of the Ohio for some hundreds of miles. When within a few days' travel of settlements, they were so reduced by famine that the German woman, enraged that she had been persuaded to desert the Indian flesh-pots, and crazed with hunger, made an unsuccessful attack on her companion with cannibal intentions.

The most famous of all the escapes of New England captives was that of Hannah Duston, Mary Neff, and a boy, Samuel Leonardson. These three were carried off with many others, in 1697, in the attack on Haverhill, Mrs. Duston's infant child having been killed by the Indians. When the captors had separated, the party to whom the two women and the boy were assigned encamped on an island in the Merrimac River. At midnight, the captives secured hatchets and killed ten Indians—two men, two women, and six children—one favorite boy, whom they meant to spare, and one badly wounded woman, escaping. After they had left the camp, the fugitives remembered that nobody in the settlements would believe, without evidence, that they had performed so redoubtable an action; they therefore returned and scalped the Indians, after which they scuttled all the canoes on the island but one, and in this escaped down the Merrimac, and finally reached Haverhill. This was such an exploit as made the actors immediately famous in that bloody time. The Massachusetts General Court gave Mrs. Duston twenty-five pounds and granted half that amount to each of her companions. The story of their daring deed was carried far to the southward, and Governor Nicholson, of Maryland, sent a valuable present to the escaped prisoners.

Many captives never returned. Besides those who were put to death, and those who died of famine, fatigue, and disease, a large number of the younger ones adopted Indian habits, intermarried with the savages, and remained in the tribes. These were spoken of with bitterness in New England as contributing to increase the enemies of their country. A lad, Timothy Rice, captured in Massachusetts during Philip's war, became one of the six chiefs of the Catholic Mohawks in Canada; and Eunice Williams, daughter of the Deerfield minister, married and remained in the tribe from which her family had suffered so much. She visited Deerfield in after years, wearing a blanket and a crucifix. Children were now and then recovered who had forgotten their mother-tongue and who had become savages in habit. When Mrs. Johnson, of New Hampshire, after a tedious captivity, got her children together again, one son was an accomplished savage, handling the bow and speaking only the Mohawk, and one daughter knew nothing but the language, religion, and culture of a Montreal convent. A lad from the mountains of Pennsylvania, when released, refused to return home; his father

visited him among the Indians of Ohio, and won his affection, and so brought him back, but he spent his life as a pioneer, and was to the last an Indian in habit and feeling.

Formal rites of adoption, not unlike those in use in some ancient communities, were sometimes performed in the case of adults who were taken to replace some dead tribesman. Colonel James Smith, who was captured while a young man in Pennsylvania and beaten to insensibility in running the gauntlet, was at length formally adopted to replace a chief. He was taken into the water, immersed, and roughly scrubbed by some young squaws to get all the white blood out of his veins. After living six years among the Indians, he returned home to find that his betrothed had married a few days before his arrival. The Indians usually insisted that adopted captives should marry. One Pennsylvania woman only accepted a husband after she had been tied to a stake and threatened with fire; and a Mrs. Bard, among the same Indians, avoided taking a husband by refusing to learn the language. Hugh Gibson, another Pennsylvania captive, was whipped for refusing the advances of a squaw, after which he contrived to escape, in company with two captive girls who had also been notified that they must marry in the tribe.

Curious complications arose from long captivities. A Pennsylvanian, taken in Chester County, reached home just as the administrator of his estate had finished selling off at auction all of his goods, which he proceeded to reclaim from his surprised neighbors before they had removed them. Tedious litigation in one instance resulted from doubt of the identity of a girl returned from captivity; and Mary Jamieson, who was taken from Pennsylvania in childhood and was twice married to Indians, spent her old age among white people in New York.

IX.

TREATMENT OF THE SAVAGES.

ONE of the worst results of Indian atrocities was their barbarizing effect on white men. During the greater part of the colonial period, the people were stirred to vindictive hatred by the ever-recurring cruelties of the savages, and it is strange that any philanthropic movements for the benefit of the Indians could outlive this irritation. Often, in an access of fury, the lower order of colonists did things unworthy of any but savages. One of the worst of the Pequots, captured by the Mohegans near Saybrook fort, was given over to them for torture, at their request, in retaliation for Pequot enormities. But the white men could not endure to see his sufferings, and Captain Underhill delivered the victim by shooting him. A captive Indian in Philip's war who would not tell secrets had them extorted by "wooding of his head with a cord,"—a nautical torture in use a few years previous to this among the buccaneers of the West Indies, and it is fair to suppose that the "pirates" in the Massachusetts troops had a hand in it. Toward the close of the war, one of Philip's men begged, with savage vanity, that he might be given over to the torture of the Mohegans, and so have the honor of dying like a brave. The soldiers, willing to gratify their savage allies, acceded to his request, and he endured infernal torments with unfaltering firmness and exultant defiance to the end, though the white

men wept with horror and pity at sight of his prolonged sufferings. The most monstrous case recorded of cruelty on the part of white men is, perhaps, the sentencing of an old squaw at Hatfield, in Massachusetts, in 1675, to be "baited by dogs," after the manner of treating wild beasts in that time.

It is to be remembered that the seventeenth was not a humane century in Europe or America; nor was the first half of the eighteenth much better. And even in our own time, sudden massacres and scenes of savage cruelty have a tendency to extinguish pity in the bosoms of people on an exposed frontier. The slaughter at the Pequot fort had some extenuation in the dangerous situation of the feeble settlements and the horrible outrages of the Pequot tribe. It is more difficult to excuse the destruction by fire of the innocent and helpless in the Narragansett stronghold. Policy as well as humanity should have suggested a more lenient course in this case. The apologetic tone of the narratives of the Pequot affair shows that there was an adverse public opinion which even the citation of Joshua's destruction of the Canaanites could not allay; and some of the soldiers of the Narragansett fight "were in much doubt then, and afterward seriously inquired, whether burning their enemies alive could be consistent with humanity and the benevolent principles of the Gospel." But the "elders," whose voice had so much weight, spoke no word against these cruelties; and for the most part, the old New England histories of the affair, though written by clergymen, are perfectly ruthless. We learn that, after the Narragansett breastwork was carried, the Indians, "in most abject terms, begged for quarter," which the English refused. The troops had nothing to do but to load and fire upon a despairing mass of human beings of all ages, the enemy being penned up and huddled together in such a manner that scarcely a shot was lost, says Dr. Trumbull. Hubbard tells the story of the burning women and children without a qualm. "We have heard of two and seventy Indian captives slain and brought down to hell, all of them, in one day," exults Dr. Increase Mather in a sermon on the prevalency of prayer. The horrors of continued war had infuriated New England against the whole red race. The Christian Indians were in imminent danger, and Gookins and Danforth, their friends, were threatened by placards in public places. Those in authority were borne upon the same current of angry passion. The serious formality of Massachusetts laws was broken by the hot lava of wrath against the "barbarous crew," and week after week captive Indians were executed, the hanging taking place at the time of the weekly lecture, in order to augment the solemnity of the occasion, perhaps. The historian, Hubbard, calls Canonchet "a damned wretch"; but as the young sachem was already dead, this is to be taken in a pulpit, rather than in a profane, sense. Because Henchman did not favor a massacre of friendly Indians, the Boston soldiers refused to march under him, and demanded the bloody-minded Thomas Oliver for their leader. A suspected Christian Indian was rather sacrificed to the fury of a Boston mob than executed; and the circumstances of his execution were most revolting, but they were surpassed in a similar cruel execution that occurred in New Amsterdam at an earlier period. In the rough, sea-faring town of Marblehead, the people were yet more uncontrollable than in Boston. The women coming out of meeting on Sunday, seeing two Indian prisoners led through the streets, fell upon them and beat them to death.

Fortunately for their fair fame, the records of the Southern colonies in the seventeenth century have not been so well preserved as those of New England; but it is easy to see that their retaliation on the Indians was not less sanguinary and cruel. Bacon put a whole Indian village to fire and sword upon suspicion of treachery. The South Carolinians suffered repeatedly from the horrible perfidy of the savages, and the whites became so incensed that they wrought many acts of positive barbarity. I shall have occasion, in speaking of the French wars, to show how remorselessly sanguinary the Pennsylvania borderer became under many provocations, and how Indian methods came to be adopted in all the colonies.

In the Northern and in the Southern colonies, the hopeless doom of most of the Indian prisoners — women and children as well as men — was to be sold away to slavery in the sugar islands. The prostrate colonies recovered a part of the cost of the wars by this measure, which at the same time cleared the forests of revengeful enemies. Only now and then a brave, but solitary and unheeded, voice, like that of the apostle Eliot, was lifted up against the monstrous inhumanity of this practice.

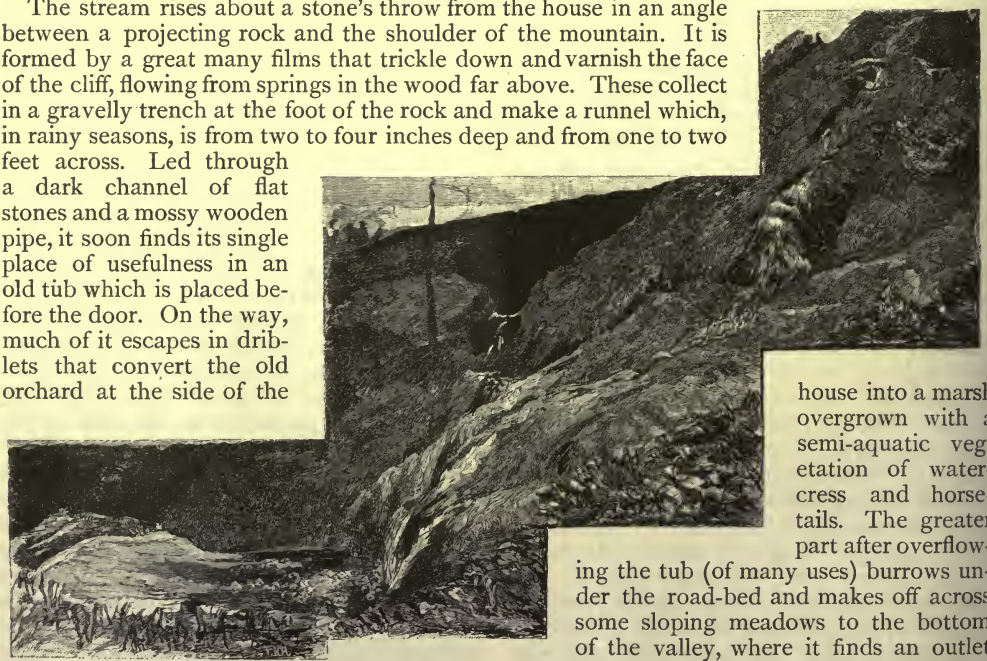
The Indian wars threw a shadow over all colonial life. Popular sympathy is deeply awakened now for parents whose child has wandered or has been abducted. But there were always many families in the colonies whose children were gone, no man knew whither,—lost in the obscurity and horror of hostile savagery. A certain melancholy came into the thought and feeling of the colonists,

through the ever-recurring bereavement and the bitterness of the never-ending strife. The somber features of the popular religious beliefs seem to have been intensified by the cruel assaults of the savages, which were sometimes regarded as visitations of divine wrath; and the gross notions of witches, tormenting fiends, and a material perdition of everlasting tortures, which filled so large a place in the thought of that time, were no doubt reënforced by the impressions which captivity and its accompanying barbarities had made upon the imaginations of men and by the vindictive feeling that is born of a chronic and cruel war. The military virtues of courage and fortitude and a daring spirit of enterprise were fortified by such a strife. Rude and strenuous energy is inconsistent with elevation of feeling and refinement of manners; but it is a quality very necessary in nation-builders and the subduers of a savage continent, and this, by the Indian wars and other tempestuous buffetings, was developed in our forefathers and remains yet a characteristic trait of the planters of new states on the Western border and of many who carry forward great schemes of material improvement. In that hard time the perseverance, alertness, and hardihood persistent to-day in American national character were brought to maturity; learning and refinement were, for the most part, pushed to the wall.

ORNAMENTAL FORMS IN NATURE.

A RIVULET runs past the door of the log-house that has stood for seventy years upon the edge of the road, squeezed between that and the nearly perpendicular wall of rock behind. The miserable little mountain farm through which it flows produces nothing salable but a stack or two of hay mixed with thistles. Its owners have to go off its bounds to earn their bread; but people who want to fill their eyes, not their mouths, might stay on it all the year round. It bears splendid crops of weeds. It is part wooded and rocky, part swampy; and in its patchy meadows, its stony and briery woods, a taste for what is beautiful may be gratified, one's interest may be excited over new objects, and his knowledge of art as well as of nature improved by the observation of countless forms, such as have furnished the types from which most of our stock of ornament has been derived.

The stream rises about a stone's throw from the house in an angle between a projecting rock and the shoulder of the mountain. It is formed by a great many films that trickle down and varnish the face of the cliff, flowing from springs in the wood far above. These collect in a gravelly trench at the foot of the rock and make a runnel which, in rainy seasons, is from two to four inches deep and from one to two feet across. Led through a dark channel of flat stones and a mossy wooden pipe, it soon finds its single place of usefulness in an old tub which is placed before the door. On the way, much of it escapes in driblets that convert the old orchard at the side of the house into a marsh overgrown with a semi-aquatic vegetation of watercress and horsetails. The greater part after overflowing the tub (of many uses) burrows under the road-bed and makes off across some sloping meadows to the bottom of the valley, where it finds an outlet to the lowlands through a miniature



THE STREAM.

ravine. There can be no finer study of crystalline effect than is afforded by the ripples and eddies of the stream. It coils around small obstacles and dashes over foot-high precipices, flashing and shining, mixing up in a most charming manner reflections of clouds and sky and perspective of weeds and pebbles. The chimeras and the dragons that the Chinese carve in rock crystal, with their glittering spines and horns, their undulations and their gleaming wave-like scales, are not half so well managed for the play of transparencies and sudden lights. The art of diamond cutting is vulgar in comparison. The little stream has the fiber and the flow of old Venetian glass in places where a mere thread of water, drawn out to the utmost fineness, flashes to a sheet over the smooth roundness of a nodule of granite.

When satiated with color, nothing is so restful to the eye as a clear substance such as this; and nothing so readily leads one back to the enjoyment of color as the constantly bright and fresh mosses, the shining quartz and vari-colored pebbles over which it flows. And then, the matters that, being a mountain streamlet, it bears along submerged or dissolved in it, —rootlets, scales of mica, cloudings of earthy substance, ocherous, milky from white marl, tawny yellow from soaking beds of dead leaves,—for a colorist, what a feast is all this!

About twenty feet from the house, and the same distance above the ground, there is a recess in the face of the cliff. It is partially hidden from view by branches and hanging vines. It has been made easy of access by steps, some of them built of flat slabs of stone, and some cut in the rock. It is commodious and sheltered enough to be used as a sort of out-of-doors sitting room; and it is furnished with a table, a couple of chairs, a settee of squared stone cushioned with moss, a few books shoved away on one of the ledges, and some odds and ends belonging to the young ladies who generally occupy it. Its walls and its shelving roof are tufted with ferns and brambles and wisps of delicate long grass. The dark rock is veined with white quartz and colored with metallic oxides and scintillates with mica. The whole place is dotted with lichens and gray mold and seamed with iridescent tracks of snails.

A NATURAL WALL-COVERING.

This "cave" is in the most advanced part of the projecting rock before mentioned. Its roof is a big bowlder which has fallen into its present position, two-thirds of it resting on a ledge of the solid rock, the other third overhanging the lower platform that makes the floor. On the outside, the mass is as richly tapestried as within, and, in addition, trees rooted in its larger clefts and flowers springing from every crevice make a rich covering of wall-space that no art can parallel.

Most of these flowers and plants recall, with endless variety, the beautiful ornamental forms of ancient art. There is a clump of

willows where the stream reaches the bottom of the valley whose growing twigs, seen against the sky, repeat the form of the well-known anthemion design common on Greek temples and Yankee table-cloths. Each shoot is tipped by a few close-curled leaves, which stand straight up together with incurved points almost meeting. Those next lower straighten out slowly from the stem, their curled margins becoming at first wavy and finally plain. At last, they curve downward, so that the tips of the leaves are much farther apart than their stalks. It is the general form (in elevation) of all growing plants; and, as such, it was copied by the Chaldeans, from whom the Greeks had it. Across the stream, a thicket of sassafras has every spray adorned with a more elegant variety of "anthemion," most of the spreading shoots enriched with small greenish-white flower-clusters which help to push apart the folded leaves. Blackberry-vines, wild cherries, young shoots of the oak put forth different versions.

The horse-tail, which grows all through the orchard and makes deceitful patches of bright green in wet, sandy places in the woods, offers a very ornamental variety of the pattern. It may usually be compared to a miniature model of a basalt column, or to a pile of fairy thimbles. It is composed of small, hollow joints, each finished at the rim with an upright, toothed fringe, and at the top it bears a flower-spike, that resembles in shape an Egyptian capital. Several of these little pillars appear in a sort of Druidic ring; and then, in the center, another with longer joints, branched, and apparently flowerless, springs up and dominates the group. The proportions of these joints and branches, the regular radiation of the latter and the gradual change of the angle at which they leave the stem, and the repetition throughout of the little toothed cup, which is, as it were, the unit of construction of the plant, make it almost solemn in its strict adherence to decorative laws.

BED-STRAW.

HORSE-TAILS.

The bed-straw is another plant which is almost as simple in plan as the horse-tail, and which offers particularly beautiful variations on the usual theme. Its jointed stem is ringed with circles of lance-shaped leaves, from the base of some of which start angular branches bearing small white flower-clusters. The stem is weaker than the horse-tail's and the joints much longer in proportion. Stem and leaves are covered with asperities, which help, very often, to bind the plants together in tangled masses of a disorderly appearance, belying their true character. The leaves and branches of these two plants being set like the spokes of a wheel, and not, as in most plants, spirally, produce a very definite anthemion, really comparable to a flower, and very like the ornament which we have derived from Chaldean plant-worshipers through the Greeks. The thousands of architects and others who, every year, weary their own souls and those of their neighbors with clumsy imitations of antique styles which were themselves based on an intelligent observation of nature, might draw a needed fresh inspiration from the study of these common plant-forms.

The type of the growing plant has furnished us, from the most ancient times, with another extremely popular ornament, the rosette. It is the plan of a plant, as the anthemion is the elevation. With the ancients, though at first a line; the rosette was good to fill out a circle; the vine was a rich and beautified waved line or scroll. With conceptions so general as these, it was no trouble to an inventive people to vary their patterns to any extent, and, in

ANTHEMIONS AND ROSETTES.

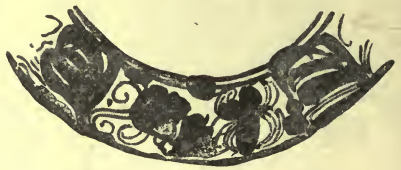
symbol of plant life, and though it always preserved somewhat of its original signification, it was used in the best periods of art simply as a beautiful radiant figure, exactly as if it were a geometrical form, but with a clear perception that it was much handsomer than any geometrical figure. Simple as were the ideas of the growth of plants conveyed by antique ornaments, the most important ideas connected with them in the designers' minds were simpler yet. The upright growing plant-form was useful to suggest or carry out a perpendicular fact, good Greek and Roman art is varied enough in its ornamental portions as well as in its figures, and that without showing much direct reference to nature. The hint once got from nature of some graceful arrangement of leaves or petals, or some notching of their edges, or modeling of their surfaces, was carried out with an eye single to the production of something elegant, rich, refined, and fitting to fill a space which, without it, would be a painful blank. There is, judged by modern standards, little nature in the anthemions

and rosettes from the buildings on the Athenian acropolis, and as little in the vine-scrolls on Greek vases, which might be intended for ivy, or for grape-vines, or for any other plant of vine-like habit. But the little that there is is put to the very best use. The Greek designer took only what he needed; the modern, when he works after nature, grabs at everything and can get no good of anything.

If we would or could work in the proper way, there is no reason why the splendid Greek system of ornament, which, through all its variations, is one of the heir-looms of our race, might not be kept always fresh and living. If we would change only on occasion, and with strict reference to the occasion, we would always find in nature what we wanted of more pliant or more sturdy, of broader or longer, of sparser or more close. But our designer goes to nature or to the past, not as a man might go to a store-house that belongs to him, to select what he wants, but, like a thief, to take whatever he can lay hands upon.

Our modern designer after nature goes to work in one of three ways. He makes a copy, a picture of his chosen object (which may bear some remote likeness to a proper ornamental form, as in the opposite sketches the branches laden with crab-apples do to the festoon from the antique); or he makes a botanical diagram of the parts of the plant or its flower and uses it as a "repeat"; or, worst of all, he takes anything that seems to him curious or striking and forces it, by hook or by crook, into some symmetrical arrangement. These two latter processes he calls conventionalizing. The picture-maker may "conventionalize" also; for he may drop his work at some preparatory stage, or may put a heavy black outline around it, or he may use a gold background: these and a number of other dodges being supposed to make a thing more ornamental. It is sorry ornament that is thus turned out. It belongs nowhere. It is fitted for no position. It is a fraud and a sham, for it is not even intended to ornament anything in particular. If painted on a plate to-day, it may be sprawled on a ceiling to-morrow.

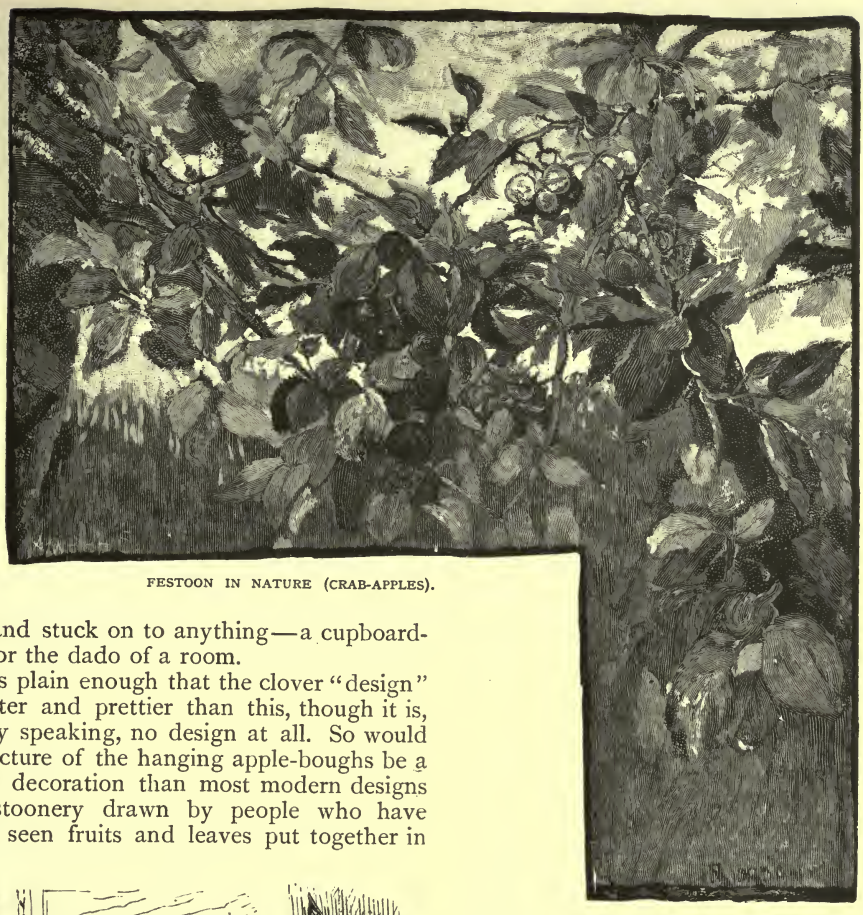
Among some designs after nature recently published is a clover design for a plate. The artist plucked his flowers and leaves and stuck them around loosely in a circle; then copied them bit by bit, as well as he could, without any further attempt at order. They fill the rim of the platter badly. They would look worse when colored, for the pink blossoms and the green leaves are disposed at hazard and would not balance. The arrangement at first suggests that it was intended to convey the idea that the flowers and leaves grow from the center out, in a ring, a way in which clover does not grow; and then one perceives that, even if the broken stems were produced, there never would be anything like organic connection between them. There is no more design about the thing than there is about a child's nosegay, after it has been flung away by the roadside, and its "naturalism" consists in merely copying a number of unrelated objects without understanding them. Nature is travestied in such work, not represented, and the requirements of art are ignored.



PAINTED DECORATION. HISPANO-MORESQUE.

Compare the Spanish-Moorish design here given. It repeats itself, with constant variations, around the rim of the plate. The circular form has been considered and has been made the basis of the pattern. All the lines flow out of the bounding circles and flow on with them. It is divided pretty regularly into segments, by the straight side of the large recurring leaf, and those panels, one of which is always opposite the eye, are filled up less evenly with the flowers and their curling pistils and stamens. This being all that was wanted from nature that time, it is all that was taken. The general idea of some flowering plant with long curving stamens and deeply cut leaves is given with great freshness and vigor, but it would be difficult to guess just what the plant was. The rim of the platter, however, has been filled by its aid with appropriate and graceful ornament, and that was the main point with the designer, who evidently did not care three straws for what all the botanists and florists on earth might think of his work.

There is a specimen of modern "conventionalizing" by a trained designer and a very learned man, Dr. Dresser. There is no mistaking the plant intended this time, though it is to be recognized by ear-marks, so to speak, rather than by any important feature. It is that victim of modern decorators, the alisma. Its stems are tortured into ugly predetermined curves; its leaves are slit in half and provided with æsthetical curly-wurlies. With machine-like regularity the first half of the first division is reversed for symmetry, and then the "motive" is repeated without a change all along the wretched band, as if that were to be chopped off wherever it might happen to be conven-



FESTOON IN NATURE (CRAB-APPLES).

ient and stuck on to anything—a cupboard-door or the dado of a room.

It is plain enough that the clover "design" is better and prettier than this, though it is, strictly speaking, no design at all. So would the picture of the hanging apple-boughs be a better decoration than most modern designs of festoonery drawn by people who have never seen fruits and leaves put together in a festoon, but who have copied from copies of the antique until all meaning, pictorial or decorative, has gone out of their work.

FESTOON IN MARBLE. (FROM THE ANTIQUE.)

Bad ornamenters as the naturalists are, the copyists are worse. In fact, if it were not for the badness and the baldness of their copies, no branch of the naturalistic school would ever have arisen. If people had continued on the old lines, exercising judgment, taste, discretion, invention, eked out when necessary by a reference to nature, no one would have thought of painting pictures of solidagos on plush for a portière, or of making pin-wheels with milkweed pods for a frieze. It is the copyists, in fact, that are responsible for all that is wrong in our arts of design. They are the people who have pandered to the vulgar desire for all sorts of ornament at once, and as much of it as possible for the money. They have debauched all known styles by running them together without rhyme or reason, and they have lacked the imagination to create out of them a new style. They have applied their invention to contriving processes by which

THE VINE IN NATURE.

work which ought to be costly might be cheaply travestied, and to "adapting" to machinery the old patterns, all the beauty of which was due to their being wrought by hand.

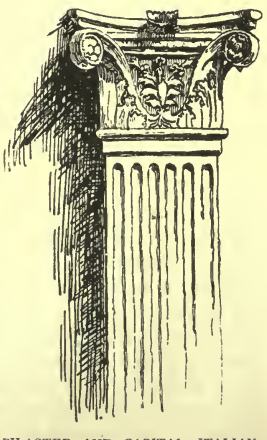
All this is to be changed, and indeed is being changed under our eyes. The man who last year was satisfied with bad copies of fine things, only was not satisfied with any reasonable number of them, must now have originals. It has begun to be understood that machine work is poor and uninteresting; and, most important, our social life is taking form and demanding to find expression in those arts that have so long helped to obfuscate and disorganize it. A new spirit is creeping into the arts of design (beginning, as is right, with architecture) which must end in completely revolutionizing them. Opinions differ about it, from that of the Georgia man who writes to the "American Architect" to say that the American mind requires "sky-scrapers," cheap elaboration, and Fourth-of-July sentiments expressed in stone and metal; who thinks that the art of the future will include wonderful combinations of dome and steeple, zinc roosters and spread eagles, and stars and stripes everywhere in red, white, and blue paint—from this gentleman's notions to the judgments of good architects who have endeavored, with some modification of the Romanesque or the early French Renaissance, to meet the requirements of our time and circumstances. The choice of these styles is suggestive, as they agree in using active rather than passive support.

THE VINE IN ART. (FROM CEILING AT RAVENNA.)

If we can assume that the architectural style of the near future will embody our ideas of wholesomeness, active strength, vitality, and our common sense, unmystic views, the demand will soon be made on the decorator that he also give form and expression in his work to the same conceptions. We shall want more action than has been put into European ornament for a long period; a high vitality will demand pure and splendid coloring; a sound intelligence will see to it that the entire arrangement is understandable, governed by exact relations and definite canons of proportion. Neither Romanesque, nor Gothic, nor Renaissance ornament answers all of these demands. The first two systems contain too much of religious symbolism; the last, with all its beauty, is too flat, tame, and meaningless for our uses. In all the fine work of the Italian Renaissance there is visible a self-satisfied smirk, a look of greasy contentment which does not suit a sharp-set generation; and the livelier French styles were but the beginning of that wonderful artistic spree which the French people have been keeping up ever since the fifteenth century, but which they have not succeeded in getting other nations to participate in. We shall have to return to ornaments such as are common to all styles, based upon necessary structure and the capacities of materials, and are given beauty and character by the adaptation of proper natural forms. There are precedents enough to guide designers and others in making such a change. In many ways the present art movement is similar to that which brought Byzantine architecture to life, and remodeled all classic ornamentation at the beginning of our era. Then, as at present, among a great commingling of races, a new and freer life had begun which had its say in a fresh and logical architecture, in the splendid coloring of mosaics, and in exuberant and fanciful ornament. Variations of the old designs were made necessary by the new shapes of arch and dome and pendentive, but not less by the

PLANT-FORMS ADAPTED TO DECORATIVE TREATMENT FOR PILASTER AND CAPITAL: FERN, DICENTRA, SKUNK-CABBAGE.

quickened feeling for a truth and power and grace that all could understand, and which, as much as any religious need, had produced the new forms of building themselves. The novel designs of the Byzantines show a closer and keener observation of nature than that of the ancient Greeks or Romans. The acanthus foliage of the capitals, from the soft and graceful ornament of the Greeks, became crisp and sharp, like the stronger variety of the plant. The rolling scrolls, borrowed from the Romans, were given life, growth, and variety. The vine especially (its significance in Christian symbolism made it specially important) became more like the natural vine than it has ever been before or since in decorative work. In a sketch of a portion of a ceiling at Ravenna, the grape-vine, with its large leaves and bunches of fruit, is not, it is true, so thoroughly naturalistic as modern French drawings from nature of sprays of the same plant, with leaves and their shadows, which admirably suggest an ornament but do not furnish one. But it states, nevertheless, a clearer and more virile conception of the nature of a vine. The top of the big bowlder that overhangs the cave before described is clambered over by a Virginia creeper. It has this barren spot all to itself, and is at perfect liberty to run straight ahead over it, or to indulge in caprices and zigzags to any extent. It does both. It stops and gathers itself up occasionally to fling some budding sprays in the air; but, for the most part, it proceeds by the shortest road in search of nourishment. This double propensity of all vines struck the Byzantine workman as a useful thing to note about them. The grapes and the large leaves of the grape-vine he was interested in, both for their symbolic meaning and their decorative appearance; but the long bare coils of brown stem, and the sudden bursting out into leaves and tendrils which are characteristic of vines in general, — these were still more to his purpose, and he was more earnestly bent upon reproducing them in his work than upon giving exact representations of foliage or of fruit. His barren lengths of stem he needed to frame in the lanky figures of his saints; the luxuriance of grape cluster and leaf and tendril served to fill the blanks between them. The resulting ornament is more like nature than the soft and regularly foliaged vine-forms that preceded it. And it was the attention which the designers of early Christian times gave to the development of their own



PILASTER AND CAPITAL, ITALIAN RENAISSANCE.

superior principles of elasticity and strength in construction that opened their minds to the perception of the same qualities in nature and enabled them to make such excellent use of natural forms in their decorations.

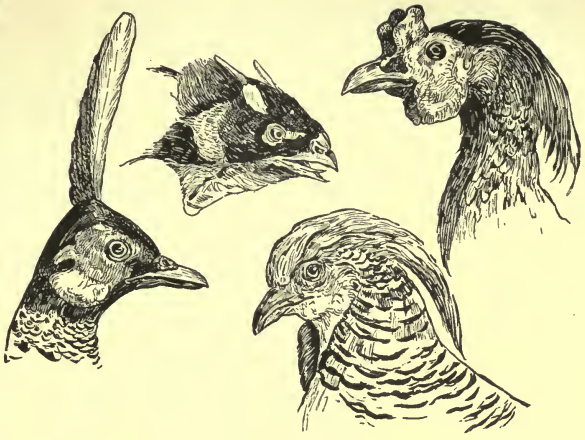
The new needs and ideas of life which have produced so many constructive problems ingraft upon them a new expression of force or grace, and to fit them for positions and purposes not, in all respects, like the old. He may get on such points plenty of useful hints from the nature that surrounds him. Every twig and ground plant will furnish him with crestings and rosettes, every vine and creeper

NATURAL FORMS SHOWING DISTRIBUTION OF COLOR: FEATHERS OF GOLDEN-WINGED WOODPECKER; WING OF CECROPIA MOTH; PETALS OF FLOWERS, LEAVES, ETC.

which architects and engineers have found means to solve must soon begin to exercise an important influence on ornamental design. The artist in this way will have to put into his work some of the feeling for constructive truth, for economy of materials and of work, and for practical usefulness that is beginning to distinguish our architecture. He will be expected to enliven and beautify whatever he touches, without taking from its apparent strength and effectiveness; to add an elegance, a magnificence, a wealth of real meaning that without him the work would lack. In doing this he will doubtless have constant opportunities to base his endeavors upon the traditional forms whose uses and general significance are well known; but he will have to with new scrolls. He will find that at times it may be better to follow the leaf of the crowfoot or of the columbine than that of the acanthus, which he has never seen. The beautifully divided leaves of the dicentra and its pretty drooping racemes of two-horned white flowers might readily suggest the leafage and the flower ornament between the volutes of a capital, as in the cut of the Renaissance capital here shown. Curled ferns might answer for the volutes themselves, and the channelings of the shaft might be copied from those of the skunk-cabbage as it pushes up through the black mud in early spring.

In the meantime, and in the absence of a sound and living art, the student may find in nature exemplifications without end of the

laws which should always govern the creation and application of ornament. In nature, most things owe whatever beauty of form they possess to perfect adaptation to their use and circumstances. An animal or plant which is only partly adapted to its conditions of existence is ugly in exact proportion to its lack of viability. In nature, any excess of force beyond what is needed for structural or functional purposes is immediately applied to the production of ornamental excrescences or fine colors. Ornament is turned again to use: the bright colors of flowers serve to attract insects; the markings of animals are for disguise or recognition, or to create fear or inspire affection.



PHEASANTS' HEADS.

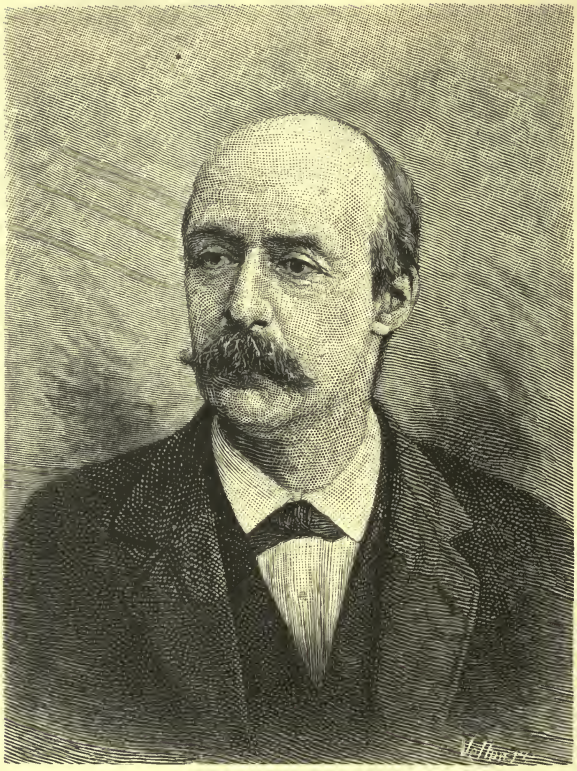
The strictest utilitarian cannot find fault with the way in which the crane's-bill and the meadow-violet expend their surplus revenue in adding to their attractiveness. In their case, as in that of the dark chevrons of the chick-weed leaf and the white crescents of the clover, the distribution of the color is guided both by the radiating or branching structure of leaf or petal and by the distances from the source of supply. The leaves of the dog-tooth violet, which have a frame-work of parallel veins bound together by cross veins, are spotted with dark color in the centers of the rectangular spaces between them. These ornamental markings represent a remnant of force left over from the construction of the leaf, and not sufficient to flush it all with color. They occupy the exact place where a good decorator would put them, close to the important points and lines but seldom upon them. This relation of color to vitality in its intensity and power, and to structure in its distribution, is very obvious in birds. The head, the gorge, breast, back, wings, and tail — the most important parts of the superficies — get the most of it. In the neighborhood of these parts, at least in vigorous species, there is sure to be some accumulation of force, which shows itself in ornamental appendages like crests and gorgets and wing covers, or in striking colors, or both. The heads and necks of several varieties of pheasants show this very plainly, but it is easily observable even in our smaller and more plain colored birds, in the tesselated wings of the hairy woodpecker, and in the painted eyebrows and quill-feathers of the wood warbler (in the same picture with dicentra, etc.). The color is seldom applied upon the working parts. It is vague and diffuse on the larger, unimportant spaces. In feathers, it is at some distance from the shaft and between it and the edge that the darkest color shows itself. In butterfly wings, the bands and spots show the same dependence on the general form and on the veining.

THE HAIRY WOODPECKER.

There is a strict analogy between all this and the way in which the work of decoration should always be carried on. In amount and intensity it should bear a relation to the importance of the work. Its distribution should be as if the builders or manufacturers, after the completion of the necessary portions of their work, would not rest at that, but proceeded to cover the contiguous spaces with decorations. Some such feeling has always regulated the distribution of ornament in every good period of art; and the corresponding notion that it is true economy, for either nation or individual, to hold surplus wealth in the form of splendid decorations seems to have been general in all former periods of great social activity and power.

Roger Riordan.

PROFESSOR AGASSIZ'S LABORATORY.



ALEXANDER AGASSIZ. (FROM A PHOTOGRAPH BY NOTMAN.)

STUDENTS of the geographical distribution of animals find that the key-word to their department of science is *temperature*. That is to say, the most important of all those combined circumstances of food, altitude, soil, etc., which affect the localization of a species, or cause a fauna to be made up as we find it in any particular district, is the matter of average heat and cold. This is particularly true of marine organisms, which, in a general way, are not only less active in winter than in summer, but far more abundant near the surface,—both in variety of kinds and in number of individuals,—than at chilly depths, and in warm waters than in northern and colder seas. The Gulf Stream, therefore, forms a very important factor in estimating the distribution of the animal life of the ocean, since its warm current permits many a southern form to wander far to the northward in its genial track; just as, conversely, a range of high mountains, such as the Rockies, enables many a snow-loving animal to creep almost to tropical limits along the lofty ridges, defying by the aid of cold altitudes the arbitrary limits which latitude used to set to the "zones" of organic life that were supposed to encircle the globe.

There is thus found to be a startling difference in the oceanic fauna north and south of Cape Cod; the bather who has tried the surf at Nahant and then at Newport needs no thermometer to understand the immense contrast of temperature between the two coasts. The reason is plain: into Massachusetts Bay pours the icy flood from Labrador and the berg-haunted banks of Newfoundland, while the south shore is washed by the great tepid current from the tropics, which the Cape swerves off until it strikes straight out to sea to warm the Irish coast. North of Cape Cod, one picks up on the beaches, and dredges from the bottom of the bay, few sea-animals (at least of invertebrates) except those of arctic habit, and these grow more abundant as he proceeds northward;

while he misses dozens and dozens of species that he knows may be collected merely by crossing the narrow peninsula which has stood for ages in some shape, a barrier to the southward extension of northern forms and to the northward travel of those animals whose home is in the southern seas.

The naturalist, then, who would study to greatest advantage the pelagic life of our part of the Atlantic must go south of Cape Cod; and if he proposes to remain in New England, he is practically restricted to the mouths of Buzzard's and Narragansett bays, since the coast of Long Island affords few advantages for his pursuit, and the Sound is too land-locked. It was with an appreciation of these facts that the late Professor Louis Agassiz settled upon Penikese Island, below New Bedford, Massachusetts, as the site of his Summer School of Natural History; and the profusion of species of marine animals and plants procured there proved his wisdom, so far as the question of locality was concerned. When Professor Agassiz died, however, and his son and successor at the Museum of Comparative Zoölogy in Cambridge, Mr. Alexander Agassiz, undertook to continue the enterprise and pursue his own investigations at the same locality, he met with difficulties.

It was discovered that, owing to inaccessibility and other circumstances, the expense of continuing the school would be too great to make it profitable in any sense, and that the oversight of so large a class involved a greater tax upon his time than Mr. Agassiz could afford. The school was therefore closed, and a position was sought which should be equally rich in material for study, but more convenient for the erection of such a laboratory as is about to be described,—a laboratory which should not attempt to carry out the widely educational idea of the elder professor, but should simply be the best desirable workshop for Mr. Agassiz and such of his assistants and advanced special students at the Cambridge Museum as he could find accommodation for. These facts are plainly stated in order to dispel a current error that the present institution is only a weak perpetuation of Professor Louis Agassiz's school at Penikese in 1873.

After very careful examination, the terminus of The Neck, at Newport, R. I., was fixed upon by Mr. Agassiz as the most suitable location. Here a promontory of solid rock, well clothed with turf, stands out boldly from the coast line. With the open ocean westward and in front as you look toward the south, and the entrance to the harbor, divided by Conanicut and other islands from the shining breadth of Narragansett Bay, beside you on the right, few points on our coast or any other give a more inspiring outlook. In 1812, some defensive earth-works crowned the bluff, giving the name Castle Hill to the promontory, the crest of which is now occupied by Mr. Agassiz's summer home. On the harbor side, at the bottom of the hill, a little winding cove "makes in,"—a mere rift in the rocks, so deep that no unsightly mud-banks are left exposed, and where boats can easily make a landing at low tide. Here stands the laboratory, sheltered from the ocean's winds, but overlooking the beautiful harbor.

No one would suspect its purpose from the appearance of the building; all the prettiness of tasteful sea-side architecture—many-gabled roof, outer stair-ways, external beams and braces, latticed porticoes, and slate-brown paint, overgrown with masses of vinery—feign romance rather than the realism to which it is devoted. A few rods away, nearer the shore, stands a windmill—not such an old-fashioned, shingle-sided relic as those which used to flap their massive arms in the face of frightened horses all around the ancient town, but a new and ingenious contrivance of iron, which, if it adds nothing to the fair picture, at least does not disfigure it. This refinement of a windmill, moving readily under the touch of a zephyr that the nerves of the old Hollandish structures never would have recognized, supplies to the laboratory the pure water and steady currents of air that preserve its vitality. The soft clucking of its musical motion is rarely silent, for day after day the south-west summer breeze comes lazily but steadily in, as though Newport lay under the track of a trade-wind.

Out from the windmill, some twenty-five yards into the harbor channel, runs a pipe which is bent up vertically at the end, and capped with a pair of Ts, through the screened, hanging tips of which the clean sea-water is sucked in in such a way that no sea-weed can enter and clog the pipe. Through this pipe the windmill will draw ten gallons a minute, at a moderate speed, pumping it into a cistern in the attic of the laboratory which holds about 1400 gallons. When this is full, the overflow—for the mill goes on regardless of the demand—escapes into an open sink downstairs, so that the condition of the cistern is always apparent. The water used in the laboratory, however, does not come by direct flow from the bottom of the cistern, but is drawn through a siphon. This secures the regular pressure and avoids the variation of "head" at different stages of water which would result from the other method. This water (as I have

already mentioned) is all clean sea-water, salt as the open ocean and is incessantly renewed.

The windmill also drives an air-pump, which forces the air into a drum, whence it escapes to the laboratory under an equal and steady pressure (secured by proper valves) of five pounds to the square inch. These arrangements for a constant and uniform supply of water and air under easy control are the foundation of the facilities here afforded for the continued and successful study of living marine animals.

There is a large cellar-basement, useful for dissection of great fishes and general storage, and a third story having a suite of chambers charming for an artist's or other delicate work for which a good light and the encouragement of pleasant surroundings are needed; but the "laboratory" proper is a room perhaps forty-five feet long by twenty-five wide, entered from the ground, with which its floor is level on the uphill side of the house.

The southern side of this room is occupied wholly by glass shelving, closets, etc. A part of the shelves hold the working library,—not many books, nor in fine bindings, but in all sorts of languages, full of strange diagrammatic figures and Latin names, of anatomical descriptions and tables of classification,—unentertaining volumes to the layman, not at all of the sort which form the "summer reading" of the publishers, yet costly and precious, for each one is the monument of months or years of patient labor, and lays bare a little corner of the globe's history unseen before. These plain books all are laid on their sides to prevent their warping. Among them are portfolios full of original drawings and manuscript notes that have grown out of the studies of the master and his students, which are left for years to season under the watchful experience which shall confirm or condemn their presumed truth before the test of publication is risked.

The rest of the glass shelving on the south wall is covered with glass dishes of all kinds. Room is precious, so the cupboards have doors of slate which, when shut, form a blackboard (every working and teaching naturalist must of necessity be a pretty good draughtsman, both with pencil and chalk); and there are everywhere hooks and other devices for convenience.

The eastern and western ends of the room have windows so guarded by shutters as to exclude the light, but admit a cool breeze; but the north wall is full of long windows, having only space between for five tables, which (though there are two extra ones in the corners) limit the number of persons who can work at one time. This north light is excellent, the bay reflecting it, while the grassy plat near by prevents any glare. Across each window may be placed a movable shelf, fixed at any height, on which a glass jar may be set between the observer and the light in such a way that the motions of any little creatures in this improvised aquarium can be seen with great plainness.

It would seem as though so well constructed a building as this, founded upon the granite core of the primitive globe, was solid enough; but microscopists—and the men who work here are nearly all microscopists—will tell you that their instruments are sensitive to a jar which the most acute of our nerves would fail to perceive, and that the least tremble is sufficient to disturb that precise focus upon the keeping of which the success of an observation depends. Independent of his foundations, therefore, Mr. Agassiz has built a line of massive arches, nowhere touched by the floors or walls of the building. It is upon these arches that the working tables and the little three-cornered microscope-stools stand, feeling the shock of no gale that may beat against the house, nor the tremor of any footfall upon the floor.

The tables are not of large size,—about like a library desk,—but are firmly constructed and serviceable. They are covered with English glazed tiles,—white, except two black rows at the end, furnishing opposite backgrounds to the glass vessel in which the often almost invisible morsel of animal life is floating. What cannot readily be seen against a white surface may become plainly apparent in front of a black one. On the long middle tables (hereafter described) Mr. Agassiz has enlarged upon this idea by covering them with spaces of variously colored tiles simulating natural sea-bottoms. The clear gray does well enough for sand; dark leaden gray for mud; a mottled castile-soap pattern in brown for pebbles; and dulse-green for sea-weed. It is a popular error, or, at any rate, prevalent thoughtlessness, that sea animals pay no attention to the sort of bottom underneath them as they move about. If this is true of any, it certainly is not of a large number of kinds. Some are confined to districts limited by one sort of bottom because it provides their only food; others because there they are safer from harm than they would be elsewhere; a third class perhaps from choice, or for some reason not readily discernible. In any case, it has been both suspected and proved that the character of the bottom has great influence, particularly in the matter of color, upon the fishes and others frequenting a district of mud or sand

or rocky or weed-grown bottom respectively. It was in order to experiment in this direction that Mr. Agassiz invented and provided these imitative surfaces, which should form an artificial bottom resembling sand, pebbles, etc., when the dish containing a fish or invertebrate to be deceived should be set upon it.

I can mention here only one of the interesting results of the experiments. The flounder, as everybody knows, is an ill-looking, dark-colored, flat fish, which creeps close along the bottom, and frequents for the most part banks of mud, from which it is almost indistinguishable. Occasionally the flounder occurs in sandy districts, in which case it is of a yellowish tinge, though not otherwise different from its black neighbor of the mud. Taking young flounders, Mr. Agassiz experimented upon their power of changing color. Placing them upon the blackish tiles, they quickly turned mud-color; moved thence to the "sand" tiles, only a few moments elapsed before their leaden skins had paled to dull yellowish white; transferred to the mimic "sea-weed," in less than five minutes a greenish hue overspread their skins, which would have served well in their native element to keep them unobserved against a mass of algæ. As the flounders grew older, the rapidity and facility with which these changes were effected lessened, and perhaps they would altogether cease in aged individuals who had never practiced as turncoats; but the readiness with which the youngsters altered their complexions to suit their circumstances, as shown by experiments in this laboratory, would give them high rank in partisan politics.

Between the ends of the two tables which, as I have said, extend lengthwise of the room as far as convenience will allow, stands a sink made of soap-stone, where overflows go and where water may be drawn by the pailful. This sink is covered like an old-fashioned well, with a flat canopy of glass resting at a convenient height upon four corner posts, so that jars may be set upon it and their contents examined from underneath with the important help of transmitted light.

The central tables each side of this are intended not for study,—that is to be done at the small desks near the windows,—but for the preservation of specimens; and to this end there is suspended over them an elaborate system of pipes, supplying air and water and bearing faucets every few inches. This system consists of eight sub-pipes connecting with two branches from the cistern siphon, which hangs well above the operator's head, but within easy reach of the hand. Each sub-pipe may be closed or opened by a stop-cock so as to admit either air or sea-water at will,—the air being brought to them by a special connection with the air-main from the windmill. Besides this, a portion of the branches can be cut off and used to supply rain-water also, which is stored in a small cistern of its own near by. Sea-water, fresh water, and air may therefore be supplied all at once and continuously, and the arrangement for each may be changed and interchanged to suit the student's convenience, while no anxiety is felt, either lest the supply may cease or lest any irregularities may occur, since automatic contrivances guard against accident to the machinery. Even if water should fly loose, or overflow somewhat, no harm would be done, for copper gutters carry away all drippings, and the cement floor, covered only with neat oil-cloth, defies injury from wetting. In case of a failure of the windmill, the cistern could be filled daily by a hand force-pump.

I have explained that this particular locality is highly favorable to the study of marine zoölogy, because the jutting headlands on each side of the harbor make a funnel into which, twice a day, the entrapped tide drives the pure ocean waters fresh from the warm path of the Gulf Stream, bringing a harvest of living things that elsewhere along the coast remain far outside. Mr. Agassiz is therefore able to get, at the very door of his laboratory, a large series of thoroughly pelagic animals which other naturalists (at least, everywhere north of Hatteras) must go far afloat for, and would regard as wholly extra littoral.

One may see anchored in the little cove behind Castle Hill a small steam-launch (it can outspeed anything of its size at Newport!), a trim sloop or two, and various dories and punts; these constitute the fleet with which materials for investigation are gathered. Two methods are practiced, according to the sort of animals desired or hoped for. If mollusks, sea-urchins, star-fishes, annelids, or mature non-swimming animals generally, or some kinds of bottom-feeding fishes, are wanted, then the launch is sent out to trawl.

The trawl used by Mr. Agassiz is a miniature of the improved apparatus designed by him and employed in his deep-sea dredging in the West Indies on board the Coast Survey steamer *Blake*. It consists of a pair of Us set on edge and fastened in that position by horizontal connecting bars of iron. Behind this frame so constructed is fastened a sack of chain-netting or canvas, or both, and in front a sort of bail-handle to which the drag-rope is attached. It is of no consequence upon which side the trawl falls when thrown overboard, since the round ends of the "Us" give equal runners on both sides; and, as it is pulled along,

the weight, position, and blade-like form of the lower bar cause the machine to hold to the bottom, and scrape every easily movable thing into the strong bag which trails, open-mouthed, behind. The "feel" of the rope tells the dredger when it is full; it is then hauled up hand over hand or by means of a windlass, and its contents are emptied out and sorted before the next load arrives. Dredging in Newport harbor, or, as we used to do it, back and forth through Vineyard Sound (to the great perturbation of weak stomachs), is a very simple matter; but when it comes to dropping the great deep-sea dredge two miles or more, and taking all day to the experiment, with the help of a donkey-engine, it becomes an art. In the two cases the apparatus differs little, except as to size and strength.

The laboratory I am describing, however, mainly is connected, thus far, with inquiries into the embryology and youthful life of fishes, and the embryology of radiates, crustacea, and worms. Materials for this, in the shape of eggs and larvæ, are almost wholly to be got just under the surface of the sea, where the wandering, playful children of all sorts of sea life—fishes, mollusks univalve and bivalve, crabs and shrimps, jelly-fishes, sea-stars, urchins, worms, etc., etc.—swarm and drift in happy aimlessness until their ranks are thinned by countless enemies, and the survivors sink to safer depths or settle on some public and preëmpted homestead among the surf-showered rocks. When the glare of the sun has left the water, and the tide stands high off the torpedo station or is just beginning to settle seaward at Beaver Tail, the professor and his students slowly cruise in search of such tiny prey. Behind them is towed a gauze net, which skims the surface and ingulfs every unlucky midget in its path, while all hands continually dip up at random gauze dipperfuls of water and carefully rinse their nets in the small tubs, on the chance of getting something worth having. It is by this sort of pleasant sea-prospecting that we have learned how rich are the tidal currents setting into Narragansett Bay in representatives of all the crowding pelagic life of the Gulf Stream; and if Mr. Agassiz neglects to drag his nets on the incoming tide, it is a small matter, for the outgoing rush leaves a thousand sea-born youngsters captives in the pocket-like cove just under his windows, where they have been entrapped and may be scooped up at leisure.

Returning from such an excursion, the buckets and tubs containing the net result are brought to the laboratory and sorted out. The visitor then would find the long central tables covered with glassware—jars and pans and bowls, white and clear as crystal, capacious as if to hold punch for the Chaplain of the Fleet, every one with a mouth as big as its body, or even bigger. Some of these high, straight-sided, flashing jars will hold several gallons; some of the shallow ones are like six-quart milk-pans, and the sizes of the others lessen to the minimum of a watch crystal, where a single egg, or gastræa larva, or dancing animalcule may be isolated from his fellows. This glassware is all made to order for the laboratory and for the Cambridge Museum. It is altogether unequaled for the purpose, since it is capacious, clean, transparent, and not affected by sea-water as metal or wood would be, while it is cheaper, lighter, and more handsome than porcelain.

Having roughly sorted and cared for the dredgings that same night, the next morning the student examines them more carefully, and arranges for preservation the specimens which he especially desires to keep alive. The method will depend upon the age, character, and known hardihood of the object, but the two requisites in all cases are cleanness of water and constant aëration. Turning off the water from one of the pipes, a rubber tube from the air-main is led to it, and it becomes an air-pipe. The jar containing the living specimen is placed on that part of the table at which, by means of the tiles underneath, it can be seen to the best advantage; a small rubber tube attached to a faucet on one pipe is made to supply to it a steady stream of clean sea-water, and another tube brings fresh air to replace the oxygen exhausted by the animal's respiration; the overflow takes care of itself, and there is no further trouble.

But this simple proceeding can be trusted only in the case of large, mature, tough animals, such as rarely have the honor of reposing in these scientific precincts. More gentle treatment is usually required, and the methods now successful have only been learned through long and costly experience.

In the first place, isolation, entire or in part, is necessary. This is accomplished by subdividing the tubes which lead from the iron pipes overhead. An inch or two from the faucet there will be slipped in an inverted T of glass bearing two tubes; these in turn may be similarly subdivided by inverted Ts, and so on, the number of outlets supplied by the one original faucet and neck being limited only by convenience. Every terminus of a tube, whether delivering water or air, is closed by a glass tip, which not only gives exit to a safely diminished stream, but does no harm to the inhabitants of the jar, as the corrupting influence of rubber in contact with salt water might. These tips are bits of glass tubing cut off as required,

melted in a spirit-lamp, drawn to a fine point, and perforated by a hole, which allows the escape of only a thread of water or a bubble of air so small as to cause no disturbance. Each man makes these glass tips for himself, bending and twisting them to suit his needs. The rubber tubing, too, is a great convenience. It is of various sizes, can be cut into any required length, pieced out by stretching over a joint of glass tubing, fitted air-tight upon iron pipes, faucets, glass rods, and the like, and bent about in the most handy and time-saving way.

Though the water comes clear enough, it will not do to allow the air supplied by the windmill to enter at once the water in which the very delicate organisms are being kept alive. It is likely to contain some moisture gathered on the way, and this moisture is liable to have been charged with iron-rust or some other mineral ingredient. The air from the pipe, therefore, is led first through a large Woulfe bottle, such as chemists are familiar with, where it leaves its deleterious moisture and goes clean to its work. That this precaution is a judicious one, is shown by the fact that the Woulfe bottles gradually become clouded within by a deposit of iron and dirt. Sometimes ducts of rubber connect two or three jars to one or more of these Woulfe bottles and to each other, and so there is a constant circulation among a community of little aquaria, economizing apparatus. All these contrivances together, and two hundred and fifty jars and bowls, can be taken care of at once on these tables, though there are only a score or so of supplying faucets.

Reckoned by their vitality in captivity, marine animals fall into three categories:

First. Those that are large and strong enough to allow water to be introduced in a steady stream directly to their jars, and that do not require any more air than the constant current of water brings; these are the crabs, shell-fish, annelids, and common full-grown shore animals, such as are ordinarily seen in aquaria.

Second. Those that will survive simple aëration of the water in which they are placed, the water itself not being changed, usually, but only added to to make up for evaporation. To this class belong crabs and other small animals that are just about to lay their eggs, together with young of all sorts in their swimming or larval stages. In these cases, however, the "injector" is often made use of. This consists of a spindle-shaped chamber of brass, with external openings, so that, as the stream of water passes through, it sucks into its current a quantity of air which goes to the jar mingled with the stream. This little injector is, in fact, a miniature Catalan blow-pipe, being constructed on exactly the same principle as that which supplies the tweers of a blast-furnace. It is a contrivance of great value in the laboratory.

Third. The morsels of almost invisible life too delicate to resist ever so feeble a current, and too volatile and minute not to escape in an overflow, however well guarded. To the receptacle of these only a very gentle though unremitting supply of air can be given, while the water must frequently be changed by cautious dipping out and pouring in by hand, a trifle at a time. No mother attends to her infant with more tender and scrupulous care than the zoölogist to these babies of the sea.

And what are they? Eggs of fishes, mollusks, crustaceans, and radiates; embryos of similar animals and of jelly-fishes — filmy, fragile, nineteen-twentieths water — which would perish under the slightest injury, and can only be kept alive by the greatest painstaking. That Mr. Agassiz has been successful beyond all precedent in preserving these excessively delicate pelagic forms in his laboratory, shows how admirable are all his methods and appliances to reproduce the most healthy conditions of nature. It was no mean triumph, for instance, to have reared those young flounders and goose-fish from eggs scooped up in the open sea, and to have kept them all summer, while he noted and sketched the various aspects of their growth. But the highest surety of the suitability of his arrangements was afforded when the vapory, translucent siphonophores, in which no one before had been able to maintain vitality for more than two or three hours, lived contentedly in their glass prison last summer during fifteen days. One highly favorable circumstance, no doubt, is that the temperature of the water in the Newport laboratory is cooler than that of the open sea. Heated by the ever-present Gulf Stream, the ocean in summer rises to a warmth of seventy-six or seventy-seven degrees Fahrenheit; by the time it has passed through the pipes and the shaded cistern, this water has been considerably cooled down, and remains at a lower temperature than that of the native element from which the subjects for study are brought. This is greatly to their advantage (the hatching of fish eggs may be checked, yet without loss of vitality, and held back indefinitely, by steady cold), and it was because of the opposite condition that sea-side students at Nahant and Salem and Gloucester have always been less successful. English laboratories have an equal difficulty, overcome only by the expensive use of ice.

But to go into all the details of laboratory

expedients employed here is beyond space, and perhaps would interest very few. Everything is intended for work and study, not for show; there is nothing in the way of an "aquarium." If it happens that the apparatus or the zoölogical specimens are pleasing, that is a happy chance, not the first intention. No living object is kept longer than there is use for it; mere curiosity must make way for original investigation into something else more obscure.

The studies at the laboratory have continued through half a dozen summers, and have been conducted by Mr. Agassiz, the late Count L. F. de Pourtalès, Professor Walter Faxon, Dr. W. K. Brooks, and Mr. T. W. Fewkes, with a few others at intervals.

Mr. Agassiz's work here has been mainly on the embryology of fishes, radiates, crustacea, annelids, and pelagic tunicates. Several contributions to the National Academy of Science and to the Proceedings of the American Academy of Arts and Sciences (Boston) have grown out of them, chiefly upon the young stages of flounders, goose-fish, and various other genera; and embryological observations on the ctenophoric jelly-fishes, on the garpike (*Lepidosteus*), and on *Balanoglossus*. Mr. Agassiz was also employed for a long time in working up the sea-urchins brought home by the *Challenger* deep-sea expedition, the results of which have been embodied in the special scientific reports of that famous cruise.

Count Pourtalès spent his energies chiefly on his favorite corals, *Foraminifera* and their kin, publishing his results in the memoirs of the Museum of Comparative Zoölogy, of which he was the keeper. Mr. Faxon, who is assistant professor of zoölogy at Harvard, made a specialty of crustacea, and wrote several papers on their embryology from here.

Dr. Brooks, who is now assistant professor of biology at Johns Hopkins University, and who carries on a marine laboratory of his own at Beaufort, North Carolina, busied himself with the embryology of mollusks, publishing one paper. Dr. Fewkes, now Mr. Agassiz's assistant in the Zoölogical Museum at Cambridge, did the same thing with jelly-fishes. Much of the work of these and other students (among them some ladies) remains unpublished in note-books and manuscript (for "rushing into print" is frowned upon by this cautious coterie), so that future results may be expected, the chief preparation for which has already been done. As to the further progress of the laboratory, Mr. Agassiz says the chief field will naturally be the study of the youth of marine animals,—not simply of their embryology, but of the successive phases presented in the development of their infant growth, and the relations these bear to adult forms and to general questions of biology and classification.

Ernest Ingersoll.

WONDERLAND.

My heart to-day is like a summer flower
Which lifts its blooming chalice to absorb
Sweet odors from the air. For, like a flower,
My heart absorbs the fiery life that dwells
Within the blossoming matter of the world
And naked strength of nature. Here, where earth
Seems peaceful as a dreamer's paradise,
I trace the movement of the universe,
The splendor that inspires the thought of man,
And glory that outshines the fancy. Here
I learn the clear and simple speech of truth,
And feel the buoyant spirit of forest birds
That fill a whole bright summer with their song.
I look upon the old world as a child
Looks with a vague and tender trust upon
Its mother's face; and, strangely moved, I see
Beyond the beauty of familiar things,
As one may see into another's heart
With the fine sense of love.

No harsh voice falls
Along the solemn quietude of the air.
Yet I can hear faint voices, which are like
Echo of unseen music: there is speech
In the melodious breeze, and there is song
Within the soft hush of the languorous noon,—
Song that would roar like thunder if the ear
Could catch its undertone. The fire and stir
Of a dædalian impulse throb beneath
The outward slumber of a life which is
Sleepless and everlasting. There is not
A leaf, a rose, a tree, nor animate thing
Which does not add a language to the world;
And I, that am a part of earth and sky,
Feel that divinity and kinship born
Of truth and noble knowledge. Oh, I love
To watch the pageant of the world unroll,
To search within its sorcery, and to drink
Its wild enchantment, even as men were wont,
In the dead days of fable, to give form
To sprite, and gnome, and god.

Our living world
Is a translucent fairyland, wherein
The infinite force of nature moves alone
To marvelous and mysterious issues. Men
May feel the spirit and witchery of its life,
Breathed forth like fragrance from a field of wheat
In ripe midsummer. For a space I dream
That I am borne through ocean spaces hence
To some vague heaven, where souls are said to dwell
In bodiless beauty, where existence is
A vision without substance: brief delight,
Less beautiful than what mine eyes have known,
Unreal as fancy when it strives to make
Being and love of empty nothingness.
True nature is a joy that ministers
To the strong, passionate heart; and here I feel
Her kiss upon me like a chastening flame,
And I am clothed in all her glory, one
Drawn to her sovereignty, like some fresh fount
Drained back to earth. Yet often nave I, too, felt
The hot blood rush into my cheeks, and fire
Leap to my brain, when, like sweet music blown,
Over a waste of water, I have heard
The story of ancient fable, tender myth
Of lands and peoples, and bewitching tales
Of quick enchantment wrought by viewless hands
Beneath the slumberous vigil of the moon.
Then I imagined me a thing of air—
A mad and protean spirit that loved to make
Blithe havoc of men's lives; or else I seemed
One of the race of conjuring giants, leagued
Against the race of mortals; or, perchance,
A magic knight in golden armor clad,
Riding with windy speed upon the trace
Of some phantasmal love.

But now all thought,
All dream, and joy, and wonder are become

One with that sense which has outlived the youth
And credulous mind of ages; which has pierced
The obscurity of the earth, and boldly flown
To the pale light of stars; whose rule has made
Man more than beast and slave, and raised his soul
To flashing heights of freedom. Here I trace
Conceptions of the first creation, forms
Transcending fancy, and the wands that guide
Each drop of dew and each propulsive power
Of our revolving planet. Here I look
Upon the magic of material things,
The witchcraft of the day, and that divine
Incarnate unity of adjusted works
Which is the body of nature. Eye, and ear,
And mind, and heart, and the transfiguring spirit
Here mingle like the colors of the earth
And elements of the air; here, too, all parts
Of truth, and wisdom, knowledge, and deep sight
Of prophecy are the mighty wings whereon
My life is borne and floated like a bird
Throughout this fairyland. Ah! who could be
Untouched and uninspired, when, face to face
With the illimitable sense of force
Embodied thus sublimely, common things
Take on the hues of dream, and wonderment
Thrills the young heart?

I am as one led forth
From somber prison darkness to some place
Whereon the sun beats fiercely; free to look
Upon the life and motion which are springs
Of deathless evolution; free to find
The deep and subtle spell of nature through
All colors, shapes, and natural substances.
I trace the secret of the mutable hills,
Of the soft meadow-grass which steals the dew,
And delicate cobwebs of the leaves; I see
The sponge-like mouths of savage plants that drink
The cooling rain, and find in crumbling rocks
Romances of the black, primeval years.
I watch the breeze-blown currents of the air
Which glide to distant lands, and bear their weight
Of heat and moisture — the creative work
Of sun-waves and the wind — the god-wise growth
Of infinite order and design. I watch
The water drawn invisibly from its streams,
Or dream that I can feel the frozen breath
Of the chilled, vapor-shaping clouds, and rise
Into the fine, sun-bosoming ether. Thus
I grow to loftier contemplation, mount
And soar upon the summits of the world;
Till, in the very strength and sweep of thought,
I stumble, and I know that I have reached
One mystery which dwells deeper than the sea—
Beyond the glow of throbbing spheres, beyond
The calm and vast eternity of skies.

George Edgar Montgomery.

[Begun in August.]

THE BREAD-WINNERS.

V.

A PROFESSIONAL REFORMER.

SLEENY walked moodily down the street, engaged in that self-torture which is the chief recreation of unhappy lovers. He steeped his heart in gall by imagining Maud in love with another. His passion stimulated his slow wits into unwonted action, until his mind began to form exasperating pictures of intimacies which drove him half mad. His face grew pale, and his fists were tightly clinched as he walked. He hardly saw the familiar street before him; he had a far clearer vision of Maud and Farnham by the garden gate: her beautiful face was turned up to the young man's with the winning sweetness of a flower, and Sam's irritated fancy supplied the kisses he had watched for in the shadow of the pear-trees. "I 'most wish't he'd 'a' done it," he growled to himself. "I had my hammer in my hand, and I could 'a' finished him then and had no more bother."

He felt a hand on his shoulder, and, turning, saw a face grinning a friendly recognition. It was a face whose whole expression was oleaginous. It was surmounted by a low and shining forehead covered by reeking black hair, worn rather long, the ends being turned under by the brush. The mustache was long and drooping, dyed black and profusely oiled, the dye and the grease forming an inharmonious compound. The parted lips, which were coarse and thin, displayed an imperfect set of teeth, much discolored with tobacco. The eyes were light green, with the space which should have been white suffused with yellow and red. It was one of those gifted countenances which could change in a moment from a dog-like fawning to a snaky venomousness.

The man wore a black hat of soft felt; his clothes were black and glistening with use and grease. He was of medium height, not especially stout, but still strong and well knit; he moved too briskly for a tramp, and his eyes were too sly and furtive to belong to an honest man.

"Well, Samivel!" he began, with a jolly facetiousness, "what's your noble game this evenin'? You look like you was down on your luck. Is the fair one unkind?"

Sam turned upon him with an angry gesture.

"Hold your jaw, or I'll break it for you! Ever since I was fool enough to mention that thing to you, you've been cacklin' about it. I've had enough of it."

"Go slow, Quaker!" the man rejoined. "If you can't take a joke, I'll stop jokin'—that settles it. Come along and get a glass of beer, and you'll feel better."

They soon came to a garden near the lake, and sat down by a little table at their beer. The consumers were few and silent. The garden was dimly lighted, for the spring came slowly up that way, and the air was not yet conducive to out-door idling. The greasy young man laid a dirty hand on the arm of Sleeny, and said:

"Honor bright, now, old fellow, I didn't mean to rough you when I said that. I don't want to hurt your feelings or lose your confidence. I want you to tell me how you are gettin' along. You aint got no better friend than me nowhere."

"Oh," said Sam, sulkily, "I got nothin' to say. She don't no more care for me than that there mug."

The expression that came over his friend's face at these discouraged words was not one of sympathetic sorrow. But he put some sympathy into his voice as he said:

"Jest think of that! Such a fine young fellow as you are, too. Where can her eyes be? And I seen you walking this evenin' by the lake just like two robins. And yet you don't get ahead any!"

"Not a step," said Sam.

"Anybody in your light, you think? Hullo there, Dutchy, swei glass. Any other fellow takin' your wind?" and his furtive eyes darted a keen interrogation. Sam did not answer at once, and his friend went on: "Why, she don't hardly know anybody but me and you, and, he-he! I wouldn't stand no chance at all against you—hum?"

"Of course you wouldn't," said Sam, with slow contempt, which brought the muddy blood into the sallow cheek in front of him. "She wouldn't look at you. I'm not afraid of no man, Andy Offitt,—I'm afraid of money."

He flattered his jealous heart by these words. It was too intolerable to think that any mere man should take his sweetheart away from him; and though he felt how hopeless was any comparison between himself and Farnham, he tried to soothe himself by the lie that they were equal in all but money.

His words startled his friend Offitt. He

exclaimed: "Why, who does she know that's got money?"

But Sleeny felt a momentary revolt against delivering to even his closest confidant the name of the woman he loved coupled with the degrading suspicions by which he had been tormented all day. He gruffly answered: "That's none of your business; you can't help me in this thing, and I aint agoin' to chin about it any more."

They sat for awhile in silence, drank their beer, and ordered more. Offitt at last spoke again:

"Well, I'll be hanged if you aint the best grit of any fellow I know. If you don't want to talk, a team of Morgan horses couldn't make you. I like a man that can hold his tongue."

"Then I'm your huckleberry," said Sleeny, whose vanity was soothed by the compliment.

"That's so," said Offitt, with an admiring smile. "If I wanted a secret kept, I'd know where to come." Then changing his manner and tone to an expression of profound solemnity, and glancing about to guard against surprise, he said: "My dear boy, I've wanted to talk to you a long time,—to talk serious. You're not one of the common kind of cattle that think of nothin' but their fodder and stall—are you?"

Now, Sam was precisely of the breed described by his friend, but what man ever lived who knew he was altogether ordinary? He grinned uneasily and answered:

"I guess not."

"Exactly!" said Offitt. "There are some of us laboring men that don't propose to go on all our lives working our fingers off to please a lot of vampires; we propose to have a little fairer divide than heretofore; and if there is any advantage to be gained, we propose to have it on the side of the men who do the work. What do you think of that?"

"That's all solid," said Sleeny, who was indifferently interested in these abstractions. "But what you goin' to do about it?"

"Do!" cried Offitt. "We are goin' to make war on capital. We are goin' to scare the blood-suckers into terms. We are goin' to get our rights—peaceably, if we can't get them any other way. We are goin' to prove that a man is better than a money-bag." He rattled off these words as a listless child says its alphabet without thinking of a letter. But he was closely watching Sam to see if any of these stereotyped phrases attracted his attention. Sleeny smoked his cigar with the air of polite fatigue with which one listens to abstract statements of moral obligations.

"What are we, anyhow?" continued the greasy apostle of labor. "We are slaves; we are Roosian scurfs. We work as many hours as our owners like; we take what pay they choose to give us; we ask their permission to live and breathe."

"Oh, that's a lie!" Sleeny interrupted, with unbroken calmness. "Old Saul Matchin and me come to an agreement about time and pay, and both of us was suited. Ef he's got his heel onto me, I don't feel it."

Offitt darted a glance of scorn upon the ignoble soul who was content with his bondage; but the mention of Matchin reminded him that he had a final shot in reserve, and he let it off at once.

"Yes, Saul Matchin is a laborin' man himself; but look at his daughter. She would die before she would marry a workman. Why?" and his green eyes darted livid fire as they looked into the troubled ones of Sleeny.

"Well, why?" he asked, slowly.

"Because she loves money more than manhood. Because she puts up her beauty for a higher bidder than any——"

"Now, shet up, will you?" cried Sam, thoroughly aroused. "I wont set here and hear her abused by you or any other man. What business is it of yours, anyway?"

Offitt felt that his shot had gone home, and pursued his advantage.

"It's my business, Sam, because I'm your friend; because I hate to see a good fellow wronged; because I know that a man is better than a money-bag. Why, that girl would marry you in a minute if you was rich. But because you're not she will strike for one of them rose-water snobs on Algonquin Avenue." Sam writhed, and his wheedling tormentor continued, watching him like a ferret. "Perhaps she has struck for one of them already—perhaps—oh, I can't say what may have happened. I hate the world when I see such doin's. I hate the heartless shams that give labor and shame to the toilers and beauty and luxury to the drones. Who is the best man," he asked, with honest frankness, "you, or some high-steppin' snob whose daddy has left him the means to be a sucker all his days? And who would the prettiest girl in Buffland prefer, you or the sucker? And you intend to let Mr. Sucker have it all his own way?"

"No, I don't!" Sam roared, like a baited bull. "Ef any man crosses my path, he can find out which is the best man."

"There, that's more like you. But what can you do alone? That's where they get us foul. The erristocrats, the money power, all hang together. The laborin' men fight singly, and alwuz get whipped. Now, we are goin' to change that. We are goin' to organize. Look here, Sam, I am riskin' my

head in tellin' you this—but I trust you, and I like you, and I'll tell you. We *have* organized. We've got a society in this town pledged to the cause of honest labor and against capital—for life or death. We want you. We want men of sand and men of sense, and you've got both. You must join."

Sam Sleeny was by this time pretty well filled with beer and wrath. He felt himself in a certain sense bound by the weighty secret which Offitt had imparted to him and flattered by his invitation. A few touches more of adroit flattery, and the agitator's victory was complete. Sleeny felt sore and tired to the very heart. He had behaved like a brute to the girl he loved; he had been put clearly in the wrong in his quarrel with her, and yet he was certain that all was not well with either of them. The tormenting syllogism ran continually through his head: "She is the prettiest woman in the world—rich fellows like pretty women,—therefore—death and curses on him!" Or sometimes the form of it would change to this: "He is rich and handsome—girls like men who are rich and handsome,—therefore——," the same rage and imprecations, and the same sense of powerless fury. He knew and cared nothing about Offitt's Labor Reform. He could earn a good living by his trade, no matter who went to Congress, and he hated these "chinny bummers," as he called them, who talked about "State help and self-help" over their beer. But to-night he was tormented and badgered to such a point that he was ready for anything which his tempter might suggest. The words of Offitt, alternately wheedling and excoriating, had turned his foolish head. His hatred of Farnham was easily extended to the class to which he belonged, and even to the money which made him formidable.

He walked away from the garden with Offitt, and turned down a filthy alley to a squalid tenement house,—called by its proprietor Perry Place, and by the neighbors Rook's Ranch,—to the lodge room of the Brotherhood of Bread-winners, which proved to be Offitt's lodging. They found there a half dozen men lounging about the entrance, who scowled and swore at Offitt for being late, and then followed him sulkily up two flights of ill-smelling stairs to his room. He turned away their wrath by soft answers, and hastily lighting a pair of coal-oil lamps, which gave forth odor more liberally than illumination, said briskly:

"Gentlemen, I have brought you a recruit this evenin' that you will all be glad to welcome to our brotherhood."

The brothers, who had taken seats where they could find them, on a dirty bed, a wooden trunk, and two or three chairs of doubtful integrity, grunted a questionable welcome to the new-comer. As he looked about him, he was not particularly proud of the company in which he found himself. The faces he recognized were those of the laziest and most incapable workmen in the town—men whose weekly wages were habitually docked for drunkenness, late hours, and botchy work. As the room gradually filled, it seemed like a roll-call of shirks. Among them came also a spiritual medium named Bott, as yet imperfectly developed, whose efforts at making a living by dark séances too frequently resulted in the laughter of skeptics and the confusion of his friends. His forehead and cheek were even then purple with an aniline dye, which some cold-blooded investigator had squirted in his face a few nights before while he was gliding through a twilight room impersonating the troubled shade of Pocahontas. This occurrence gave, for the moment, a peculiarly sanguinary and sinister character to his features, and filled his heart with a thirst for vengeance against an unbelieving world.

After the meeting had been called to order, and Sam had taken an oath of a hot and lurid nature, in which he renounced a good many things he had never possessed, and promised to do a lot of things of which he had no idea, Mr. Offitt asked "if any brother had anything to offer for the good of the order." This called Mr. Bott to his feet, and he made a speech, on which he had been brooding all day, against the pride of so-called science, the arrogance of unrighteous wealth, and the groveling superstition of Christianity. The light of the kerosene lamp shone full on the decorated side of his visage, and touched it to a ferocious purpose. But the brotherhood soon wearied of his oratory, in which the blasphemy of thought and phrase was strangely contrasted with the ecclesiastical whine which he had caught from the exhorters who were the terror of his youth. The brothers began to guy him without mercy. They requested him to "cheese it"; they assisted him with uncalled-for and inappropriate applause, and one of the party got behind him and went through the motion of turning a hurdy-gurdy. But he persevered. He had joined the club to practice public speaking, and he got a good half hour out of the brothers before they coughed him down.

When he had brought his speech to a close, and sat down to wipe his streaming face, a brother rose and said, in a harsh, rasping voice, "I want to ask a question."

"That's in order, Brother Bowersox," said Offitt.

The man was a powerful fellow, six feet

high. His head was not large, but it was as round as an apple, with heavy cheek-bones, little eyes, close-cut hair, and a mustache like the bristles of a blacking-brush. He had been a driver on a street-car, but had recently been dismissed for insolence to passengers and brutality to his horses.

"What I want to ask is this: I want to know if we have joined this order to listen to chin-music the rest of our lives, or to do somethin'. There is some kind of men that kin talk tell day of jedgment, lettin' Gabrel toot and then beginnin' ag'in. I aint that kind; I j'ined to do somethin';—what's to be done?"

He sat down with his hand on his hip, squarely facing the luckless Bott, whose face grew as purple as the illuminated side of it. But he opened not his mouth. Offitt answered the question:

"I would state," he said glibly, "the objects we propose to accomplish: the downfall of the money power, the rehabitation of labor, the——"

"Oh, yes!" Bowersox interrupted, "I know all about that,—but what are we goin' to *do?*"

Offitt paled a little, but did not flinch at the savage tone of the surly brute. He began again in his smoothest manner:

"I am of the opinion that the discussion of sound principles, such as we have listened to to-night, is among the objects of our order. After that, organization for mutual profit and protection against the minions of the money power,—for makin' our influence felt in elections,—for extendin' a helpin' hand to honest toil,—for rousin' our bretheren from their lethargy, which, like a leaden pall——"

"I want to know," growled Bowersox, with sullen obstinacy, "what's to be done."

"Put your views in the form of a motion, that they may be properly considered by the meetin'," said the imperturbable president.

"Well, I motion that we stop talkin' and commence doin'——"

"Do you suggest that a committee be appointed for that purpose?"

"Yes, anything." And the chairman appointed Bowersox, Bott, and Folgum such a committee.

All breathed more freely and felt as if something practical and energetic had been accomplished. The committee would, of course, never meet nor report, but the colloquy and the prompt action taken upon it made every one feel that the evening had been interesting and profitable. Before they broke up, Sleeny was asked for his initiation fee of two dollars, and all the brethren were dunned for their monthly dues.

"What becomes of this money?" the neophyte bluntly inquired of the hierophant.

"It pays room rent and lights," said Offitt, with unabashed front, as he returned his greasy wallet to his pocket. "The rest goes for propagatin' our ideas, and especially for influencin' the press."

Sleeny was a dull man, but he made up his mind on the way home that the question which had so long puzzled him—how Offitt made his living—was partly solved.

VI.

TWO MEN SHAKE HANDS.

SLEENY, though a Bread-winner in full standing, was not yet sufficiently impressed with the wrongs of labor to throw down his hammer and saw. He continued his work upon Farnham's conservatory, under the direction of Fergus Ferguson, the gardener, with the same instinctive fidelity which had always characterized him. He had his intervals of right feeling and common sense, when he reflected that Farnham had done him no wrong, and probably intended no wrong to Maud, and that he was not answerable for the ill luck that met him in his wooing, for Maud had refused him before she ever saw Farnham. But, once in a while, and especially when he was in company with Offitt, an access of jealous fury would come upon him, which found vent in imprecations which were none the less fervid for being slowly and haltingly uttered. The dark-skinned, unwholesome-looking Bread-winner found a singular delight in tormenting the powerful young fellow. He felt a spontaneous hatred for him, for many reasons. His shapely build, his curly blonde hair and beard, his frank blue eye, first attracted his envious notice; his steady, contented industry excited in him a desire to pervert a workman whose daily life was a practical argument against the doctrines of socialism, by which Offitt made a part of his precarious living; and after he had met Maud Matchin and had felt, as such natures will, the force of her beauty, his instinctive hate became an active, though secret, hostility. She had come one evening with Sleeny to a spiritualist conference frequented by Offitt, and he had at once inferred that Sleeny and she were either engaged to be married or on the straight road toward it. It would be a profanation of the word to say that he loved her at first sight. But his scoundrel heart was completely captivated so far as was possible to a man of his sort. He was filled and fired with a keen cupidity of desire to possess and own such beauty and grace. He railed against marriage, as he did

against religion and order, as an invention of priests and tyrants to enslave and degrade mankind; but he would gladly have gone to any altar whatever in company with Maud Matchin. He could hardly have said whether he loved or hated her the more. He loved her much as the hunter loves the fox he is chasing to its death. He wanted to destroy anything which kept her away from him: her lover, if she had one; her pride, her modesty, her honor, if she were fancy-free. Aware of Sleeny's good looks, if not of his own ugliness, he hated them both for the comeliness that seemed to make them natural mates for each other. But it was not in his methods to proceed rashly with either. He treated Maud with distant respect, and increased his intimacy with Sleeny until he found, to his delight, that he was not the prosperous lover that he feared. But he still had apprehensions that Sleeny's assiduity might at last prevail, and lost no opportunity to tighten the relations between them, to poison and pervert the man who was still a possible rival. By remaining his most intimate friend, he could best be informed of all that occurred in the Matchin family.

One evening, as Sam was about leaving his work, Fergus Ferguson said:

"You'll not come here the morn. You're wanted till the house—a bit o' work in the library. They'll be tellin' you there."

This was faithfully reported by Sam to his confessor that same night.

"Well, you are in luck. I wish I had your chance," said Offitt.

Sam opened his blue eyes in mute wonder.

"Well, what's the chance, and what would you do with it, ef you had it?"

Offitt hesitated a moment before replying.

"Oh, I was just a jokin'. I meant it was such an honor for common folks like us to git inside of the palace of a high-toned cuss like Farnham; and the fact is, Sammy," he continued, more seriously, "I *would* like to see the inside of some of these swell places. I am a student of human nature, you know, in its various forms. I consider the lab'rin' man as the normal healthy human—that is, if he don't work too hard. I consider wealth as a kind of disease; wealth and erristocracy is a kind of dropsy. Now, the true reformer is like a doctor,—he wants to know all about diseases, by sight and handlin'! I would like to study the symptoms of erristocracy in Farnham's house—right in the wards of the hospital."

"Well, that beats me," said Sam. "I've been in a lot of fine houses on Algonquin Avenue, and I never seen anything yet that favored a hospital."

This dense stupidity was almost more than Offitt could bear. But a ready lie came to his aid.

"Looky here!" he continued, "I'll tell you a secret. I'm writin' a story for the 'Irish Harp,' and I want to describe the residence of jess such a vampire as this here Farnham. Now, writin', as I do, in the cause of humanity, I naturally want to git my facts pretty near right. You kin help me in this. I'll call to-morrow to see you while you're there, and I'll get some p'ints that'll make Rome howl when they come out."

Sam was hardly educated up to the point his friend imagined. His zeal for humanity and the "rehabitation" of labor was not so great as to make him think it a fine thing to be a spy and a sneak in the houses of his employers. He was embarrassed by the suggestion, and made no reply, but sat smoking his pipe in silence. He had not the diplomatist's art of putting a question by with a smile. Offitt had tact enough to forbear insisting upon a reply.

He was, in fact, possessed of very considerable natural aptitude for political life. He had a quick smile and a ready tongue; he liked to talk and shake hands; he never had an opinion he was not willing to sell; he was always prepared to sacrifice a friend, if required, and to ask favors from his worst enemies. He called himself Andrew Jackson Offitt—a name which, in the West, is an unconscious brand. It generally shows that the person bearing it is the son of illiterate parents, with no family pride or affections, but filled with a bitter and savage partisanship which found its expression in a servile worship of the most injurious personality in American history. But Offitt's real name was worse than Andrew Jackson—it was Ananias, and it was bestowed in this way: When he was about six years old, his father, a small farmer in Indiana, who had been a sodden, swearing, fighting drunkard, became converted by a combined attack of delirium tremens and camp-meeting, and resolved to join the church, he and his household. The morning they were going to the town of Salem for that purpose, he discovered that his pocket had been picked, and the money it contained was found on due perquisition in the blue jeans trowsers of his son Andrew Jackson. The boy, on being caught, was so nimble and fertile in his lies that the father, in a gust of rage, declared that he was not worthy the name of the great President, but that he should be called Ananias; and he was accordingly christened Ananias that morning in the meeting-house at Salem. As long as the old man lived, he called him by that dreadful

name; but when a final attack of the trembling madness had borne him away from earth, the widow called the boy Andrew again, whenever she felt careless about her spiritual condition and the youth behaved himself, but used the name of Sapphira's husband when the lad vexed her, or the obligations of the christening came strongly back to her superstitious mind. The two names became equally familiar to young Offitt, and always afterward he was liable to lapses of memory when called on suddenly to give his prenomen; and he frequently caused hateful merriment among his associates by signing himself Ananias.

When Sam presented himself at Captain Farnham's house the next morning, he was admitted by Budsey, who took him to the library and showed him the work he was to do. The heat of the room had shrunk the wood of the heavy doors of carved oak so that the locks were all out of position. Farnham was seated by his desk, reading and writing letters. He did not look up as Sam entered, and paid no attention to the instructions Budsey was giving him. For the first time in his life, Sleeny found that this neglect of his presence was vaguely offensive to him. A week before, he would no more have thought of speaking to Farnham, or being spoken to by him, than of entering into conversation with one of the busts on the bookcases. Even now he had no desire to talk with the proprietor of the house. He had come there to do certain work which he was capable of doing well, and he preferred to do it and not be bothered by irrelevant gossip. But, in spite of himself, he felt a rising of revolt in his heart, as he laid out his tools, against the quiet gentleman who sat with his back to him, engaged in his own work and apparently unconscious of Sleeny's presence. A week before, they had been nothing to each other, but now a woman had come between them, and there is no such powerful conductor in nature. The quiet in which Farnham sat seemed full of insolent triumph to the luckless lover, and scraps of Offitt's sounding nonsense went through his mind: "A man is more than a money-bag"; "the laborer is the true gentleman"; but they did not give him much comfort. Not until he became interested in his work did he recover the even beat of his pulse and the genuine workmanlike play of his faculties. Then he forgot Farnham's presence in his turn, and enjoyed himself in a rational way with his files and chisels and screw-drivers.

He had been at work for an hour at one door, and had finished it to his satisfaction, and sat down before another, when he heard the bell ring, and Budsey immediately afterward ushered a lady through the hall and into the drawing-room. His heart stood still at the rustle of the dress,—it sounded so like Maud's; he looked over his shoulder through the open door of the library and saw, to his great relief, that there were two female figures taking their seats in the softly lighted room beyond. One sat with her back to the light, and her features were not distinctly visible; the other was where he could see three-quarters of her face clearly relieved against the tapestry portière. There is a kind of beauty which makes glad every human heart that gazes on it, if not utterly corrupt and vile, and it was such a face as this that Sam Sleeny now looked at with a heart that grew happier as he gazed. It was a morning face, full of the calm joy of the dawn, of the sweet dreams of youth untroubled by love, the face of Aurora before she met Tithonus. From the little curls of gold on the low brow to the smile that hovered forever, half formed, on the softly curving lips and over the rounded chin, there was a light of sweetness, and goodness, and beauty, to be read of all men, and perhaps in God's good time to be worshiped by one.

Budsey announced "Mrs. Belding and Miss Halice," and Farnham hastened to greet them.

If Sam Sleeny had few happy hours to enjoy, he could at least boast himself that one was beginning now. The lovely face bore to his heart not only the blessing of its own beauty, but also a new and infinitely consoling thought. He had imagined till this moment, in all seriousness, that Maud Matchin was the prettiest woman in the world, and that therefore all men who saw her were his rivals, the chief of whom was Farnham. But now he reflected, with a joyful surprise, that in this world of rich people there were others equally beautiful, and that here, under Farnham's roof, on terms of familiar acquaintance with him, was a girl as faultless as an angel,— one of his own kind. "Why, of course," he said to himself, with a candid and happy self-contempt, "that's *his* girl — you dunderheaded fool — what are you botherin' about?"

He took a delight which he could not express in listening to the conversation of these friends and neighbors. The ladies had come over, in pursuance of an invitation of Farnham's, to see the additions which had recently arrived from Europe to his collection of bronzes and pottery, and some little pictures he had bought at the English water-color exhibition. As they walked about the rooms, expressing their admiration of the profusion of pretty things which filled the cabinets and encumbered the tables, in words equally pretty and profuse, Sleeny listened to their

voices as if it were music played to cheer him at his work. He knew nothing of the things they were talking about, but their tones were gentle and playful; the young lady's voice was especially sweet and friendly. He had never heard such voices before; they are exceptional everywhere in America, and particularly in our lake country, where the late springs develop fine high sopranos, but leave much to be desired in the talking tones of women. Alice Belding had been taught to use her fine voice as it deserved, and Cordelia's intonations could not have been more "soft, gentle, and low,—an excellent thing in woman."

After awhile, the voices came nearer, and he heard Farnham say:

"Come in here a moment, please, and see my new netsukes; I got them at a funny little shop in Ostend. It was on a Sunday afternoon, and the man of the house was keeping the shop, and I should have got a great bargain out of him, but his wife came in before we were through, and scolded him for an imbecile and sent him into the back room to tend the baby, and made me pay twice what he had asked for my little monsters."

By this time they were all in the library, and the young lady was laughing, not loudly, but musically, and Mrs. Belding was saying:

"Served you right for shopping on Sunday. But they are adorable little images, for all that."

"Yes," said Farnham, "so the woman told me, and she added that they were authentic of the twelfth century. I asked her if she could not throw off a century or two in consideration of the hard times, and she laughed, and said I blagued, and honestly she didn't know how old they were, but it was *drôle, tout de même, qu'on pût adorer un petit bon Dieu d'une laideur pareille.*"

"Really, I don't see how they can do it," said Mrs. Belding, solemnly; at which both the others laughed, and Miss Alice said, "Why, mamma, you have just called them adorable yourself."

They went about the room, admiring, and touching, and wondering, with the dainty grace of ladies accustomed to rare and beautiful things, until the novelties were exhausted and they turned to go. But Budsey at that moment announced luncheon, and they yielded to Farnham's eager importunity, and remained to share his repast.

They went to the dining-room, leaving Sleeny more than content. He still heard their voices, too distant to distinguish words; but he pleased himself by believing that there was a tender understanding in the tones of Farnham and Miss Belding when they addressed each other, and that it was altogether a family party. He had no longer any feeling of slight or neglect because none of them seemed aware of his presence while they were in the room with him. There was, on the contrary, a sort of comfort in the thought that he belonged to a different world from them; that he and Maud were shut out—shut out together—from the society and the interests which claimed the Beldings and the Farnhams. "You was a dunderheaded fool," he said, cheerfully apostrophizing himself again, "to think everybody was crazy after your girl." And he did an honest and hearty day's work for Farnham that day.

He was brought down to a lower level by hearing the door open, and the voice of Offitt asking if Mr. Sleeny was in.

"No one of that name here," said Budsey.

"I was told at Matchin's he was here."

"Oh! the young man from Matchin's. He is in the library," and Offitt came in, looking more disreputable than usual, as he had greased his hair inordinately for the occasion. Budsey evidently regarded him with no favorable eye; he said to Sleeny, "This person says he comes from Matchin's; do you know him?"

"Yes, it's all right," said Sam, who could say nothing less; but when Budsey had left them, he turned to Offitt with anything but welcome in his eye.

"Well, you're come, after all."

"Yes," Offitt answered, with an uneasy laugh. "Curiosity gets us all, from Eve down. What a lay-out this is, anyhow," and his small eyes darted rapidly around the room. "Say, Sam, you know Christy Fore, that hauls for the Safe Company? He was telling me about the safe he put into this room—said nobody'd ever guess it *was* a safe. Where the devil is it?"

"I don't know. It's none of my business, nor yours either."

"I guess you got up wrong foot foremost, Sam, you're so cranky. Where can the —— thing be? Three doors and two winders and a fire-place, and all the rest bookcases. By Jinx! there it is, I'll swear." He stepped over to one of the cases where a pair of oaken doors, rich with arabesque carving, veiled a sort of cabinet. He was fingering at them when Sam seized him by the shoulder, and said:

"Look here, Andy, what *is* your game, anyhow? I'm here on business, and I aint no fence, and I'll just trouble you to leave."

Offitt's face turned livid. He growled:

"Of all Andylusian jacks, you're the beat. I aint agoin' to hurt you nor your friend

Farnham. I've got all the p'ints I want for my story, and devilish little thanks to you, neither. And say, tell me, aint there a back way out? I don't want to go by the dinin'-room door. There's ladies there, and I aint dressed to see company. Why, yes, this fits me like my sins," and he opened the French window, and stepped lightly to the gravel walk below, and was gone.

Sleeny resumed his work, ill content with himself and his friend. "Andy is a smart fellow," he thought; "but he had no right to come snoopin' around where I was at work, jist to get points to worry Mr. Farnham with."

The little party in the drawing-room was breaking up. He heard their pleasant last words, as the ladies resumed their wraps and Farnham accompanied them to the door. Mrs. Belding asked him to dinner, "with nobody but ourselves," and he accepted with a pleased eagerness. Sleeny got one more glimpse of the beautiful face under the gray hat and feather, and blessed it as it vanished out of the door. As Farnham came back to the library, he stood for a moment by Sam, and examined what he had done.

"That's a good job. I like your work on the green-house, too. I know good work when I see it. I worked one winter as a boss carpenter myself."

It seemed to Sleeny like the voice of a brother speaking to him. He thought the presence of the young lady had made everything in the house soft and gentle.

"Where was you ever in that business?" he asked.

"In the Black Hills. I sawed a million feet of lumber and built houses for two hundred soldiers. I had no carpenters; so I had to make some. I knew more about it when I got through than when I began."

Sleeny laughed — a cordial laugh that wagged his golden beard and made his white teeth glisten.

"I'll bet you did!" he replied.

The two men talked a few minutes like old acquaintances; then Sleeny gathered up his tools and slung them over his shoulder, and as he turned to go both put out their hands at the same instant, with an impulse that surprised each of them, and said "Good-morning."

VII.

GHOSTLY COUNSEL.

A MAN whose intelligence is so limited as that of Sam Sleeny is always too rapid and rash in his inferences. Because he had seen Farnham give Maud a handful of roses, he was ready to believe things about their relations that had filled him with fury; and now, because he had seen the same man talking with a beautiful girl and her mother, the conviction was fixed in his mind that Farnham's affections were placed in that direction, and that he was therefore no longer to be dreaded as a rival. He went home happier, in this belief, than he had been for many a day; and so prompt was his progress in the work of deceiving himself, that he at once came to the conclusion that little or nothing now stood between him and the crowning of his hopes. His happiness made him unusually loquacious, and at the supper-table he excited the admiration of Matchin and the surprise of Maud by his voluble history of the events of the day. He passed over Offitt's visit in silence, knowing that the Matchins detested him; but he spoke with energetic emphasis of the beauty of the house, the handsome face and kindly manners of Farnham, and the wonderful beauty and sweetness of Alice Belding.

"Did that bold thing go to call on him alone?" cried Miss Maud, thoroughly aroused by this supposed offense against the proprieties of life.

"Why, no, Mattie," said Sam, a little disconcerted. "Her ma was along."

"Why didn't you say so, then?" asked the unappeased beauty.

"I forgot all about the old lady, though she was more chinny than the young one. She just seemed like she was a-practicin' the mother-in-law, so as to do it without stumblin' when the time come."

"Hullo! Do you think they are strikin' a match?" cried Saul, in high glee. "That would be first-rate. Keep the money and the property all together. There's too many of our rich girls marryin' out of the State lately — keeps buildin' dull."

"I don't believe a word of it," Maud interposed. "He aint a man to be caught by a simperin' school-girl. And as to money, he's got a plenty for two. He can please himself when he marries."

"Yes, but may be he wont please you, Mattie, and that would be a pity," said the ironical Saul.

The old man laughed loudly at his own sarcasm, and pushed his chair back from the table, and Maud betook herself to her own room, where she sat down, as her custom was, by the window, looking over the glowing lake, and striving to read her destiny as she gazed into the crimson and golden skies. She did not feel at all so sure as she pretended that there was no danger of the result that Sleeny had predicted; and now that she was brought face to face with it, she was confounded at discovering how much it meant to her. She was carrying a dream in her heart which would make or

ruin her, according as it should prove true or false. She had not thought of herself as the future wife of Farnham with any clearness of hope, but she found she could not endure the thought of his marrying any one else and passing forever out of her reach. She sat there, bitterly ruminating, until the evening glow had died away from the lake and the night breeze spread its viewless wings and flapped heavily in over the dark ridge and the silent shore. Her thoughts had given her no light of consolation; her chin rested on her hands, her elbows on her knees; her large eyes, growing more luminous in the darkness, stared out at the gathering night, scarcely noting that the sky she gazed at had changed from a pompous scene of red and yellow splendor to an infinite field of tender and dark violet, fretted with intense small stars.

"What shall I do?" she thought. "I am a woman. My father is poor. I have got no chance. Jurildy is happier to-day than I am, and got more sense."

She heard a timid rap at her door, and asked, sharply:

"Who's there?"

"It's me," said Sleeny's submissive voice.

"What do you want?" she asked again, without moving.

"Mr. Bott give me two tickets to his séance to-night,"—Sam called it "seeuns,"—"and I thought mebbe you'd like to go."

There was silence for a moment. Maud was thinking: "At any rate, it will be better than to sit here alone and cry all the evening." So she said: "I'll come down in a minute." She heard Sam's heavy step descending the stairs, and thought what a different tread another person had; and she wondered whether she would ever "do better" than take Sam Sleeny; but she at once dismissed the thought. "I can't do that; I can't put my hand in a hand that smells so strong of sawdust as Sam's. But he is a good soul, and I am sorry for him, every time I look in the glass."

Looking in the glass, as usual, restored her good humor, and she started off to the ghostly rendezvous with her faithful attendant. They never talked very much when they were alone together, and this evening both were thoughtful. Maud had never taken this commerce with ghosts much to heart. She had a feeling, which she could hardly have defined, that it was a common and plebeian thing to believe in it, and if she ever heard it ridiculed she joined in the cry without mercy. But it was an excitement and an interest in a life so barren of both that she could not afford to throw it away. She had not intelligence enough to be disgusted or shocked by it. If pressed to explain the amount of her faith in the whole business, she would probably have said she thought "there was something in it," and stopped at that. In minds like hers, there is no clearly drawn line between the unusual and the supernatural. An apparent miracle pleased her as it would please a child, without setting her to find out how it was done. She would consult a wizard, taking the chances of his having occult sources of information, with the same irregular faith in the unlikely with which some ladies call in homeopathic practitioners.

All the way to the rooms of Bott, she was revolving this thought in her mind: "Perhaps he could tell me something about Mr. Farnham. I don't think much of Bott; he has too many knuckles on his hands. I never saw a man with so many knuckles. I wouldn't mention Mr. Farnham to him to save his life, but I might get something out of him without telling him anything. He is certainly a very smart man, and whether it's spirits or not, he knows lots of things."

It was in this mood that she entered the little apartment where Bott held what he called his "Intermundane Séances." The room was small and stuffy. A simulacrum of a chest of drawers in one corner was really Bott's bed, where the seer reposed at night, and which, tilted up against the wall during the day, contained the rank bedclothes, long innocent of the wash-tub. There were a dozen or so of cane-bottom chairs, a little table for a lamp, but no other furniture. At one side of the room was a small closet without a door, but with a dark and dirty curtain hung before its aperture. Around it was a wooden railing, breast high.

A boy with a high forehead, and hair combed behind ears large and flaring like those of a rabbit, sat by the door, and took the tickets of invited guests and the half-dollars of the casuals. The seer received everybody with a nerveless shake of a clammy hand, showed them to seats, and exchanged a word or two about the weather, and the "conditions," favorable or otherwise, to spiritual activity. When he saw Maud and Sam his tallowy face flushed, in spots, with delight. He took them to the best places the room afforded, and stammered his pleasure that they had come.

"Oh! the pleasure is all ours," said Maud, who was always self-possessed when she saw men stammering. "It's a great privilege to get so near to the truth as you bring us, Mr. Bott."

The prophet had no answer ready; he merely flushed again in spots, and some new arrivals called him away.

The room was now pretty well filled with

the unmistakable crowd which always attend such meetings. They were mostly artisans, of more intellectual ambition than their fellows, whose love of the marvelous was not held in control by any educated judgment. They had long, serious faces, and every man of them wore long hair and a soft hat. Their women were generally sad, broken-spirited drudges, to whom this kind of show was like an opera or a ball. There were two or three shame-faced believers of the better class, who scoffed a little but trembled in secret, and a few avowed skeptics, young clerks on a mild spree, ready for fun if any should present itself.

Bott stepped inside the railing by the closet, and placing his hands upon it, addressed the assembly. He did not know what peculiar shape the manifestations of the evening might take. They were in search of truth; all truth was good. They hoped for visitors from the unseen speers; he could promise nothing. In this very room the spirits of the departed had walked and talked with their friends; perhaps they might do it again; he knew not. How they mingled in the earth-life, he did not pretend to say; perhaps they materialized through the mejum; perhaps they dematerialized material from the audience which they rematerialized in visible forms; as to that, the opinion of another—he said with a spacious magnanimity—was as good as his. He would now request two of the audience to step up and tie him. One of the long-haired ruminant men stood up, and a young fellow, amid much nudging and giggling among the scorners, was also forced from his chair. They came forward, the believer with a business-like air, which showed practice, and the young skeptic blushing and ill at ease. Bott took a chair inside the curtain, and showed them how to tie him. They bound him hand and foot, the believer testified that the binding was solid, and the skeptic went to his seat, playfully stepping upon the toes of his scoffing friends. The curtain was lowered, and the lamp was turned down.

In a few moments, a scuffling sound was heard in the closet, and Bott's coat came flying out into the room. The believer pulled back the curtain, and Bott sat in his chair, his shirt sleeves gleaming white in the dusk. His coat was laid over his shoulders, and almost as soon as the curtain was lowered he yelled for light, and was disclosed sitting tied as before, clothed in his right coat.

Again the curtain went down, amid a sigh of satisfaction from the admiring audience, and a choking voice, which tried hard not to sound like Bott's, cried out from the closet: "Turn down the light; we want more power." The kerosene lamp was screwed down till hardly a spark illumined the visible darkness, and suddenly a fiery hand appeared at the aperture of the closet, slowly opening and shutting its long fingers.

A half dozen voices murmured: "A spirit hand"; but Sam Sleeny whispered to Maud: "Them are Bott's knuckles, for coin." The hand was withdrawn and a horrible face took its place—a pallid corpse-like mask, with lambent fire sporting on the narrow forehead and the high cheek-bones. It staid only an instant, but Sam said, "That's the way Bott will look in ——."

"Hush!" said Maud, who was growing too nervous to smile, for fear of laughing or crying.

A sound of sobbing came from a seat to the right of them. A poor woman had recognized the face as that of her husband who had died in the army, and she was drawing the most baleful inferences from its fiery adjuncts.

A moment later, Bott came out of the closet, crouching so low that his head was hardly two feet from the ground. He had a sheet around his neck, covering his whole person, and a white cap over his head, concealing most of his face. In this constrained attitude he hopped about the clear space in front of the audience with a good deal of dexterity, talking baby-talk in a shrill falsetto. "Howdy, pappa! Howdy, mamma! Itty Tudie tum adin!"

A rough man and woman, between joy and grief, were half hysterical. They talked to the toad-like mountebank in the most endearing tones, evidently believing it was their dead baby toddling before them. Two or three times the same horrible imposture was repeated. Bott never made his appearance without somebody recognizing him as a dear departed friend. The dim light, the unwholesome excitement, the servile credulity fixed by long habit, seemed to produce a sort of passing dementia upon the regular habitués.

With these performances the first part came to an end. The light was turned on again, and the tying committee was requested to come forward and examine the cords with which Bott still seemed tightly bound. The skeptic remained scornfully in his seat, and so it was left for the believer to announce that not a cord had been touched. He then untied Bott, who came out from the closet, stretching his limbs as if glad to be free, and announced that there would be a short intermission for an interchange of views.

As he came toward Maud, Sam rose and said:

"Whew! he smells like a damp match. I'll go out and smoke a minute, and come back."

Bott dropped into the seat which Sleeny had left.

To one who has never attended one of these queer *cenacula*, it would be hard to comprehend the unhealthy and even nauseous character of the feeling and the conversation there prevalent. The usual decent restraints upon social intercourse seem removed. Subjects which the common consent of civilized creatures has banished from mixed society are freely opened and discussed. To people like the ordinary run of the believers in spiritism, the opera, the ballet, and the annual Zola are unknown, and they must take their excitements where they can find them. The dim light, the unhealthy commerce of fictitious ghosts, the unreality of act and sentiment, the unwonted abandon, form an atmosphere in which these second-hand mystics float away into a sphere where the morals and the manners are altogether different from those of their working days.

Miss Matchin had not usually joined in these morbid discussions. She was of too healthy an organization to be tempted by so rank a mental feast as that, and she had a sort of fierce maidenhood about her which revolted at such exposures of her own thought. But to-night she was sorely perplexed. She had been tormented by many fancies as she looked out of her window into the deepening shadows that covered the lake. The wonders she had seen in that room, though she did not receive them with entire faith, had somewhat shaken her nerves; and now the seer sat beside her, his pale eyes shining with his own audacity, his lank hair dripping with sweat, his hands uneasily rubbing together, his whole attitude expressive of perfect subjection to her will.

"Why isn't this a good chance?" she thought. "He is certainly a smart man. Horrid as he looks, he knows lots. May be he could tell me how to find out."

She began in her airiest manner: "Oh, Mr. Bott, what a wonderful gift you have got! How you must look down on us poor mortals!"

Bott grew spotted, and stammered:

"Far from it, Miss Matchin. I couldn't look down on you."

'Oh, you're flattering. That's not right, because I believe every word you say — and 'that aint true."

She rushed desperately on in the same light tone.

"I'm going to ask you something very particular. I don't know who can tell me, if you can't. How can a young lady find out whether a young gentleman is in love with her or not? Now, tell me the truth this time," she said, with a nervous titter, "for it's very important."

This question from any one else would not have disconcerted Bott in the least. Queries as absurd had frequently been put to him in perfect good faith, and answered with ready and impudent ignorance. But, at those rattling words of Maud Matchin, he turned livid and purple, and his breath came heavily. There was room for but one thought in that narrow heart and brain. He had long cherished a rather cowardly fondness for Maud, and now that this question was put to him by the agitated girl, his vanity would not suffer him to imagine that any one but himself was the subject of her dreams. There was, to him, nothing especially out of the way in this sort of indirect proposal on the part of a young woman. It was entirely in keeping with the general tone of sentiment among the people of his circle, which aimed at nothing less than the emancipation of the world from its old-fashioned decencies.

But he would not answer hastily; he had a coward's caution. He looked a moment at the girl's brilliant color, her quick, high breathing, her eager eyes, with a gloating sense of his good luck. But he wanted her thoroughly committed. So he said, with an air in which there was already something offensively protecting:

"Well, Miss Matchin, that depends on the speer. If the affection be unilateral, it is one thing; if it be recippercal, it is another. The currents of soul works in different ways."

"But what I mean is, if a young lady likes a young gentleman pretty well, how is she going to find out for sure whether he likes her?" She went intrepidly through these words, though her cheeks were burning, and her eyes would fall in spite of her, and her head was singing.

There was no longer any doubt in Bott's mind. He was filled with an insolent triumph, and thought only of delaying as long as possible the love chase of which he imagined himself the object. He said, slowly and severely:

"The question is too imperious to be answered in haste. I will put myself in the hands of the sperruts, and answer it as they choose after the intermission."

He rose and bowed, and went to speak a word or two to his other visitors. Sam came back and took his seat by Maud, and said:

"I think the fun is about over. Less go home."

"Go home yourself, if you want to," was the petulant reply. "I am going to stay for the inspirational discourse."

"Oh, my!" said Sam. "That's a beautiful word. You don't know how pretty your mouth looks when you say that." Sam had had his beer, and was brave and good-natured.

Bott retired once more behind the railing, but took his seat in a chair outside the cur-

tain, in full view of the audience. He sat for some minutes motionless, staring at vacancy. He then slowly closed his eyes, and a convulsive shudder ran through his frame. This was repeated at rapid intervals, with more or less violence. He next passed his hands alternately over his forehead, as if he were wiping it, and throwing some invisible, sticky substance, with a vicious snap, to right and left. At last, after a final shudder, which stiffened him into the image of death for a moment, he rose to his feet and, leaning on the railing, began to intone, in a dismal whine, a speech of which we need give only the opening words.

"Dear brothers and sisters of the earth-life! On pearly wings of gossamer-down we float down from our shining speers to bring you messages of the higher life. Let your earth-soul be lifted to meet our sperrut-soul; let your earth-heart blend in sweet accordion with our heaven-heart; that the beautiful and the true in this weary earth-life may receive the bammy influence of the Eden flowrets, and rise, through speers of disclosure, to the plane where all is beautiful and all is true."

He continued in this strain for some time, to the evident edification of his audience, who listened with the same conventional tolerance, the same trust that it is doing your neighbor good, with which the ordinary audience sits under an ordinary sermon. Maud, having a special reason for being alert, listened with a real interest. But during his speech proper he made no allusion to the subject on which she had asked for light. It was after he had finished his harangue, and had gone through an *entr'acte* of sighs and shudders, that he announced himself once more in the hands of the higher intelligences, and ready to answer questions. "It does not need," he whined, "the word of the mouth or the speech of the tongue to tell the sperruts what your souls desire. The burden of your soul is open to the sperrut-eye. There sits in this room a pure and lovely soul in quest of light. Its query is, How does heart meet heart in mutual knowledge?"

Maud's cheek grew pale and then red, and her heart beat violently. But no one noticed her, and the seer went on. "If a true heart longs for another, there is no rest but in knowledge, there is no knowledge but in trewth, there is no trewth but in trust. Oh, my brother, if you love a female, tell your love. Oh, my sister, if you love—hum—if you love—hum—an individual of the opposite sex—oh, tell your love! Down with the shams of a false-hearted society; down with the chains of silence that crushes your soul to the dust! If the object of your hearts' throbs is noble, he will respond. Love claims love. Love has a right to love. If he is base, go to a worthier one. But from your brave and fiery heart a light will kindle his, and dual flames will wrap two chosen natures in high-menial melodies, when once the revelating word is spoke."

With these words he subsided into a deep trance, which lasted till the faithful grew tired of waiting and shuffled slowly out of the door. When the last guest had gone, he rose from his chair, with no pretense of spiritual dignity, and counted his money and his tickets. He stretched himself in two chairs, drew his fingers admiringly through his lank locks, while a fatuous grin of perfect content spread over his face, as he said aloud to himself, "She has got it bad. I wonder whether she will have the nerve to ask me. I'll wait awhile, anyhow. I'll lose nothing by waiting."

Meanwhile, Maud was walking rapidly home with Sam. She was excited and perplexed, and did not care to answer Sam's rather heavy pleasantries over the evening's performance. He ridiculed the spirit-lights, the voices, and the jugglery, without provoking a reply, and at last he said:

"Well, what do you think of his advising the girls to pop? This aint leap year!"

"What of that?" she answered, hastily. "I don't see why a girl hasn't as good a right to speak her mind as a man."

"Why, Mattie," said Sam, with slow surprise, "no decent girl would do that."

They had come to Matchin's gate. She slipped in, then turned and said:

"Well, don't be frightened, Mr. Sleeny; I'm not going to propose to you," and she was gone from his sight.

She went directly to her room, and walked up and down a few moments without taking off her hat, moving with the easy grace and the suppressed passion of an imprisoned panther. Then she lighted her lamp and placed it on her bureau at one side of her glass. She searched in her closet and found a candle, which she lighted and placed on the other side of the glass. She undressed with reckless haste, throwing her clothes about on the floor, and sat down before her mirror with bare arms and shoulders, and nervously loosened her hair, watching every movement with blazing eyes. The thick masses of her blue-black curls fell down her back and over her sloping shoulders, which glowed with the creamy light of old ivory. The unequal rays of the lamp and candle made singular effects of shadow on the handsome face, the floating hair, and the strong and wholesome color of her neck and arms. She gazed at herself with eager eyes and parted lips, in an anxiety too great to be assuaged by her girlish pride

in her own beauty. "This is all very well," she said, "but he will not see me this way. Oh! if I only dared to speak first. I wonder if it would be as the spirits said. 'If he is noble, he will respond!' He *is* noble, that's sure. 'Love claims love,' they said. But I don't know as I love him. I *would*, if that would fetch him, quick enough;" and the hot blood came surging up, covering neck and brow with crimson.

VIII.

A BUD AND A BLOSSOM.

FARNHAM was sitting the next evening in his library, when Budsey entered and said Mr. Ferguson desired to see him. The gaunt Scotchman came in and said with feverish haste: "The cereus grandiflorus will be goin' to bloom the night. The buds are tremblin' and laborin' now." Farnham put on his hat and went to the conservatory, which was separated from the house by the entire extent of the garden. Arriving there, the gardener took him hurriedly to an inner room, dimly lighted, — a small square piece between the ferns and the grapes,— where the regal flower had a wall to itself. Two or three garden chairs were disposed about the room. Ferguson mounted on one of them, and turned up the gas so that its full light shone upon the plant. The bud was a very large one, perfect and symmetrical; the strong sheath, of a rich and even brown, as yet showed only a few fissures of its surface, but even now a faint odor stole from the travailing sphere, as from a cracked box of alabaster filled with perfume.

The face of the canny Fergus was lighted up with an eager joy. He had watched the growth and progress of this plant from its infancy. He had leaned above its cradle and taken pride in its size and beauty. He had trained it over the wall — from which he had banished every rival — in large and graceful curves, reaching from the door of the fernery to the door of the grapery, till it looked, in the usual half light of the dim chamber, like a well-regulated serpent maturing its designs upon the neighboring paradise; and now the time was come when he was to see the fruit of his patience and his care.

"Heaven be thankit," he murmured devoutly, "that I was to the fore when it came."

"I thank you, Fergus, for calling me," said Farnham, smiling. "I know it must have cost you an effort to divide such a sight with any one."

"It's your siller bought it," the Scotchman answered sturdily; "but there's nobody knows it, or cares for it, as I do,—and that's the truth."

His glance was fixed upon the bud, which seemed to throb and stir as he spoke. The soft explosive force within was at work so strongly that the eye could watch its operation. The fissures of the sheath widened visibly and turned white as the two men looked at them.

"It is a shame to watch this beautiful thing happening for only us," Farnham said to the gardener. "Go and tell Mrs. Belding, with my compliments, and ask her and Miss Belding to come down." But observing his crestfallen expression, he took compassion on him, and said: "No, you had better remain, for fear something should happen in your absence. I will go for the ladies."

"I hope ye'll not miss it," said Fergus, but his eyes and his heart were fixed upon the bud, which was slowly gaping apart, showing a faint tinge of gold in its heart.

Farnham walked rapidly up the garden, and found the Beldings at the door, starting for evening service with their prayer-books in their hands.

"Do you wish to see the prettiest thing you ever saw in your lives? of course I except your mirrors when in action," he began, without salutation. "If so, come this moment to my conservatory. My night-blooming cereus has her coming-out party to-night."

They both exclaimed with delight, and were walking with him toward the garden. Suddenly, Mrs. Belding stopped and said:

"Alice, run and get your sketch-book and pencil. It will be lovely to draw the flower."

"Why, mamma! we shall not have time for a sketch."

"There, there! do as I tell you, and do not waste time in disputing."

The young girl hesitated a moment, and then, with instinctive obedience, went off to fetch her drawing materials, while her mother said to Farnham:

"Madame de Veaudry says Alice is very clever with her pencil; but she is so modest I shall have to be severe with her to make her do anything. She takes after me. I was very clever in my lessons, but never would admit it."

Alice came down the steps. Farnham, seeing her encumbered by her books, took them from her, and they went down the walks to the conservatory. They found Ferguson sitting, with the same rapt observation, before his tropical darling. As the ladies entered, he rose to give them seats, and then retired to the most distant corner of the room, where he spent the rest of the evening entirely unaware of any one's presence, and given up to

the delight of his eyes. The bud was so far opened that the creamy white of the petals could be seen within the riven sheath, whose strong dark color exquisitely relieved the pallid beauty it had guarded so long. The silky stamens were still curled about the central style, but the splendor of color which was coming was already suggested, and a breath of intoxicating fragrance stole from the heart of the immaculate flower.

They spoke to each other in low tones, as if impressed with a sort of awe at the beautiful and mysterious development of fragrant and lovely life going forward under their sight. The dark eyes of Alice Belding were full of that vivid happiness which strange and charming things bring to intelligent girlhood. She was looking with all her soul, and her breath was quick and high, and her soft red lips were parted and tremulous. Farnham looked from her to the flower and back again, gazing on both with equal safety, for the one was as unconscious of his admiring glances as the other.

Suddenly, the sound of bells floated in from the neighboring street, and both of the ladies started. "No, don't you go," said Mrs. Belding to her daughter. "I must, because I have to see my 'Rescue the Perishing.' But you can just as well stay here and make your sketch. Mr. Farnham can take care of you, and I will be back in an hour."

"But, mamma!" cried Miss Alice, too much scandalized to speak another word.

"I wont have you lose this chance," her mother continued. "I am sure Mr. Farnham will not object to taking care of you a little while; and if he hasn't the time, Fergus will bring you home—hm, Fergus?"

"Ay, madam, with right guid will," the gardener said, his hard face softening into a smile.

"There, sit down in that chair and begin your sketch. It is lovely just as it is." She waited until Alice, whose confusion had turned her face crimson, had taken her seat, opened her sketch-book, and taken her pencils in her trembling hands, and then the brisk and hearty woman drew her shawl about her and bustled to the door.

"I will walk to the church door with you," said Farnham, to the infinite relief of Alice, who regained her composure at the instant, and began with interest to sketch the flower. She thought, while her busy fingers were at work, that she had perhaps been too prudish in objecting to her mother's plan. "He evidently thinks nothing of it, and why should I?"

By the time Farnham returned, the cereus had attained its full glory of bloom. Its vast petals were thrown back to their fullest extent, and shone with a luminous beauty in which its very perfume seemed visible; the countless recurved stamens shot forth with the vigorous impulse and vitality of sun rays; from the glowing center to the dark fringe with which the shattered sheath still accented its radiant outline it blazed forth, fully revealed; and its sweet breath seemed the voice of a pride and consciousness of beauty like that of the goddess on Mount Ida, calmly triumphant in the certainty of perfect loveliness.

Alice had grown interested in her task, and looked up for only an instant with her frank, clear eyes as Farnham entered. "Now, where shall I sit?" he asked. "Here, behind your right elbow, where I can look over your shoulder and observe the work as it goes on?"

"By no means. My hand would lose all its little cunning in that case."

"Then I will sit in front of you and study the artistic emotions in your face."

"That would be still worse, for you would hide my subject. I am sure you are very well as you are," she added, as he seated himself in a chair beside her, a little way off.

"Yes, that is very well. I have the flower three-quarters and you in profile. I will study the one for a panel and the other for a medal."

Miss Alice laughed gently. She laughed often from sheer good humor, answering the intention of what was said to her better than by words.

"Can you sketch and talk too?" asked Farnham.

"I can sketch and listen," she said. "You will talk and keep me amused."

"Amusement with malice aforethought! The order affects my spirits like a Dead March. How do the young men amuse young ladies nowadays? Do they begin by saying, 'Have you been very gay lately?'"

Again Miss Alice laughed. "She is an easy-laughing girl," thought Farnham. "I like easy-laughing girls. When she laughs, she always blushes a very little. It is worth while talking nonsense to see a girl laugh so pleasantly and blush so prettily."

It is not worth while, however, to repeat all the nonsense Farnham uttered in the next hour. He got very much interested in it himself, and was so eager sometimes to be amusing that he grew earnest, and the gentle laugh would cease and the pretty lips would come gravely together. Whenever he saw this, he would fall back upon his trifling again. He had the soldier's fault of point-blank compliment, but with it an open sincerity of manner which relieved his flattery of any offensiveness. He had practiced it in several capitals with some success. A dozen times this even-

ing, a neat compliment came to his lips and stopped there. He could hardly understand his own reserve before this laughing young lady. Why should he not say something pretty about her hair and eyes, about her graceful attitude, about the nimble play of her white fingers over the paper? He had uttered frank flatteries to peeresses without rebuke. But he held his hand before this school-girl, with the open dark-brown eyes and a club of yellow hair at the back of her neck. He could not help feeling that, if he talked to her with any forcing of the personal accent, she would stop laughing and the clear eyes would be troubled. He desired anything rather than that, and so the conversation went rattling on as free from personalities as the talk of two light-hearted and clever school-boys.

At one moment he was describing a bill of fare in a Colorado hotel.

"With nice bread, though, one can always get on," she said.

"True," Farnham answered; "but this bread was of a ghostly pallor and flatness, as if it had been baked by moonlight on a grave-stone."

"The Indian women cook well, do they not?" she asked.

"Some are not so bad as others. One young chief boasted to me of his wife's culinary accomplishments. He had been bragging all the morning about his own exploits, of the men he had killed and the horses he had stolen, and then to establish his standing clearly in my mind, he added: 'My squaw same white squaw—savey pie.'"

"Even there, then, the trail of the pie-crust is over them all."

"No! only over the aristocracy."

"I should like so much to see that wonderful country."

"It is worth seeing," he said, with a curious sinking of the heart, "if you are not under orders."

He could not help thinking what a pleasant thing a journey through that Brobdingnaggian fairy-land would be with company like the young girl before him. Nature would be twice as lovely reflected from those brown eyes. The absurdities and annoyances of travel would be made delightful by that frank, clear laugh. The thought of his poor Nellie flitted by him an instant, too gentle and feeble for reproach. Another stronger thought had occupied his mind.

"You ought to see it. Your mamma will need rest before long from her Rescue-the-Perishings, and you are overworking yourself dreadfully over that sketch-book. There is a touch of malaria about the fountain in Bluff Park. Colorado will do you both no end of good. I feel as if I needed it myself. I haven't energy enough to read Mr. Martin's 'Life of the Prince Consort.' I shall speak to Mrs. Belding as soon as she returns."

"Do, by all means. I should like to go, but mamma would not spend three nights in a sleeping-car to see the Delectable Mountains themselves."

He rose and walked about the room, looking at the flower and the young artist from different points of view, and seeing new beauties in each continually. There were long lapses of conversation, in which Alice worked assiduously and Farnham lounged about the conservatory, always returning with a quick word and a keen look at the face of the girl. At last he said to himself: "Look here! She is not a baby. She is nearly twenty years old. I have been wondering why her face was so steady and wise." The thought that she was not a child filled his heart with pleasure and his face with light. But his volubility seemed to die suddenly away. He sat for a good while in silence, and started a little as she looked up and said:

"Now, if you will be very gentle, you can see my sketch and tell me what to do next."

It was a pretty and unpretentious picture that she had made. The flower was faithfully though stiffly given, and nothing especially remarkable had been attempted or achieved. Farnham looked at the sketch with eyes in which there was no criticism. He gave Alice a word or two of heartier praise for her work than she knew she deserved. It was rather more than she expected, and she was not altogether pleased to be so highly commended, though she could hardly have said why. Perhaps it was because it made her think less of his critical faculty. This was not agreeable, for her admiration of him from her childhood had been one of the greatest pleasures of her life. She had regarded him as children regard a brilliant and handsome young uncle. She did not expect from him either gallantry or equality of treatment.

"There! Do not say too much about it—you will make me ashamed of it. What does it lack?"

"Nothing, except something on the right to balance the other side. You might sketch in roughly a half-opened flower on the vine about there," indicating the place.

She took her pencils and began obediently to do what he had suggested. He leaned over her shoulder, so near her she could feel his breath on the light curls that played about her ear. She wished he would move. She grew nervous, and at last said:

"I am tired. You put in that flower."

He took the book and pencils from her, as she rose from her chair and gave him her place, and with a few strong and rapid strokes finished the sketch.

"After all," she said to herself, with hearty appreciation, "men do have the advantage of girls. He bothered me dreadfully, and I did not bother him in the least. And yet I stood as near to him as he did to me."

Mrs. Belding came in a moment later. She was in high spirits. They had had a good meeting — had converted a Jew, she thought. She admired the sketch very much; hoped Alice had been no trouble to Farnham. He walked home with the ladies, and afterward smoked a cigar with great deliberation under the limes.

Mrs. Belding asked Alice how they had got on.

"He did not eat you, you see. You must get out of your ideas of men, especially men of Arthur Farnham's age. He never thinks of you. He is old enough to be your father."

Alice kissed her mother and went to her own room, calculating on the way the difference between her age and Captain Farnham's.

(To be continued.)

A BURNS PILGRIMAGE.

A SHINING-BEACHED crescent of country facing to the sunset, and rising higher and higher to the east till it becomes mountain, is the county of Ayrshire, fair and famous among the southern Scotch Highlands. To a sixty-mile measure by air, between its north and south promontories, it stretches a curving coast of ninety; and when Robert Burns strolled over its breezy uplands, he saw always beautiful and mysterious silver lines of land thrusting themselves out into the mists of the sea, pointing to far-off island peaks, seeming sometimes to bridge and sometimes to wall vistas ending only in sky. These lines are as beautiful, elusive, and luring now as then, and in the inalienable loyalty of nature bear testimony to-day to their lover.

This is the greatest crown of the hero and the poet. Other great men hold fame by failing records which moth and fire destroy. The places that knew them know them no more when they are dead. Marble and canvas and parchment league in vain to keep green his memory who did not love and consecrate by his life-blood, in fight or in song, the soil where he trod. But for him who has done this,— who fought well, sang well,— the morning cloud, and the wild rose, and broken blades of grass under men's feet, become immortal witnesses; so imperishable, after all, are what we are in the habit of calling the "perishable things of this earth."

More than two hundred years ago, when the followers and holders of the different baronies of Ayrshire compared respective dignities and values, they made a proverb which ran:

"Carrick for a man; Kyle for a coo;
Cunningham for butter and cheese; Galloway for woo."

Before the nineteenth century set in, the proverb should have been changed, for Kyle is the land through which "Bonny Doon" and Irvine Water run; and there has been never a man in all Carrick of whom Carrick can be proud, as is Kyle of Robert Burns. It has been said that a copy of his poems lies on every Scotch cottager's shelf, by the side of the Bible. This is probably not very far from the truth. Certain it is, that in the villages where he dwelt there seems to be no man, no child, who does not apparently know every detail of the life he lived there, nearly a hundred years ago.

"Will ye be drivin' over to Tarbolton in the morning?" said the pretty young vice-landlady of the King's Arms at Ayr, when I wrote my name in her visitors' book late one Saturday night.

"What made you think of that?" I asked, amused.

"And did ye not come on account o' Burns?" she replied. "There's been a many from your country here by reason of him this summer. I think you love him in America a'most as well as we do oursel's. It's vary seldom the English come to see anythin' aboot him. They've so many poets o' their own, I suppose, is the reason o' their not thinkin' more o' Burns."

All that there was unflattering in this speech I forgave by reason of the girl's sweet low voice, pretty gray eyes, and gentle, refined hospitality. She might have been the daughter of some country gentleman, welcoming a guest to the house. And she took as much interest in making all the arrangements for my drive to Tarbolton the next morning as if it had been a pleasure excursion for herself. It is but a dull life she leads, helping her widowed mother keep the King's Arms — dull, and unprofitable too, I fear, for it takes four men-servants and seven women to keep up the house, and I saw no

symptom of any coming or going of customers in it. A stillness as of a church on week-days reigned throughout the establishment. "At the races and when the yeomanry come," she said, there was something to do; but "in the winter nothing, except at the times of the county balls. You know, ma'am, we've many county families here," she remarked with gentle pride, "and they all stop with us."

There is a compensation to the lower orders of a society where rank and castes are fixed, which does not readily occur at first sight to the democratic mind naturally rebelling against such defined distinctions. It is very much to be questioned whether, in a republic, the people who find themselves temporarily lower down in the social scale than they like to be or expect to stay, feel, in their consciousness of the possibility of rising, half so much pride or satisfying pleasure as do the lower classes in England, for instance, in their relations with those whom they serve, whose dignity they seem to share by ministering to it.

The way from Ayr to Tarbolton must be greatly changed since the day when the sorrowful Burns family trod it, going from the Mount Oliphant farm to that of Lochlea. Now it is for miles a smooth road, on which horses' hoofs ring merrily, and neat little stone houses, with pretty yards, line it on both sides for some distance. The ground rises almost immediately, so that the dwellers in these little suburban houses get fine off-looks seaward and a wholesome breeze in at their windows. The houses are built joined by twos, with a yard in common. They have three rooms besides the kitchen, and they rent for twenty-five pounds a year; so no industrious man of Ayr need be badly lodged. Where the houses leave off, hedges begin—thorn and beech, untrimmed and luxuriant, with great outbursts of white honeysuckle and sweet-brier at intervals. As far as the eye could see were waving fields of wheat, oats, and "rye-grass," which last being just ripe was of a glorious red color. The wheat-fields were rich and full, sixty bushels to the acre. Oats, which do not take so kindly to the soil and air, produce sometimes only forty-eight.

Burns was but sixteen when his father moved from Mount Oliphant to the Lochlea farm, in the parish of Tarbolton. It was in Tarbolton that he first went to dancing-school, joined the Freemasons, and organized the club which, no doubt, cost him dear, "The Bachelors of Tarbolton." In the beginning, this club consisted only of five members besides Burns and his brother; afterward it was enlarged to sixteen. Burns drew up the rules, and the last one—the tenth—is worth remembering, as an unconscious defining on his part of his ideal of human life:

> "Every man proper for a member of this society must have a friendly, honest, open heart, above everything dirty or mean, and must be a professed lover of one or more of the sex. The proper person for this society is a cheerful, honest-hearted lad, who, if he has a friend that is true, and a mistress that is kind, and as much wealth as genteelly to make both ends meet, is just as happy as this world can make him."

Walking to-day through the narrow streets of Tarbolton, it is well-nigh impossible to conceive of such rollicking good cheer having made abiding-place there. It is a close, packed town, the houses of stone or white plaster,—many of them low, squalid, with thatched roofs and walls awry; those that are not squalid are grim. The streets are winding and tangled; the people look poor and dull. As I drove up to the "Crown Inn," the place where the Tarbolton Freemasons meet now, and where some of the relics of Burns's Freemason days are kept, the "first bells" were ringing in the belfry of the old church opposite, and the landlord of the inn replied with a look of great embarrassment to my request to see the Burns relics:

"It's the Sabbath, mem."

Then he stood still, scratching his head for a few moments, and then set off, at full run, down the street without another word.

"He's gone to the head Mason," explained the landlady. "It takes three to open the chest. I think ye'll na see it the day," and she turned on her heel with a frown and left me.

"They make much account o' the Sabbath in this country," said my driver. "Another day ye'd do better."

Thinking of Burns's lines to the "Unco Guid," I strolled over into the church-yard opposite, to await the landlord's return. The bell-ringer had come down, and followed me curiously about among the graves. One very old stone had carved upon it two high-top boots; under these, two low shoes; below these, two kneeling figures, a man and a woman, cut in high relief; no inscription of any sort.

"What can it mean?" I asked.

The bell-ringer could not tell; it was so old nobody knew anything about it. His mother, now ninety years of age, remembered seeing it when she was a child, and it looked just as old then as now.

"There's a many strange things in this grave-yard," said he; and then he led me to a corner where, inclosed by swinging chains and stone posts, was a carefully kept square of green turf, on which lay a granite slab. "Every year comes the money to pay for

keeping that grass green," he said, "and no name to it. It's been going on that way for fifty years."

The stone wall around the grave-yard was dilapidated and in parts was falling down.

"I suppose this old wall was here in Burns's time," I said.

"Ay, yes," said the bell-ringer, and pointing to a low, thatched cottage just outside it, "and yon shop — many's the time he's been in it playin' his tricks."

The landlord of the inn now came running up, with profuse apologies for the ill success of his mission. He had been to the head Mason, hoping he would come over and assist in the opening of the chest, in which were kept a Mason's apron worn by Burns, some jewels of his, and a book of minutes kept by him. But "bein' 's it's the Sabbath," and "he's sick in bed," and it was "against the rules to open the regalia chest unless three Masons were present," the kindly landlord, piling up reason after reason, irrespective of their consistency with each other, went on to explain that it would be impossible; but I might see the chair in which Burns always sat. This was a huge oaken chair, black with age, and furrowed with names cut deep in the wood. It was shaped and proportioned like a child's high chair, and had precisely such a rest for the feet as is put on children's high chairs. To this day the Grand Mason sits in it at their meetings, and will so long as the St. James Lodge exists.

"They've been offered hundreds of pounds for that chair, mem, plain as it is. You'd not think it; but there's no money'd buy it from the lodge," said the landlord.

The old club-house where the jolly "Bachelors of Tarbolton" met in Burns's day is a low, two-roomed, thatched cottage, half in ruins. The room where the bachelors smoked, drank, and sang is now little more than a cellar filled with rubbish and filth,—nothing left but the old fire-place to show that it was ever inhabited. In the other half of the cottage lives a laborer's family,—father, mother, and a young child: their one room, with its bed built into the wall, and their few delf dishes on the dresser, is probably much like the room in which Burns first opened his wondrous eyes. The man was lying on the floor playing with his baby. At the name of Burns, he sprang up with a hearty "Ay, weel," and ran out in his blue stocking feet to show me the cellar, of which, it was plainly to be seen, he was far prouder than of his more comfortable side of the house. The name by which the inn was called in Burns's day he did not know. But "He's a Mason over there: he'll know," he cried; and, before I could prevent him, he had darted, still shoeless, across the road, and asked the question of a yet poorer laborer, who was taking his Sunday on his door-sill with two bairns between his knees. He had heard, but had "forgotten." "Feyther'll know," said the wife, coming forward with the third bairn, a baby, in her arms. "I'll rin an ask feyther." The old man tottered out and gazed with a vacant, feeble look at me, while he replied impatiently to his daughter: "Manson's Inn, 'twas called; ye've heard it times eneuch."

"I dare say you always drink Burns's health at the lodge when you meet," I said to the laborer.

"Ay, ay, his health's ay dronkit," he said, with a coarse laugh, "weel dronkit."

A few rods to the east, and down the very road Burns was wont to come and go between Lochlea and Tarbolton, still stands "Willie's mill,"— cottage, and mill, and shed, and barn, all in one low, long, oddly joined (or jointed) building of irregular heights, like a telescope pulled out to its full length; a little brook and a bit of gay garden in front. In the winter the mill goes by water from a lake near by; in the summer by steam — a great change since the night when Burns went

> "Todlin' down on Willie's mill,"

and though he thought he

> "Was na fou, but just had plenty,"

could not for the life of him make out to count the moon's horns.

> "To count her horns, wi' a' my power,
> I set mysel';—
> But whether she had three or four
> I could na tell."

To go by road from Tarbolton to Lochlea farm is to go around three sides of a square, east, north, and then west again. Certain it is that Burns never took so many superfluous steps to do it; and as I drove along I found absorbing interest in looking at the little cluster of farm buildings beyond the fields, and wondering where the light-footed boy used to "cut across" for his nightly frolics. There is nothing left at Lochlea now of him or his; nothing save a worn lintel of the old barn. The buildings are all new, and there is a look of thrift and comfort about the place, quite unlike the face it must have worn in 1784. The house stands on a rising knoll, and from the windows looking westward and seaward there must be a fine horizon and headlands to be seen at sunset. Nobody was at home on this day except a barefooted servant-girl, who was keeping the house while the family were at church. She came to the

door with an expression of almost alarm, at the unwonted apparition of a carriage driving down the lane on Sunday, and a stranger coming in the name of a man dead so long ago. She evidently knew nothing of Burns except that, for some reason connected with him, the old lintel was kept and shown. She was impatient of the interruption of her Sabbath, and all the while she was speaking kept her finger in her book—"Footprints of Jesus"—at the place where she had been reading, and glanced at it continually, as if it were an amulet which could keep her from harm through the worldly interlude into which she had been forced.

"It's a pity ye came on the Sabba-day," remarked the driver again, as we drove away from Lochlea. "The country people 'ull not speak on the Sabbath." It would have been useless to try to explain to him that the spectacle of this Scottish "Sabba-day" was of itself of almost as much interest as the sight of the fields in which Robert Burns had walked and worked.

The farm of Mossgiel, which was Burns's next home after Lochlea, is about three miles from Tarbolton, and only one from Mauchline. Burns and his brother Gilbert had become tenants of it a few months before their father's death in 1784. It was stocked by the joint savings of the whole family; and each member of the family was allowed fair rates of wages for all labor performed on it. The allowance to Gilbert and to Robert was seven pounds a year each, and it is said that, during the four years that Robert lived there, his expenses never exceeded this pittance.

To Mossgiel he came with new resolutions. He had already reaped some bitter harvests from the wild oats sown during the seven years at Lochlea. He was no longer a boy. He says of himself at this time:

"I entered on Mossgiel with a full resolution, 'Come, go; I will be wise.'"

Driving up the long straight road which leads from the highway to the hawthorn fortress in which the Mossgiel farm buildings stand, one recalls these words, and fancies the brave young fellow striding up the field, full of new hope and determination. The hawthorn hedge to-day is much higher than a man's head, and completely screens from the road the farm-house and the outbuildings behind it. The present tenants have lived on the farm forty years, the first twenty in the same house which stood there when Robert and Gilbert Burns pledged themselves to pay one hundred and twenty pounds a year for the farm. When the house was rebuilt, twenty years ago, the old walls were used in part, and the windows were left in the same places; but, instead of the low, sloping-roofed, garret-like rooms upstairs, where Burns used to sleep and write, are now comfortable chambers of modern fashion.

"Were you not sorry to have the old house pulled down?" I said to the comely, aged farm-wife.

"'Deed, then, I was very prood," she replied; "it had na 'coomodation, and the thatch took in the rain an' all that was vile."

In the best room of the house hung two autograph letters of Burns's plainly framed: one, his letter to the lass of ——, asking her permission to print the poem he had addressed to her; the other, the original copy of the poem. These were "presented to the house by the brother of the lady," the woman said, and they had "a great value now." But when she first came to this part of the country she was "vary soorpreezed" to find the great esteem in which Burns's poetry was held. In the North, where she had lived, he was "na thocht weel of." Her father had never permitted a copy of his poems to be brought inside his doors, and had forbidden his children to read a word of them. "He thocht them too rough for us to read." It was not until she was a woman grown, and living in her husband's house, that she had ever ventured to disobey this parental command, and she did not now herself think they were "fitted for the reading of young pairsons." "There was much more discreet writin's," she said severely; an opinion which there was no gainsaying.

There is a broader horizon to be seen, looking westward from the fields of Mossgiel, than from those of Lochlea; the lands are higher and nobler of contour. Superb trees, which must have been superb a century ago, stand to right and left of the house,—beeches, ashes, oaks, and planes. The fields which are in sight from the house are now all grass-grown. I have heard that, twenty years ago, it was confidently told in which field Burns, plowing late in the autumn, broke into the little nest of the

"Wee sleekit, cow'rin', tim'rous beastie,"

whom every song-lover has known and pitied from that day to this, and whose misfortunes have answered ever since for a mint of re-assuring comparison to all of us, remembering that "the best-laid schemes o' mice an' men" must "gang aft aglee"; and the other field, also near by, where grew that mountain daisy,

"Wee, modest, crimson-tippéd flower,"

whose name is immortal in our hearts as that of Burns. This farm-wife, however, knew nothing about them. The stern air of the

north country in which she had been reared still chilled somewhat her thoughts of Burns and her interest in his inalienable bond on the fields of her farm.

It is but a mile from Mossgiel's gate to Mauchline, the town of "bonnie Jean" and Nansie Tinnoch and Gavin Hamilton. Surely a strange-assorted trio to be comrades of one man. Their houses are still standing: Jean's, a tumble-down, thatched cottage, looking out-of-place enough between the smart, new houses built on either side of it; Gavin Hamilton's, a dark, picturesque stone house, joined to the ruins of Mauchline Castle; and Nansie Tinnoch's, a black and dilapidated hovel, into which it takes courage to go. It stands snugged up against the wall of the old grave-yard, part below it and part above it — a situation as unwholesome as horrible; a door at the head of the narrow stair-way opening out into the grave-yard itself, and the slanting old stones leering in at the smoky windows by crowds. In the days when all the "country side" met at the open air services in this church-yard,

"Some thinkin' on their sins, an' some on their claes,"

no doubt Nansie Tinnoch's was a lighter, whiter, cheerier place than now; else the "Jolly Beggars" would never have gone there to tipple.

It was the nooning between services when I reached Mauchline, and church-goers from a distance were taking their beer and crackers decorously in the parlor of the inn. As the intermission was only three-quarters of an hour long, this much of involuntary dissipation was plainly forced on them; but they did not abuse it, I can testify. They partook of it as of a Passover: young men and maidens as sober and silent as if they had been doing solemn penance for sins, as indeed, from one point of view, it might perhaps be truly said that they were.

By dint of some difficult advances I drew one or two of them into conversation about the Mossgiel farm and the disappearance of the old relics of Burns's life in that region. It was a great pity, I said, that the Mossgiel house had to be taken down.

"'Deed, then, it was na such thing," spoke up an elderly man. "It was na moor than a wreck, an' I'm the mon who did it."

He was the landlord of the farm, it appeared. He seemed much amused at hearing of the farm-wife's disapproval of Burns's verses and of her father's prohibition of them.

"He was a heepocritical auld Radical, if ye knows him," he said, angrily. "I hope we'll never have ony worse readin' in our country than Robert Bur-r-r-ns." The prolongation of the "r" in the Scotch way of saying "Burns" is something that cannot be typographically represented. It is hardly a rolling of the "r," nor a multiplication of it; but it takes up a great deal more time and room than any one "r" ought to.

After the landlady had shown to me the big hall where the Freemasons meet, "the Burns' Mother Lodge," and the chest which used to hold the regalia at Tarbolton in Burns's day, and the little bedroom in which Stedman and Hawthorne had slept, — coming also to look at Burns's fields, — she told me in a mysterious whisper that there was a nephew of Burns's in the kitchen, who would like to see me, if I would like to see him. "A nephew of Burns's!" I exclaimed. "Weel, not exactly," she explained, "but he's a grand-nephew of Burns's wife; she thet was Jean, ye know," with a deprecating nod and lowering of the eyelid. So fast is the clutch of a Scotch neighborhood on its traditions of offended virtue, even to-day poor Jean cannot be mentioned by a landlady in her native town without a small stone cast backward at her.

Jean's grand-nephew proved to be a middle-aged man; not "ower weel-to-do," the landlady said. He had tried his hand at doctoring both in Scotland and America, — a rolling stone evidently, with too much of the old fiery blood of his race in his veins for quiet and decorous prosperity. He, too, seemed only half willing to speak of poor "Jean" — his kinswoman; but he led me to the cottage where she had lived, and pointed out the window from which she was said to have leaned out many a night listening to the songs of her lover when he sauntered across from the Whiteford Arms, Johnny Pigeon's house, just opposite, "not fou, but having had plenty" to make him merry and affectionate. Johnny Pigeon's is a "coöperative store" now; and new buildings have altered the line of the street so that "Rob Mossgiel" would lose his way there to-day.

The room in which Burns and his "bonnie Jean" were at last married in Gavin Hamilton's house, by Hamilton himself, is still shown to visitors. This room I had a greater desire to see than any other spot in Mauchline. "We can but try," said the grand-nephew; "but it's a small chance of seeing it the Sabba."

The sole tenant of this house now is the widow of a son of Gavin Hamilton's. Old, blind, and nearly helpless, she lives there alone with one family servant, nearly as old as herself, but hale, hearty, and rosy as only an old Scotch woman can be. This servant opened the door for us, her cap, calico gown,

and white apron all alike bristling with starch, religion, and pride of family. Her mistress would not allow the room to be shown on the Sabbath, she said. Imploringly it was explained to her that no other day had been possible, and that I had come "all the way from America."

"Ye did na do weel to tak the Sabbath," was her only reply, as she turned on her heel to go with the fruitless appeal to her mistress. Returning, she said curtly,

"She winna shew it on the Sabbath."

At this crisis my companion, who had kept in the background, stepped forward with:

"You don't know me, Elspie, do ye?"

"No, sir," she said stiffly, bracing herself up mentally against any further heathenish entreaties.

"What, not know —— ——?" repeating his name in full.

Presto! as if changed by a magician's trick, the stiff, starched, religious, haughty family retainer disappeared, and there stood, in the same cap, gown, and apron, a limber, rollicking, well-nigh improper old woman, who poked the grand-nephew in the ribs, clapped him on the shoulder, chuckling, ejaculating, questioning, wondering, laughing, all in a breath. Reminiscence on reminiscence followed between them.

"An' do ye mind Barry, too?" she asked. (This was an old man-servant of the house.) "An' many's the quirrel, an' many's the gree we had."

Barry was dead. Dead also was the beautiful girl whom my companion remembered well — dead of a broken heart before she was eighteen years of age. Forbidden to marry her lover, she had drooped and pined. He went to India and died. It was in a December the news of his death came, just at Christmas time, and in the next September she followed him.

"Ay, but she was a bonnie lass," said Elspie, the tears rolling down her face.

"I dare say she (nodding his head toward the house) — I dare say she's shed many a salt tear over it, but naebody 'll ever know she repentit," quoth the grand-nephew.

"Ay, ay," said Elspie. "There's a wee bit closet in every hoos."

"'Twas in that room she died," pointing up to a small ivy-shaded window. "I closed her eyes wi' my hands. She's never spoken of. She was a bonnie lass."

The picture of this desolate old woman, sitting there alone in her house, helpless, blind, waiting for death to come and take her to meet that daughter whose young heart was broken by her cruel will, seemed to shadow the very sunshine on the greensward in the court. The broken arches and crumbling walls of the old stone abbey ruins seemed, in their ivy mantles, warmly, joyously venerable by contrast with the silent, ruined, stony old human heart still beating in the house they joined.

In spite of my protestations, the grand-nephew urged Elspie to show us the room. She evidently now longed to do it; but, casting a fearful glance over her shoulder, said:

"I daur na! I daur na! I could na open the door that she'd na hear't," and she seemed much relieved when I made haste to assure her that on no account would I go into the room without her mistress's permission. So we came away, leaving her gazing regretfully after us, with her hand shading her eyes from the sun.

Going back from Mauchline to Ayr, I took another road, farther to the south than the one leading through Tarbolton, and much more beautiful, with superb beech trees meeting overhead, and gentlemen's country seats, with great parks, on either hand.

On this road is Montgomerie Castle, walled in by grand woods, which Burns knew so well.

> "Ye banks and braes and streams around
> The castle o' Montgomery,
> Green be your woods and fair your flowers,
> Your waters never drumlie!
> There simmer first unfauld her robes,
> And there the langest tarry,
> For there I took the last fareweel
> O' my sweet Highland Mary."

Sitting in the sun, on a bench outside the gate-house, with his little granddaughter on his lap, was the white-haired gate-keeper. As the horses' heads turned toward the gate, he arose slowly, without a change of muscle, and set down the child, who accepted her altered situation also without a change of muscle in her sober little face.

"Is it allowed to go in?" asked the driver.

"Eh — ye'll not be calling at the hoos?" asked the old man, surprised.

"No, I'm a stranger; but I like to see all the fine places in your country," I replied.

"I've no orders," looking at the driver reflectively; "I've no orders — but — a decent pairson" — looking again scrutinizingly at me, — "I think there can be no hairm," and he opened the gate.

Grand trees, rolling tracts of velvety turf, an ugly huge house of weather-beaten stone, with white pillars in front; conservatories joining the wings to the center; no attempt at decorative landscape art; grass, trees, distances, — these were all; but there were miles of these. It was at least a mile's drive to the other entrance to the estate, where the old

stone gate-way house was in ruin. I fancy that it was better kept up in the days before an Earl of Eglinstoune sold it to a plain Mr. Patterson.

At another fine estate nearer Ayr, where an old woman was gate-keeper and also had "no orders" about admitting strangers, the magic word "America" threw open the gates with a sweep, and bent the old dame's knees in a courtesy which made her look three times as broad as she was long. This estate had been "always in the Oswald family, an' is likely always to be, please God," said the loyal creature, with another courtesy at the mention, unconsciously devout as that of the Catholic when he crosses himself. "An' it's a fine country ye've yersel' in America," she added, politely. The Oswald estate has acres of beautiful curving uplands, all green and smooth and open; a lack of woods near the house, but great banks of sunshine instead, make a beauty all their own; and the Ayr Water running through the grounds, and bridged gracefully here and there, is a possession to be coveted. From all points is a clear sight of sea, and headlands north and south,—Ayr harbor lying like a crescent, now silver, now gold, afloat between blue sky and green shore, and dusky gray roof-lines of the town.

The most precious thing in all the parish of Ayr is the cottage in which Burns was born. It is about two miles south from the center of the town, on the shore of "Bonnie Doon," and near Alloway Kirk. You cannot go thither from Ayr over any road except the one Tam o' Shanter took: it has been straightened a little since his day, but many a rod of it is the same that Maggie trod; and Alloway Kirk is as ghostly a place now, even at high noon, as can be found "frae Maidenkirk to Johnny Groat's." There is nothing left of it but the walls and the gable, in which the ancient bell still hangs, intensifying the silence by its suggestion of echoes long dead.

The Burns cottage is now a sort of inn, kept by an Englishman whose fortunes would make a tale by themselves. He fought at Balaklava and in our civil war; and side by side on the walls of his dining-room hang, framed, his two commissions in the Pennsylvania Volunteers and the menu of the Balaklava Banquet, given in London to the brave fellows that came home alive after that fight. He does not love the Scotch people.

"I would not give the Americans for all the Scotch ever born," he says, and is disposed to speak with unjust satire of their apparent love of Burns, which he ascribes to a perception of his recognition by the rest of the world and a shamefaced desire not to seem to be behindhand in paying tribute to him.

"Oh, they let on to think much of him," he said. "It's money in their pockets."

The room in which Burns was born is still unaltered, except in having one more window let in. Originally, it had but one small square window of four panes. The bed is like the beds in all the old Scotch cottages, built into the wall, similar to those still seen in Norway. Stifling enough the air surely must have been in the cupboard bed in which the "waly boy" was born.

> "The gossip keekit in his loof;
> Quo' scho, 'Wha lives will see the proof,—
> This waly boy will be nae coof;
> I think we'll ca' him Robin.'"

Before he was many days old, or, as some traditions have it, on the very night he was born, a violent storm "tirled" away part of the roof of the poor little "clay biggin," and mother and babe were forced to seek shelter in a neighbor's cottage. Misfortune and Robin early joined company and never parted. The little bedroom is now the showroom of the inn, and is filled with tables piled with the well-known boxes, pincushions, baskets, paper-cutters, etc., made from sycamore wood grown on the banks of Doon and Ayr. These articles are all stamped with some pictures of scenery associated with Burns or with quotations from his verses. It is impossible to see all this money-making without thinking what a delicious, rollicking bit of verse Burns would write about it himself if he came back to-day. There are those who offer for sale articles said to be made out of the old timbers of the Mossgiel house; but the Balaklava Englishman scouts all that as the most barefaced imposture. "There wasn't an inch of that timber," he says,—and he was there when the house was taken down—"which wasn't worm-eaten and rotten; not enough to make a knife-handle of!"

One feels disposed to pass over in silence the "Burns Monument," which was built in 1820, at a cost of over three thousand pounds; "a circular temple supported by nine fluted Corinthian columns emblematic of the nine muses," say the guide-books. It stands in a garden overlooking the Doon, and is a painful sight. But in a room in the base of it are to be seen some relics at which no Burns lover can look unmoved: the Bibles he gave to Highland Mary, the ring with which he wedded Jean (taken off after her death), and two rings containing some of his hair.

It is but a few steps from this monument down to a spot on the "banks o' bonnie Doon," from which is a fine view of the "auld brig."

This shining, silent water, and the overhanging, silent trees, and the silent bell in the gable of Alloway Kirk, speak more eloquently of Burns than do all nine of the Corinthian muse-dedicated pillars in his monument.

So do the twa brigs of Ayr, which still stand at the foot of High street, silently recriminating each other as of old.

"I doubt na, frien', ye'll think ye'r nae sheep-shank
When ye are streekit o'er frae bank to bank,"

sneers the Auld; and

"Will your poor, narrow foot-path of a street,
Where twa wheelbarrows tremble when they meet,
Your ruined, formless bulk o' stane and lime,
Compare wi' bonny brigs o' modern time?"

retorts the New; and "the sprites that owre the brigs of Ayr preside" never interrupt the quarrel. Spite of all its boasting, however, the new bridge cracked badly two years ago, and had to be taken down and entirely rebuilt.

The dingy little inn where

"Tam was glorious,
O'er a' the ills o' life victorious,"

is still called by his name, and still preserves, as its chief claims to distinction, the big wooden mug out of which Tam drank and the chair in which he so many market nights

"gat planted unco richt."

The chair is of oak, well-nigh black as ebony, and furrowed thick with names cut upon it. The smart young landlady who now keeps the house commented severely on this desecration of it, and said that for some years the house had been "keepit" by a widow, who was "in no sense up to the beesiness," and "a' people did as they pleased in the hoos in her day." The mug has a metal rim and base, but spite of these it has needed to be clasped together again by three ribs of cane, riveted on. "Money couldn't buy it," the landlady said. It belongs to the house, is mentioned always in the terms of lease, and the house has changed hands but four times since Tam's day.

In a tiny stone cottage in the southern suburbs of Ayr live two nieces of Burns, daughters of his youngest sister Isabella. They are vivacious still, and eagerly alive to all that goes on in the world, though they must be well on in the seventies. The day I called they had "just received a newspaper from America," they said. "Perhaps I knew it. It was called 'The Democrat.'" As I was not able to identify it by that description, the younger sister made haste to fetch it. It proved to be a paper printed in Madison, Iowa. The old ladies were much interested in the approaching American election, had read all they could find about General Garfield, and were much impressed by the wise reticence of General Grant. "He must be a vary cautious man; disna say enough to please people," they said, with sagacious nods of approbation. They remembered Burns's wife very well, had visited her when she was living, a widow, at Dumfries, and told with glee a story which they said she herself used to narrate, with great relish, of a peddler lad who, often coming to the house with wares to sell in the kitchen, finally expressed to the servant his deep desire to see Mrs. Burns. She accordingly told him to wait, and her mistress would no doubt before long come into the room. Mrs. Burns came in, stood for some moments talking with the lad, bought some trifle of him, and went away. Still he sat waiting. At last the servant asked why he did not go. He replied that she had promised he should see Mrs. Burns.

"But ye have seen her. That was she," said the servant.

"Eh, eh?" said the lad. "Na! never tell me now that was 'bonnie Jean'!"

Burns's mother, too, their grandmother, they recollected well, and had often heard her tell of the time when the family lived at Lochlea, and Robert, spending his evenings at the Tarbolton merry-makings with the Bachelors' Club or the Masons, used to come home late in the night, and she used to sit up to let him in. These doings sorely displeased the father, and at last he said grimly, one night, that he would sit up to open the door for Robert. Trembling with fear, the mother went to bed and did not close her eyes, listening apprehensively for the angry meeting between father and son. She heard the door open, the old man's stern tone, Robert's gay reply, and in a twinkling more the two were sitting together over the fire, the father splitting his sides with half unwilling laughter at the boy's inimitable descriptions and mimicry of the scenes he had left. Nearly two hours they sat there in this way, the mother all the while cramming the bedclothes into her mouth, lest her own laughter should remind her husband how poorly he was carrying out his threats. After that night "Rob" came home at what hour he pleased, and there was nothing more heard of his father's sitting up to reprove him.

They believed that Burns's intemperate habits had been greatly exaggerated. Their mother was a woman twenty-five years old and the mother of three children when he died, and she had never once seen him the "waur for liquor." "There were vary mony idle people i' the warld, an' a great deal o' talk," they said.

After his father's death, he assumed the position of the head of the house, and led in family prayers each morning, and everybody said, even the servants, that there were never such beautiful prayers heard. He was a generous soul. After he left home he never came back for a visit, however poor he might be, without bringing a present for every member of the family; always a pound of tea for his mother, "and tea was tea then," the old ladies added. To their mother he gave a copy of Thomson's "Seasons," which they still have. They have also some letters of his, two of which I read with great interest. They were to his brother and were full of good advice. In one he says:

"I intended to have given you a sheetful of counsels, but some business has prevented me. In a word, learn taciturnity. Let that be your motto. Though you had the wisdom of Newton or the wit of Swift, garrulousness would lower you in the eyes of your fellow-creatures."

In the other, after alluding to some village tragedy, in which great suffering had fallen on a woman, he says:

"Women have a kind of steady sufferance which qualifies them to endure much beyond the common run of men; but perhaps part of that fortitude is owing to their short-sightedness, as they are by no means famous for seeing remote consequences in their real importance."

The old ladies said that their mother had liked "Jean" on the whole, though "at first not so weel, on account of the connection being what it was." She was kindly, cheery, "never bonny"; but had a good figure, danced well and sang well, and worshiped her husband. She was "not intellectual"; "but there's some say a poet shouldn't have an intellectual wife," one of the ingenuous old spinsters remarked, interrogatively. "At any rate, she suited him, an' it was ill speering at her after all that was said and done," the younger niece added, with real feeling in her tone. Well might she say so. If there be a touching picture in all the long list of faithful and ill-used women, it is that of "bonnie Jean"—the unwedded mother of children, the forgiving wife of a husband who betrayed others as he had betrayed her—when she took into her arms and nursed and cared for her husband's child, born of an outcast woman, and bravely answered all curious questioners with, "It's a neebor's bairn I'm bringin' up." She wrought for herself a place and an esteem of which her honest and loving humility little dreamed.

There is always something sad in seeking out the spot where a great man has died. It is like living over the days of his death and burial. The more sympathetically we have felt the spell of the scenes in which he lived his life, the more vitalized and vitalizing that life was, the more are we chilled and depressed in the presence of places on which his wearied and suffering gaze rested last. As I drove through the dingy, confused, and ugly streets of Dumfries, my chief thought was, "How Burns must have hated this place!" Looking back on it now, I have a half regret that I ever saw it, that I can recall vividly the ghastly grave-yard of St. Michael's, with its twenty-six thousand grave-stones and monuments, crowded closer than they would be in a marble-yard, ranged in rows against the walls without any pretense of association with the dust they affect to commemorate. What a ballad Burns might have written about such a show! And what would it not have been given to him to say of the "Genius of Coila finding her favorite son at the plow, and casting her mantle over him," *i. e.*, the sculptured monument, or, as the sexton called it, "Máwsolem," under which he has had the misfortune to be buried. A great Malvern bath-woman, bringing a bathing-sheet to an unwilling patient, might have been the model for the thing. It is hideous beyond description, and in a refinement of ingenuity has been made uglier still by having the spaces between the pillars filled in with glass. The severe Scotch weather, it seems, was discoloring the marble. It is a pity that the zealous guardians of its beauty did not hold it precious enough to be boarded up altogether.

The house in which Burns spent the first eighteen months of his dreary life in Dumfries is now a common tenement-house at the lower end of a poor and narrow street. As I was reading the tablet let into the wall, bearing his name, a carpenter went by, carrying his box of tools slung on his shoulder.

"He only had three rooms there," said the man, "those three up there," pointing to the windows; "two rooms and a little kitchen at the back."

The house which is usually shown to strangers as his is now the home of the master of the industrial school, and is a comfortable little building joining the school. Here Burns lived for three years; and here, in a small chamber not more than twelve by fifteen feet in size, he died on the 21st of July, 1796, sadly harassed in his last moments by anxiety about money matters and about the approaching illness of his faithful Jean.

Opening from this room is a tiny closet lighted by one window.

"They say he used to make up his poetry in here," said the servant-girl; "but I dare say it is only a supposeetion; still, it 'ud be a quiet place."

"They say there was a great lot o' papers up here when he died," she added, throwing open the narrow door of a ladder-like stairway that led up into the garret, "writin's that had been sent to him from all over the world, but nobody knew what become of them. Now that he's so much thought aboot, I wonder his widow did not keep them. But, ye know, the poor thing was just comin' to be ill; that was the last thing he wrote when he knew he was dyin', for some one to come and stay with her; and I dare say she was in such a sewither she did not know about anything."

The old stone stairs were winding and narrow—painted now, and neatly carpeted, but worn into depressions here and there by the plodding of feet. Nothing in the house, above or below, spoke to me of Burns so much as did they. I stood silent and rapt on the landing, and saw him coming wearily up, that last time; after which he went no more out forever, till he was borne in the arms of men, and laid away in St. Michael's graveyard to rest.

That night, at my lonely dinner in the King's Arms, I had the Edinburgh papers. There were in them three editorials headed with quotations from Burns's poems, and an account of the sale in Edinburgh, that week, of an autograph letter of his for ninety-four pounds!

Does he think sadly, even in heaven, how differently he might have done by himself and by Earth, if Earth had done for him then a tithe of what it does now? Does he know it? Does he care? And does he listen when, in lands he never saw, great poets sing of him in words simple and melodious as his own?

"For now he haunts his native land
As an immortal youth: his hand
Guides every plow;
He sits beside each ingle-nook,
His voice is in each rushing brook,
Each rustling bough.

"His presence haunts this room to-night,
A form of mingled mist and light
From that far coast.
Welcome beneath this roof of mine!
Welcome! this vacant chair is thine,
Dear guest and ghost!"*

*Longfellow.

H. H.

LOVE'S POWER.

If I were blind, and thou shouldst enter
E'er so softly in the room,
I should know it,
I should feel it,
Something subtle would reveal it,
And a glory round thee center
That would lighten up the gloom.
And my heart would surely guide me,
With Love's second-sight provide me,
One amid the crowd to find,
If I were blind!

If I were deaf, and thou hadst spoken
Ere thy presence I had known,
I should know it,
I should feel it,
Something subtle would reveal it,
And the seal at once be broken
By Love's liquid undertone.
Deaf to other, stranger voices,
And the world's discordant noises,—
Whisper, wheresoe'er thou art,
'Twill reach my heart!

If I were dead, and thou shouldst venture
Near the coffin where I lay,
I should know it,
I should feel it,
Something subtle would reveal it,
And no look of mildest censure
Rest upon that face of clay.
Shouldst thou kiss me, conscious flashes
Of Love's fire through Death's cold ashes
Would give back the cheek its red,
If I were dead!

Josephine Pollard.

OUR STORY.

I.

I BECAME acquainted with Miss Bessie Vancouver at a reception given by an eminent literary gentleman in New York. The circumstances were a little peculiar. Miss Vancouver and I had each written and recently published a book, and we were introduced to each other as young authors whose works had made us known to the public, and who, consequently, should know each other. The peculiarity of the situation lay in the fact that I had not read Miss Vancouver's book, nor had she read mine. Consequently, although each felt bound to speak of the work of the other, neither of us could do it except in the most general and cautious way. I was quite sure that her book was a novel, but that was all that I knew about it, except that I had heard it well spoken of; but she supposed my book was of a scientific character, whereas, in reality, it also was a novel, although its title did not indicate the fact. There was therefore an air of restraint and stiffness about our first interview which it might not have had if we had frankly acknowledged our short-comings. But, as the general conversation led her to believe that she was the only person in the room who had not read my book, and me to believe that I was the only one who had not read hers, we were naturally loath to confess the truth to each other.

I next met Miss Vancouver in Paris, at the house of a lady whose parlors are the frequent rendezvous of Americans, especially those given to art or literature. This time we met on different ground. I had read her book and she mine; and as soon as we had shaken hands we began to talk of each other's work, not as if it had been the beginning of a new conversation, but rather as the continuation of one broken off. Each liked the book of the other extremely, and we were free to say so.

"But I am not satisfied with my novel," said Miss Vancouver. "There is too much oneness about it; by which I mean that it is not diversified enough. It is all, or nearly all, about two people, who, of course, have but one object in life, and it seems to me now that their story might have been finished a great deal sooner; though, of course, in that case it would not have been long enough to make a book."

To this I politely answered that I did not agree with her, for the story was interesting to the very end; but, of course, if she had put more characters into it, and they had been as good in their way as those she already had, the book would have been that much the better. "As for me," I continued, "my trouble is entirely the other way. I have no oneness whatever. My tendency is much more to fifteen or twenty-ness. I carry a story a little way in one direction, and then I stop and go off in another. It is sometimes difficult to make it understood why a character should have been brought into the story at all; and I have had a good deal of trouble in making some of them do something toward the end to show that they are connected with the general plot."

She said she had noticed that there was a wideness of scope in my book; but what she would have said further I do not know, for our hostess now came down upon us and carried off Miss Vancouver to introduce her to an old lady who had successfully steered about fifty barques across that sea on which Miss Vancouver had just set out.

Our next meeting was in a town on the Mediterranean, in the south of France. I had secured board at a large *pension* there, and was delighted to find that Miss Bessie Vancouver and her mother were already inmates of the house. As soon as I had the opportunity, I broached to her an idea which had frequently possessed my mind since our conversation in Paris. I proposed that we should write a story together, something like Erckmann-Chatrian, or Mark Twain and Mr. Warner in "The Gilded Age." Since she had too much unity of purpose and traveled in too narrow a path, and I branched off too much, and had too great a tendency to variety, our styles, if properly blended, would possess all the qualities needed in a good story; and there was no reason why we should not, writing thus together, achieve a success greater, perhaps, than either of us could expect writing alone. I had thought so much on this subject that I was able to say a great deal, and to say it pretty well, too, so far as I could judge. Miss Vancouver listened with great attention, and the more I said, the more the idea pleased her. She said she would take the afternoon to consider the matter, and in the evening she told me in the parlor that she had made up her mind, if I still thought well of the plan, to assist me in writing a story,—this being the polite way in which she

chose to put it,—but that she thought it would be better for us to begin with a short story, and not with a book, for in this way we could sooner see how we would be likely to succeed. Of course I agreed to this proposition, and we arranged that we should meet the next morning in the garden and lay out a plan for our story.

The garden attached to the house in which we lived was a very quaint and pleasant one. It had been made a hundred years ago or more by an Italian nobleman, whose mansion, now greatly altered, had become our present *pension*. The garden was laid out in a series of terraces on the side of a hill, and abounded in walks shaded by orange and lemon trees, arbors, and vine-covered trellises; fountains, half concealed by overhanging ivy; and suddenly discovered stair-ways, wide and shadowy, leading up into regions of greater quaintness and seclusion. Flowers were here, and palm-trees, and great cactus-bushes, with their red fruit half hollowed out by the nibbling birds. From the upper terraces we could see the blue Mediterranean spreading far away on one side, while the snow-covered tops of the Maritime Alps stood bright against the sky. The garden was little frequented, and altogether it was a good place in which to plan a story.

We consulted together for several days before we actually began to work. At first, we sat in an arbor on one of the lower terraces, where there were a little iron table and some chairs; but now and then a person would come there for a morning stroll, and so we moved up higher to a seat under a palm-tree, and the next day to another terrace, where there was a secluded corner overshadowed by huge cacti. But the place which suited us best of all was the top of an old tower at one end of the garden. This tower had been built many, many hundred years before the garden was thought of, and its broad, flat roof was level with one of the higher terraces. Here we could work and consult in quiet, with little fear of being disturbed.

Not finding it easy to plan out the whole story at once, we determined to begin by preparing backgrounds. We concluded that as this was to be a short story, it would be sufficient to have descriptions of two natural scenes in which the two principal incidents should occur; and as we wished to do all our work from natural models, we thought it best to describe the scene which lay around us, than which nothing could be more beautiful or more suitable. One scene was to be on the sea-shore, with a mellow light upon the rippling waves, and the sails of fishing-vessels in the distance. This Miss Vancouver was to do, while I was to take a scene among the hills and mountains at the back of the town. I walked over there one afternoon when Miss Vancouver had gone out with her mother. I got on a high point, and worked up a very satisfactory description of the frowning mountains behind me, the old monasteries on the hills, and the town stretching out below, with a little river rushing along between two rows of picturesque washerwomen to the sea.

We read our backgrounds to each other, and were both very well satisfied. Our styles were as different as the scenes we described. Hers was clear and smooth, and mine forcible and somewhat abrupt, and thus the strong points of each scene were better brought out; but, in order that our styles might be unified, so to speak, by being judiciously blended, I suggested some strong and effective points to be introduced into her description, while she toned down some of my phrases and added a word here and there which gave a color and beauty to the description which it had not possessed before.

Our backgrounds being thus satisfactory,—and it took a good deal of consultation to make them so,—our next work was to provide characters for the story. These were to be drawn from life, for it would be perfectly ridiculous to create imaginary characters when there were so many original and interesting personages around us. We soon agreed upon an individual who would serve as a model for our hero; I forget whether it was I or Miss Vancouver who first suggested him. He was a young man, but not so very young either, who lived in the house with us, and about whom there was a mystery. Nobody knew exactly who he was, or where he came from, or why he was here. It was evident he did not come for society, for he kept very much to himself; and the attractions of the town could not have brought him here, for he seemed to care very little about them. We seldom saw him except at the table and occasionally in the garden. When we met him in the latter place, he always seemed anxious to avoid observation; and as we did not wish to hurt his feelings by letting him suppose that he was an object of curiosity to us, we endeavored, as far as possible, to make it apparent that we were not looking at him or thinking of him. But still, whenever we had a good chance, we studied him. Of course we could not make out his mystery, but that was not necessary, nor did we, indeed, think it would be proper. We could draw him as we saw him, and then make the mystery what we pleased; its character depending a good deal upon the plot we devised.

Miss Vancouver undertook to draw the hero, and she went to work upon him immediately. In personal appearance, she altered the model a good deal. She darkened his hair, and took off his whiskers, leaving him only a mustache. She thought, too, that he ought to be a little taller, and asked me my height, which is five feet nine. She considered that a very good height, and brought the hero up to it. She also made him some years younger, but endeavored, as far as seemed suitable to the story, to draw him exactly as he was.

I was to do the heroine, but found it very hard to choose a model. As I said before, we determined to draw all our characters from life, but I could think of no one, in the somewhat extensive company by which we were surrounded, who would answer my purpose. Nor could I fix my mind upon any person in other parts of the world, whom I knew or had known, who resembled the idea I had formed of our heroine. After thinking this matter over a good deal, I told Miss Vancouver that I believed the best thing I could do would be to take her for my model. I was with her a good deal, and thus could study out and work up certain points as I wrote, which would be a great advantage. She objected to this, because, as she said, the author of a story should not be drawn as its heroine. But I asserted that this would not be the case. She would merely suggest the heroine to me, and I would so do my work that the heroine would not suggest her to anybody else. This, I thought, was the way in which a model ought to be used. After we had talked the subject over a good deal, she agreed to my plan, and I went to work with much satisfaction. I gave no definite description of the lady, but endeavored to indicate the impression which her person and character produced upon me. As such impressions are seldom the same in any two cases, there was no danger that my description could be referred back to her.

When I read to her the sketch I had written, she objected to parts of it as not being correct; but as I asserted that it was not intended as an exact copy of the model, she could not say it was not a true picture; and so, with some slight modifications, we let it stand. I thought myself that it was a very good piece of work. To me it seemed very life-like and piquant, and I believed that other people would think it so.

We were now ready for the incidents and the plot, but at this point we were somewhat interrupted by Mrs. Vancouver. She came to me one morning, when I was waiting to go with her daughter to our study in the garden, and told me that she was very sorry to notice that Miss Vancouver and I had attracted attention to ourselves by being so much together; and, while she understood the nature of the literary labor on which we were engaged, she did not wish her daughter to become the object of general attention and remark in a foreign *pension*. I was very angry when I heard that people had been directing upon us their impertinent curiosity, and I discoursed warmly upon the subject.

"Where is the good," I said, "of a person or persons devoting himself or themselves, with enthusiasm and earnestness, to his or their life-work, if he or they are to be interfered with by the impertinent babble of the multitude?"

Mrs. Vancouver was not prepared to give an exact answer to this question, but she considered the babble of the multitude a very serious thing. She had been talking to her daughter on the subject, and thought it right to speak to me.

That morning we worked separately in our rooms, but we accomplished little or nothing. It was, of course, impossible to do anything of importance in a work of this kind without consultation and coöperation. The next day, however, I devised a plan which would enable us, I thought, to pursue our labors without attracting attention; and Mrs. Vancouver, who was a kind-hearted woman, and took a great interest in her daughter's literary career, told me if I could successfully carry out anything of the kind, I might do so. She did not inquire into particulars, nor did I explain them to Miss Bessie; but I told the latter that we would not go out together into the garden, but I would go first, and she should join me about ten minutes afterward on the tower; but she was not to come if she saw any one about.

Near the top of the hill, above the garden, once stood an ancient mansion, of which nothing now remained but the remnants of some massive masonry. A court-yard, however, of this old edifice was still surrounded by a high wall, which formed the upper boundary of our garden. From a point near the tower a flight of twisting stone steps, flanked by blank walls, which turned themselves in various directions to suit the angles of the stair-way, led to a green door in this wall. Through this door Miss Vancouver and myself, and doubtless many other persons, had often wished to pass; but it was locked, and, on inquiry, we found that there was no key to be had. The day previous, however, when wandering by myself, I had examined this door, and found that it was fastened merely by a snap-lock which had no handle,

but was opened by a key. I had a knife with a long, strong blade, and pushing this into the hasp, I easily forced back the bolt. I then opened the door and walked into the old court-yard.

When Miss Vancouver appeared on the tower, I was standing at the top of the stone steps just mentioned, with the green door slightly ajar. Calling to her in a low tone, she ran up the steps, and, to her amazement, I ushered her into the court-yard and closed the door behind us.

"There," I exultingly exclaimed, "is our study, where we can write our story without interruption. We will come and go away separately; the people of the *pension* will not know that we are here or have been here, and there will be no occasion for that impertinent attention to which your mother so properly objects."

Miss Vancouver was delighted, and we walked about and surveyed the court-yard with much satisfaction. I had already selected the spot for our work. It was in the shade of an olive-tree, the only tree in the inclosure, beneath which there was a rude seat. I spread a rug upon the grass, and Miss Bessie sat upon the seat, and put her feet upon the rug, leaving room for me to sit thereon. We now took out our little blank-books and our stylograph pens and were ready for work. I explained that I had done nothing the day before; and Miss Vancouver said that had also been the case with her. She had not wished to do anything important without consultation; but supposing that, of course, the hero was to fall in love with the heroine, she thought she might as well make him begin, but she found she could not do it as she wished. She wanted him to indicate to the lady that he was in love with her without exactly saying so. Could I not suggest some good form for giving expression to this state of things? After a little reflection, I thought I could.

"I will speak," said I, "as if I were the hero, and then you can see how it will suit."

"Yes," said she, "but you must not forget that what you say should be very gradual."

I tried to be as gradual as I could, and to indicate by slow degrees the state of mind in which we wished our hero to be. As the indication became stronger and stronger, I thought it right to take Miss Vancouver's hand; but to this she objected, because, as she said, it was more than indication, and besides, it prevented her from writing down what I said. We argued this point a little while without altering our position, and I asserted that the hand-holding only gave point and earnestness to the hero's remarks, which otherwise would not be so natural and true to life; and if she wanted to use her right hand, her left hand would do to hold. We made this change, and I proceeded with the hero's remarks.

There was in our *pension* a young German girl named Margarita. She was a handsome, plump maiden, and spoke English very well. There was another young lady, also a German, named Gretzel. She was a little creature and the fast friend of Margarita. These two had a companion whose name I did not know. She was a little older than the others, and was, I think, a Pole. She also understood English. As I was warming up toward the peroration of our hero's indication, I raised my eyes, and saw, on the brow of the hill, not a stone's throw from us, these three girls. They were talking earnestly and walking directly toward us. The place where they were was used as a public pleasure-ground, and was separated from the old court-yard by a pale-fence. Although the girls could not come to us, there was nothing to prevent their seeing us if they chose to look our way, for they were on ground which was higher than the top of the fence.

When I saw these girls, I was horror-stricken, and my knees, on which I rested, trembled beneath me. I did not dare to rise, nor to change my position, for fear the motion should attract attention; nor did I cease my remarks, for had I suddenly done so, my companion would have looked around to see what was the matter, and would certainly have jumped up, or have done something which would have brought the eyes of those girls upon us; but my voice dropped very low, and I wondered if there was any way of my gently rolling out of sight.

But at this moment our young man with a mystery suddenly appeared on the other side of the fence, walking rapidly toward the girls. There was something on the ocean, probably a ship, to which he directed their attention, and then he actually led them off, pointing, as it appeared, to a spot from which the distant object could be more plainly seen. They all walked away and disappeared behind the brow of the hill. With a great feeling of relief, I arose and recounted what had happened. Miss Vancouver sprang to her feet, shut up her blank-book, and put the stopper on her stylograph.

"This place will not do at all to work in," she said. "I will not have those girls staring at us."

I was obliged to admit that this particular spot would not do. I had not thought of any one walking in the grounds immediately above us, especially in the morning, which was our working time.

"They may return," she said, "and we must go away immediately and separately."

But I could not agree thus to give up our new-found study. The inclosure was quite extensive, with ruins at the other end, near which we might find some spot entirely protected from observation. So I went to look for such a place, leaving Miss Vancouver under the olive-tree, where; if she were seen alone, it would not matter. I found a spot which might answer, and, returning to the tree, sent her to look at it. While we were thus engaged, we heard the report of the noon cannon. This startled us both. The hour for *déjeûner à la fourchette* at the *pension* was twelve o'clock, and people were generally very prompt at that meal. It would not do for us to be late. Snatching up our effects, we hurried to the green door, but when I tried to open it as before, I found it impossible—a projecting strip of wood on the inside of the door-way preventing my reaching the bolt with my knife-blade. I tried to tear away the strip, but it was too firmly fastened. We both became very nervous and troubled. It was impossible to get out of the inclosure except through that door, for the wall was quite high and the top covered with broken glass imbedded in the mortar. The party on the hill had had time to go down and around through the town to the *pension*. Our places at the table would be the only ones empty. What could attract more attention than this? And what would Mrs. Vancouver think and say? At this moment, we heard some one working at the lock on the other side. The door opened, and there stood our hero.

"I heard some one at this door," he said, "and supposing it had been accidentally closed, I came up and opened it."

"Thank you; thank you very much!" cried Miss Vancouver.

And away she ran to the house. If only I were late, it did not matter at all. I followed with our hero, and endeavored to make some explanation of the predicament of myself and the young lady. He took it all as a matter of course, as if the old court-yard were a place of general resort.

"When persons stroll through that door," he said, "they should put a piece of stick or of stone against the jamb, so that if the door is blown shut by the wind the latch may not catch."

And then he called my attention to a beautiful plant of the aloe kind which had just begun to blossom.

Miss Vancouver reached the breakfast-table in good time, but she told me afterward she would work in the old court-yard no more. The perils were too many.

For some days after this our story made little progress, for opportunities for consultation did not occur. I was particularly sorry for this, because I wanted very much to know how Miss Vancouver liked my indicative speech and what she had made of it. Early one afternoon about this time our hero, between whom and myself a slight acquaintance had sprung up, came to me and said:

"The sea is so perfectly smooth and quiet to-day that I thought it would be pleasant to take a row, and I have hired a boat. How would you like to go with me?"

I was pleased with his friendly proposition, and I am very fond of rowing; but yet I hesitated about accepting the invitation, for I hoped that afternoon to find some opportunity for consultation in regard to the work on which I was engaged.

"The boat is rather large for two persons," he remarked. "Have you any friends you would like to ask to go with us?"

This put a different phase upon affairs. I instantly said that I thought a row would be charming that afternoon, and suggested that Mrs. Vancouver and her daughter might like to take advantage of the opportunity.

The ladies were quite willing to go, and in twenty minutes we set off, two fishermen in red liberty caps pushing us from the pebbly beach. Our hero took one oar and I another, and we pulled together very well. The ladies sat in the stern and enjoyed the smooth sea and the lovely day. We rowed across the little bay and around a high promontory, where there was a larger bay with a small town in the distance. The hero suggested that we should land here, as we could get some good views from the rocks. To this we all agreed; and when we had climbed up a little distance, Mrs. Vancouver found some wild flowers which interested her very much. She was, in a certain way, a floraphobist, and took an especial delight in finding in foreign countries blossoms which were the same as or similar to flowers she was familiar with in New England. Our hero had also a fancy for wild flowers, and it was not long before he showed Mrs. Vancouver a little blossom which she was very sure she had seen either at East Gresham or Milton Center. Leaving these two to their floral researches, Miss Vancouver and I climbed higher up the rocks, where the view would be better. We found a pleasant ledge, and, although we could not see what was going on below us, and the view was quite cut off in the direction of the town, we had an admirable outlook over the sea, on which, in the far distance, we could see the sails of a little vessel.

"This will be an admirable place to do a little work on our story," I said. "I have brought my blank-book and stylograph."

"And so have I," said she.

I then told her that I had been thinking over the matter a good deal, and that I believed in a short story two long speeches would be enough for the hero to make, and proposed that we should now go on with the second one. She thought well of that, and took a seat upon a rocky projection, while I sat upon another quite near.

"This second speech," said I, "ought to be more than indicative, and should express the definite purpose of the hero's sentiments; and I think there should be corresponding expressions from the heroine, and would be glad to have you suggest such as you think she would make." I then began to say what I thought a hero ought to say under the circumstances. I soon warmed up to my task wonderfully, and expressed with much earnestness and ardor the sentiments I thought proper for the occasion. I first held one of Miss Vancouver's hands, and then both of them, she trusting to her memory in regard to memoranda. Her remarks in the character of the heroine were, however, much briefer than mine, but they were enough. If necessary, they could be worked up and amplified. I think we had said all or nearly all there was to say when we heard a shout from below. It was our hero calling us. We could not see him, but I knew his voice. He shouted again, and then I arose from the rock on which Bessie was sitting and answered him. He now made his appearance some distance below us, and said that Mrs. Vancouver did not care to come up any higher to get the views, and that she thought it would be better to reach home before the sun should set.

That evening, in the *salon*, Bessie spoke to me apart. "Our hero," she said, "is more than a hero; he is a guardian angel. You must fathom his mystery. I am sure that it is far better than anything we can invent for him."

I set myself to work to discover, if possible, not only the mystery which had first interested us in our hero, but also the reason and purpose of his guardian-angelship. He was an American, and now that I had come to know him better, I found him a very agreeable talker.

II.

Our hero was the first person whom I told of my engagement to Bessie. Mrs. Vancouver was very particular that this state of affairs should be made known. "If you are engaged," she said, "of course you can be together as much as you please. It is the custom in America, and nobody need make any remarks."

In talking to our hero, I told him of a good many little things that had happened at various times, and endeavored by these friendly confidences to make him speak of his own affairs. It must not be supposed that I was actuated by prying curiosity, but certainly I had a right to know something of a person to whom I had told so much; but he always seemed a great deal more interested in us than in himself, and I took so much interest in his interest, which was very kindly expressed, that his affairs never came into our conversation.

But just as he was going away,—he left the little town a few days before we did,—he told me that he was a writer, and that for some time past he had been engaged upon a story.

Our story was never finished. His was. This is it.

Frank R. Stockton.

DEATH'S FIRST LESSON.

Three sad, strange things already death hath shown
To me who lived but yesterday. My love,
Who loved to kiss my hands and lips above
All other joys,—whose heart upon my own
So oft has throbbed,—fears me, now life has flown,
And shuddering turns away. The friend who strove
My trust to win, and all my faith did prove,
Sees, in my pale, still form, a bar o'erthrown
To some most dear desire. While one who spake
No fond and flattering word of love or praise,
Who only cold and stern reproof would give
To all my foolish, unconsidered ways—
This one would glad have died that I might live,
This heart alone lies broken for my sake.

Susan Marr Spalding.

NEWE YORK, ye 1st Aprile, 1883.

YE worste of my ailment is this, yt it groweth not Less with much nursinge, but is like to those fevres wch ye leeches Starve, 'tis saide, for that ye more Bloode there be in ye Sicke man's Bodie, ye more foode is there for ye Distemper to feede upon.—And it is moste fittinge yt I come backe to ys my Journall (wherein I have not writt a Lyne these manye months) on ye 1st of Aprile, beinge in some Sort myne owne foole and ye foole of Love, and a poore Butt on whome his hearte hath play'd a Sorry tricke.—

For it is surelie a strange happenninge, that I, who am ofte accompted a man of ye Worlde, (as ye Phrase goes,) sholde be soe Overtaken & caste downe lyke a Schoole-boy or a countrie Bumpkin, by a meere Mayde, & sholde set to Groaninge and Sighinge, &, for that She will not have me Sighe to Her, to Groaninge and Sighinge on paper, wch is ye greter Foolishnesse in Me, yt some one maye reade it Here-after, who hath taken his dose of ye same Physicke, and made no Wrye faces over it; in wch case I doubte I shall be much laugh'd at.—Yet soe much am I a foole, and soe enamour'd of my Foolishnesse, yt I have a sorte of Shamefull Joye in tellinge, even to my Journall, yt I am mightie deepe in Love withe ye yonge Daughter of Mistresse Ffrench, and all maye knowe what an Angell is ye Daughter, since I have chose Mrs. French for my Mother in Lawe.—(Though she will have none of my choosinge.)—And I likewise take comforte in ye Fancie, yt this poore Sheete, whon I write, may be made of ye Raggs of some lucklesse Lover, and, and maye ye more readilie drinke up my complaininge Inke.—

This muche I have learnt yt Fraunce distilles not, nor ye Indies growe not, ye Remedie for my Aile.—For when I 1st became sensible of ye folly of my Suite, I tooke to drynkinge & smoakinge, thinkinge to cure my minde, but all I got was a head ache, for fellow to my Hearte ache.—A sorrie Payre!—I then made Shifte, for a while, withe a Bicycle, but breakinge of Bones mendes no breakinge of Heartes, and 60 myles a Daye bringes me no nearer to a Wèddinge.—This beinge Lowe Sondaye, (wch my Hearte telleth me better than ye Allmanack,) I will goe to Churche; wh. I maye chaunce to see her.—Laste weeke, her Eastre bonnett vastlie pleas'd me, beinge most cunninglie devys'd in ye mode of oure Grandmothers, and verie lyke to a coales Scuttle, of white satine.—

2nd Aprile.

I trust I make no more moane, than is just for a man in my case, but there is small comforte in lookinge at ye backe of a white Satine bonnett for two Houres, and I maye saye as much.—Neither any cheere in Her goinge out of ye Churche, & walkinge downe ye Avenue, with a Puppe by ye name of Williamson.

4th Aprile.

Because a man have a Hatt with a Brimme to it like ye Poope-Decke of a Steam-Shippe, and breeches lyke ye Case of an umbrella, and have loste money on Hindoo, he is not therefore in ye beste Societie.—I made this observation, at ye Clubbe, last nighte, in ye hearinge of Wmson, who made a mightie Pretence, to reade ye Spt of ye Tymes.—I doubte it was scurvie of me, but it did me muche goode.

7th Aprile.

Ye manner of my meetinge with Her and fallinge in Love with Her (for ye two were of one date) is thus—I was made acquainte withe Her on a Wednesdaie, at ye House of Mistresse Varick, ('twas a Reception,) but did not hear Her Name, nor She myne, by reason of ye noise, and of Mrsse Varick having but lately a newe sett of Teethe, of wh. she had not yet gott, as it were, ye just Pitche and accordance.—I sayde to Her that ye Weather was warm for that season of ye yeare.—She made answer She thought I was right, for Mr Williamson had saide ye same thinge to Her not a minute past—I tolde Her She muste not holde it originall or an Invention of Wmson, for ye Speache had beene manie yeares in my Familie.—Answer was made, She wolde be muche bounden to me if I wolde maintaine ye Rightes of my Familie, and lett all others from usinge of my propertie, when perceivinge Her to be of a livelie Witt, I went about to ingage her in converse, if onlie so I mighte looke into Her Eyes, wh. were of a coloure suche as I have never seene before, more like to a Pansie, or some such flower, than anything else I can compair with them.—Shortlie we grew most friendlie, so that She did aske me if I colde keepe a Secrett.—I answering I colde, She saide She was anhungred, having Shopp'd all ye forenoone since Breakfast.—She pray'd me to gett Her some Foode.—What, I ask'd.—She answer'd merrilie, a Beafe-

steake.—I tolde Her y^t^ that *Confection* was not on y^e^ Side-Boarde; but I presentlie brought Her such as there was, & She beinge behinde a Screane, I stoode in y^e^ waie, so y^t^ none mighte see Her, & She did eate and drynke as followeth, to witt —

iij cupps of Bouillon (w^ch^ is a Tea, or Tisane, of Beafe, made verie hott & thinne)
iv Alberte biscuit
ij éclairs
i creame-cake

together with divers small cates & comfeits wh^of^ I know not y^e^ names.

So y^t^ I was grievously afeard for Her Digestion, leste it be over-tax'd. Saide this to Her, however addinge it was my Conceite, y^t^ by some Processe, lyke Alchemie, wh^by^ y^e^ baser metals are transmuted into golde, so y^e^ grosse mortall foode was on Her lippes chang'd to y^e^ fabled Nectar & Ambrosia of y^e^ Gods.—She tolde me 'twas a sillie Speache, yet seam'd not ill-pleas'd withall.—She hath a verie prettie Fashion, or Tricke, of smilinge, when She hath made an end of speakinge, and layinge Her finger upon Her nether Lippe, like as She wolde bid it be stille.—After some more Talke, wh^in^ She show'd that Her Witt was more deepe, and Her minde more seriouslie inclin'd, than I had Thoughte from our first Jestinge, She beinge call'd to go thence, I did see Her mother, whose face I knewe, & was made sensible, y^t^ I had given my Hearte to y^e^ daughter of a House wh. with myne owne had longe been at grievous Feud, for y^e^ folly of oure Auncestres.—Havinge come to wh. heavie momente in my Tale, I have no Patience to write more to-nighte.

22^nd^ Aprile.

I was mynded to write no more in y^s^ journall, for verie Shame's sake, y^t^ I shoude so complayne, lyke a Childe, whose toie is taken f^m^ him, butt (mayhapp for it is nowe y^e^ fulle Moone, & a moste greavous period for them y^t^ are Love-strucke) I am fayne, lyke y^e^ Drunkarde who maye not abstayne f^m^ his cupp, to set me anewe to recordinge of My Dolorous mishapp.—When I sawe Her agayn, She beinge aware of my name, & of y^e^ division betwixt oure Houses, wolde have none of me, butt I wolde nott be putt Off, & made bolde to question Her, why She sholde showe me suche exceed^g^ Coldness.—She answer'd, 'twas wel knowne what Wronge my Grandefather had done Her G.father.—I saide, She confounded me with My G.father—we were nott y^e^ same Persone, he beinge muche my Elder, & besydes Deade.—She w^d^ have it, 'twas no matter for jestinge.—I tolde Her, I wolde be resolv'd, what grete Wronge y^is^ was.—Y^s^ more for to make Speache th^n^ for mine owne advertisem^t^, for I knewe wel y^e^ whole Knaverie, wh. She rehears'd, Howe my G. father had cheated Her G.father of Landes upp y^e^ River, with more, howe my G.father had impounded y^e^ Cattle of Hern.—I made answer, 'twas foolishnesse, in my mynde, for y^e^ iii^d^ Generation to so quarrell over a Parsel of rascallie Landes, y^t^ had long ago beene solde for Taxes, y^t^ as to y^e^ Cowes, I wolde make them goode, & th^r^ Produce & Offspringe, if it tooke y^e^ whole Wash^tn^ Markett.—She however tolde me y^t^ y^e^ Ffrenche familie had y^e^ Where w^al^ to buye what they lack'd in Butter, Beafe & Milke, and likewise in *Veale*, wh. laste I tooke much to Hearte, wh. She seeinge, became more gracious &, on my pleadinge, accorded y^t^ I sholde have y^e^ Privilege to speake with Her when we next met.—Butt neyther then, nor at anie other Tyme th^after^ wolde She suffer me to visitt Her. So I was harde putt to it to compass waies of gettinge to see Her at such Houses as She mighte be att, for Routs or Feasts, or y^e^ lyke.—

But though I sawe Her manie tymes, oure converse was ever of y^is^ Complex^n^, & y^e^ accursed G.Father satt downe, & rose upp with us.—Yet colde I see by Her aspecte, y^t^ I had in some sorte Her favoure, & y^t^ I mislyk'd Her not so gretelie as She w^d^ have me thinke.—So y^t^ one daie, ('twas in Januarie, & verie colde,) I, beinge moste distrackt, saide to Her, I had tho't 'twolde pleasure Her more, to be frends w. a man, who had a knave for a G.father, y^n^ with One who had no G.father att alle, lyke W^mson^ (y^e^ Puppe).—She made answer, I was exceedinge fresshe, or some such matter. She cloath'd her thoughte in phrase more befittinge a Gentlewoman.—Att this I colde no longer contayne myself, but tolde Her roundlie, I lov'd Her, & 'twas my Love made me soe unmannerlie.—And w. y^is^ speache I att y^e^ leaste made an End of my Uncertaintie, for She bade me speake w. Her no more.—I wolde be determin'd, whether I was Naught to Her.—She made Answer She colde not justlie say I was Naught, seeing y^t^ wh^ever^ She mighte bee, I was One too manie.—I saide, 'twas some Comforte, I had even a Place in Her thoughtes, were it onlie in Her disfavour.—She saide, my Solace was indeede grete, if it kept pace with y^e^ measure of Her Disfavour, for, in plain Terms, She hated me, & on Her intreatinge of me to goe, I went.—Y^is^ happ'd att y^e^ house of M^rss^ Varicke, wh. I 1^st^ met Her, who (M^rss^ Varicke) was for staying me,

yt I might eate some Ic'd Cream, butt of a Truth I was chill'd to my Taste allreadie.—Albeit I afterwards tooke to walkinge of ye Streets till near Midnight.—'Twas as I saide before in Januarie & exceedinge colde.

20th Maie.

How wearie is yis dulle procession of ye Yeare! For it irketh my Soule yt eache Monthe shoude come so aptlie after ye Month afore, & Nature looke so Smug, as She had done some grete thinge.—Surelie if she make no Change, she hath work'd no Miracle, for we knowe wel, what we maye look for.—Ye Vine under my Window hath broughte forth Purple Blossoms, as itt hath eache Springe these xii Yeares.—I wolde have had them Redd, or Blue, or I knowe not what Coloure, for I am sicke of likinge of Purple a Dozen Springes in Order.—And wh. moste galls me is yis, I knowe howe yis sadd Rounde will goe on, & Maie give Place to June, & she to July, & onlie my Hearte blossom not nor my Love growe no greener.

2nd June.

I and my Foolishnesse, we laye Awake last night till ye Sunrise gun, wh. was Shott att 4½ o'ck, & wh. beinge hearde in yt stillnesse fm. an Incredible Distance, seem'd lyke as 'twere a Full Stopp, or Period putt to yis Wakinge-Dreminge, what I did turne a newe Leafe in my Counsells, and after much Meditation, have commenc't a newe Chapter, wh. I hope maye leade to a better Conclusion, than them yt came afore.—For I am nowe resolv'd, & havinge begunn wil carry to an Ende, yt if I maie not over-come my Passion, I maye at ye least over-com ye Melancholie, & Spleene, borne yof, & beinge a Lover, be none ye lesse a Man.—To wh. Ende I have come to yis Resolution, to departe fm. ye Towne, & to goe to ye Countrie-House of my Frend, Will Winthrop, who has often intreated me, & has instantlie urg'd, yt I sholde make him a Visitt.—And I take much Shame to myselfe, yt I have not given him yis Satisfaction since he was married, wh. is nowe ii Yeares.—A goode Fellowe, & I minde me a grete Burden to his Frends when he was in Love, in wh. Plight I mockt him, who am nowe, I much feare me, mockt myselfe.

3rd June.

Pack'd my cloathes, beinge Sundaye. Ye better ye Daie, ye better ye Deede.

4th June.

Goe downe to Babylon to-daye.

5th June.

Att Babylon, att ye Cottage of Will Winthrop, wh. is no Cottage, but a grete House, Red, w. Verandahs, & builded in ye Fashn of Her Maiestie Q. Anne.—Found a mightie House-full of People.—Will, his Wife, a verie proper fayre Ladie, who gave me moste gracious Reception, Mrss Smithe, ye ii Gresham girles (knowne as ye Titteringe Twins), Bob White, Virginia Kinge & her Mothr, Clarence Winthrop, & ye whole Alexander Family.—A grete Gatheringe for so earlie in ye Summer.—In ye afternoone play'd Lawne-Tenniss.—Had for Partner one of ye Twinns, agst Clarence Winthrop & ye other Twinn, wh. by beinge Confus'd, I loste iii games.—Was voted a Duffer.—Clarence Winthrop moste unmannerlie merrie.—He call'd me ye Sad-Ey'd Romeo, & lykewise cut down ye Hammocke whin I laye, allso tied up my Cloathes wh. we were att Bath.—He sayde, he Chaw'd them, a moste barbarous worde for a moste barbarous Use.—Wh. we were Boyes, & he did yis thinge, I was wont to trounce him Soundlie, but nowe had to contente Myselfe w. beatinge of him iii games of Billyardes in ye Evg., & w. daringe of him to putt on ye Gloves w. me, for Funne, wh. he mighte not doe, for I coude knocke him colde.

10th June.

Beinge gon to my Roome somewhatt earlie, for I found myselfe of a peevish humour, Clarence came to me, and prayd a few minutes' Speache.—Sayde 'twas Love made him so Rude & Boysterous, he was privilie betroth'd to his Cozen, Angelica Robertes, she whose Father lives at Islipp, & colde not containe Himselfe for Joye.—I sayinge, there was a Breache in ye Familie, he made Answer, 'twas true, her Father & His, beinge Cozens, did hate each other moste heartilie, butt for him he cared not for that, & for Angelica, She gave not a Continentall.—But, sayde I, Your Consideration matters mightie Little, synce ye Governours will not heare to it.—He answered 'twas for that he came to me, I must be his allie, for reason of our olde Friendsp. With that I had no Hearte to heare more, he made so Light of suche a Division as parted me & my Happinesse, but tolde him I was his Frend, wolde serve him when he had Neede of me, & presentlie seeing my Humour, he made excuse to goe, & left me to write downe this, sicke in Mynde, and thinkinge ever of ye Woman who wil not oute of my Thoughtes for any change of Place, neither of employe.—For indeede I doe love Her moste heartilie, so yt my Wordes can not saye it, nor will yis Booke containe it.—So I wil even goe to Sleepe, yt in my Dreames perchaunce my Fancie maye do my Hearte better Service.

12th June.

She is here.—What Spyte is yis of Fate & ye alter'd gods! That I, who mighte nott gett

to see Her when to See was to Hope, muste nowe daylie have Her in my Sighte, stucke lyke a fayre Apple under olde Tantalus his Nose.— Goinge downe to ye Hotell to-daye, for to gett me some Tobackoe, was made aware yt ye Ffrench familie had hyred one of ye Cottages round-abouts.—'Tis a goodlie Dwellinge Without—Woude I coude speake with as much Assurance of ye Innsyde!

13th June.

Goinge downe to ye Hotell againe To-daye, for more Tobackoe, sawe ye accursed name of Wmson on ye Registre.—Went about to a neighbouringe Farm & satt me downe behynd ye Barne, for a ½ an Houre.—Frighted ye Horned Cattle w. talkinge to My Selfe.

15th June.

I wil make an Ende to yis Businesse.—Wil make no longer Staye here.—Sawe Her to-day, driven Home fm. ye Beache, about 4½ of ye After-noone, by Wmson, in his Dogge-Carte, wh. ye Cadde has broughten here.—Wil betake me to ye Boundlesse Weste—Not yt I care aught for ye Boundlesse Weste, butt yt I shal doe wel if haplie I leave my Memourie amg ye Apaches & bringe Home my Scalpe.

16th June.

To Fyre Islande, in Winthrop's Yacht—ye Twinnes w. us, so Titteringe & Choppinge Laughter, yt 'twas worse yn a Flocke of Sandpipers.— Found a grete Concourse of people there, Her amonge them, in a Suite of blue, yt became Her bravelie.— She swimms lyke to a Fishe, butt everie Stroke of Her white Arms (of a lovelie Roundnesse) clefte, as 't were, my Hearte, rather yn ye Water.— She bow'd to me, on goinge into ye Water, w. muche Dignitie, & agayn on Cominge out, but yis Tyme w. lesse Dignitie, by reason of ye Water in Her Cloathes, & Her Haire in Her Eyes.—

17th June.

Was for goinge awaie To-morrowe, butt Clarence cominge againe to my Chamber, & mightilie purswadinge of me, I feare I am comitted to a verie sillie Undertakinge.—For I am promis'd to Help him, secretlie to wedd his Cozen.— He wolde take no Deniall, wolde have it, his Brother car'd Naughte, 'twas but ye Fighte of theyre Fathers, he was bounde it sholde be done, & 'twere best I stoode his Witnesse, who was wel lyked of bothe ye Braunches of ye Family.— So 'twas agree'd, yt I shal stay Home to-morrowe fm. ye Expedition to Fyre Islande, feigning a Head-Ache, (wh. indeede I meante to do, in any Happ, for I cannot see Her againe,) & shall meet him at ye little Churche on ye Southe Roade.— He to drive to Islipp to fetch Angelica, lykewise her Witnesse, who sholde be some One of ye Girles, she hadd not yet made her Choice.— I made yis Condition, it sholde not be either of ye Twinnes.— No, nor Bothe, for that matter.— Inquiringe as to ye Clergyman, he sayde ye Dominie was allreadie Squar'd.

Newe York, ye Buckingham Hotell,
19th June.

I am come to ye laste Entrie I shall ever putt downe in ys Booke, and needes must yt I putt it downe quicklie, for all hath Happ'd in so short a Space, yt my Heade whirles w. thynkinge of it. Ye after-noone of Yesterdaye, I set about Counterfeittinge of a Head-Ache, & so wel did I compasse it, yt I verilie thinke one of ye Twinnes was mynded to Stay Home & nurse me.— All havinge gone off, & Clarence on his waye to Islipp, I sett forth for ye Churche, where arriv'd I founde it emptie, w. ye Door open.—Went in & writh'd on ye hard Benches a ¼ of an Houre, when, hearinge a Sounde, I look'd up & saw standinge in ye Door-waye, Katherine Ffrench.—She seem'd muche astonished, saying You Here! or ye lyke.— I made Answer & sayde yt though my Familie were greate Sinners, yet had they never been Excommunicate by ye Churche.— She sayde, they colde not Putt Out what never was In.—While I was bethynkinge me wh. I mighte answer to yis, she went on, sayinge I must excuse Her, She wolde goe upp in ye Organ-Lofte.— I enquiringe what for? She sayde to practice on ye Organ.—She turn'd verie Redd, of a warm Coloure, as She sayde this.— I ask'd Do you come hither often? She replyinge Yes, I enquir'd how ye Organ lyked Her.— She sayde Right well, when I made question more curiously (for She grew more Redd eache moment) how was ye Action? ye Tone? how manie Stopps? Wht She growinge gretelie Confus'd, I led Her into ye Churche, & show'd Her yt there was no Organ, ye Choire beinge indeede a Band, of i Tuninge-Forke, i Kitt, & i Horse-Fiddle.— At this She fell to Smilinge & Blushinge att one Tyme.— She perceiv'd our Errandes were ye Same, & crav'd Pardon for Her Fibb.— I tolde Her, If She came Thither to be Witness at her Frend's Weddinge, 'twas no greate Fibb, 'twolde indeede be Practice for Her.—This havinge a rude Sound, I added I thankt ye Starrs yt had bro't us Together. She sayde if ye Starrs appoint'd us to meete no oftener yn this Couple shoude be Wedded, She was wel content. This cominge on me lyke a last Buffett of Fate, that She shoude so despitefully intreate

me, I was suddenlie Seized with so Sorrie a Humour, & withal so angrie, yt I colde scarce Containe myselfe, but went & Sat downe neare ye Doore, lookinge out till Clarence shd. come w. his Bride.— Lookinge over my Sholder, I sawe yt She wente fm. Windowe to Windowe within, Pluckinge ye Blossoms fm. ye Vines, & settinge them in her Girdle.—She seem'd most tall and faire, & swete to look uponn, & itt Anger'd me ye More.—Meanwhiles, She discours'd pleasantlie, askinge me manie questions, to the wh. I gave but shorte and churlish answers. She ask'd Did I nott Knowe Angelica Roberts was Her best Frend? How longe had I knowne of ye Betrothal? Did I thinke 'twolde knitt ye House together, & Was it not Sad to see a Familie thus Divided?—I answer'd Her, I wd. not robb a Man of ye precious Righte to Quarrell with his Relations.—And then, with meditatinge on ye goode Lucke of Clarence, & my owne harde Case, I had suche a sudden Rage of peevishnesse yt I knewe scarcelie what I did.—Soe when She ask'd me merrilie why I turn'd my Backe on Her, I made Reply, I had turn'd my Backe on muche Follie.—Wh. was no sooner oute of my Mouthe than I was mightilie Sorrie for it, and turninge aboute, I perceiv'd She was in Teares & weepinge bitterlie. Wht my Hearte wolde holde no More, & I rose upp & tooke Her in my arms & Kiss'd & Comforted Her, She makinge no Denyal, but seeminge gretelie to Neede such Solace, wh. I was not Loathe to give Her.—Whiles we were at This, onlie She had gott to Smilinge, & to sayinge of Things which even yis paper shal not knowe, came in ye Dominie, sayinge, He judg'd We were the Couple he came to Wed.—With him ye Sexton & ye Sexton's Wife.— My swete Kate, alle as rosey as Venus's Nape, was for Denyinge of yis, butt I wolde not have it, & sayde Yes.— She remonstrating w. me, privilie, I tolde Her She must not make me Out a Liar, yt to Deceave ye Man of God were a greavous Sinn, yt I had gott Her nowe, & wd. not lett her Slipp from me, & did soe Talke Her Downe, & w. suche Strengthe of joie, yt allmost before She knewe it, we Stoode upp, & were Wed, w. a Ringe (tho' She Knewe it nott) wh. belong'd to My G.father. (Him yt Cheated Hern.)—

Wh. was no sooner done, than in came Clarence & Angelica, & were Wedded in theyre Turn.—The Clergyman greatelie surprised, but more att ye Largenesse of his Fee.

This Businesse beinge Ended, we fled by ye Trayne of 4½ o'cke, to yis Place, where we wait till ye Bloode of all ye Ffrenches have Tyme to coole downe, for ye wise Mann who meeteth his Mother in Lawe ye 1st tyme, wil meete her when she is Milde.—

And so I close yis Journall, wh., tho' for ye moste Parte 'tis but a peevish Scrawle, hath one Page of Golde, whon I have writt ye laste strange Happ whby I have layd Williamson by ye Heeles & found me ye sweetest Wife yt ever

* * *

stopp'd a man's Mouthe w. kisses for writinge of Her Prayses.

NIGHTS WITH UNCLE REMUS.*

BY JOEL CHANDLER HARRIS,

Author of "Uncle Remus, His Songs and Sayings," "At Teague Poteet's," etc.

XII.

"IN SOME LADY'S GARDEN."

WHEN the little boy next visited Uncle Remus, the old man was engaged in the somewhat tedious operation of making shoe-pegs. Daddy Jack was assorting a bundle of sassafras roots, and Aunt Tempy was transforming a meal-sack into shirts for some of the little negroes—a piece of economy of her own devising. Uncle Remus pretended not to see the child.

"Hit's des lak I tell you all," he remarked, as if renewing a conversation; "I monstus glad dey aint no bad chilluns on dis place fer ter be wadin' in de spring-branch, en flingin' mud on de yuther little chilluns, w'ich de goodness knows dey er nasty 'nuff widout dat. I monstus glad dey aint none er dat kinder young uns 'roun' yer—I is dat."

"Now, Uncle Remus," exclaimed the little boy, in an injured tone, "somebody's been telling you something on me."

The old man pretended to be very much astonished.

"Heyo! whar you bin hidin', honey? Yer 'tis mos' way atter supper en you aint in de bed yit. Well—well—well! Set over ag'in de chimbly jam dar whar you kin dry dem shoes. En de ve'y nex' time w'at I see you wadin' in dat branch, wid de sickly season comin' on, I'm a gwine ter take you 'cross my shoulder en kyar you ter Miss Sally, en ef dat aint do no good, den I'll kyar you ter Mars John, en ef dat aint do no good den I'm done wid you: so dar now!"

The little boy sat silent a long time, listening to the casual talk of Uncle Remus and his guests, and watching the vapor rise from his wet shoes. Presently there was a pause in the talk, and the child said:

"Uncle Remus, have I been too bad to hear a story?"

The old man straightened himself up and pushed his spectacles back on his forehead.

"Now, den, folks, you year w'at he say. Shill we pursue on atter de creeturs? Shill er shant?"

"Bless you' soul, Brer Remus, I mos' 'shame' myse'f, yit I tell you de Lord's trufe, I'm des ez bad atter dem ar tales ez dat chile dar."

"Well, den," said Uncle Remus, "a tale hit is. One time dey wuz a man, en dish yer man he had a gyardin. He had a gyardin, en he had a little gal fer ter min' it. I don't speck dish yer gyardin wuz wide lak Miss Sally gyardin, but hit 'uz lots longer. Hit 'uz so long dat it run down side er de big road, 'cross by de plum thicket, en back up de lane. Dish yer gyardin wuz so nice en long dat it tuck 'n 'trac' de 'tention er Brer Rabbit; but de fence wuz built so close en so high, dat he can't git in nohow he kin fix it."

"Oh, I know about that!" exclaimed the little boy. "The man catches Brother Rabbit and ties him, and the girl lets him aloose to see him dance."

Uncle Remus dropped his chin upon his bosom. He seemed to be humbled.

"Sis Tempy," he said, with a sigh, "you'll hatter come in some time w'en we aint so crowded, en I'll up en tell you 'bout Billy Malone en Miss Janey."

"*That* wasn't the story I heard, Uncle Remus," said the little boy. "*Please* tell me about Billy Malone and Miss Janey."

"Ah-yi!" exclaimed Uncle Remus, with a triumphant smile; "I 'low'd may be I wa'n't losin' de use er my 'membrence, en sho nuff I aint. Now, den, we'll des wuk our way back en start fa'r en squar'. One time dey wuz a man, en dish yer man he had a gyardin en a little gal. De gyardin wuz chock full er truck, en in de mawnin's, w'en de man hatter go off, he call up de little gal, he did, en tell 'er dat she mus' be sho en keep ole Brer Rabbit outer de gyardin. He tell 'er dis eve'y mawnin'; but one mawnin' he tuck en forgit it twell he git ter de front gate, en den he stop en holler back:

"'Oh, Janey! You Janey! Min' w'at I tell you 'bout ole Brer Rabbit. Don't you let 'im git my nice green peas.'

"Little gal, she holler back: 'Yes, daddy.'

"All dis time, Brer Rabbit he 'uz settin' out dar in de bushes dozin'. Yit, w'en he year he name call out so loud, he cock up one year en lissen, en he 'low ter hisse'f dat he bleedz ter outdo Mr. Man. Bimeby, Brer Rabbit, he went 'roun' en come down de big road des ez natchul ez ef he bin trafflin' som'ers. He see de little gal settin' by de gate, en he up'n 'low:

"'Aint dish yer Miss Janey?'

"Little gal say: 'My daddy call me Janey.'" Uncle Remus mimicked the voice and manner of a little girl. He hung his head, looked excessively modest, and spoke in a shrill tone. The effect was so comical that even Daddy Jack seemed to enjoy it.

"'My daddy call me Janey; w'at yo' daddy call you?'

"Brer Rabbit look on de groun', en sorter study lak folks does w'en dey feels bad. Den he look up en 'low:

"'I bin lose my daddy dis many long year, but w'en he 'live he call me Billy Malone.' Den he look at de little gal hard en 'low: 'Well, well, well! I aint seed you sence you 'uz a little bit er baby, en now yer you is mighty nigh a grown 'oman. I pass yo' daddy in de road des now, en he say I mus' come en tell you fer ter gimme a mess er sparrer-grass.'

"Little gal, she fling de gate wide open, en let Mr. Billy Malone git de sparrer-grass.

"Man come back en see whar somebody done bin tromplin' on he gyardin truck, en den he call up de little gal, en up 'n ax 'er who bin dar sence he bin gone; en de little gal, she 'low, she did, dat Mr. Billy Malone bin dar. Man ax who in de name er goodness is Mr. Billy Malone. Little gal 'low hit's des a man w'at say 'er daddy sont 'im fer ter git some sparrer-grass on account er ole acquaintance. Man got his 'spishuns, but he aint say nothin'.

"Nex' day, w'en he start off, he holler en tell de little gal fer ter keep one eye on ole Brer Rabbit en don't let nobody git no mo' sparrer-grass. Brer Rabbit, he settin' off dar in de bushes, en he year w'at de man say, en he see 'im w'en he go off. Bimeby, he sorter run 'roun', ole Brer Rabbit did, en he come hoppin' down de road, twell he git close up by de little gal at de gyardin gate. Brer Rabbit

drapt 'er his biggest bow, en ax 'er how she come on. Den, atter dat, he 'low, he did:

"'I see yo' daddy gwine 'long down de road des now, en he gimme a rakin' down kaze I make 'way wid he sparrer-grass, yit he say dat bein's how I sech a good fr'en' er de fambly I kin come en ax you fer ter gimme a mess er Inglish peas.'

"Little gal, she tuck 'n fling de gate wide open, en ole Brer Rabbit, he march in, he did, en he git de peas in a hurry. Man come back atter w'ile, en he 'low:

"'Who bin tromplin' down my pea-vines?'

"'Mr. Billy Malone, daddy.'

"Man slap he han' on he forrud*; he dunner w'at ter make er all dis. Bimeby, he 'low:

"'W'at kinder lookin' man dish yer Mr. Billy Malone?'

"'Split lip, pop eye, big year, en bob-tail, daddy.'

"Man say he be bless ef he aint gwine ter make de 'quaintance er Mr. Billy Malone; en he went ter wuk, he did, en fix 'im up a box-trap, en he put some goobers in dar, en he tell de little gal nex' time Mr. Billy Malone come fer 'vite 'im in. Nex' mawnin', Man git little ways fum de house en tuck 'n holler back, he did:

"'W'atsumever you does, don't you dast ter let nobody git no mo' sparrer-grass, en don't you let um git no mo' Inglish peas.'

"Little gal holler back: 'No, daddy.'

"Den, atter dat, 'twant long 'fo' yer come Mr. Billy Malone hoppin' 'long down de big road. He drapt a bow, he did, en he 'low:

"'Mawnin', Miss Janey, mawnin'! Met yo' daddy down de big road, en he say dat I can't git no mo' sparrer-grass en green peas, but you k'n gimme some goobers.'

"Little gal, she lead de way, en tell Mr. Billy Malone dar dey is in de box. Mr. Billy Malone, he lick he chops, he did, en 'low:

"'You oughter be monstus glad, honey, dat you got sech a good daddy lak dat.'

"Wid dat, Mr. Billy Malone wink he off eye, en jump in de box."

"W'at I done tell you!" exclaimed Aunt Tempy.

"He jump in de box," continued Uncle Remus, "en dar he wuz, en ef de little gal hadder bin a minnit bigger, I lay she'd 'a' tuck 'n done some mighty tall winkin'.

"Man aint gone fur, en 'twant long 'fo' yer he come back. W'en Brer Rabbit year 'im comin' he bounce 'roun' in dar same ez a flea in a piller-case, but 'taint do no good. Trap done fall, en Brer Rabbit in dar. Man look thro' de slats, en 'low:

"'Dar you is—same ole hoppum-skippum run en jumpum. Youer de ve'y chap I'm atter. I want yo' foot fer ter kyar in my pocket, I want yo' meat fer ter put in de pot, en I want yo' hide fer ter w'ar on my head.'

"Dis make cole chill rush up en down Brer Rabbit backbone, en he git more 'umble dan a town nigger w'at bin kotch out atter nine erclock.* He holler en cry, en cry en holler:

"'Do pray, Mr. Man, tu'n me go! I done 'ceive you dis time, but I aint gwine ter 'ceive you no mo'. Do pray, Mr. Man, tu'n me go des dis little bit er time.'

"Man he aint sayin' nothin'. He look lak he studyin' 'bout sump'n n'er way off yan', en den he take de little gal by de han' en go off todes de house."

"Sholy Brer Rabbit time done come now!" exclaimed Aunt Tempy, in a tone of mingled awe and expectation.

Uncle Remus paid no attention to the interruption, but went right on.

"Hit seem lak dat Brer Rabbit got no mo' luck, kaze de man en de little gal aint good en gone skacely twell yer come Brer Fox a pirootin' 'roun'. Brer Fox year Brer Rabbit hollin', en he up 'n ax w'at de 'casion er sech gwines on right dar in de broad open daylight. Brer Rabbit squall out:

"'Lordy, Brer Fox! you better make 'as'e 'way fum yer, kaze Mr. Man ull ketch you en slap you in dish yer box en make you eat mutton twell you ull des nat'ally bus' right wide open. Run, Brer Fox, run! He bin feedin' me on mutton de whole blessid mawnin', en now he done gone atter mo'. Run, Brer Fox, run!'

"Yit, Brer Fox aint run. He up 'n ax Brer Rabbit how de mutton tas'e.

"'He tas'e mighty good 'long at fus, but nuff's a nuff, en too much is a plenty. Run, Brer Fox, run! He ull ketch you sho!'

"Yit, Brer Fox aint run. He up 'n 'low dat he b'leeve he want some mutton hisse'f, en wid dat he onloose de trap en let Brer Rabbit out, en den he tuck 'n git in dar. Brer Rabbit aint wait fer ter see w'at de upshot gwine ter be, needer—I boun' you he aint. He des tuck 'n gallop off in de woods, en he laff en laff twell he hatter hug a tree fer ter keep fum drappin' on de groun'."

"Well, but what became of Brother Fox?" the little boy asked, after waiting some time for Uncle Remus to proceed.

"Now, den, honey," said the old man, falling back upon his dignity, "hit een about takes all my spar' time fer ter keep up wid you en

*Forehead.

*During slavery, the ringing of the nine o'clock bell in the towns and villages at night was the signal for all negroes to retire to their quarters.

Brer Rabbit, let 'lone keepin' up wid Brer Fox. Ole Brer Rabbit tuck 'n tuck keer hisse'f, en now let Brer Fox take keer hisse'f."

"I say de word!" exclaimed Aunt Tempy.

.XIII.

BROTHER 'POSSUM GETS IN TROUBLE.

WHEN Uncle Remus began his story of Billy Malone and Miss Janey, Daddy Jack sat perfectly quiet. His eyes were shut, and he seemed to be dozing; but, as the story proceeded, he grew more and more restless. Several times he was upon the point of interrupting Uncle Remus, but he restrained himself. He raised his hands to a level with his chin, and beat the ends of his fingers gently together, apparently keeping time to his own thoughts. But his impatience exhausted itself, and when Uncle Remus had concluded, the old African was as quiet as ever. When Brother Fox was left so unceremoniously to his fate, Daddy Jack straightened himself temporarily and said:

"Me yent bin a yerry da tale so. 'E nice, fer true, 'e mek larf come; oona no bin-a yerry um lak me."

"No," said Uncle Remus, with grave affability, "I speck not. One man, one tale; 'n'er man, 'n'er tale. Folks tells um diffunt. I boun' yo' 'way de bes', Brer Jack. Out wid it—en we ull set up yer, en hark at you en laff wid you plum twell de chick'ns crow."

Daddy Jack needed no other invitation. He clasped his knee in his hands and began:

"Dey is bin lif one Màn wut plan' some pea in 'e geerden. 'E plan' some pea, but 'e mek no pea: B'er Rabbit, 'e is fine um. 'E fine um un 'e eat um. Màn mek no pea, B'er Rabbit 'e do 'stroy um so. 'E plan' dem pea; dey do grow, un 'e go off. 'E come bahk; pea no dere. B'er Rabbit teer um up un mek 'e cud wit' dem. So long tam, Màn say 'e gwan ketch um, un 'e no ketch um. Màn go, B'er Rabbit come; Màn come, B'er Rabbit go. Bumbye, Màn, 'e is git so mad, 'e y-eye bin-a come red; 'e crack 'e toof, 'e do cuss. 'E say 'e gwan ketch B'er Rabbit nohow. Dun 'e is bin-a call 'e lilly gal. 'E talk, 'e tell 'im fer let B'er Rabbit troo da geerden gett. Lil gal say yasser. 'E talk, 'e tell 'im wun B'er Rabbit go troo da gett, dun 'e mus' shed da gett, un no le'm come pas' no mo.' Lil gal say yasser.

"Ole Màn is bin-a gone 'bout 'e wuk; lil gal, 'e do lissun. B'er Rabbit, 'e come tippy-toe, tippy-toe; gone in da geerden; eat dem pea tell 'e full up; eat tell he mos' git seeck wit' dem pea. Dun 'e start fer go out; 'e fine da gett shed. 'E shek um, 'e no open; 'e push um, 'e no open; 'e fair grunt, 'e push so hard 'e no open. 'E bin-a call da lil gal; 'e do say:

"'Lil gal, lil gal! cum y-open da gett. 'Tis hu't me feelin' fer fine da gett shed lak dis.'

"Lil gal no talk nuttin'. B'er Rabbit say:

"''Tis-a bin hu't me feelin', lil gal! Come y-open da gett, lil gal, less I teer um loose from da hinch.'

"Lil gal v'ice come bahk. 'E talk:

"'Daddy say mus'n'.'

"B'er Rabbit open 'e mout'. 'E say:

"'See me long sha'p toof? 'E bite you troo un troo!'

"Lil gal skeer; 'e tu'n loose da gett un fly! B'er Rabbit *gone!* Ole Màn come bahk; 'e ahx 'bout B'er Rabbit. Lil gal say:

"''E done gone, daddy. I shed da gett, I hol' um fas'. B'er Rabbit bin show 'e toof; 'e gwan fer bite-a me troo un troo. I git skeer', daddy.' Màn ahx:

"'How 'e gwan fer bite you troo un troo, wun 'e toof fix fer bite grass? B'er Rabbit tell one big tale. 'E no kin bite-a you. Wun 'e come 'g'in, you shed dem gett, you hol'um tight, you no le'm go pas' no mo'.' Lil gal say yasser.

"Nex' day mawnin', Màn go 'long 'bout 'e wuk. Lil gal, 'e play 'roun', un 'e play 'roun'. B'er Rabbit, 'e is come tippy-tippy. 'E fine gett open; 'e slip in da geerden. 'E chaw dem pea, 'e gnyaw dem pea; 'e eat tell dem pea tas'e bad. Dun 'e try fer go out; gett shed fas'. 'E no kin git troo. 'E push, gett no open; 'e keek wit' um fut, gett no open; 'e butt wit' um head, gett no open. Dun 'e holler:

"'Lil gal, lil gal! come y-open da gett. 'E berry bad fer fool wit' ole màn lak me. I no kin hol' me feelin' down wun you is do lak dis. 'E berry bad.'

"Lil gal hol' 'e head down; e' no say nuttin'. B'er Rabbit say:

"'Be shame, lil gal, fer do ole màn lak dis. Me feelin' git wusser. Come y-open de gett 'fo' I is teer um down.'

"Lil gal say: 'Daddy say mus'n'.'

"B'er Rabbit open 'e y-eye wide; 'e is look berry mad. 'E say:

"'See me big y-eye? I pop dis y-eye stret at you, me kill-a you dead. Come y-open da gett 'fo' me y-eye pop.'

"Lil gal skeer for true. 'E loose de gett, 'e fair fly. B'er Rabbit done *gone!* Lil gal daddy come bahk. 'E ahx wey is B'er Rabbit. Lil gal say:

"''E done gone, daddy. I hol' gett fas'; 'e is bin-a 'come berry mad. 'E say he gwan pop 'e y-eye at me, shoot-a me dead.' Màn say:

"'B'er Rabbit tell-a two big tale. How 'e gwan shoot-a you wit' 'e y-eye? 'E y-eye sem lak turrer folks' y-eye. Wun 'e come some mo', you shed dem gett, you hol' um fas'.' Lil gal say yasser.

"Nex' day mawnin', Màn go, B'er Rabbit come. 'E is ma'ch in da gett un eat-a dem pea tell 'e kin eat-a no mo'. 'E sta't out; gett shed. 'E no kin come pas'. 'E shek, 'e push, 'e pull; gett shed. Dun 'e holler:

"'Lil gal, lil gal! come y-open da gett. 'Tis berry bad fer treat you kin lak dis. Come y-open da gett, lil gal. 'Tis full me up wit' sorry wun you do lak dis.'

"Lil gal, 'e no say nuttin'. B'er Rabbit say:

"''E berry bad fer treat you' kin lak dis. Tu'n go da gett, lil gal.' Lil gal say:

"'How you is kin wit' me, B'er Rabbit?'

"'You' gran'daddy foller at' me nuncle wit' 'e dog. Da mek we is kin. Come y-open da gett, lil gal.'"

"Dat ole Rabbit wuz a-talkin', mon!" exclaimed Aunt Tempy, enthusiastically.

"Lil gal no say nuttin' 'tall," Daddy Jack went on, with renewed animation. "Dun B'er Rabbit say:

"'See me long, sha'p toof, lil gal? Me bite-a you troo un troo.' Lil gal say:

"'Me no skeer da toof. 'E bite nuttin' 'tall 'cep' 'e bite grass.' B'er Rabbit say:

"'See me big y-eye? I pop um at you, shoot-a you dead.' Lil gal say:

"'Me no skeer da y-eye. 'E sem lak turrer folks' y-eye.' B'er Rabbit say:

"'Lil gal, you mek me 'come mad. I no lak fer hu't-a me kin. Look at me ho'n! I run you troo un troo.'

"B'er Rabbit lif' 'e two year up; 'e p'int um stret at da lil gal. Lil gal 'come skeer da ho'n; 'e do tu'n go da gett; 'e fly fum dey-dey."

"Well, ef dat don't beat!" exclaimed Aunt Tempy, laughing as heartily as the little boy. "Look at um one way, en Rabbit year does look lak sho 'nuff ho'ns."

"Lil gal tu'n go da gett," Daddy Jack continued; "B'er Rabbit *gone!* Màn come bahk; 'e ahx wey is B'er Rabbit. Lil gal cry; 'e say 'e skeer B'er Rabbit ho'n. Màn say 'e is hab no ho'n. Lil gal is stan' um down 'e see ho'n. Màn say da ho'n is nuttin' 'tall but B'er Rabbit year wut 'e yeddy wit'. 'E tell lil gal nex' tam B'er Rabbit come, 'e mus' shed da gett; 'e mus' run fum dey-dey un leaf um shed. Lil gal say yasser.

"Màn gone, B'er Rabbit come. 'E is go in da gett; 'e eat-a dem pea tell 'e tire'. 'E try fer go pas' da gett; gett shed. 'E call lil gal; lil gal *gone!* 'E call, call, call; lil gal no yeddy. 'E try fer fine crack in da palin': no crack dey. 'E try fer jump over: da palin' too high. 'E 'come skeer; 'e is 'come so skeer, 'e squot 'pun da groun'; 'e shek, 'e shiver.

"Màn come bahk. 'E ahx wey B'er Rabbit. Lil gal say 'e in da geerden. Màn hug lil gal, 'e is lub um so. 'E go in da geerden; 'e fine B'er Rabbit. 'E ketch um—'e ca' um off fer kill um; 'e mad fer true. Lil gal come holler:

"'Daddy, daddy! missus say run dere! 'E wan' you come stret dere!'

"Màn tie B'er Rabbit in da bag; 'e hang um on tree-lim'. 'E say:

"'I gwan come bahk. I l'arn you fer mek cud wit' me green pea.'

"Màn gone fer see 'e missus. Bumbye, B'er 'Possum is bin-a come pas'. 'E look up, 'e ketch glimp' da bag 'pun da lim'. 'E say:

"'Ki! Wut dis is bin-a hang in da bag 'pun da tree-lim'?' B'er Rabbit say:

"'Hush, B'er 'Possum! 'Tis-a me. I bin-a lissen at dem sing in da cloud.'

"B'er 'Possum lissen. 'E say:

"'I no yed dem sing, B'er Rabbit.'

"'Hush, B'er 'Possum! How is I kin yeddy dem sing wun you is mek-a da fuss dey-dey?'

"B'er 'Possum, 'e hol' 'e mout' still, 'cep' 'e do grin. B'er Rabbit say:

"'I yed dem now! I yed dem now! B'er 'Possum, I wish you is yeddy dem sing!'

"B'er 'Possum say 'e mout' water fer yeddy dem sing in da cloud. B'er Rabbit, 'e say 'e is bin-a hab so long tam 'quaintun wit' B'er 'Possum, 'e le'm yeddy dem sing. 'E say:

"'I git fum da bag, I tun-a you in tell you is yeddy dem sing. Dun you is git fum da bag, tell I do come bahk un 'joy mese'f.'

"B'er 'Possum, 'e do clam up da tree; 'e git dem bag, 'e bring um down. 'E tak off da string; 'e tu'n B'er Rabbit go. 'E crawl in un 'e quile up. 'E say:

"'I no yeddy dem sing, B'er Rabbit!'

"'Hi! wait tell da bag git tie, B'er 'Possum. You yed dem soon 'nuff!' 'E wait.

"'I no yeddy dem sing, B'er Rabbit!'

"'Hi! wait tell I clam da tree, B'er 'Possum. You yed dem soon 'nuff!' 'E wait.

"'I no yeddy dem sing, B'er Rabbit!'

"'Wait tell I fix um 'pun da lim', B'er 'Possum. You yed dem soon 'nuff!' 'E wait.

"B'er Rabbit clam down; 'e run 'way fum dey-dey; 'e hide in da bush side. Màn come bahk. 'E see da bag moof. B'er 'Possum say:

"'I no yeddy dem sing. I wait fer yed um sing!'

"Màn tink 'e B'er Rabbit in da bag. 'E say:

"'Ah-yi-ee! I mekky you yed dem sing!'

"Màn tek-a da bag fum da tree-lim'; 'e do slam da bag 'gin da face da ye't'. 'E tek-a 'e walkin'-cane, un 'e do beat B'er 'Possum wut is do um no ha'm tell e' is mos' kill um. Màn tink B'er Rabbit mus' bin dead by dis. 'E look in da bag; 'e 'tretch 'e y-eye big; 'e 'stonish. B'er Rabbit, 'e do come fum da bush side; 'e do holler, 'e do laff. 'E say:

"'You no is ketch-a me! I t'ief you' green pea,—I t'ief um some mo',—I t'ief um tel I dead!'

"Màn, 'e 'come so mad, 'e is fling hatchet at B'er Rabbit un chop off 'e tail."

At this moment Daddy Jack subsided. His head drooped forward, and he was soon in the land of Nod. Uncle Remus sat gazing into the fire-place, as though lost in reflection. Presently, he laughed softly to himself, and said:

"Dat's des 'bout de long en de short un it. Mr. Man clip off Brer Rabbit tail wid de hatchet, en it bleed so free dat Brer Rabbit rush off ter de cotton-patch en put some lint on it, en down ter dis day dat lint mos' de fus t'ing you see w'en Brer Rabbit jump out'n he bed en tell you good-bye."

"But, Uncle Remus, what became of Brother 'Possum?"

Uncle Remus smacked his lips and looked wise.

"Don't talk 'bout Brer 'Possum, honey. Ef dat ar Mr. Man wuz nice folks lak we all is, en I aint 'spute it, he tuck' n tuck B'er 'Possum en bobbycue 'im, en I wish I had a great big piece right now. Dat I does."

XIV.

WHY THE GUINEA-FOWLS ARE SPECKLED.

One night, while the little boy was watching Uncle Remus broil a piece of bacon on the coals, he heard a great commotion among the guinea-fowls. The squawking and *pot-racking* went on at such a rate that the geese awoke and began to scream, and finally the dogs added their various voices to the uproar. Uncle Remus leaned back in his chair and listened.

"I speck may be dat's de patter-rollers gwine by," he said, after awhile. "But you can't put no 'pen'unce in dem ar guinny-hins, kaze dey'll wake up en holler ef dey year deyse'f sno'. Dey'll fool you sho."

"They are mighty funny, anyhow," said the little boy.

"Dat's it!" exclaimed Uncle Remus. "Dey looks quare, en dey does quare. Dey aint do lak no yuther kinder chick'n, en dey aint look lak no yuther kinder chick'n. Yit folks tells me," the old man went on, reflectively, "dat dey er heap mo' kuse lookin' now dan w'at dey use' ter be. I year tell dat dey wuz one time w'en dey wuz all blue, 'stid er havin' all dem ar teenchy little spots on um."

"Well, how did they get to be speckled, Uncle Remus?" asked the little boy, seeing that the old man was disposed to leave the subject and devote his attention to his broiling bacon.

Uncle Remus did not respond at once. He turned his meat over carefully, watched it a little while, and then adroitly transferred it to the cover of a tin bucket, which was made to answer the purpose of a plate. Then he searched about in the embers until he found his ash-cake, and in a little while his supper was ready to be eaten.

"I aint begrudgin' nobody nothin'," said Uncle Remus, measuring the victuals with his eye; "yit I'm monstus glad Brer Jack aint nowhar's 'roun', kaze dey aint no tellin' de gawm dat ole nigger kin eat. He look shaky, en he look dry up, en he aint got no toof, yit w'ence he set hisse'f down whar dey any vittles, he des nat'ally laps hit up. En let 'lone dat, he ull wipe he mouf en look 'roun' des lak he want mo'. Time Miss Sally see dat ole nigger eat one meal er vittles, I boun' you he hatter go back down de country. I aint begrudgin' Brer Jack de vittles," Uncle Remus went on, adopting a more conciliatory tone, "dat I aint, kaze folks is got ter eat; but, gentermens! you be 'stonish' w'en you see Brer Jack 'pesterin' 'long er he dinner."

The little boy sat quiet awhile, and then reminded Uncle Remus of the guinea-fowls.

"Tooby sho, honey, tooby sho! W'at I doin' runnin' on dis a-way 'bout ole Brer Jack? W'at he done ter me? Yer I is gwine on 'bout Brer Jack, en dem ar guinny-hins out dar waitin'. Well, den, one day Sis Cow wuz a-grazin' 'bout in de ole fiel' en lookin' atter her calf. De wedder wuz kinder hot, en de calf, he tuck 'n stan', he did, in he mammy shadder, so he kin keep cool, en so dat one flip un he mammy tail kin keep de flies off 'n bofe un um. Atter w'ile, 'long come a drove er guinnies. De guinnies, dey howdied, en Sis Cow, she howdied, en de guinnies, dey sorter picked 'roun' en sun deyse'f; en Sis Cow, she crap de grass en ax um de news er de neighborhoods. Dey went on dis a-way twell 'twant 'long 'fo' dey year mighty kuse noise out dar t'er side er de old fiel'. De guinnies, dey make great 'miration, des lak dey does deze days, en old Sis Cow fling up 'er head en look all 'roun'. She aint see nothin'.

"Atter w'ile dey year de kuse fuss 'gin, en dey look 'roun', en bless gracious! stan'in,

right dar, 'twix' dem en sundown, wuz a great big lion!"

"A lion, Uncle Remus?" asked the little boy, in amazement.

"Des ez sho ez you er settin' dar, honey,—a great big lion. You better b'leeve dey wuz a monstus flutterment 'mungs de guinnies, en ole Sis Cow, she look mighty skeer'd. De lion love cow-meat mos' better dan he do any yuther kinder meat, en he shake he head en 'low ter hisse'f dat he'll des about ketch ole Sis Cow en eat 'er up, en take en kyar de calf ter he fambly.

"Den he tuck 'n shuck he head, de lion did, en make straight at Sis Cow. De guinnies dey run dis a-way, en dey run t'er way, en dey run all 'roun' en 'roun'; but ole Sis Cow, she des know she got ter stan' 'er groun', en w'en she see de lion makin' todes 'er, she des tuck 'n drapt 'er head down en pawed de dirt. De lion, he crope up, he did, en crope 'roun', watchin' fer good chance fer ter make a jump. He crope 'roun', he did, but no diffunce which a-way he creep, dar wuz ole Sis Cow hawns p'intin' right straight at 'im. Ole Sis Cow, she paw de dirt, she did, en show de white er her eyes, en beller way down in 'er stomach.

"Dey went on dis a-way, dey did, twell bimeby de guinnies, dey see dat Sis Cow aint so mighty skeerd, en den dey 'gun ter take heart. Fus' news you know, one un um sorter drap he wings en fuzzle up de fedders, en run out 'twix' Sis Cow en de lion. W'en he git dar, he sorter dip down, he did, en fling up dirt des lak you see um do in de ash-pile. Den he tuck 'n run back, he did, en time he git back, 'n'er one run out en raise de dus' 'twix' Sis Cow en de lion. Den 'n'er one, he run out en dip down en shoo up de dus'; den 'n'er one run out en dip down, en a 'n'er one, en yit a 'n'er one, twell, bless gracious! time dey all run out en dip down en raise de dus', de lion wuz dat blin' twell he aint kin see he han' befo' 'im. Dis make 'im so mad dat he make a splunge at Sis Cow, en de ole lady, she kotch him on her hawns en got 'im down, en des nat'ally to' he intruls out."

"Did she kill the lion, Uncle Remus?" asked the little boy, incredulously.

"Dat she did—dat she did! Yit 'taint make 'er proud, kaze atter de lion done good en dead, she tuck en call up de guinnies, she did, en she 'low dey bin so quick fer ter he'p 'er out, dat she wanter pay um back. De guinnies, dey say, sezee:

"'Don't bodder 'long er we all, Sis Cow,' sezee. 'You had yo' fun en we all had ourn, en 'ceppin dat ar blood en ha'r on yo' hawn,' sezee, 'dey aint none un us any de wuss off,' sezee.

"But ole Sis Cow, she stan' um down, she did, dat she got ter pay um back, en den atter w'ile she ax um w'at dey lak bes'.

"One un um up en make answer dat w'at dey lak bes', Sis Cow, she can't gi' um. Sis Cow, she up en 'low dat she dunno 'bout dat, en she ax um w'at is it.

"Den de guinnies, dey tuck 'n huddle up, dey did, en hol' er confab wid one er n'er, en w'iles dey er doin' dis, ole Sis Cow, she tuck 'n fetch a long breff, en den she call up 'er cud, en stood dar chawin' on it des lak she aint had no tribalation dat day.

"Bimeby one er de guinnies step out fum de huddlement en make a bow en 'low dat dey all 'ud be mighty proud ef Sis Cow kin fix it some way so dey can't be seed so fur troo de woods, kaze dey look blue in de sun, en dey look blue in de shade, en dey can't hide deyse'f nohow. Sis Cow, she chaw on 'er cud, en shet 'er eyes, en study. She chaw en chaw, en study en study. Bimeby she 'low:

"'Go fetch me a pail!' Guinny-hin laff!

"'Law, Sis Cow! w'at de name er goodness you gwine do wid a pail?'

"'Go fetch me a pail!'

"Guinny-hin, she run'd off, she did, en atter w'ile yer she come trottin' back wid a pail. She sot dat pail down," continued Uncle Remus, in the tone of an eye-witness to the occurrence, "en Sis Cow, she tuck 'er stan' over it, en she let down 'er milk in dar twell she mighty nigh fill de pail full. Den she tuck 'n make dem guinny-hins git in a row, en she dip 'er tail in dat ar pail, en she switch it at de fust un en sprinkle 'er all over wid de milk; en eve'y time she switch 'er tail at um she low:

"'I loves dis un!' Den she 'ud sing:

> "'Oh, Blue go 'way! you shill not stay!
> Oh, Guinny, be Gray, be Gray!'

"She tuck 'n sprinkle de las' one un um, en de guinnies, dey sot in de sun twell dey git dry, en fum dat time out dey got dem little speckles on um."

XV.

BROTHER RABBIT'S LOVE-CHARM.

"Dey wuz one time," said Uncle Remus one night, as they all sat around the wide hearth,—Daddy Jack, Aunt Tempy, and the little boy in their accustomed places,—"Dey wuz one time w'en de t'er creeturs push Brer Rabbit so close dat he tuck up a kinder idee dat may be he wa'nt ez smart ez he mout be, en he study 'bout dis plum twell he git humble ez de nex' man. 'Las' he 'low ter hisse'f dat he better make inquirements——"

"Ki!" exclaimed Daddy Jack, raising both hands and grinning excitedly, "wut tale dis? I bin yerry da tale wun I is bin wean't fum me mammy."

"Well, den, Brer Jack," said Uncle Remus, with instinctive deference to the rules of hospitality, "I speck you des better whirl in yer en spin 'er out. Ef you git 'er mix up anywhars I ull des slip in front er you en ketch holt whar you lef' off."

With that, Daddy Jack proceeded:

"One tam, B'er Rabbit is bin lub one noung leddy."

"Miss Meadows, I speck," suggested Uncle Remus, as the old African paused to rub his chin.

"'E no lub Miss Meadow nuttin' 'tall!" exclaimed Daddy Jack, emphatically. "'E bin lub turrer noung leddy fum dat. 'E is bin lub werry nice noung leddy. 'E lub 'um hard, 'e lub 'um long, un 'e is gwan try fer mek dem noung leddy marry wit' 'im. Noung leddy seem lak 'e no look 'pon B'er Rabbit, un dis is bin-a mek B'er Rabbit feel werry bad all da day long. 'E moof 'way off by 'ese'f; 'e lose 'e fat, un 'e heer is bin-a come out. Bumbye, 'e see one ole Affiky mans wut is bin-a hunt in da fiel' fer root un yerrub fer mek 'e met'cine truck. 'E see um, un he go toze um. Affiky mans open 'e y-eye big; 'e 'stonish'. 'E say:

"'Ki, B'er Rabbit! you' he'lt' is bin-a gone; 'e bin-a gone un lef you. Wut mekky you is look so puny lak dis? Who is bin hu't-a you' feelin'?'

"B'er Rabbit larf wit' dry grins. 'E say:

"'Shoo! I bin got well. Ef you is see me wun I sick fer true, 'twill mekky you heer stan' up, I skeer you so.'

"Affiky mans, 'e mek B'er Rabbit stick out 'e tongue; 'e is count B'er Rabbit pulse. 'E shekky 'e head; 'e do say:

"'Hi, B'er Rabbit! Wut all dis? You is bin ketch-a da gal-fever, un 'e strak in 'pon you' gizzud.'

"Den B'er Rabbit, 'e is tell-a da Affiky mans 'bout dem noung leddy wut no look toze 'im, un da Affiky mans, 'e do say 'e bin know gal sem lak dat, 'e is bin shum befo'. 'E say 'e kin fix all dem noung leddy lak dat. B'er Rabbit, 'e is feel so good, 'e jump up high; 'e is bin crack 'e heel; 'e shekky da Affiky mans by de han'.

"Affiky mans, 'e say B'er Rabbit no kin git da gal 'cep' 'e is mek 'im one cha'm-bag. 'E say 'e mus' git one el'phan' tush, un 'e mus' git one 'gater toof, un 'e mus' git one rice-bud bill. B'er Rabbit werry glad 'bout dis, un 'e hop way fum dey-dey.

"'E hop, 'e run, 'e jump all nex' day night, un bumbye 'e see one great big el'phan' come breakin' 'e way troo da woots. B'er Rabbit, 'e say:

"'Ki! Oona big fer true! I bin-a yeddy talk 'bout dis in me y-own countree. Oona big fer true; too big fer be strong.'

"El'phan' say: 'See dis!'

"'E tek pine tree in 'e snout; 'e pull um by da roots; 'e toss um way off. B'er Rabbit say:

"'Hi! dem tree come 'cause you bin high; 'e no come 'cause you bin strong.'

"El'phan' say: 'See dis!'

"'E rush troo da woots; 'e fair teer um down. B'er Rabbit say:

"'Hoo! dem is bin-a saplin' wey you 'stroy. See da big pine? Oona no kin 'stroy dem.'

"El'phan' say: 'See dis!'

"'E run 'pon da big pine; da big pine is bin too tough. El'phan' tush stick in deer fer true; da big pine hol' um fas'. B'er Rabbit git-a dem tush; 'e fetch um wey da Affiky mans lif. Affiky mans say el'phan' is bin too big fer be sma't. 'E say 'e mus' haf one 'gater toof fer go wit' el'phan' tush.

"B'er Rabbit, 'e do crack 'e heel; 'e do fair fly fum dey-dey. 'E go 'long, 'e go 'long. Bumbye 'e come 'pon 'gater. Da 'sun shiün hot; da 'gater do 'joy' 'ese'f. B'er Rabbit say:

"'Dis road, 'e werry bad; less we mek good one by da crick-side.'

"'Gater lak dat. 'E wek 'ese'f up fum 'e head to 'e tail. Dey sta't fer clean da road. 'Gater, 'e do teer da bush wit' 'e toof; 'e sweep-a da trash way wit' 'e tail. B'er Rabbit, 'e do beat-a da bush down wit' 'e cane. 'E hit lef', 'e hit right; 'e hit up, 'e hit down; 'e hit all 'roun'. 'E hit un 'e hit, tell bumbye 'e hit 'gater in 'e mout' un knock-a da toof out. 'E grab um up; 'e gone fum dey-dey. 'E fetch-a da 'gater toof wey da Affiky mans lif. Affiky mans say:

"'Gater is bin-a got sha'p toof fer true. Go fetch-a me one rice-bud bill.'

"B'er Rabbit gone! 'E go 'long, 'e go 'long, tell 'e see rice-bud swingin' on bush. 'E ahx um kin 'e fly.

"Rice-bud say: 'See dis!'

"'E wissle, 'e sing, 'e shek 'e wing; 'e fly all 'roun' un 'roun'.

"B'er Rabbit say rice-bud kin fly wey da win'. is bin blow, but 'e no kin fly wey no win' blow.

"Rice-bud say, 'Enty?'

"'E wait fer win' stop blowin'; 'e wait, un 'e fly all 'roun' un 'roun'.

"B'er Rabbit say rice-bud yent kin fly in house wey dey no win'.

"Rice-bud say, 'Enty?'

"'E fly in house, 'e fly all 'roun' un 'roun'. B'er Rabbit pull de do' shed; 'e look at dem rice-bud; 'e say, 'Enty!'

"'E ketch dem rice-bud; 'e do git um bill, 'e fetch um wey da Affiky mans lif. Affiky mans say dem rice-bud bill slick fer true. 'E tekky da el'phan' tush, 'e tekky da 'gater toof, 'e tekky da rice-bud bill, he pit um in lil bag; 'e swing dem bag 'pon B'er Rabbit neck. Den B'er Rabbit kin marry dem noung gal. Enty!"

Here Daddy Jack paused and flung a glance of feeble tenderness upon 'Tildy. Uncle Remus smiled contemptuously, seeing which 'Tildy straightened herself, tossed her head, and closed her eyes with an air of indescribable scorn.

"I dunner what Brer Rabbit mout er done," she exclaimed; "but I lay ef dey's any ole nigger man totin' a cunjer-bag in dis neighborhood, he'll git mighty tired un it 'fo' it do 'im any good—I lay dat!"

Daddy Jack chuckled heartily at this, and dropped off to sleep so suddenly that the little boy thought he was playing possum.

XVI.

BROTHER RABBIT SUBMITS TO A TEST.

"UNCLE REMUS," said the child, "do you reckon Brother Rabbit really married the young lady?"

"Bless yo' soul, honey," responded the old man with a sigh, "hit b'long ter Brer Jack fer ter tell you dat. 'Taint none er my tale."

"Wasn't that the tale you started to tell?"

"Who? Me? *Shoo!* I aint 'sputin' but w'at Brer Jack tale des ez purty ez dey er any needs fer, yit 'taint none er my tale."

At this, the little boy laid his hand upon Uncle Remus's knee and waited.

"Now, den," said the old man, with an air of considerable importance, "we er got ter go 'way back behine dish yer yallergater doin's w'at Brer Jack bin mixin' us up wid. 'Ef I makes no mistakes wid my 'membrence, de place wharbouts I lef' off wuz whar Brer Rabbit had so many 'p'intments fer ter keep out de way er de t'er creeturs dat he 'gun ter feel monstus humblyfied. Let um be who dey will, you git folks in a close place ef you wanter see um shed der proudness. Dey beg mo' samer dan a nigger w'en de patter-rollers ketch 'im. Brer Rabbit aint do no beggin', kaze dey aint kotch; yit dey come so nigh it, he 'gun ter feel he weakness.

"W'en Brer Rabbit feel dis a-way, do he set down flat er de groun' en let de t'er creeturs rush up en grab 'im? He mout do it deze days, kaze times done change; but in dem days he des tuck 'n sot up wid hisse'f en study 'bout w'at he gwine do. He study en study, en las' he up 'n tell he ole 'oman, he did, dat he gwine on a journey. Wid dat, ole Miss Rabbit, she tuck 'n fry 'im up a rasher er bacon, en bake 'im a pone er bread. Brer Rabbit tied dis up in a bag en tuck down he walkin' cane en put out."

"Where was he going, Uncle Remus?" asked the little boy.

"Lemme 'lone, honey! Lemme sorter git hit up, like. De trail mighty cole 'long yer, sho; kaze dish yer tale aint come 'cross my min' not sence yo' gran'pa fotch us all out er Ferginny, en dat's a monstus long time ago.

"He put out, Brer Rabbit did, fer ter see ole Mammy-Bammy Big-Money."

"Dat uz dat ole witch-rabbit," remarked Aunt Tempy, complacently.

"Yasser," continued Uncle Remus, "de ve'y same ole creetur w'at I done tell you 'bout we'n Brer Rabbit los' he foot. He put out, he did, en atter so long a time he git dar. He take time fer ter ketch he win', en den he sorter shake hisse'f up en rustle 'roun' in de grass. Bimeby he holler:

"'Mammy-Bammy Big-Money! Oh, Mammy-Bammy Big-Money! I journeyed fur, I journeyed fas'; I glad I foun' de place at las'.'

"Great big black smoke rise up out er de groun', en ole Mammy-Bammy Big-Money 'low:

"'Wharfo', Son Riley Rabbit, Riley? Son Rabbit Riley, wharfo'?'

"Wid dat," continued Uncle Remus, dropping the sing-song tone by means of which he managed to impart a curious dignity and stateliness to the dialogue between Brother Rabbit and Mammy-Bammy Big-Money,—"Wid dat Brer Rabbit up 'n tell 'er, he did, 'bout how he fear'd he losin' the use er he min', kaze he done come ter dat pass dat he aint kin fool de yuther creeturs no mo', en dey push 'im so closte twell 'twont be long 'fo' dey 'll git 'im. De ole witch-rabbit she sot dar, she did, en suck in black smoke en puff it out 'gin, twell yer can't see nothin 'tall but 'er great big eyeballs en 'er great big years. Atter w'ile she 'low:

"'Dar sets a squer'l in dat tree, Son Riley; go fetch dat squer'l straight ter me, Son Riley Rabbit, Riley.'

"Brer Rabbit sorter study, en den he 'low, he did:

"'I aint got much sense lef', yit ef I can't coax dat chap down from dar, den hit's kaze I done got some zeeze w'ich it make me fibble in de min',' sezee.

"Wid dat, Brer Rabbit tuck 'n empty de provender out 'n he bag en got 'im two rocks, en put de bag over he head en sot down

und' de tree whar de squer'l is. He wait little w'ile, en den he hit de rocks tergedder—*blip!*

"Squer'l, he holler, 'Hey!'

"Brer Rabbit wait little, en den he tuck 'n slap de rocks tergedder—*blap!*

"Squer'l he run down de tree little bit en holler, 'Heyo!'

"Brer Rabbit aint sayin' nothin'. He des pop de rocks togedder—*blop!*

"Squer'l, he come down little furder, he did, en holler, 'Who dat?'

"'Biggidy Dicky Big-Bag!'

"'What you doin' in dar?'

"'Crackin' hick'y nuts.'

"'Kin I crack some?'

"'Tooby sho, Miss Bunny Bushtail; come git in de bag.'

"Miss Bunny Bushtail hang back," continued Uncle Remus, chuckling; "but de long en de short un it wuz dat she got in de bag, en Brer Rabbit he tuck 'n kyar'd 'er ter ole Mammy-Bammy Big-Money. De ole witch-rabbit, she tuck 'n tu'n de squer'l 'a-loose, en 'low:

"'Dar lies a snake in 'mungs' de grass, Son Riley; go fetch 'im yer, en be right fas', Son Riley Rabbit, Riley.'

"Brer Rabbit look 'roun', en sho 'nuff dar lay de bigges' kinder rattlesnake, all quile up ready fer business. Brer Rabbit scratch he year wid he behine leg, en study. Look lak he gwine git in trouble. Yit atter w'ile he go off in de bushes, he did, en cut 'im a young grape-vine, en he fix 'im a slip-knot. Den he come back. Snake 'periently look lak he sleep. Brer Rabbit ax 'im how he come on. Snake aint say nothin', but he quile up little tighter, en he tongue run out lak it bin had grease on it. Mouf shot, yit de tongue slick out en slick back 'fo' a sheep kin shake he tail. Brer Rabbit, he 'low, he did:

"'Law, Mr. Snake, I mighty glad I come 'cross you,' sezee. 'Me en ole Jedge B'ar bin havin' a turrible 'spute 'bout how long you is. We bofe 'gree dat you look mighty purty w'en you er layin' stretch out full lenk in de sun; but Jedge B'ar, he 'low you aint but th'ee foot long, en I stood 'im down dat you 'uz four foot long ef not mo',' sezee. 'En de talk got so hot dat I come mighty nigh hittin' 'im a clip wid my walkin'-cane, en ef I had I boun' dey'd er bin some bellerin' done roun' dar,' sezee.

"Snake aint say nothin', but he look mo' complassy* dan w'at he bin lookin'.

"'I up 'n tole ole Jedge B'ar,' sez Brer Rabbit, sezee, 'dat de nex' time I run 'cross you I gwine take 'n medjer you; en goodness knows I mighty glad I struck up wid you, kaze now dey wont be no mo' 'casion fer any 'sputin' 'twix' me en Jedge B'ar,' sezee.

"Den Brer Rabbit ax Mr. Snake ef he wont be so good ez ter onquile hisse'f. Snake he feel mighty proud, he did, en he stretch out fer all he wuff. Brer Rabbit, he medjer, he did, en 'low:

"'Dar one foot fer Jedge B'ar; dar two foot fer Jedge B'ar; dar th'ee foot fer Jedge B'ar; en, bless goodness, dar four foot fer Jedge B'ar, des lak I say!'

"By dat time Brer Rabbit done got ter snake head, en des ez de las' wud drop out 'n he mouf, he slip de loop 'roun' snake neck, en den he had 'im good en fas'. He tuck 'n drag 'im, he did, up ter whar de ole witch-rabbit settin' at; but w'en he git dar, Mammy-Bammy Big-Money done make 'er disappearance, but he year sump'n way off yander, en seem lak it say:

"'Ef you git any mo' sense, Son Riley, you'll be de ruination ev de whole settlement, Son Riley Rabbit, Riley.'

"Den Brer Rabbit drag de snake 'long home, en stew 'im down en rub wid de grease fer ter make 'im mo' soopler in de lim's. Bless yo' soul, honey! Brer Rabbit mout 'er bin kinder fibble in de legs, but he want no ways cripple und' de hat." †

*A mixture of "complacent" and "placid." Accent on the second syllable.

†A version of this story makes Brother Rabbit capture a swarm of bees. Mr. W. O. Toggle, of Georgia, who has made an exhaustive study of the mythology of the Creek Indians, has discovered a variant of the legend. The Rabbit (Chufee) becomes alarmed because he has nothing but the nimbleness of his feet to take him out of harm's way. He goes to his Creator and begs that greater intelligence be bestowed upon him. Thereupon the snake test is applied, as in the negro story, and the Rabbit also catches a swarm of gnats. He is then told that he has as much intelligence as there is any need for, and he goes away satisfied.

(END OF THE SERIES.)

TOPICS OF THE TIME.

The Temperance Outlook.

THERE is no question, whether of morals or economics, now agitating the public mind, of more importance than the treatment of intemperance. The statistics of some of our prisons show that seven-eighths of their inmates reached their wretched condition through drunkenness. The withdrawal of such a multitude from active industry, the pauperism directly entailed upon thousands, the insecurity of property, and the heavy tax upon the community for their support and for the support of the machinery that seizes and disposes of them, give us the economic side of the giant evil; while the moral side, infinitely more sad and appalling, is represented in the rending asunder of families, the multiplication of criminals, and the disintegration and degradation of society. These facts are patent to all observers, and there is a very general demand for action against this formidable enemy. For many years philanthropists have met and sounded the alarm, and sporadic efforts have been made, mostly of a missionary and persuasive sort, to mitigate the evil. There had been in almost all the States laws regulating the sale of alcoholic liquors with a view to prevent excesses, but these laws had all proved to be dead letters, and nowhere was the evil checked except where small communities became virtually their own police and throttled it. The State of Maine was, we believe, the first State which attempted to sweep the curse from its entire area by an act of legislation, and hence "the Maine law" has become a significant term in general use. Maine not only enacted its law, but has firmly kept it on the statute-book, while elsewhere like action has been afterward annulled. After many years, two more States, Kansas and Iowa, have not only followed Maine's example, but have gone beyond the pattern — having inserted a clause in the State constitution forbidding the sale of alcoholic liquors as a beverage. And now this style of action against the enemy is prominently suggested as the panacea for the whole land. In many States parties are formed, or forming, for the insertion of such a constitutional amendment in the State fundamental law, and a large number of active minds are busy with the agitation for a like insertion in the national constitution. Will these efforts prove successful? We mean, will they, if successful in gaining the proximate end of constitutional prohibition, be successful in the ultimate object of destroying the rum monster? It is an invidious thing to find fault with a movement whose aim is the noblest and whose spirit is the purest. It is easy and natural to count such a fault-finder as an enemy to the truth, as an ally of the special foe, as seeking adroitly to weaken the progress of reform. And yet conscientious men must do that invidious thing, when they see that a reform, with however noble a purpose, is riding over the clearest principles of right and actually preparing the way for the utter failure of the noble purpose. Reformers should not, in reforming on their line, open other lines of error that shall need reform. It is unwise treatment to cure a chill by producing a fever.

The prime objection to a constitutional amendment on the subject of temperance is that it is wholly unnecessary. Law, as enacted by a legislature, would be just as efficacious. A people will obey a statute just as soon as an article in the fundamental law. Again, a constitution is not the place for such specific applications of principle, but for the general principle itself. If the constitution says that the legislature shall have power to make all laws necessary to the peace and welfare of the community, and then lays down certain principles which limit this grant of power, it has done all a constitution should do. Anything further destroys its character as a constitution. If one detailed law is to be inserted, why not a thousand? If a law against the sale of ardent spirits, why not a law against an equal evil, the prostitution of women? Why not a law against gambling, which slays its thousands annually? Making the constitution a statute-book is to mar its character and influence and to confound things that differ. Such an action must have a reaction. The people will some time see what an error they have made, and when these laws are wiped off the constitution, their prestige will suffer. That which has influence must never be apparently degraded. If so, the influence is gone, or at least modified. To exalt, therefore, a law and put it into the constitution, when afterward it must be removed from its false position, is really to degrade that law. This degradation of the prohibitory law we shall inevitably see in those States which now so eagerly lift it into the constitution. Such a righteous restoration of the law to its own place will be claimed (falsely, and yet effectively) by the rum interest as a victory for them.

But there is another error in this movement, which so greatly involves principle that consciences must speak out. The movement makes no discrimination between things that differ. Fermented wine differs as widely from distilled rum or whisky as coffee differs from opium, and yet this prohibitory movement ties them up in the same bundle and puts the one label on the whole! Human reason revolts at such arbitrary dealing. There is a broad and deep common sense throughout the community, which, without conscious reasoning, rejects all this and will render all attempts of the kind futile in the end. It may be quiet for a time while a wild, panic-like fury impels the reformers, but it will assert itself as surely as water will seek and find its level. Men will not believe that a glass of wine at the dinner-table and a glass of whisky at the bar are the same thing, any more than they will believe that a cup of coffee at the dinner-table and a whiff of opium at Ah-Ching's are the same thing. Men will not believe that a glass of wine is the beginning of drunkenness, although they have heard it asserted *ad nauseam* all their lives. Men will not believe that the fermented

juice of the grape from Nature's own process is to be classed with the results of manufacture through man's alembics. Men will not believe that the universal praise of wine by every people in all ages, including the sacred writers of the Holy Scriptures, is an error and a sin. One of the chief reasons of the ill success of the temperance movements of past years is this failure to discriminate, and by carrying this plan into the present effort the temperance leaders are showing that they learn nothing from the past. The improvement among educated people in the drinking customs of society is due, not to any of these extreme total abstinence movements, but to the general growth of sensible temperance; and yet these fanatical people claim it all as *their* triumph, and so go on in their most mistaken policy. The total abstinence movement has always been a hinderance to true temperance reform, by setting sensible people against all proper effort to help reform on account of the absurd complexion the reform has assumed. The vast numbers in the United States who would have fought as splendid soldiers for temperance have remained comparatively idle all these years, through fear of being identified with the extremists who had usurped the title of Temperance men. All this loss is rightfully laid at the door of the Total Abstinence propaganda. That the temperance question should be made a political question is most desirable. No question more vitally concerns the whole country with respect to its highest welfare. We should have temperance men in office and temperance laws enacted. But temperance must be temperance. It must be a sensible and practical scheme that sensible and practical men will support which shall bring about the desired reformation. It must be a scheme which the great majority of moral men will recognize to be sound in its logic and even in its justice. Anything else than this may, under pressure of an excitement, achieve a temporary success, but only this will be a permanent cure of the rampant abomination. The liquor men are now more defiant and more numerous, in proportion to the population, than in any former period. They work their criminal mills openly in the face of all, and we see the streams of vice and crime pouring forth from these sources to lay waste the community and overwhelm the dikes which philanthropy has erected. The courts, the police, and the public officers generally, seeing the bold mien of these disturbers of the peace, find it easier for their weak natures to humor them and to connive at their wicked works than to oppose them. The great majority of the community are thus oppressed and tyrannized over by this minority, who laugh at law and hound the defenders of law. The only end of this enormity will be in the *union of the majority*, and this can never be effected by extreme measures or fanatical pronunciamentos. Discrimination between liquors that are hurtful and those that are (in moderate use) healthful; discrimination between modes of drinking, as treating and drinking at meals; discrimination between places for drinking only and places for lunch or dinner; discrimination between drinking on the premises where the liquor is sold and drinking it at home; discrimination between day and night in the sale,—these and other like discriminations are to be made in place of the sweeping demands of the ultra men if a union of temperance forces is to be consummated. Without this union the evil must go on propagating itself daily, and on the so-called temperance leaders must rest the blame. They have constituted an unreasonable shibboleth. When they abandon that the enemy will be conquered, unless meanwhile the enemy shall have conquered all the ground and made our land a moral desert. Admirable laws, exactly suited to diminish the curse and destroy the political power of the rum interest, have been introduced into the New York Legislature, and would have been enacted but for the solid vote against them of the so-called temperance members, directed by their "Temperance" constituency at home. This class of reformers will have their zeal intensified by the action of Kansas and Iowa, and they may carry a few more of the States. Would to God their success were really success, that the rum interest were stricken to the heart by it! But not until the reaction takes place, and these men are convinced of their error and are ready to build on truth and not on impulse, can we expect that union of all good elements which will finally dig the grave of Rum and bury him beyond all resurrection.

The Reticence of American Politicians.

ONE of the most singular facts in American politics to-day is the reluctance of party leaders to discuss the public questions of the time. To whatever cause this reluctance is due, the fact itself is too well known to require proof, being constantly apparent in the conduct of our public men without distinction of party. In reading the speeches and debates in Congress, for instance, we rarely find in them a firm grasp of the subject in hand, or anything beyond an attempt to humor some interest, class, or section, or to advance the personal fortunes of the speakers. So also in addressing the people, it is seldom that a politician of either party handles a subject of living interest with the ability and ease of a master, while some of the most important questions are habitually passed over with as little notice as possible.

Take, for instance, the subject of administrative reform. This has been more widely discussed among the people than any other reformatory measure of the time; yet very few of our public officers, administrative or legislative, have contributed anything toward the reform, either by advocating it before the people or by devising methods for putting it into practice. On the subject of the tariff, again, many members of Congress seem to be all at sea, their treatment of it indicating either great ignorance of the subject or great timidity in acting out their convictions. On the question of inter-state commerce and the government of corporations, which bids fair to become the leading issue in American politics, our public men have nothing to say; and the same is true as to nearly every question that now interests the public mind.

Such conduct on the part of the people's representatives can hardly be paralleled in any other country where free government exists. It is the business of leaders to lead; and in all free countries the people look to the leaders of parties to formulate public opinion and prepare the issues of the time. In England, the discussion of all important questions, pending and prospective, is recognized as one of the most essential

functions of a member of Parliament, and particularly of those who hold the leading positions in the councils of parties; and the leaders are not at all backward in discharging this duty, but use every available opportunity to set forth their views and every suitable means to bring over the public to their way of thinking. So also in France, Germany, and Italy, the leaders of parties are men of positive views, and frank and earnest in their advocacy; so that the opposite characteristic in our own politicians is as clearly anomalous as it is out of harmony with the principles of popular government.

Why it is that our public men are thus non-committal on pending questions it is not easy to see. If their reserve is due to the fear of losing their popularity and their influence among the people, they are making a great mistake; for a man of strong convictions and a mind of his own is far more respected by his fellow-citizens than one who waits to find out what the people think before taking his own position. The American people are not tyrants, neither are they a mob, but a body of men of more or less intelligence and interest in political questions, and desirous of hearing these questions treated in all their aspects. Of course, when it comes to action, the people expect their representatives to carry out their views and enact such laws as the popular conscience approves; and if a man has been so unfortunate as to place himself on the wrong side, he must expect, in the end, to be defeated. We do not forget that, according to our present practice, a representative must be a resident of the district from which he is chosen, and that this is, to some extent, a bar to the free expression of his individual views. But this practice is the result of custom merely, and is not required by the national constitution, which recognizes States only, and not districts; and there is little doubt that a man of ability and popular gifts could easily break through the custom, and thus obtain ample freedom in the choice of a constituency. We admit, however, that so long as the practice continues it must, in some cases, hamper the action of men seeking legislative office.

Again: it is possible that some men refrain from expressing their opinions freely for fear of placing themselves in antagonism to the dominant sentiment of their party. Party action being essential to the conduct of a free government, a man who wishes to take part in practical politics must act with some party, and this he cannot do unless he agrees in the main with the party's principles. But our national parties at the present time can hardly be said to have any principles, since neither has yet taken a definite position on any leading question; and so long as this is the case no public man ought to hesitate to express his personal convictions. Such expression is, in fact, essential even for party purposes; for the policy of a party must be determined by the dominant sentiment of its members, and what that sentiment is can be ascertained only by a free interchange of views.

Moreover, a wide latitude of opinion is allowable within the limits of party—is indeed inevitable, if the party contains men of ideas, for such men will not sink their convictions at the bidding of party managers. Nor is a party's usefulness at all impaired by such diversity of views, provided its members agree on certain general principles of action. The Liberal party of England, for instance, contains men of all shades of opinion, from aristocratic Whiggism to democratic Radicalism; yet it is the strongest and most efficient political party in the world, as the history of its achievements during the past fifty years abundantly proves. No public man, then, is justified in hesitating to express his own convictions for fear of alienating himself from his party.

We suspect, however, that in some cases our politicians refrain from expressing themselves on pending questions because they have not studied them enough to understand them, so that they really have no settled convictions with regard to them. The old Southern question so overshadowed all others for a whole generation that most men in public life gave their attention exclusively to that, to the neglect of the commercial and financial questions that have now come to the front. And now that the Southern question is forever settled, the men that were brought up under its shadow are not sufficiently familiar with the new questions to deal with them understandingly; for these questions are not only different from the old one, but of a different kind, so that a preparation for the public life of twenty years ago is by no means a preparation for the public life of to-day.

But whatever may be the reason for the reticence of our public men and their reluctance to express their personal views, the fact itself is not creditable to them, while it is surely an injury to the public welfare. It is the duty of party leaders and men in official position to organize the people for effective political work, and this they cannot do without a full discussion of public questions and the free expression of individual views. And we repeat our conviction that leaders who will take this course, and utter their own opinions without fear or favor, will gain rather than lose in public estimation; and, what is far more important, they will do much to elevate American public life above the low level of commonplace on which it has so long moved.

"College-Bred" Statesmen.

SOME remarks in these columns on "The Outlook for Statesmen in America" (THE CENTURY for June) have been taken as unwarrantably prejudiced in favor of "college-bred" statesmen. That article was partly intended as a defense of "college-bred" men in politics, as against the supposed popular preference for "self-made" men. We used the latter term without definition and in its popular and exterior sense. We did not suppose it necessary to explain that we really think it of no consequence whatever who is a man's maker, in the secular sense, so long as the man is well made. Schools and colleges generally afford the shortest cut to learning and culture; and if any "self-made" man gets learning and culture without school or college, he will be apt to tell you that he has wasted a good part of his life, and has missed accomplishing much that he meant to accomplish for lack of the proper tools.

We are well aware of the fact that there are many men who get learning at college without culture, and that there are many men outside of the colleges who have, with comparatively little accurate learning, a great deal of valuable culture. Besides, there are many "universities" which have no academic foundation whatever, and which people do not generally think of

as institutions of learning. We heard an eminent university president say the other day, that it was idle to call Horace Greeley, for instance, a self-made, *i. e.*, an uneducated man, for he was educated in the great university of the city of New York,—not the institution of that name on Washington Square, but the metropolis itself, with all its thousand influences of culture.

There are a good many "college-bred" men in our present Congress, but not a few of these seem to have gained very little of true culture in their college studies, and count in Congress among the uneducated, prejudiced, immoral, or mentally feeble; while some of the ablest and most influential men at the capital are without any college diploma,—though not, of course, without the advantages of schools and of study. What we say is, that politics under the spoils system does not tend to bring into public life the really well educated and thoughtful men of the country,—who, under present circumstances, as a rule, prefer other professions to that of government. We believe, however, for reasons given in the former editorial, that the prospect has recently improved for the influx into political life of a more thoroughly trained class of politicians and legislators; and we believe that our schools and colleges ought to, and will, give more and more of the training which is especially useful in public life as well as in all practical affairs. The recent extraordinary confession and exhortation of Charles Francis Adams, Jr., at Harvard (no matter how one-sided his comments on Greek may be regarded), will help to make our institutions of learning see their duty in this respect more clearly than ever.

OPEN LETTERS.

New York as a Field for Fiction.

Now that the great literary symposium on the novel has resolved itself into a general experience-meeting, perhaps the man-in-the-corner-under-the-gallery has a right to make his voice heard in the way of modest suggestion.

My text will be found in "The House of a Merchant Prince," by W. H. Bishop, pp. 1 to 420. (Boston: Houghton, Mifflin & Co.) It is a somewhat ungracious thing to complain of good work that it is not better; but that is exactly what I wish to do. And I choose Mr. Bishop's book because it is the latest, and in some ways the strongest book of a class against which I think I have good grounds of complaint — rather as a reader than as a critic. Its bold sub-title, "A Novel of New York," may fairly be held to imply that its author means to draw us a picture of social life in New York. Now, my point is that he has drawn his picture, not from life, but from a well-worn and conventional model. And if I can make my point in such space as you can afford to give me, I may have some hopes of getting that model sent out of the literary workshop, and of inducing the literary artist to go out among living folk to study character and color — and elsewhere than at the dinner-table or the five-o'clock tea. My crusade is against the model, and in behalf of the artist.

Mr. Bishop gives us a plot which, were his method more dramatic,—less purely narrative,—would be of startling force and interest. As it is, the story is strong and natural. This is much to be thankful for, in a day when the æsthetic elect frown on the telling of a story in picture, poem, or novel, and snub the laymen of the Philistine public who believe that, while Cinderella lasts in her meek youth and beauty, a plain tale will find readers, and that "Little Bo Peep," in its pastoral simplicity and its purely Greek trust in the omnipotence of Fate, gives guarantee that the narrative poem hath some hold on immortality.

But a story is a narration of the doings and sayings of men and women, and it seems to me that Mr. Bishop has intrusted the acting out of his history mainly to mere figures representative of certain classes of men and women. He takes the typical merchant prince, the self-made and self-reliant man; his wife, the typical weak and indulgent mother and ambitious woman of the world; his daughter, the typical spoiled child of wealth and superficial culture; her lovers, the typical patrician noodle and the typical handsome, selfish, undisciplined young parvenu. These are all types, not individuals; they all talk alike, and they all talk too well; they have no dramatic verisimilitude in them; they do not live. They are well described; but we believe in them so long as Mr. Bishop is telling us of them, and no longer.

Yet he has been at the minutest pains to reproduce every detail of their manners and their belongings and their looks. He even goes so far as to inform us that his impetuous young lover, at an important crisis of his life, passed "a cambric handkerchief over his forehead," thereby removing any fears of his readers that the youth's plebeian extraction might have been shown unpleasantly in the use of the humble yet strangely ostentatious bandanna. And, apart from such excesses as this, the work is singularly conscientious and accurate. Nothing has escaped this keen observer's eye — nothing save the vital essence that is all the difference between the conventional figure and the creation of character.

Did this spring from the author's incapacity, it would not be worth the protest I am making. But it is done with deliberate intent. Mr. Bishop has accepted that weary old saying, "There is nothing in New York society to write about"; and, finding that, notwithstanding the people clamor for a novel of New York society, he takes up this old model that has seen so much service, dresses it for a dance and for a dinner and for a walk down "the avenue," and with its aid gives us a picture of New York life as unreal as the lithographed revels on the lid of a bonbon box.

Where the book does not treat of "society," it is written on a different plan. With a sharp eye for

what an artist might call social and intellectual "values," the author sketches the picturesque differences between the hurrying rout that roars up Broadway when night calls her brief truce in life's war of labor, and that calm and pleasing procession that loiters, gracious and fair to look upon, along Fifth Avenue on a mild spring Sunday. His clerks and other plain folk at the shop and in the boarding-house are natural people. The old Irishman, who appears for five minutes on Harvey's Terrace, McFadd, who was "knowin' to it," is a positive bit of character. We can go home with him, and fancy for ourselves how he looks and talks, and what he thinks, after he has left the scene. So with the two young lovers. Mr. Bishop believes in them, and makes us believe in them. Bainbridge is genuine, and a very pleasant fellow to know. Ottilie is only a commonplace girl; but she is just as charming and lovable as many other commonplace girls that we know. Between these two are delightful and delicate episodes of love; and it is not often that they drop into an unpleasant habit, affected by their "society" companions, of writing out their talk—as, for instance, where Ottilie, telling her betrothed of her uncle's business troubles in 1861, says: "Under the influence of the imminent prospect of war, the prices of commodities were advancing almost from moment to moment. Small dealers everywhere were desirous to buy, to realize the further rise themselves." For surely these phrases never came impromptu from between the red lips of even the precisest and best informed of Vassar's daughters—unless, it may be, she had just been reading "Norman Leslie" or "Vassall Morton," of which fine old curiosities of American literature I don't believe the dear girl had ever heard. Yes, they are most agreeable company, these young people; but when they leave us for a chapter, on comes "society" again, a phantasmal parade, with dinners and dog-carts, napery and drapery.

But is not this indeed society, you ask? Does not society "entertain," and dress, and drive? Is it not ambitious, showy, luxurious?

Oh, yes, society is all that, and does all these things; but any society that is worth writing about is a great deal more, and does many other things. You cannot tell all about people from their occupations. That is wherein people differ from machines. Silas Marner was a weaver; but we know something more of him than that "his hand satisfied itself with throwing the shuttle, and his eye with seeing the little squares in the cloth complete themselves under his effort." Major Pendennis was a "club man"; yet Thackeray introduces us not only into the privacy of his club, but into the intimacy of his very soul—or whatever you please to call it. Giboyer was one of a thousand Bohemians; but he was *one*, a very distinct individuality, not merely a bunching together of the salient characteristics of the other nine hundred and ninety-nine.

But may we find such a field for character-study in New York as Thackeray found in London and Augier in Paris? Must we not import our character, like our fashions, and our dressing-cases, and our wine?

Why?

This city was a well-to-do Dutch colony. It was strengthened by a forced infusion of English blood. Later, it became the home of many political refugees from France, and it drew to itself, in time, some part of the Huguenot colony in Westchester. It grew to maturity in provincial conservatism. Suddenly, within the span of a man's life, it has become the sole receiving port of a marvelously great immigration, the commercial and financial center of the nation, and one of the largest and richest cities of the world. This, it seems to me, is a promising place to look for social phenomena, if only in the clash of the old and the new, and the general struggle to fix standards of society.

Go down to Trinity, whose chimes, heard most clearly by brief-hungry young lawyers and shabby speculators in the skyward stories of tall office buildings, call the unheeding living where Wall street's whirlpool sucks in the tide of Broadway, and bewail the dust-eaten dead within the peaceful pale below. Note the elaborate monuments carved with honored names, and the simple brown stones beneath which lie plain so-and-so, "tallow-chandler, and his beloved wife." This was the fashionable quarter of the city when the century was young—

> "In days when Bleecker street was *rus*,
> And Murray Hill as is to us
> Champlain—Au Sable; when this fuss
> And fret were quiet;
> When ladies yet might think it queer
> To date in '18—'; when all here,
> In brief, was 'up-town'; in the year,
> Say, '08 * * *"

—in the days when citizen Morris, of the United States, gave Louis Philippe, destined to become king of the French, a pair of boots to help him on his way to Canandaigua. (And right grateful was that "king in exile," then and thereafter.) Here we may read a record of the simple social system of that time. Try to trace, to-day, the classes then so clearly defined. And yet it is but two or three generations since then—a couple of turns of the kaleidoscope.

Is this harking back too far? Go up to the Latin quarter of New York, between Fourth and Thirteenth streets and Sixth and Second avenues. Go into any street and pick out the family mansion that was once the pride of the block. It is now a cheap lodging-house. Clinched with nails are the great mahogany folding-doors that in the old years were never closed between room and room. In the parlor tinkles and crashes a cheap grand piano, where once stood Gertrude's inlaid Broadwood—the little spinet-like affair over which her lover leaned when she played—the Battle of Prague, was it? Upstairs is her own room, where she stood, now white and now red, in that awful five minutes before they called her down to be wed, while her mother strained her to her heart in convulsive embraces, and then held her off at arm's length, lest a tear should fall on the snowy satin. There is a young couple to-night in the room that was so dainty then, that is so shabby now. A young couple from England it is. They sit hand in hand before the unhome-like anthracite fire. They are having a hard time of it, waiting for the business men of New York to awake to a sense of their own needs and march in a procession to beg for the services of that able and highly recommended young graduate of Cambridge, who has come to make his fortune in a new country, where, of course, skilled labor is at a premium. She is trying to cheer him up, as young

wives will. Their time will come, she tells him— "for I'm sure there's nothing they can do here that *you* couldn't do, dear." In the next room sit two young Bohemians, smoking bad cigarettes, discussing the best places to get cheap dinners and the best places to sell great poems, incidentally settling questions of art and literature that have bothered the world these many years, and casting glances of not ungenerous calculation at the ever-lessening amber beer in the cracked pitcher between them. It would not much disturb their stout and hopeful young spirits if they knew that in that very chamber the first master of the house once on a time lay dead. Nay, I think they would only write poems about it, could they fancy him stretched out there, a day's growth of gray beard on his stern old chin, pointing at the ceiling from out the folds of the white handkerchief, all the strangeness and distance of death setting the familiar face apart from the household heart.

For Gertrude and her young bridegroom we must perhaps look in Greenwood. But where are their children? Down or up in the world? Their gentlehood crushed out of them by that poverty which is the destruction of the poor, or leading the dance of youth and love in some grander, newer home far uptown? For such changes there are in this city, of which some novelists will have it that it has no more interesting social life than is shown in a report of Mrs. Blank's kettledrum or Mrs. Dash's theater party, or than we may study in the columns of the "Society Journal" or the "Upholsterers' Weekly Chippendale."

To me it has always seemed that there is one class in New York that sits guard over a past full of romance and quaint color. This is what I suppose must be called, conventionally, the Knickerbocker class— not those uncommonly proud Vans and Vanders who stalk loftily through Mr. Augustin Daly's American vaudevilles from the German, but the agreeable relics of the simple provincial society of two generations ago. A class not unthrifty, not extravagant, yet not well fitted to make or to hoard money, they live in a golden mean of comfort, perhaps even in an atmosphere of mild luxury, on the borders of the world of fashion. They know little of Kensington stitch or of Eastern-woven portières: their parlors are upholstered in damask and their bedrooms in chintz. They are outdazzled by the glare and glitter with which the newer folk of vaster fortunes surround themselves. Living mostly upon the rentals of shops and warehouses built upon what were once their country-places, they draw year by year more closely to themselves, forming a sort of little Faubourg St. Germain, a colony of their own, among a faster-going people who respect them and despise their surroundings. It is a colony of rheumatic old beaux and faded old belles; where young faces are rare, and To-day somehow seems half Yesterday.

This is the world which interested Mr. Henry James when he wrote "Washington Square." But Mr. James had but a mild æsthetic sympathy with it; and, in fact, his Washington Square might as well have been the smokiest of sparrow-haunted London parks as that fair old spot that was once the Potter's Field, and then the Parade Ground, and where, for many years, old Pop Willis (a brother of the poet, and he was proud of it) ruled, majestic and many-buttoned, over nurse-maids and grass-plot-invading children.

Truly, it were but a dull life to chronicle now, but it had its youth. You may listen to some gracious and garrulous old lady, with hair in puffs whiter than her widow's cap, purring over her reminiscences, until fancy begins to mimic memory, and to vivify for you some few hours of the dead days, and you almost believe that you yourself were at that fine party in Chambers street, where they had tea and cakes for the ladies, and sherry,— no, sherry-wine, if you please, —and where the gentlemen wrote verses in their hostess's album. And you may see the gentle old gossip, a bright-eyed girl, with brown hair done up in a knot *à la Grecque* high on her pretty nape; you may see her tie her fleecy hood under her chin, when ten o'clock strikes, and set out with mammá and papá — no "mommer" and "popper" then, the gods be thanked! — for her home in Greenwich Village or Chelsea, to lay her innocent head upon her pillow and blush in her dreams with thinking of that young man whose hair was curly, whose cheeks were red, whose black satin stock could not dim the glory of the Newgate collar, which the old people thought rakish and scarcely Christian.

And the young man? Well, you may fancy him sitting with his host and a few choice companions over a bowl of punch, and issuing forth into the lonely street what time the watchman cried "Twelve o'clock, and all's well!"— there to join in a baritone chorus of:

> "Says I, 'Fair maid, where are you going,
> *All* a-blowing,
> All on a day so fine?'
> Says she, 'I'm going to the Bricklayers' Arms.
> Says I, 'Oh, come to mine!'"

— until Mr. Jacob Hays warned them to cease.

A very ungentlemanly performance, you think. So it was. But it occurs to me that I have heard some young gentlemen from Columbia College do pretty much the same thing of winter nights, only the hour was three instead of twelve, and they sang "The Babies on our Block."

But the readers of the present demand a novel of the present? So be it. Let the deodorized American Zola go down into the old Ninth Ward any Sunday, and watch the solid burgesses heading their family processions churchward, as staidly as though they had not been in their youth, every man of them, members of the volunteer fire department, and had not broken the laws of God and the heads of their fellow-men whenever they got a chance.

This is the true bourgeois class of New York, made up of eminently respectable, commonplace, well-to-do, narrow-minded men and women, among whom, of course, there must be, here and there, a few young hearts fluttering with nobler ambitions, a few finer natures yearning for a finer and higher life. Let this deodorized Zola record the fortunes of some Greenwich Dorothy, whose ideas of life were something too delicate for her plain-going elders, who "loved, may be, perfume, soft textures, lace, a half-lit room" — some

> "Poor child—with heart the downiest nest
> Of warmest instincts unconfest,
> Soft, callow things that vaguely felt
> The breeze caress, the sunlight melt,
> But yet, by some obscure decree,
> Unwinged from birth."

Let him record the history of one such, "far too subtly graced" for her surroundings, who, more lucky than her sisters, found a way to a wider, livelier, and more cultured world; and let him tell us what breath of her own she brought into its hot-house atmosphere.

Or who will write us a tale of the New England invaders? New York was a good place for trade; Boston was not. But New Yorkers were a poor lot at trading, and Bostonians had business at their finger-tips. So thousands to whom the ungrateful soil of New England would not give subsistence came hither and made money out of the very stones of New York. They had the largest share in building up the new city north of Fourteenth street, and to this day many of them hold together in a solid phalanx, with one wing there and the other resting on Lenox, Massachusetts. They take all the London reviews, and they believe in the higher culture. They are liberal in religion, and intensely protectionistic in political economy. They were the right arm of loyalty in New York during the late war, and they have never quite got over it — like a certain estimable family, of whom a bored friend once remarked that their grandfather had signed the Declaration of Independence, and they had all been signing it ever since. Contrast this class, which represents what the British would call "progressive conservatism," with the restless, rootless Western element, full of a wild love of magnificence and the luxury of display, full of a hearty bear-a-hand hospitality toward new men and new ideas indiscriminately. What Romeo-and-Juliet dramas may not be enacted between a house in one and a house in the other of these two sets! Let us hear of the loves of Priscilla Hoskins and Calaveras Gashwiler, Jr.

Paris may be Paris, London may be London, Berlin may be Berlin; but every country of the civilized world has had its influence on the social life of New York. Even the troubles of the last French empire troubled us. For that mad whirlwind of shameless and senseless gayety that danced and fluttered along before the deadly leaden deluge of war and revolution, sent a hot puff over to these shores, and blew hither a host of fortuneless and fortune-hunting French aristocrats — and, moreover, alas! blew homeward many American butterflies whose wings had lost their bloom in Louis Napoleon's court. These people, finding themselves unwelcome in this clearer and purer air, settled down together and held a carnival among themselves for a little while, and then their carnival ended in a choice collection of domestic tragedies, most of which were wasted on the newspaper reporter, who measures the interest of a divorce case with a column-rule.

The limitations of space kindly help to cover up my inability to write a condensed gazetteer of New York society. I strive only to show that — if I may allow myself a glittering metaphor — we have here, in one firmament, a number of stellar systems, where one star differeth from another in glory, but where all are very particular about being considered glorious; where color, size, luster, age, is variously esteemed the prime qualification of a good star; where orbits often impinge awkwardly on other orbits; where the planet of one system drops into a mere asteroid in another; and where lights wax and wane and flare and flicker and come and go as in no group lit by the sun of an older civilization.* Or, to put it more simply, I strive to show that here is a field worthy of the same conscientious, earnest, investigating, analytical study that the best English novelists have expended on another, — larger, no doubt, yet scarcely so rich in sharply differentiated products; for class distinction in England has been reduced almost to one of the actual sciences, and, thanks to a well-arranged schedule of social rank, you may, without injustice, clap its appropriate label on almost any British growth, from duke down to navvy.

The field is clear. I do not deny that there are many who have explored it, and successfully to some extent; but I have not yet found the man who has entered it with a full appreciation of its multiform richness, to do work that will live; and I regret to say that no one seems inclined to try the experiment. Mr. Cable has discovered his own city, and has already overpaid the debt that the discoverer owes the world. Mr. Howells and Mr. Lathrop find their account in Boston. Mr. Julian Hawthorne has his duties to his ideal and ennobling hero. Mr. James devotes himself to settling international complications of taste and affection. Mrs. Burnett smiles now exclusively on Thespis.

The novelist of New York will find no competition. Yet none the less will he have, when he comes, a welcome and plenty of work to his hand; for if the mere journalist whose range of vision is bounded by his office walls may see this much, how much more is to be found by the man who has served his apprenticeship to fiction, who has the eye to study and the hand to write!

I cast my hint upon the waters. I hope somebody will fish it out in whose care it will thrive.

H. C. Bunner.

* Dr. J. W. Francis, who certainly should have known whereof he spake, said in 1857, in his address before the New York Historical Society:

"New York is the most cosmopolitan of modern cities; hence, in a great measure, its ineffective municipal government, its rowdyism, its perpetual demolition, its spasmodic and versatile phenomena, its advantages and its nuisances, its dangers and its blessings as a place of abode; larger opportunities with greater risks, more liberality of sentiment with less rectitude of principle, more work and more dissipation, higher achievement and deeper recklessness; in a word, more obvious and actual extremes of fortune, character, violence, philanthropy, indifference and zeal, taste and vulgarity, isolation and gregariousness, business and pleasure, vice and piety. Wherever there is more in quantity, there is a corresponding latitude in quality. Enterprise hath here an everlasting carnival; fashion is often rampant; financial crises sweep away fortunes; reputations are made and lost with magical facility; friends come and go; life and death, toil and amusement, worth and folly, truth and error, poetry and matter of fact alternate with more than dramatic celerity."

["Old New York," p. 377.]

The Woman's Christian Temperance Union.

EDITOR OF THE CENTURY.

SIR: I thank you for this opportunity to present a subject of transcendent interest and importance.

The Woman's Christian Temperance Union is the lineal descendant of the woman's crusade of 1874, whose first "praying band" was led from the Presbyterian church of Hillsboro' by Mrs. Thompson, daughter of Governor Trimble. It is, in fact, "the sober second thought" of that marvelous uprising by means of which woman uttered her protest against the

forgetfulness and the neglect as the result of which home has lacked protection from the dram shop. The "praying bands," earnest, impetuous, inspired, have become the woman's Christian temperance unions,—firm, patient, and persevering. Thirty States are already organized, and three thousand local auxiliaries, dotting the continent, fulfill the Bible injunction, "Make a chain, for the cities are full of blood and the land of violence." Our methods of work are quiet, practical, and systematic. We have learned by the argument of defeat and the logic of events what not to do, as well as some things to attempt. The evolution of our activities has been from the individual to the home, thence to society, and finally to the Government itself.

The W. C. T. U. stands as the exponent, not alone of that return to physical sanity which will follow the downfall of the drink habit, but also of the reign of a religion of the body, which shall correlate with Christ's wholesome, practical, yet blessedly spiritual religion of the soul. "The kingdom of Heaven is within you" shall have a new significance to the clear-eyed, steady-limbed Christians of the future, from whose brain, blood, and brawn the taint of alcohol and nicotine has been eliminated by ages of pure habits and noble heredity. "The body is the temple of the Holy Ghost" will not then seem so mystical a statement, nor one indicative of a temple so insalubrious as now. "He that destroyeth this temple, him shall God destroy" will be seen to involve no element of vengeance, but to be, instead, the declaration of such boundless love and pity for our race as would not suffer its deterioration to reach the point of absolute failure and irremediable loss. The women of this land have never had such training as our "Topical Studies" furnish, in the laws by which childhood shall set out upon its endless journey with a priceless heritage of powers laid up in store by the tender, sacred foresight of those by whom the young immortal's being was evoked. The laws of health were never studied by so many mothers, or with such immediate results for good on their own lives and those of their children. The deformed waist and foot of the average fashionable woman never seemed so hideous and wicked, nor the cumbrous dress of the period so unendurable, as now, when, from studying one "poison habit," our minds, by the inevitable laws of thought, reach out to wider researches and more varied deductions than we had dreamed of at first. The economies of a simpler style of living never looked so feasible as to home-makers who have learned something about the priceless value of time and money for the purposes of a Christ-like benevolence. The value of a trained intellect never had such significance as since we have learned what an incalculable advantage results from a direct style; what value resides in the power to classify facts; what boundless resources for illustrating and enforcing truth come as the sequel of a well-stored memory and a cultivated imagination. The puerility of mere talk for talk's sake; the unworthiness of "idle words" and vacuous, purposeless gossip; the waste of long and aimless letter-writing, never looked so egregious as to our workers, who find each day too short for the glorious and gracious deeds waiting for them on every hand.

Frances E. Willard.

The Massachusetts Experiment in Education.

THE conventional school, with its book-lessons and recitations, is familiar to all; but the new public school, with its realistic methods, its entertaining sessions devoted apparently more to talking than recitation, more to amusement than drudgery, is unknown as yet except to the fortunate children of a few towns. We recently visited a model primary school-room in eastern Massachusetts, and, sitting down among the little children, tried to see the system pursued there from the little one's point of view.

It is a plain room, with windows on two sides. In the sunny windows are blossoming plants, and on the walls above the dado-like blackboard are pretty pictures, stuffed birds, and crayon sketches of plants and animals, shells, and curious things from fields and woods. The boys and girls enter the room together, and take their seats behind their little desks, on which are slates and pencils,—nothing more. The teacher comes, a smiling woman with flowers in her hand. She advances to the front of the two-score children, and begins to sing. They all sing: "This is the way we wash our slates, wash our slates, so early in the morning. This is the way we wipe our slates, wipe our slates, so early in the morning." Some of the older girls bring little pails of water, and each child dips a sponge in the water and washes the slate as they sing.

"Pussy Willow's class," says the teacher, "may copy the red words; Tommy Thorndike's class may take the green words; and Jenny's class may take the white words."

These words are already written in colored crayons on the blackboard. Three rows of the children take their slates and begin to copy the colored words,—a happy device for teaching to write and "to tell colors."

"Sophy May's class," resumes the teacher, "may come to the blackboard, and the babies may make a fence and a gate with the sticks."

One of the girls places a handful of large shoe-pegs on the desk of each of the youngest children, and several of the children come to the teacher's desk and stand before the blackboard. They are invited to tell what the teacher holds in her hand. Every hand is raised with almost frantic eagerness. They know what that is. "What is it, Johnny?" "A cat." "Can you tell me a story about it?" Every hand is up. "Well, Katy?" "I see a cat." "Good, now look at this on the board." She writes in script "cat." "What is that?" Not a hand is raised, though every eye is intently studying the unfamiliar letters. "What is this?" says the teacher, rapidly making a sketch of the cat. They all see that. "Now [pointing to the word] what does this stand for?" Two hands are up. "Freddy?" "A cat." "Oh, no. Mary?" "Cat." "Right! Now I will add our old friend," and with this the article is prefixed to the word. "Now Freddy is right—'a cat.' Who can find another?" With this, the word "cat" is written a number of times on different parts of the board, and the children eagerly hunt it up.

The sentence, "I see a cat," is written on the board. That puzzles the children. One has it; another, and another. "Mary?" "I have a cat." "No. Sophy?" "I see a cat." The word "see" is wholly new to the

class, and they get at it from the context, and have its appearance fixed in the mind by association. "Now you may copy this on your slates. Good-bye." This dismisses the class, and they return to their seats to write and rewrite the two new words whose sound, meaning, and aspect they have just learned. The pronoun and the article they learned before; so that now they join them to new words, and study spelling, language, and writing at the same time.

At first sight, there appears no special novelty in this lesson. Other teachers have used objects as a basis of instruction. The thing to be observed is this: These children do not know their letters. They do not study the alphabet at all. The aim is far wider than mere learning to read. First, the child's interest must be won by the sight of some familiar object. Secondly, the word is a substitute for the picture. The child is not told anything. He must arrive at things through his own thinking. There is no reward or punishment, no head or foot of the class. Each one must tell a story; that is, he must say something, make a complete sentence, and not use detached words. Lastly, and perhaps the most important of all, the young scholar must be happy in his pursuit of knowledge, because that which is happily learned is remembered.

The youngest class in numbers is now called up to a large table, on which are scattered a number of wooden blocks, such as are used for toys. The six little men and women have learned already five numerals. They can count five, but no more. To-day they are to learn five more numbers. Again the same merry session, the same stories told, language, expression, grammar, and numbers, all taught at once. Each child has ten blocks, and the game begins. The teacher leads the sport.

"I have five blocks, two and two and one. Now I hold one more. How many are there now?" Half the hands are up. "Well, Teddy?" "Seven," says Ted, with enthusiasm. "How many think Teddy is right? None. Well, Kitty, tell us about it." "I have five blocks, and I add one and have six." "Six what?" "Six blocks." "How many noses have we around the table? Well, Tommy?" "Eight." "No; we will not count company. Tell me something about it." "I see seven noses." "Now we'll all go to sleep." Every head is bent down while the teacher quickly removes two of the six blocks. "We wake up and find something." Every eye is intently studying the blocks. "Tell us about it, Jenny." "There were six blocks, and two have been taken away." "How many are left, Teddy?" "There are four blocks left."

With exhaustless patience, good humor, and ingenuity, the lesson proceeds, every problem being performed with the blocks, and every fact fixed in the mind by a statement made by the child. If bad grammar is used, it is quietly corrected without a word of explanation. The habit of right speaking is the only aim.

By this time the school is becoming weary. They have all worked hard for fifteen minutes. It is time for a change. The class is dismissed, and the teacher begins to sing. It is a merry song about the rain and the snow, and all join with the greatest interest, because at the end, when the snow falls and covers the ground, there are mock snow-balls to be picked up from the floor and tossed all over the room in a jolly riot of fun. Everybody feels better and ready for work again.

The teacher writes a series of simple sums in addition on the board, and the whole school watch her with the keenest interest. Now for a grand competition in language, grammar, arithmetic, and imagination. As soon as the figures are set forth a dozen hands are up. "Well, Lizzy?" Lizzy rises and says: "I was walking in the fields, and I met two butterflies, and then I saw two more, and that made four butterflies." "Good." The answer is put under the sum, and another child is called. "I had seven red roses, and a man gave me three white roses, and then I had ten roses." By this time the school has caught the spirit of the game. Forty hands are up, trying in almost frantic eagerness for a chance to bowl over one of the sums and tell a story. Whispering is plenty. One by one the sums are answered and the quaint stories told. Then all the upper figures of the sums are removed, and the lesson is changed to subtraction. Again the stories. "I had four red apples, and I gave two away, and then I had two apples," etc. Nearly every one mentioned the color of the object described. The children plainly observed color in everything. They took their subjects from out-of-doors, as if all their thoughts were of the woods, the fields, and the street. The most striking feature of the lesson is the intense eagerness to tell something, the alertness, the free play to the imagination of the pupils, and the absence of formality and anything like a task or recitation. It is practically an exercise in imagination, grammar, language, expression, and arithmetic.

Then follows another song. The slates of those who have been writing are examined, and even the babies who were playing with the shoe-pegs are commended for their work. They are not strictly learners. They are like little fellows put in a boy's choir, not to sing, but to sit among singers in an atmosphere of study.

A class in reading is then called up. Each child has a book, and reads a sentence in turn. The manner of reading is peculiar. The pupil first reads the entire sentence over to herself in silence, and then, looking up from the book, speaks it in a natural manner, as if talking to the teacher. The lesson is a story, aptly illustrated by a good picture, and the children not only understand what they read, but enjoy it. This done, they turn back to a story they had read before. Now the exercise is to read the story, a paragraph at a time, in their own words, to practice expression, and to prove that they understand what they read. Next, a new story is taken, and the class gives its attention not to the text, but to the picture. "Can any one tell me something about this picture?" There is an intense study over the book for a moment, and then the hands go up. "I see a dog." "I see a crane." "The crane is standing on one foot." "The dog is a pug." "Tell us something about the dog." "The dog has four legs." "He has two ears." "The crane has wings." "The crane is a bird." "The dog is an animal." "The pug looks very cross. Perhaps he is going to bark at the crane." All these statements are given in breathless eagerness, as if each child were anxious to add something to the sum of human knowledge, and not one of them is over seven years of age.

Another class is called. They form a line before

the blackboard, and the teacher says: "Who can tell me something? Well, Susie?" "I have a red apple in my pocket." The teacher writes this on the board, and before it is half written the hands are up and there is a ripple of laughter through the class. Teacher has made a mistake. "Where is it, Tommy?" "You made a small i at the beginning." "Right. Another story." "It is a cloudy day." This is written: "It's a cloudy Day." The hands go up again. "Where is it, Jane?" "The capital D is wrong." The hands are still up, eagerly thrust right in the teacher's face, in a sort of passionate anxiety to get the chance to explain the error. "She said it *is*, and not *it's*." "Right." Still the hands are up. "The dot has been left out." "Good. Any more mistakes?" Not a hand is raised, though the eyes scan the letters again to see if there be nothing more. They crowd close up to the blackboard, and watch every word as it is written with unflagging interest.

To vary the lesson, a sentence is written on the board containing two words the children have never seen. They swarm, like bees around a plate of honey, standing close up to the strange words, even touching each letter with tiny fingers, and silently trying to spell them out by the sound of the letters. One child tries and fails, plainly showing that nearly all the sentence is understood, but the new words are not wholly mastered. Another tries and gets it right, and is rewarded by dismissal to her seat. Other sentences and new words are tried, and there is a lively competition to read them. No one speaks the new words alone, but each reads the whole sentence in an intelligent manner, as if it were grasped as a whole. As fast as the right answer is given, the pupils return to their seats till all have answered.

The first class in simple fractions then comes up. It is studying the deep science of wholes and halves, quarters and eighths. The first step is really to see a whole divided into eight parts, and then to study a diagram on the board. The class gather around a low table, and each is given a lump of clay. Each one pats his lump down to a square pancake on the table. The object now is to enable each child to see visible quantities by size and weight and the effect of division. The cake of clay is divided into two equal parts, and these again divided, and the portions compared by size and weight. Each experiment with the clay is made the basis of an example of fractions, and must be explained in words. The addition of fractions is studied in the same way. One child's cake is divided into eight parts, and four are taken away and half a cake added from another cake. The children see the one half and the four eighths put together to form one whole, and they speak of it as a real fact, and not as an unmeaning formula read in a book. On the blackboard they draw in white chalk four bands of equal size. Then each is divided by a red line and subdivided by green lines. The pupil sees, by tracing the colors through each band, the exact relation of whole, halves, and quarters.

With all the lessons that have been described there is at frequent intervals a story or some exercise to change the current of the thoughts. Not all these lessons can be seen in one day or in one school. They are only typical lessons as seen by the writer in different primary schools in Boston, Dedham, and Quincy.

If there is any one thing over which the children of the United States have shed floods of useless tears, it is the "Tables of Weights and Measures" in the ancient arithmetics. Here is a new set of miserables just come to the edge of these horrid tables. Shall they go on in the old unhappy way, trying to say "two pints make one quart," or shall they see the things, and, half in sport, learn the easy lesson? After the lesson they can glibly recite the table, because they have seen what it means.

Here are the tin and wooden measures, with a pail of water and a bushel of bran, ranged on the table before the class. The teacher holds up the smallest tin measure and asks what it is. Some say it is a quart, others a pint. After some delay it is decided to be a gill. "Can any one spell it or write it on the board?" This is done, and the next step is to experiment with the measure. One of the girls fills it with water and makes a statement about it: "I have one gill of water." Having obtained a unit of measure, the next is taken, and the pint is considered by filling it with water by means of the gill measure, and counting the number of gills required to fill it. For dry measure, the bran is used instead of water.

This class are from nine to twelve years old. They are in the upper primary classes, and have spent two or three years already at school. It might be thought that they would not care for such a method of instruction. It does not so appear. There is the same alertness of attention, the same eagerness to tell a story or to express themselves, as in the youngest children, with perhaps a little less playfulness and more gravity.

A class in geography is studying the shape, surface, and general features of the continent of Australia. One of the class is appointed to act as its scribe, and write out the facts as learned. The pupils are supposed to have read their books, and are now up for examination. On a table before the class is a pile of brown molding sand. The first step is to spell the name Australia. This, it may be remarked, is the constant practice—to spell all the important words of the lesson as it proceeds, the correct spelling being at the same time written on the board by the scribe. The study of the shape of Australia, its surface, mountain ranges, and plains, is performed entirely with the molding sand. Each pupil volunteers a fact concerning the matter, and illustrates it in the heap of sand. First, the general outline, then the capes, bays, etc., then the mountain ranges, plains, etc. If any one makes a mistake, either in describing the thing or in arranging the sand, there is a vote taken to see if the majority of the class can correct the error. By the end of the lesson, a complete relief map has been constructed in sand on the table. Every subject in geography, the divisions of land and water, etc., that can be shown by a plan or map, is illustrated on the table, in the sand or with modeling clay. The child is not told to read in a book that "an island is a portion of land entirely surrounded by water." These children are given a lump of clay, and instructed to make an island of clay on the table, and then to cover the top of the table (it is really a shallow tank) with water, to show that the island is really surrounded by water. In some schools the table is painted blue to represent the water, and the brown sand aptly indicates the land.

As with the weights and measures, so the measures of length are studied by means of a tape stretched along the wall. Upon this tape the pupils measure off the foot, the yard, the rod. Each child is provided with a foot-rule as part of his school apparatus, and it is frequently used in the various lessons. The study of the rod and yard grows out of this, and they get what no one who merely learns by rote that "twelve inches make one foot, three feet make one yard," etc., ever can get,—an exact and real idea of the yard and rod. From this tape the teacher readily brings out a lesson in numbers. For instance, she writes on the board: "If I paid $9.00 for eighteen feet of land, how much did three yards cost?" The pupils see the foot and yard plainly marked off on the tape. They have a realizing sense of the comparative lengths, and this assists the mental process required to solve the question. In fact, all arithmetical problems can be taught by the blocks, the wet and dry measures, the rules and tapes, without once referring to a book. In point of fact, it does not appear advisable to use books at all, but to study numbers from objects, or by means of the board or stories of imaginary transactions from real life. The study of numbers is confined to the first four rules, simple fractions, and perhaps interest. This carries the pupil about half way through the grammar school, and it covers all that is required in ordinary business transactions. The tables, addition, multiplication, weights, etc., are in time all learned, but they are placed last and not first. I heard a teacher recite rapidly a series of sums in this way: "I had six apples, I took one away, added five, divided by two, squared them, gave away five, lost one, sold two, bought ten and ten and five and four and three, and lost seven, and divided them all with Kate and Jenny and Tommy and Jack and Ned. How many did they have, and how many were left?" For about thirty seconds there was a pause, and then one called out that he had it, and then another and another, till all said they had solved the problem. Perhaps a whole minute elapsed, and then, on calling on one scholar for the answer, it was put to the vote of the school whether or not the answer was right. While there may be nothing specially novel in this method of teaching, this point must be observed: These children had been wholly instructed by the new methods. They were probably weak on the "tables," or in the mere parrot-like recitation of formulas, yet they displayed a degree of quickness, a readiness of memory, comprehension, and reasoning, that was remarkable. With shorter questions involving, say, two sums in one rapidly spoken sentence, the answers came in a volley from the class the instant the sentence was finished, showing that the mental processes had been just as rapid as the spoken words.

It is said that the majority of public school children leave school when about half way through the grammar school. The question is, Does this objective teaching fit or unfit the boy for his probable position in life? Is this the best schooling for the poor man's child? Without venturing our final opinion, it may be observed that the aims of the system are in the right direction, and that all the aims are more or less thoroughly accomplished. First of all, the child must be happy. He must be at ease and pleased with his work, or little will be learned, and the training will be slight. The child has senses through which he receives all he can know, and makes known the thought that is in him. His senses must be trained by use; hence the games, the blocks, the colors, the music, pictures, and real objects. Imagination is perhaps the most valuable mental quality given to human beings: it must be cultivated continually, that the mind may work quickly and surely. This is the aim of the continual story-telling, the imaginary sums, and the use of pictures. The studies are very limited, because reading, writing, and arithmetic are the tools with which the work of the world is performed. These are enough for the boy or girl who must leave school before the grammar term is over. If he has these, the world of work and learning is all before him. It has been said that the boy taken from these schools and made an entry clerk will be a failure, because, while he is quick of observation, lively of imagination, and learned in a thousand things of the fields, the woods, and the sea, his business is to take the numbers from bales and boxes correctly. This is all that is required, and all the rest is useless. This may be true in a certain sense. Let us wait twenty years and see where the boy will be. Will he be still an entry clerk, or a merchant? In mechanical trades there is a fear that such teaching will unfit the boy for tending a nail machine or a shoe-pegging machine. This might be well founded if such trades were to cling to the old minute subdivision of labor, and the Old World notion that a workman must stick to one trade all his life. A celebrated builder of machine tools once said of one of his lathes: "It will take a man of science to run that lathe." The tendency of all tools is toward complexity, and mechanical trades continually demand more "all-round men," more workmen ready to change from tool to tool, and task to task. The American boy from the new schools will be a master at many trades, because he has been taught to use his imagination, to observe, to use his senses and his mind in a workman-like manner.

Charles Barnard.

A Romantic Career.

Dr. Francis Lieber was one of the remarkable characters of our generation. A statesman without station in politics, he was an enthusiastic, versatile, learned, suggestive, vigorous thinker on public affairs, whose works have influenced the ablest men of this country, and whose fame is international. He was not popular in the sense of being one who elicited the applause of multitudes. As a writer, he was too profound for the general reader; as a teacher and lecturer, he was adapted to superior and not to inferior intellects; and so he seemed to have less influence than he really possessed. But he had the power of attracting, informing, and inspiring strong minds. Wherever he lived, he was surrounded by the best of friends, and engaged with them in the discussion of the loftiest themes. In Berlin, Rome, Paris, London, New York, Boston, and Philadelphia, he made himself felt by his acquisitions, his good sense, his political wisdom, his love of duty and of right, his adhesion to the truth. He is foremost among many noble emigrants from Germany to America.

His long career was romantic. Follow him in the quick succession of events during an active period of sixty years,—watching the victorious appearance of the French in Berlin; harboring the desire to enter Napoleon's army that he might kill the conqueror; wounded in the battle of Waterloo; imprisoned by the Prussian government for his love of liberty; participating in the struggle of the Greeks for independence; walking through Rome with the historian Niebuhr, and making notes of his pithy sayings; becoming a proficient in athletic sports; confined again in prison for his political views; introduced by Niebuhr to Grote, and hoping to become teacher of German in the new London University; an immigrant in this country, looking for something to do; now writing letters for German journals; now conducting a swimming school (where John Quincy Adams, while President, displayed his skill); now studying the improvement of prisons, as one acquainted with duress; now translating Beaumont and Tocqueville's great work; now drafting, by request, an elaborate plan for Girard College, that it might be organized as a seminary for teachers, and as a technical institute; and now editing an Encyclopædia Americana, with the aid of Joseph Story and many other illustrious writers. At length, he was established as professor in the University of South Carolina at Columbia, where his great books on civil liberty, political ethics, and legal hermeneutics were written; but at last became so uncomfortable that he left his southern home, and was reëstablished in New York as a professor in Columbia College. He was an incessant contributor to the newspapers, and a correspondent who never tired of exchanging letters; he was thoroughly roused by the Civil War, was consulted by Stanton, Halleck, Sumner, and others high in the national councils; was called upon to form a code for the government of armies in the field; was obliged to see, in his own family, brother turned against brother (one son serving with the Confederates, and two with the Union army). He suggested to European publicists the formation of an international council on international law. He became keeper of the public military archives, to which were sent all papers captured in the South, and was invited to serve as an umpire between Mexico and the United States. Honored with many academic titles, he was more honored by the respect of his pupils and by the unqualified homage of the principal writers on public law in this country and abroad. Such is the record of a life now fully revealed to the public by the diaries and letters which he wrote from 1814 to 1872.

His biography, which has recently been published by Messrs. J. R. Osgood & Co., under the editorship of Mr. T. S. Perry, illustrates in a very curious manner the growth of ideas in the human intellect. With a little care, we can see over and over again the growth of a good germ, in a good soil, till it produces good fruit,—which, in its turn, may become the seed-corn in another hill.

Mr. Perry tells us, as the result of his observations of Lieber's life, that it was a continual exposition of his favorite motto: "No right without its duties; no duty without its rights." His correspondents have seen this sentence printed on his note-paper; his readers have often met it in his books. Whence came it? A letter to Judge Thayer, in 1869, gives the Genesis of this Deuteronomy. Lieber bound for Greece, with his freedom-loving comrades, in 1822, saw at the end of the schooner's yard-arm a little flame. "That is bad, indeed," said the captain, who explained that the flames (electrical lights) were called Castor and Pollux, or St. Elmo's fire. If both appeared, it foretold fine sailing; if only one, foul weather. "Thought I," says Lieber, "this is like *right* and *duty:* both together, and all is well; *right* alone, despotism; *duty* alone, slavery."

In the great battle of this century, at Waterloo, enthusiastic Lieber took part. His little pocket memorandum-book is still extant in which he noted the passing events, and his fuller narrative has thrice been printed. Here he underwent a personal experience of the conduct of soldiers on the march, in the field, and in the hospital. It made a deep impression on his susceptible mind. The memory of consuming thirst was so vivid that for a long time afterward he could not see liquid of any kind without feeling an intense desire to swallow it. He always remembered the anniversary of Waterloo; and he made use of his experience as a soldier to interpret other historic events. When our Civil War was raging, it was this veteran of Waterloo who was asked by the Government to draw up a code for the government of armies in the field, and this he did with such skill that "General Order No. 100" of the United States Army became the basis of European usages.

Napoleon was Lieber's pet aversion, as the students of his "Civil Liberty" are well aware. He would not allow that the Emperor was even worthy of comparison with Washington. His abhorrence was manifested in many pages; but the beginning of this hostility is indicated in a very remarkable letter addressed to George S. Hillard in 1858, in which he declares that when he was thirteen years old, "in the year '13," he took a solemn oath, with a voice as loud as sobbing would permit, that he "would enter the French army, come near Napoleon's person, and rid the earth of that son of sin and crime." "I did it fervently, devoutly, unreservedly," he adds. The auto-psychological comments which he bases on this recollection are very curious. "Keep this letter," he concludes, "for my biography. Do not think I wrote it all in ten minutes."

Lieber was twice imprisoned in Köpenick, in 1819 and again in 1824, because he was suspected of being too free in his utterances on political liberty. He never lost his interest in the subject of penal discipline; he was a close student of the prison reforms which originated in this country forty years ago; he wrote an elaborate introduction to his translation of the celebrated work of the French commissioners; late in life he coöperated with those citizens of New York who were seeking to secure improvements in prison discipline; but more remarkable than all this is the fact that after he received a political pardon, and returned to Berlin, he used all his efforts to secure good penal administration in Germany, discussed the subject with Humboldt, Bülow, and the King, urged that prison inspectors should be appointed who could lecture in universities, and was himself invited to become a professor in the very university from which, as a political offender, he had been excluded in his youth.

Allusion has been made more than once to the code prepared by Lieber for the government of the United States Army in the field. It was issued by the War Department under the designation General Order No. 100, and was frequently referred to by its author as "the Old Hundred." Perry's memoir throws some interesting light upon its preparation. In February, 1863, he sends the *projet* of the code to General Halleck, earnestly asking for suggestions and amendments. For this purpose, he is going to send one copy to the soldier General Scott, and one to the civilian Horace Binney; fifty copies also to General Hitchcock for distribution.

"You," he says to Halleck, "well read in the literature on this branch of international law, know that nothing of the kind exists in any language. I had no guide, no groundwork, no text-book. I can assure you as a friend, that no counselor of Justinian sat down to his task of the Digest with a deeper feeling of the gravity of his labor than filled my breast in the laying down for the first time such a code, where nearly everything was floating. Usage, history, reason, and conscientiousness, and sincere love of truth, justice, and civilization have been my guides; but, of course, the whole must still be very imperfect."

At a later date, it is evident that he was quite well aware of the significance of this pioneer code. Twenty years have passed, and the idea which he gave birth to has been nurtured by skillful hands with ever increasing vigor, till at length it seems very near its maturity. It seems probable that the manual on this subject, approved by the Institute of International Law, in its meeting at Oxford in 1880, will receive the official sanction of European powers.

Lieber loved correspondence. He gave freely, and freely he received, — not finished, copied, formal epistles, nor the diffuse utterances of dictation, but sharp, lively, racy notes and queries. If his style was sometimes *staccato*, it had the merit of being pointed and of compelling attention. Consequently, the letters now brought together are very readable. The choice has been made with a nice instinct, which has retained personalities, as in his long-continued intimacy with G. S. Hillard; philosophical reflections, like those addressed to Samuel Tyler in Maryland, and to Bluntschli and Mittermaier in Germany; pleasantry, like his letters to Mrs. Ticknor; and patriotism, like his letters during the war. By this course, Mr. Perry has succeeded in giving us a rounded portrait, not a flat one, — the many-sided likeness of a many-sided man. Mittermaier, Bluntschli, and Holtzendorff are the German correspondents, Hilliard, Sumner, Samuel Tyler, Allibone, Thayer, General Halleck, and Hamilton Fish, the Americans, whose letters from Lieber have been most fully printed.

I miss the letters addressed to Binney, Laboulaye, Woolsey, and others who are known to have been his friends; and I venture the surmise that another volume might be collected from the stores at the editor's command. In behalf of many readers, I bespeak from Mr. Perry another volume of Lieber's letters, two or three years hence.

D. C. Gilman.

The Christian League. — A Postscript.

THANK you, Mr. Editor. Your invention of "Open Letters" gives me just the chance I want to grind my own little hatchet. Your types, far better than my hectograph, will multiply the answer that I ought to make to the many who are writing me kind and curious letters about "The Christian League of Connecticut." Mr. Franklin mentioned, at the last Convention, the large correspondence which had grown out of his connection with the League as its Secretary; and upon me, as its historian, an almost equal burden has been thrown. Some of the inquirers write to head-quarters, as they should; but letters directed to the League at Hartford are sometimes forwarded to me. A few of my English correspondents seem to be puzzled by the geography, but that is nothing strange for Englishmen. If Mr. Franklin should visit England, as I hope he may, he will undoubtedly prepare a large map, after the manner of the missionary secretaries, showing the location of the principal League Clubs, and indicating with spots of some bright color the towns in which churches have been consolidated. I trust that my English friends will avail themselves of the opportunity of hearing Mr. Franklin's lecture, if for no other purpose, that they may obtain a little information about American geography.

The grateful and appreciative words that have come to me from all quarters give me far greater honor than belongs to me. In making the record that I have made of this beneficent movement, I have only done my duty. The praise is due to those — and they are many, nor do they all live in Connecticut — in whose minds and hearts this impulse toward coöperation in Christian work lives and grows from year to year. It is plain that a destructive analysis has done its worst upon the church, and that we have reached a period of reconstruction and synthesis. The fragments of the great denominations steadily gravitate together; the Presbyterians, North and South, are beginning to talk in their assemblies about coming together, and disunion can never survive discussion. No man can give a Christian reason for opposing reunion; every reason against it is drawn from selfish considerations or hateful passions which Christian men cannot long justify themselves in cherishing. When the Presbyterians come together, the Methodists and the Baptists cannot afford to stay apart, and we shall presently see the centripetal forces acting as vigorously as the centrifugal forces have been acting for a century or two. All this is in the air. He who cannot discern it is dull-witted indeed. I have only reported the movements of the *Zeitgeist*.

Mr. Franklin made a few quotations from his letters. Let me give an extract or two from mine, to indicate the depth of the feeling on this subject, and the social and ecclesiastical conditions out of which this feeling springs. A minister of the Methodist Episcopal Church in New England writes to me as follows:

"You see from my address where I am. Here are five churches and only eight hundred people in the entire township. The —— church has no regular preaching. The other churches are in good order as to buildings and parsonages. The Methodists are said to have the largest congregations. At my first service, last Sunday, there were eighty-six. The salaries

are three hundred and fifty or four hundred dollars and rent, save that the —— clergyman has to pay his rent from his salary of four hundred dollars. * * * It seems to me that as long as such churches can get men to be pastors they will stick to their narrow denominational ideas and have different churches. But I do not think that God has called me into the ministry for any such purpose. One of the clergymen said he had been very happy here for ten years, and thought I should be. I cannot be, unless I can bring about some union of these churches. With the call for men to heathen lands and the West, how can I be happy here? * * * This much is settled. I cannot give my life to the preservation of mere denominational lines. What can I do in the way of the Christian League? Have you those articles in pamphlet form? If I could put one in every family here, and call a meeting in the large, beautiful town hall!"

The good man in his perplexity sees a glimmer of light in the West; but there is reason to fear that his flight thither would prove to be only a translation from a Yankee frying-pan to a prairie fire, as the following extracts will show. The writer of the letter from which they are taken is a Congregational minister in the Far West—a man with the most ample knowledge of all that region, and with a grasp of mind and a temper of soul that speak for themselves:

"I am convinced that if the policy of our missionary societies could be this, to have fewer churches and better, to withdraw from competition in many a hopeless field, that we may do the right thing where the way is open and the need great, we should do a much better work than we do. Only last week I was told by Rev. —— ——, who has long known Kansas, that he knew of fifty places in which the Congregationalists and Presbyterians should unite. If that could be done so that there would be twenty-five less Congregational churches and twenty-five less Presbyterian, there would be (1) a saving of fifteen thousand dollars missionary money; (2) a saving of an indefinite amount for church-buildings; (3) the release of fifty men to preach the Gospel in other places; (4) fifty fields that would be an attraction to men of spirit, in the place of fifty fields that no one but a mendicant would think of taking.

"*I am not at all surprised at the scarcity of ministers.* The policy of our home missionary societies tends to keep men from the ministry. We have a dead and dreary level of little churches that offer no inviting field for young men. It is easy to say that any young man fit for the ministry ought to be ready to enter the smallest field, that he ought to have the spiritual efficiency to make his small field a large one. I have said this myself. It is the true thing to say. But if the field is small, not because of the wickedness of sinners, but because of the folly of saints and the mistakes of the home missionary authorities, the case becomes hopeless. We must expect to begin small in new places; the trouble is that our fields remain small, and must remain so while this mistaken policy continues. If a young man is asked to endure hardships for Christ's sake, by all means let us not take the courage out of him by false pity; but if it turns out that the call for self-sacrifice is not for Christ at all, but for *our church*, we need not wonder if the truest consecration comes to be a forgotten grace, and that the best men cannot be found for the ministry."

The writers of these letters—and I have many like them—are not theorists; they are men who stand in the midst of this sectarian confusion, and who are doing their best to bring a little order out of its tumult, and to mix a little sweetness with its bitter waters. Such voices have a right to be heard, and they will be heard. The men who have the ordering of the work of our home missionary societies must attend to these mischiefs at once. Some of them, as I happen to know, are heartily disposed to do so; others, I fear, are ready to wink at any amount of "scrouging" if it do but inure to the benefit of their respective sects.

I will add but one word more, that the scarcity of ministers, so much complained of, is due, as my Western correspondent shows, to the spirit of schism, perhaps quite as much as to any other cause. There would be no lack of ministers, even numerically, if the churches that have no right to exist were blotted out. And, if that were done, we should soon report a great gain not only in the number but also in the quality of the men seeking the ministry.

Washington Gladden.

[THE following letter has been received by the Editor from the (Protestant Episcopal) Bishop of New Mexico and Arizona:]

I read with great interest Dr. Gladden's series of articles in THE CENTURY, entitled "The Christian League of Connecticut." The subject is handled with marked ability and in an excellent spirit. The Doctor has hit the plague-spot of modern Christianity. I am thoroughly convinced that the needless divisions among Christians is to-day a greater hinderance to the spread of Christ's religion than any other evil, not excepting infidelity and intemperance. If this seems to some to put the case too strongly, let them remember that divisions kill charity, the most important of Christian graces.

Doubtless the evil is sufficiently grave in New England; but it grows worse the farther West you come. I think I understate the case when I say that in the great cities of the West not one in ten of the nominally Protestant population are in the habit of attending any place of worship. Farther West, and in thinly settled districts, the evil is still greater. In the Western States and Territories, you may travel hundreds of miles and not meet with a place where any regular service is held.

You will pass a score of small settlements, around stations with sufficient population to make a congregation; but, not being able to unite on any one denomination, they live practically heathens. When you reach a town of from one thousand to five thousand inhabitants, you will find half a dozen sects, each generally with a handful of followers, a half-starved minister, and a shabby little church; and yet an expert would often fail to discover in what essential particular these denominations differed with each other.

Of course, there must be a cure, but my object in writing this letter is to help men to see the enormity of the evil. When Christian men begin to look in earnest, a remedy will be found.

In conclusion, let me recommend Dr. Gladden's suggestion, in organizing new congregations, to use only the short platform of the Apostles' Creed. I would add to this a request that all sincere followers of Our Lord would use daily that touching prayer of his, "that all may be one," on which is conditioned the concluding sentence "that the world may believe that Thou hast sent me."

Geo. K. Dunlop.

LAS VEGAS, N. M., June 26, 1883.

Standard Railway Time.

PEOPLE whose journeyings have been limited to short distances can hardly appreciate the perplexity experienced by a traveler who undertakes to make a long tour in this country, when he endeavors to ascertain by what standard he must time his movements in order to catch a train advertised to depart at a certain hour. It is a lamentable fact that our railways are run to-day by no less than fifty different meridian times, varying from each other by all sorts of odd combinations of minutes. The roads using the various standards cross and interlace each other in such a puzzling manner as to render any ready acquisition of knowledge of the standard by which each is governed a sheer impossibility. Studying a map of the system is like tracing the intricacies of a labyrinth.

This condition of affairs has largely arisen from the fact that, in the early days of railroads, the several lines were isolated from each other, and each, as a rule, adopted as its standard the meridian time of the city in which its head-quarters happened to be located. As these lines were extended and branches were constructed, each adhered to its original standard, or compromised upon some intermediate meridian suitable for its own system, without regard to the standards of other lines in the same section. Many new lines of road, using standards varying from all the others, have been constructed across the original lines, thus adding to the confusion, which was bad enough before. So generally does this condition of affairs exist, that there is to-day scarcely a railroad center of any importance in the United States at which the standards used by the roads entering it do not number from two to five. The inconvenience this causes was aptly expressed, not long since, by a bright and intelligent Virginia lady, one of a party of tourists. Finding herself utterly unable to reconcile the time shown by her usually reliable watch to the varying times shown by the railway clocks at different points, she turned to the writer, and, using a provincial expression, asked appealingly: "Please tell me what is *sure enough* time?"

An effort is now being made in railway circles to arrive at a "sure enough" time, which has been not only indorsed but strongly recommended for adoption by the managing officers of a large number of important railway lines.

The system proposed is based, so far as it affects the railway lines, upon readily understood principles.

First. That the same standard should be used by all lines within sections as largely extended as may be possible, without entailing such a difference between local and railroad time as to cause inconvenience to the public. It is believed, however, that as exact time is seldom required except for purposes connected with transportation, standard time could be readily substituted for local time in all cases where the difference would not be much over thirty minutes.

Second. That where a second standard becomes necessary, it should differ from the first by the simplest and most readily calculated variation,—an even hour.

Third. That the changes from one standard to another should be made at well known points of departure, and so far as may be possible at points where changes now occur, and where no practical difficulty would cause danger or inconvenience to railway operations.

The section of country which includes within its limits over eighty per cent. of all the railways lies within thirty degrees of longitude westward from the eastern boundary of the State of Maine.

In railway circles, all roads east of Buffalo, Pittsburg, Wheeling, Bristol (Tennessee), etc., are distinctively known as Eastern roads, and the lines west of those points as Western roads. In examining a map of these Eastern roads, grouped together, we find that a meridian line, drawn centrally between their eastern and western extremities, coincides almost exactly with the seventy-fifth meridian west from Greenwich. A similar grouping of the Western roads between Buffalo, Pittsburg, etc., on the east, and the western boundary of Kansas on the west, develops the fact that the ninetieth meridian west from Greenwich is very approximately the central meridian for the system of roads embraced within that section.

The seventy-fifth and ninetieth meridians being fifteen degrees apart, their time differs, of course, by an even hour. It is proposed that all railroads east of Buffalo, Pittsburg, etc., shall use the seventy-fifth meridian time, which is approximately four minutes slower than the meridian time of New York; and that the Western roads shall use the ninetieth meridian time, which is nine minutes slower than Chicago time.

The meridian equidistant from these central meridians crosses the railway lines in Ohio and other States at points where the peculiarities of railway operations prevent the change being made from one standard to another, and the difficulty has been met by extending the Western standard to the eastern termini of such roads at Buffalo, Salamanca, Pittsburg, etc. Similar practical questions decide the standards for all roads south of the points named to Charleston, South Carolina. In Canada, all roads between Quebec and Detroit would use the seventy-fifth meridian time. The western limit of the ninetieth meridian, or "central time" system, is fixed at points on the great transcontinental lines, where a complete change is now made in the personnel of the hands in charge of trains, or, more technically speaking, at the ends of divisions. The standard for the next western or "Mountain" system is the time of the one hundred and fifth meridian, which coincides with Denver (Colorado) time, and, for the Pacific coast, that of the one hundred and twentieth meridian. The change from the Mountain to the Pacific system is proposed to be made at Yuma, Ogden, and Missoula, all convenient locations. For the extreme eastern section, east of Quebec and Vanceboro, the sixtieth meridian time may be employed.

By the adoption of this system over eighty per cent. of the railroads will use but two standards where they now use forty, and these standards will differ from each other by an even hour. The standard for each section will differ from every other section by one, two, three, or four hours; hence the minutes will be identical in all the sections. At points where the changes are made from one standard to the next, as Pittsburg, Wheeling, etc., similar changes are now made, the distinction being that instead of the readily calculated difference of one hour these changes now consist of differences of odd minutes varying from thirteen to thirty-six, numbers inconvenient to calculate and which constantly cause annoying mistakes.

It has been pretty generally conceded that the system proposed will be, *per se*, advantageous to the railway companies. As affecting the general public, the traveling portion will certainly be benefited. For the rest, numerous instances now exist where railroad time is exclusively used without inconvenience in localities where the railroad standard differs by over thirty minutes from true local time.

Multiples of Greenwich time have been adopted for the system proposed, because they have been found to be the meridians best adapted for the purpose desired to be accomplished. It is a petty, school-boy patriotism which urges that Washington time should be adopted as the prime meridian, in the face of the fact that its adoption would aggravate rather than diminish the difficulties of the situation, so far as the railways at least are concerned.

The adoption of the system proposed will reduce the present uncertainty to comparative if not absolute certainty; and as Greenwich time is the standard by which all navigators' chronometers are regulated, it will give us a national standard time that will be in harmonic accord with a system which may be extended to include within its limits the whole world. For reasons of this nature, every scientific society in this country which has considered the subject has recommended the adoption of the seventy-fifth, ninetieth, etc., meridians west from Greenwich as those upon which time standards should be based.

But the question whether these meridians are also best adapted for the use of the railways, and how they can be practically adopted without serious inconvenience, has been heretofore an open one in railway circles. It is hoped and believed that a solution has now been reached. The question is to be finally decided at conventions of railway managers to be held in Chicago and in New York City in October, 1883.

W. F. Allen.

Reforming the Alfabet.

In "Science" for June 1st, Mr. Alexander M. Bell designates six consonant sounds in the English language as having no proper letters to represent them, and proposes that the deficiency be supplied with "Visibl Speech" symbols. Five of the six sounds which he mentions ar the same as five of the six usually designated by spelling reformers as not properly represented; but he puts in *wh* and leaves out *ch*. Now that the combination *wh* represents, not a singl sound, but two sounds, any one can prove for himself. If there is but one sound it wil be possibl to "hold" it, in the musical sens; but the result of a trial in this case is the sound of *h* followed by that of *u* in *quack*; or els som noise never represented by *wh*.

Then why is *ch* omitted? From his spelling *catch* in his list of exampls with the sign for *sh*, it may be inferred that Mr. Bell would reply that *ch* is made up of *t* and *sh*. The holding test does not giv a distinct result in this case, owing to the peculiarity of the sound; but a trial wil prove that *ch* is pronounct with the vocal organs in one position, and hence stands for a singl sound. That the sound of *ch* does not include that of *sh* becoms evident from it being necessary, after pronouncing the former, to change the positions of the tongue and lips slightly before *sh* can be spoken.

Mr. Bell givs the six "Visibl Speech" letters which he proposes as substitutes, and invites the reader to judg as to the simplicity of their forms and their adaptability for intermixture with Roman letters. They are not prepossessing, for, not having any structural elements in common with Roman characters, they look even more out of place than script letters would if mixt with Roman. The sign for *sh* is almost exactly like an eye such as ar used with hooks on ladies' dreses; that for *zh* (*z* in *azure*) is the same with an aded mark; those for the two sounds of *th* resembl script *w's*; that for *ng* is not so easily described, but the main part of it resembls the apothecary's scrupl mark. Their foreign look is, of course, the least rational objection, but practically it would be found the hardest one to remove. Another disadvantage is that the similarity of two pairs of these letters would cause many mistakes in distributing type. The argument that by these and other fysiological signs the pronunciation of foreign words can be represented, is no reason for introducing them into the alfabet in which our daily papers, our Bibls, and school-books ar printed. "Why not hav two alfabets?" Mr. Bell asks; an excellent suggestion, but let the "Visibl Speech" alfabet be kept distinct for the use of def mutes, for grammars of foreign languages, and other filological uses. There is no more need of continually reminding the reader of the vocal proces he uses in speaking each letter, than of reminding him as often as he sees the word that *husband* was originally *house-band*.

What shal we do, then? for, as Mr. Bell says, the new letters advised by som reformers hav failed to be adopted by the rest. Wel, here is a plan which the writer formed over thre years ago, and which he stil deems the most feasibl. Reformers ar agreed that *q*, *x*, and either *c* or *k* must go. The retaining of *k* rather than *c* would seem preferabl, because when a person sees a *k* he knows alredy what it stands for, and would not hav to forget that it sometimes denoted the same sound as *s*. A tendency in this direction has begun in the spelling of Sokrates, Sanskrit, and som other foreign words. The fact that *k* is preferred in German, to which the Anglo-Saxon part of our language is so closely allied, also pronounces in its favor, for, as Mr. Bell insists, international agrement is highly desirabl. Now, why not use these discarded familiar letters for thre of the unrepresented sounds, insted of offending the eye unnecessarily with newly devised signs, and requiring every foreigner who lerns our language to share the burden? In deciding which sound each letter shal represent, let us invoke again the principl of international agrement. Thus, in Italian, *c* in certain situations has the sound of *ch* in *church;* why not choose a change that makes one more point of agrement between the two languages insted of one that makes another point of differenc? The use of *x* for the *zh* sound would not be far from its present initial use, as in *xylofone*; and, if no weightier determining reason arose, let *q* take the place of *ng*, because it resembls *g* in projecting below the line. Perhaps it wil be decided to replace *w* and *y* by vowels, as in Franklin's scheme; if so, these with one Anglo-Saxon letter, alredy lookt upon with favor, would make up the six lacking consonants.

In THE CENTURY for last December was an articl on the spelling reform by Professor Lounsbury, with all but one of the views in which I desire to expres ful agrement, together with great admiration of the manner of treatment. But Professor Lounsbury, to, deems the introduction of new letters "a necessity of the situation." Besides mentioning the six consonant sounds alredy referred to, he states that we hav fourteen simpl vowel sounds, and only five letters to represent them. But there is a simpl remedy for this deficiency also, and that, to, in conformity with the principl of international agrement. We hav only to use with each of these five letters two of the diacritical marks so frely used in continental languages to hav the means of representing fifteen vowels.

New letters have alredy been devised, and ar used in the organ of the Spelling Reform Association. "Transition letters" hav also been invented, to make the change to ful fonetic spelling a gradual one; but this scheme savors of the wisdom that cut off a dog's tail an inch at a time out of compassion.

Surely, if the growing disposition of the Germans to replace their peculiar alfabet by the one used in writing English, French, Italian, and Spanish is a move in the right direction, and if it would be well for the Russians and Chinese to do the same, then the formation of a peculiarly English alfabet, by the introduction of ten or more new letters, is a long step backward.

Frederick A. Fernald.

The Training of Children's Voices.

THE experience of teachers trained at this college and practicing its methods is exactly that which Mr. W. L. Tomlins relates in your June number. Of those who teach singing by note in English and Scotch elementary schools, seventy per cent. practice our system of singing; hence their experience is wide and various. With Mr. Tomlins, our teachers find that coarse and loud tone limits the compass of the voice; they find, too, that children who are in the habit of shouting, either in the play-ground or at the Sunday-school, have very poor singing voices. As an illustration of Mr. Tomlins's point that children's voices are naturally high, let me mention the work of Mr. Frank Sharp, superintendent of music in the board schools at Dundee, Scotland, and a teacher of our system. Mr. Sharp's children's choir has frequently performed Handel's "Messiah" in public, not only in Dundee, but in Edinburgh, Glasgow, and Aberdeen. In these performances, the treble and alto parts both of the solos and choruses are sung by children, without the assistance of a single adult voice, tenors and basses only being brought in to complete the harmony. I have noticed the ease with which the boy and girl trebles attack the G's and A's of Handel's music. They sing these notes with far less effort than most adult sopranos. The reason is that the low and medium voices have been carefully separated from the really high ones, and the registers of the voice have been developed. Mr. Tomlins evidently means that a *fair proportion* of children's voices are high. We find that they differ in compass just as much as the voices of adults.

The habit of singing by ear, once formed, is difficult to cure, and we regard it as of utmost importance that the understanding should keep pace with vocal skill.

J. Spencer Curwen.

THE TONIC SOL-FA COLLEGE, London, June 6, '83.

BRIC-À-BRAC.

In Swimming-time.

CLOUDS above, as white as wool,
Drifting over skies as blue
As the eyes of beautiful
Children when they smile at you;
Groves of maple, elm, and beech,
With the sunshine sifted through
Branches, mingling each with each,
Dim with shade and bright with dew;
Stripling trees, and poplars hoar,
Hickory and sycamore,
And the drowsy dogwood bowed
Where the ripples laugh aloud,
And the crooning creek is stirred
To a gayety that now
Mates the warble of the bird
Teetering on the hazel-bough;
Grasses long and fine and fair
As your school-boy sweetheart's hair,
Backward roached and twirled and twined
By the fingers of the wind;
Vines and mosses, interlinked
Down dark aisles and deep ravines,
Where the stream runs, willow-brinked,
Round a bend where some one leans
Faint and vague and indistinct
As the like reflected thing
In the current shimmering.
Childish voices farther on,
Where the truant stream has gone,
Vex the echoes of the wood
Till no word is understood,
Save that one is well aware
Happiness is hiding there.
There, in leafy coverts, nude
Little bodies poise and leap,
Spattering the solitude
And the silence everywhere —
Mimic monsters of the deep!
Wallowing in sandy shoals —
Plunging headlong out of sight;
And, with spurtings of delight,
Clutching hands, and slippery soles,
Climbing up the treacherous steep
Over which the spring-board spurns
Each again as he returns.
Ah! the glorious carnival!
Purple lips and chattering teeth —
Eyes that burn — but, in beneath,
Every care beyond recall,
Every task forgotten quite —
And again, in dreams at night,
Dropping, drifting through it all!

James Whitcomb Riley.

Model Children.

DAT fust chile am Abs'lum 'Neezer,
An' dat nex' one's Ephaham;
Ober dar am Potiphar Cæsar —
Him as we fo' short call Sam.

Sorter 'semblin'? Like free pins, sah;
Can't mos' tell which which one am;
Dat, I 'spec', is case dey's twins, sah —
Abs'lum, Ephaham, an' Sam.

Yo' nebber seed sich peaceable chillun;
No, dey nebber disumgree;
Jes' watch 'em eat dat water-millun —
Peaceable, sah, as dey ken be.

Dar, now, chillun, quit yer foolin';
Frow dat piece o' peel away;
Yes, dey likes ter all be rulin',
But dey'll mind jes' when I say.

Luff him be, dar, Ephaham; yo'
Needn't took de biggest share!
Fo' de solem' fack I'll flam yo'
If ye doan divide dat fair!

Did'n ye heah me talkin', Abs'lum?
Luff right go ob Eph'ham's ha'r!
Dar's enuff; ye all ken hab sum,—
Cuff him agin, sah, if yo' dare!

Potiphar, stop dat! Mind yer mudder!
Look out 'fo' ye tear his cloze!
Haint yer 'shamed to scratch yer brudder?
See dat poor little Abs'lum's nose!

Hi! yo' wile-cat, dar! He's stranglin'!
Doan yer da's to frow dat stone!
'Pears yer wuss'n dogs fur janglin',
If I da's to leab yer 'lone!

Whist! I heah de ole man 'wakin'!
Skatter quick, wid all yer might;
Ye ken bet ye'll git a shakin'
If ye doan skoot out o' sight.

See 'em git! Yah! yah! What chillun!
Coorse dey'll jangle when dey's mad;
But dey'll quit, sah, mighty willin',
When I menshum de ole man's gad.

Charles H. Turner.

What's in a Name?

IN letters large upon the frame,
That visitors might see,
The painter placed his humble name:
O'Callaghan McGee.

And from Beërsheba to Dan,
The critics with a nod
Exclaimed: "This painting Irishman
Adores his native sod.

"His stout heart's patriotic flame
There's naught on earth can quell;
He takes no wild romantic name
To make his pictures sell!"

Then poets praised in sonnets neat
His stroke so bold and free;
No parlor wall was thought complete
That hadn't a McGee.

All patriots before McGee
Threw lavishly their gold;
His works in the Academy
Were very quickly sold.

His "Digging Clams at Barnegat,"
His "When the Morning Smiled,"
His "Seven Miles from Ararat,"
His "Portrait of a Child,"

Were purchased in a single day
And lauded as divine.—
* * *
That night as in his *atelier*
The artist sipped his wine,

And looked upon his gilded frames,
He grinned from ear to ear:—
"They little think my *real* name's
V. Stuyvesant De Vere!"

R. K. Munkittrick.

A Midsummer Day's Dream.

OH, the bright, the breezy sky,
Blue and boundless, pure and high!
Oh, the winds, the clouds, the bliss,
Wed to woodland hours like this!
Bird and insect! teach me, pray,
Songs to match with yours to-day!

Chirp and chirrup — by my fate
Not too long you bid me wait!
Lovely winglings! Oh, for feather
Light as yours, this summer weather!
Oh, for music like the bee!
Oh, for wild-wasp minstrelsy!

Speckled Spider, venture near!
There is naught for you to fear.
Two-tailed Cricket, come and be
Mine accepted company;
Bring your cousins, too, the Ants;
Here are crumbs for all your wants!

Daddy Long-legs! hither haste,
Thin of leg and thick of waist;
Tell me, Daddy, minus prayers,
Tumbling down the kitchen stairs,
Is it true, what I'm afraid is,
You're a sinner, bound for Hades?

Nonsense — that I'll not believe!
What's this traveling up my sleeve?
Ho! friend Grasshopper, is't you,
With your sharp and rasping shoe?
Skip, old Hammer-head, away —
No molasses, sir, to-day!

Ah, what's here? my Lady fair!
Crimson speck upon the air!
Lady-bird — oh, wherefore roam,
Why so far from hearth and home?
Spotted Lady, fly — return —
Else the fire your house will burn!

Beetle, wood-moth, bird on wing —
Nature's tribes, that own no sting —
Come and flutter by my side,
Here in covert safe abide;
I'll your boon companion be
For your noble company!

Here I'll come, for each bright day,
While the birds and blossoms stay,
While the wooing breezes roll
Sweet content through heart and soul,
And from banks of blowing thistle
I can list yon blackbird's whistle!

Come — oh, come! for you and me
All these summer mornings be;
Come — oh, come! for me and you
Each soft evening drops its dew;
Morn and noon and sunset's glow
Made for you and me, you know!

William M. Briggs.

A Bundle of Letters.

STRANGE how much sentiment
Clings like a fragrant scent
To these love-letters pent
In their pink covers:
Day after day they came
Feeding love's fickle flame;—
Now, she has changed her name,—
Then, we were lovers.

Loosen the silken band
Round the square bundle, and
See what a dainty hand
Scribbled to fill it
Full of facetious chat;
Fancy how long she sat
Molding the bullets that
Came with each billet!

Ah, I remember still
Time that I used to kill
Waiting the postman's shrill,
Heart-stirring whistles,
Calling vague doubts to mind,
Whether or no I'd find
That he had left behind
One of her missals.

Seconds become an age
At this exciting stage;
Two eager eyes the page
Scan for a minute;
Then, with true lover's art,
Study it part by part,
Until they know by heart
Everything in it.

What is it all about?
Dashes for words left out,—
Pronouns beyond a doubt!
Very devoted.
Howells she's just begun;
Dobson her heart has won;
Locker and Tennyson
Frequently quoted.

Criss-cross the reading goes,
Rapturous rhyme and prose,—
Words which I don't suppose
Look very large in
Books on the "ologies";
Then there's a tiny frieze
Full of sweets in a squeeze,
Worked on the margin.

Lastly,— don't pause to laugh! —
That is her autograph
Signing this truce for half
Her heart's surrender;
Post-scriptum, one and two,—
Desserts,— the dinner's through! —
Linking the "I" and "You"
In longings tender.

Such is the type of all
Save one, and let me call
Brief notice to this small
Note neatly written:
'Tis but a card, you see,
Gently informing me
That it can never be! —
This is the mitten!

Frank Dempster Sherman.

Massachusetts French.

DEDICATED (WITH APOLOGIES) TO CHARLES FRANCIS ADAMS, JR.

THE model was a Frenchman; tall and muscular was he,
And the pose was very difficult, as any one might see;
For he shot fictitious arrows from a stout but stringless bow;
And the Life Class sat before him — thirty young men in a row.

He stood stock-still one hour — yet one more, nor moved a hair;
The students still worked steadily with fixed, artistic stare.
The model groaned in secret, and the sweat was on his brow,
And he longed to beg for respite, but alas! he knew not how.

He knew no English, they no French; so all still held their peace,
Though all, no doubt, knew Latin, and were fluent when in Greece;
For Latin school and college had made them "cultured" men,
With no thought that French or German might come handy now and then.
The use of all such knowledge their teachers ne'er could see;
So the sum of their acquirements was a guinea-hen-like "*Oui.*"

At last one youth, more pitiful or lazy than the rest,
Observed the clouding of his eyes, the heaving of his breast;
"Oh, fellows! we are cruel; he must rest awhile," he cried.
But all looked blank and helpless and nobody replied.

Then one young man who felt a pride in his knowledge of the tongue,
But had been too modest to come forth till other hope was gone,
Stepped forward to the model, full in all the students' view,
And lisped in accents dulcet: "*Ah, monsieur, restez-vous!*"

"*Mais non, messieurs!*" the model said, and "*Oui,*" the youth replied;
And still the weary man said "*Non*"; still "*Oui*" the chorus cried.
"What cruel creatures!" thought the man. "Why wont he rest?" said they.
But neither class nor man has seen the point unto this day.

Bell F. Hapgood.

THE CENTURY MAGAZINE.

VOL. XXVI. OCTOBER, 1883. No. 6.

OUTDOOR INDUSTRIES IN SOUTHERN CALIFORNIA.

CLIMATE is to a country what temperament is to a man — Fate. The figure is not so fanciful as it seems, for temperament, broadly defined, may be said to be that which determines the point of view of a man's mental and spiritual vision; in other words, the light in which he sees things. And the word climate is, primarily, simply a statement of bounds defined according to the obliquity of the sun's course relative to the horizon; in other words, the slant of the sun. The tropics are tropic because the sun shines down too straight: vegetation leaps into luxuriance under the nearly vertical ray; but human activities languish; intellect is supine; only the passions, human nature's rank weed growths, thrive. In the temperate zone, again, the sun strikes the earth too much aslant. Human activities develop; intellect is keen; the balance of passion and reason is normally adjusted; but vegetation is slow and restricted. As compared with the productiveness of the tropics, the best that the temperate zone can do is scanty.

There are a few spots on the globe where the conditions of the country override these laws, and do away with these lines of discrimination in favors. Florida, Italy, the south of France and of Spain, a few islands, and South California, complete the list.

These places are doubly dowered. They have the wealths of the two zones, without the drawbacks of either. In South California this results from two causes: first, the presence of a temperate current in the ocean, near the coast; second, the configuration of the mountain ranges which intercept and reflect the sun's rays, and shut South California off from the rest of the continent. It is, as it were, climatically insulated — a sort of island on land. It has just enough of sea to make its atmosphere temperate. Its continental position and affinities give it a dryness no island could have; and its climatically insulated position gives it an evenness of temperature much beyond the continental average.

It has thus a cool summer and a temperate winter; conditions which secure the broadest and highest agricultural and horticultural possibilities. It is the only country in the world where dairies and orange orchards will thrive together.

It has its own zones of climate; not at all following lines parallel to the equator, but following the trend of its mountains. The California mountains are a big and interesting family of geological children, with great gaps in point of age, the Sierra Nevada being oldest of all. Time was when the Sierra Nevada fronted directly on the Pacific, and its rivers dashed down straight into the sea. But that is ages ago. Since then have been born out of the waters the numerous coast ranges, all following more or less closely the shore line. These are supplemented at Point Conception by east and west ranges, which complete the insulating walls of South or semi-tropic California. The coast ranges are the youngest of the children born; but the ocean is still pregnant of others. Range after range, far out to sea, they lie, with their attendant valleys, biding their time, popping their heads out here and there in the shape of islands.

This colossal furrow system of mountains must have its correlative system of valleys; hence the great valley divisions of the country. There may be said to be four groups or kinds of these: the low and broad valleys, so broad that they are plains; the high mountain valleys; the rounded plateaus of the Great Basin, as it is called, of which the Bernardino Mountains are the southern rim; and the

[Copyright, 1883, by THE CENTURY CO. All rights reserved.]

river valleys or cañons—these last running at angles to the mountain and shore lines.

When the air in these valleys becomes heated by the sun, it rushes up the slopes of the Sierra Nevada as up a mighty chimney. To fill the vacuum thus created, the sea air is drawn in through every break in the coast ranges as by a blower. In the upper part of the California coast it sucks in with fury, as through the Golden Gate, piling up and demolishing high hills of sand every year, and cutting grooves on the granite fronts of mountains.

The country may be said to have three distinct industrial belts: the first, along the coast, a narrow one, from one to fifteen miles wide. In this grow some of the deciduous fruits, corn, pumpkins, and grain. Dairy and stock interests flourish. The nearness of the sea makes the air cool, with fogs at night. There are many *ciénagas*, or marshy regions, where grass is green all the year round, and water is near the surface everywhere. Citrus fruits do not flourish in this belt, except in sheltered spots at the higher levels.

The second industrial belt comprises the shorter valleys opening toward the sea; a belt of country averaging perhaps forty miles in width. In this belt all grains will grow without irrigation; all deciduous fruits, including the grape, flourish well without irrigation. The citrus fruits thrive, but need irrigation.

The third belt lies back of this, farther from the sea; and the land, without irrigation, is worthless for all purposes except pasturage. That, in years of average rain-fall, is good.

The soils of South California are chiefly of the cretaceous and tertiary epochs. The most remarkable thing about them is their great depth. It is not uncommon, in making wells, to find the soil the same to a depth of one hundred feet; the same thing is to be observed in cañons, cuts, and exposed bluffs on the sea-shore. This accounts for the great fertility of much of the land. Crops are raised year after year, sometimes for twenty successive years, on the same fields, without the soil's showing exhaustion; and what are called volunteer crops, sowing themselves, give good yields for the first, second, and even third year after the original planting.

To provide for a wholesome variety and succession of seasons, in a country where both winter and summer were debarred full reign, was a meteorological problem that might well have puzzled even nature's ingenuity. But next to a vacuum, she abhors monotony; and to avoid it, she has, in California, resorted even to the water-cure—getting her requisite alternation of seasons by making one wet and the other dry.

To define the respective limits of these seasons becomes more and more difficult, the longer one stays in California, and the more one studies rain-fall statistics. Generally speaking, the wet season may be said to be from the middle of October to the middle of April, corresponding nearly with the outside limits of the north temperate zone season of snows. A good description of the two seasons would be—and it is not so purely humorous and unscientific as it sounds—that the wet season is the season in which it can rain, but may not; and the dry season is the season in which it cannot rain, but occasionally does.

Sometimes the rains expected and hoped for in October do not begin until March, and the whole country is in anxiety; a drought in the wet season meaning drought for a year, and great losses. There have been such years in California, and the dread of them is well founded. But often, the rains, coming later than their wont, are so full and steady that the requisite number of inches fall, and the year's supply is made good. The average rain-fall in San Diego county is ten inches; in Los Angeles, San Bernardino, and Ventura counties, fifteen; in Santa Barbara, twenty. These five counties are all that properly come under the name of South California, resting the division on natural and climatic grounds. The political division, if ever made, will be based on other than natural or climatic reasons, and will include two, possibly three, more counties.

The pricelessness of water in a land where no rain falls during six months of the year cannot be appreciated by one who has not lived in such a country. There is a saying in South California that if a man buys water he can get his land thrown in. This is only an epigrammatic putting of the literal fact that the value of much of the land depends solely upon the water which it holds or controls.

Four systems of irrigation are practiced: First, flooding the land. This is possible only in flat districts, where there are large heads of water. It is a wasteful method, and is less and less used each year. The second system is by furrows. By this system, a large head of water is brought upon the land and distributed in small streams in many narrow furrows. The streams are made as small as will run across the ground, and are allowed to run only twenty-four hours at a time. The third system is by basins dug around tree roots. To these basins water is brought by pipes or ditches; or, in mountain lands, by flumes. The fourth system is by sub-irrigation. This is the most expensive system of all, but is thought to economize water. The water is carried in pipes laid from two to three feet

VALLEY IRRIGATION.

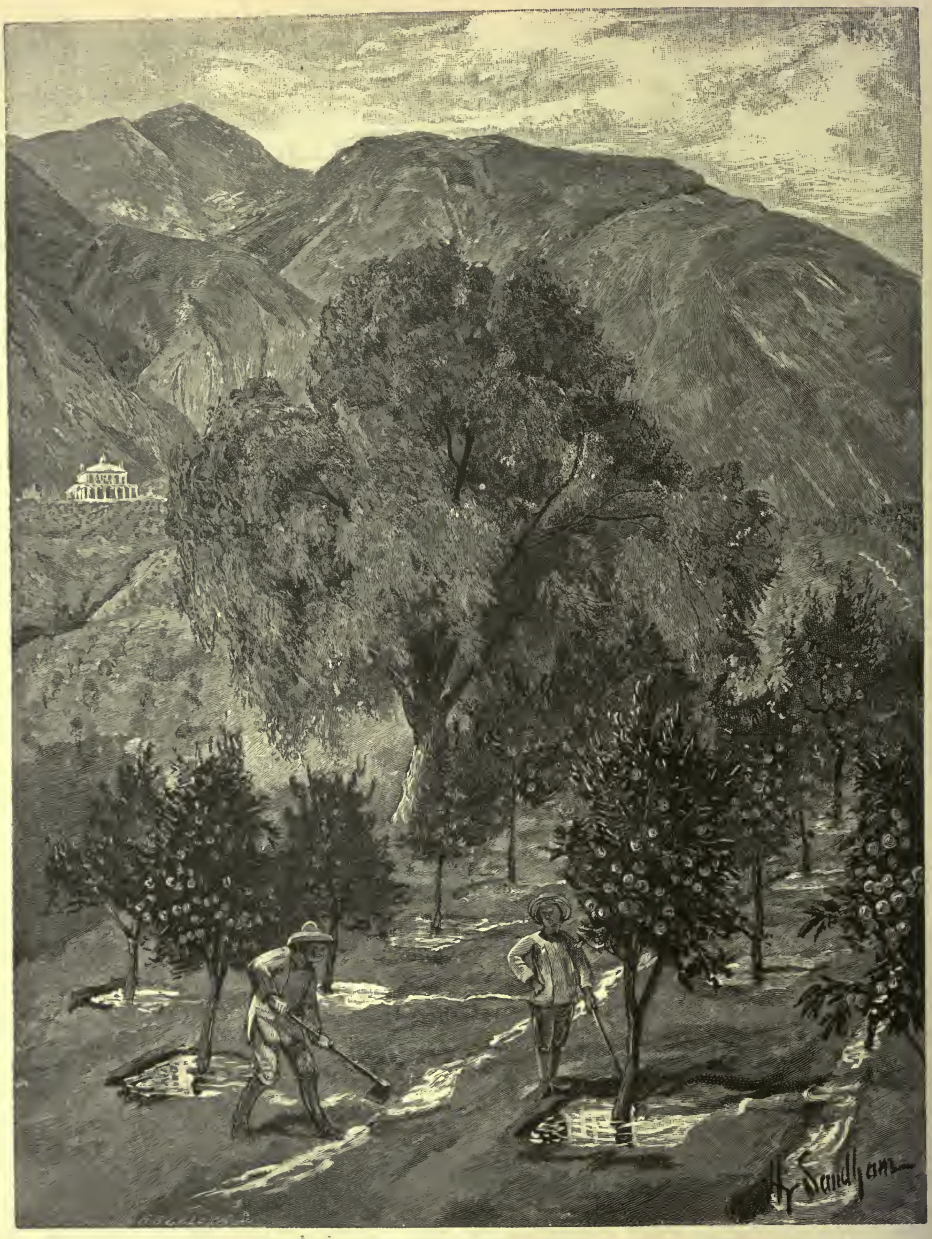
under ground. By opening valves in these pipes the water is let out and up, but never comes above the surface.

The appliances of one sort and another belonging to these irrigation systems add much to the picturesqueness of South California landscapes. Even the huge, tower-like, round-fanned windmills by which the water is pumped up are sometimes, spite of their clumsiness, made effective by gay colors and by vines growing on them. If they had broad, stretching arms, like the Holland windmills, the whole country would seem a-flutter.

The history of the industries of South California since the American occupation is interesting in its record of successions: successions, not the result of human interventions and decisions so much as of climatic fate, which, in epoch after epoch, created different situations.

The history begins with the cattle interest; hardly an industry, perhaps, or at any rate an unindustrious one, but belonging in point of time at the head of the list of the ways and means by which money has been made in the country. It dates back to the old mission days; to the two hundred head of cattle which the wise Galvez brought, in 1769, for stocking the three missions projected in Upper California.

From these had grown, in the sixty years of the friars' unhindered rule, herds, of which it is no exaggeration to say that they covered thousands of hills and were beyond counting. It is probable that even the outside estimates of their numbers were short of the truth. The cattle wealth, the reckless ruin of the secularization period, survived, and was the leading wealth of the country at the time of its surrender to the United States. It was most wastefully handled. The cattle were killed, as they had been in the mission days, simply for their hides and tallow. Kingdoms full of people might have been fed on the beef which rotted on the ground every year, and the California cattle



MOUNTAIN IRRIGATION.

ranch in which either milk or butter could be found was an exception to the rule.

Into the calm of this half barbaric life broke the fierce excitement of the gold discovery in 1849. The swarming hordes of ravenous miners must be fed; beef meant gold. The cattlemen suddenly found in their herds a new source of undreamed-of riches. Cattle had been sold as low as two dollars and a half a head. When the gold fever was at its highest, there were days and places in which they sold for three hundred. It is not strange that the rancheros lost their heads, grew careless and profligate.

Then came the drought of 1864, which killed off cattle by thousands of thousands. By thousands they were driven over steep places into the sea to save pasturage, and to save the country from the stench and the poison of their dying of hunger. In April of that year, fifty thousand head were sold in Santa Barbara for thirty-seven and a half

cents a head. Many of the rancheros were ruined; they had to mortgage their lands to live; their stock was gone; they could not farm; values so sank, that splendid estates were not worth over ten cents an acre.

Then came in a new set of owners. From the north and from the interior poured in the thriftier sheep men, with big flocks; and for a few years the wide belt of good pasturage land along the coast was chiefly a sheep country.

Slowly, farmers followed; settling, in the beginning, around town centers such as Los Angeles, Santa Barbara, Ventura. Grains and vegetables were grown for a resource when cattle and sheep should fail. Cows needed water all the year round; corn only a few months. A wheat-field might get time to ripen in a year when by reason of a drought a herd of cattle would die.

Thus the destiny of the country steadily went on toward its fulfilling, because the inexorable logic of the situation forced itself into the minds of the population. From grains and vegetables to fruits was a short and natural step, in the balmy air, under the sunny sky, and with the traditions and relics of the old friars' opulent fruit growths lingering all through the land. Each palm, orange tree, and vineyard left on the old mission sites was a way signal to the new peoples; mute, yet so eloquent, the wonder is that so many years should have elapsed before the road began to be thronged.

Such, in brief, is the chronicle of the development of South California's outdoor industries down to the present time; of the successions through which the country has been making ready to become what it will surely be, the Garden of the world; a garden with which no other country can vie; a garden in which will grow, side by side, the grape and the pumpkin, the pear and the orange, the olive and the apple, the strawberry and the lemon, Indian corn and the banana, wheat and the guava.

The leading position which the fruit interest will ultimately take has been reached only in Los Angeles County. There the four chief industries, ranged according to their relative importance, stand as follows: Fruit, grain, wool, stock and dairy. This county may be said to be preëminently the garden of the Garden. No other of the five counties can compete with it. Its fruit harvest is nearly unintermitted all the year round. The main orange crop ripens from January to May, though oranges hang on the trees all the year. The lemon, lime, and citron ripen and hang, like the orange. Apricots, pears, peaches, nectarines, strawberries, currants, and figs are plentiful in June; apples, pears, peaches, during July and August. Late in July, grapes begin and last till January. September is the best month of all, having grapes, peaches, pomegranates, walnuts, almonds, and a second crop of figs. From late in August till Christmas, the vintage does not cease.

HEAD GATE ON IRRIGATING DITCH.

The county has a sea-coast line of one hundred miles and contains three millions of acres; two-thirds mountain and desert, the remaining million good pasturage and tillable land. What is known as the great Los Angeles valley has an area of about sixty miles in length by thirty in width, and contains the three rivers of the county — the Los Angeles, the Santa Ana, and the San Gabriel. Every drop of the water of these rivers and of the numberless little springs and streams ministering to their system is owned, rated, utilized, and, one might almost add, wrangled over. The chapters of these water litigations

are many and full; and it behooves every new settler in the county to inform himself on that question first of all, and thoroughly.

In the Los Angeles valley lie several lesser valleys, fertile and beautiful; most notable of these, the San Gabriel valley, where was the site of the old San Gabriel Mission, twelve miles east of the town of Los Angeles. This valley is now taken up in large ranches or in colonies of settlers banded together for mutual help and security in matter of water rights. This colony feature is daily becoming more and more an important one in the development of the whole country. Small individual proprietors cannot usually afford the purchase of sufficient water to make horticultural enterprises successful or safe. The incorporated colony, therefore, offers advantages to large numbers of settlers of a class that could not otherwise get foothold in the country,—the men of comparatively small means, who expect to work with their hands and await patiently the slow growth of moderate fortunes,—a most useful and abiding class, making a solid basis for prosperity. Some of the best results in South California have already been attained in colonies of this sort, such as Anaheim, Riverside, and Pasadena. The method is regarded with increasing favor. It is a rule of give and take, which works equally well for both country and settlers.

The South California statistics of fruits, grain, wool, honey, etc., read more like fancy than like fact, and are not readily believed by one unacquainted with the country. The only way to get a real comprehension and intelligent acceptance of them is to study them on the ground. By a single visit to a great ranch one is more enlightened than he would be by committing to memory scores of Equalization Board Reports. One of the very best, if not the best, for this purpose is Baldwin's ranch, in the San Gabriel valley. It includes a large part of the old lands of the San Gabriel Mission, and is a principality in itself.

There are over a hundred men on its pay-roll, which averages $4000 a month. Another $4000 does not more than meet its running expenses. It has $6000 worth of machinery for its grain harvests alone. It has a dairy of forty cows, Jersey and Durham; one hundred and twenty work-horses and mules, and fifty thoroughbreds.

It is divided into four distinct estates: the Santa Anita, of 16,000 acres; Puente, 18,000; Merced, 20,000; and the Potrero, 25,000. The Puente and Merced are sheep ranches, and have 20,000 sheep on them. The Potrero is rented out to small farmers. The Santa Anita is the home estate. On it are the homes of the family and of the laborers. It has fifteen hundred acres of oak grove, four thousand acres in grain, five hundred in grass for hay, one hundred and fifty in orange orchards, fifty of almond trees, sixty of walnuts, twenty-five of pears, fifty of peaches, twenty of lemons, and five hundred in vines; also small orchards of chestnuts, hazel-nuts, and apricots; and thousands of acres of good pasturage.

From whatever side one approaches Santa Anita in May, he will drive through a wild garden — asters, yellow and white; scarlet pentstemons, blue larkspur, monk's-hood; lupines, white and blue; gorgeous golden eschscholtzia, alder, wild lilac, white sage—all in riotous flowering.

Entering the ranch by one of the north gates, he will look southward down gentle slopes of orchards and vineyards far across the valley, the tints growing softer and softer, and blending more and more with each mile, till all melt into a blue or purple haze. Driving from orchard to orchard, down half-mile avenues through orchards skirting seemingly endless stretches of vineyard, he begins to realize what comes of planting trees and vines by hundreds and tens of hundreds of acres, and the Equalization Board Statistics no longer appear to him even large. It does not seem wonderful that Los Angeles County should be reported as having sixty-two hundred acres in vines, when here on one man's ranch are five hundred acres. The last Equalization Board Report said the county had 256,135 orange and 41,250 lemon trees. It would hardly have surprised him to be told that there were as many as that in the Santa Anita groves alone. The effect on the eye of such huge tracts, planted with a single sort of tree, is to increase enormously the apparent size of the tract; the mind stumbles on the very threshold of the attempt to reckon its distances and numbers, and they become vaster and vaster as they grow vague.

The orange orchard is not the unqualifiedly beautiful spectacle one dreams it will be; nor, in fact, is it so beautiful as it ought to be, with its evergreen shining foliage, snowy blossoms, and golden fruit hanging together and lavishly all the year round. I fancy that, if travelers told truth, ninety-nine out of a hundred would confess to a grievous disappointment at their first sight of the orange at home. In South California, the trees labor under the great disadvantage of being surrounded by bare brown earth. How much this dulls their effect one realizes on finding now and then a neglected grove where grass has been allowed to grow under the trees, to their ruin as fruit-bearers, but incomparably heightening their beauty. Another fatal defect in the orange-tree is its contour. It is too round, too stout

CALIFORNIA SHEEP RANCH.

for its height; almost as bad a thing in a tree as in a human being. The uniformity of this contour of the trees, combined with the regularity of their setting in evenly spaced rows, gives large orange groves a certain tiresome quality, which one recognizes with a guilty sense of being shamefully ungrateful for so much splendor of sheen and color. The exact spherical shape of the fruit possibly helps on this tiresomeness. One wonders if oblong bunches of long-pointed and curving fruit, banana-like, set irregularly among the glossy green leaves, would not look better; which wonder adds to ingratitude an impertinence, of which one suddenly repents on seeing such a tree as I saw in a Los Angeles garden in

SHEEP-SHEARING.

the winter of 1882,—a tree not over thirty feet high, with twenty-five hundred golden oranges hanging on it, among leaves so glossy they glittered in the sun with the glitter of burnished metal. Never the Hesperides saw a more resplendent sight.

But the orange looks its best plucked and massed; it lends itself then to every sort and extent of decoration. At a citrus fair in the Riverside colony in March, 1882, in a building one hundred and fifty feet long by sixty wide, built of redwood planks, were five long tables loaded with oranges and lemons; rows, plates, pyramids, baskets; the bright redwood walls hung with great boughs, full as when broken from the tree; and each plate and pyramid decorated with the shining green leaves. The whole place was fairly ablaze, and made one think of the Arabian Nights' Tales. The acme of success in orange culture in California is said to have been attained in this Riverside colony, though it is only six years old, and does not yet number two thousand souls. There are in its orchards two hundred and nine thousand orange trees, of which twenty-eight thousand are in bearing, twenty thousand lemon trees, and eight thousand limes.

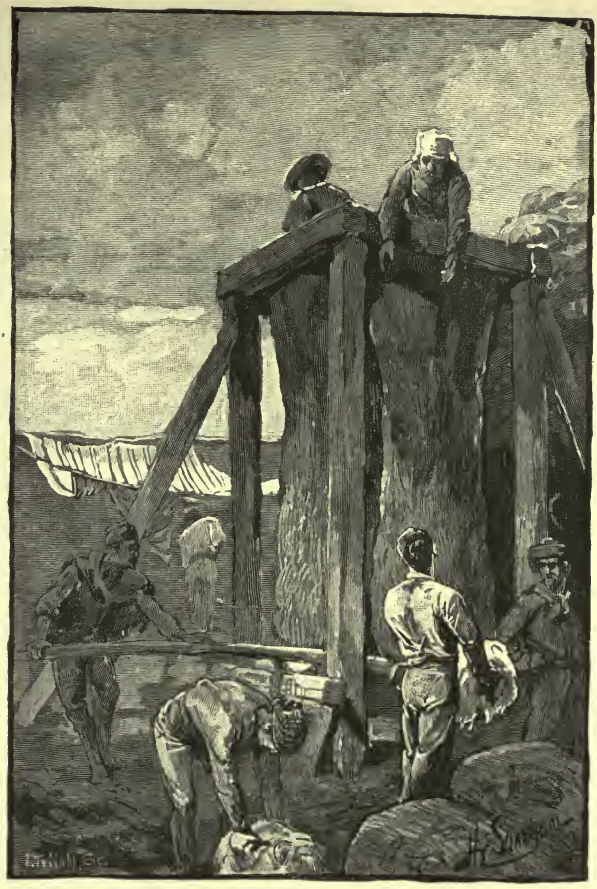
The profits of orange culture are slow to begin, but, having once begun, mount up fast. Orange orchards at San Gabriel have in many instances netted $500 an acre annually. The following estimate, the result of sixteen years' experience, is probably a fair one of the outlay and income of a small orange grove:

10 acres of land, at $75 per acre	$750.00
1000 trees, at $75 per hundred	750.00
Plowing and harrowing, $2.50 per acre	25.00
Digging holes, planting, 10 cents each	100.00
Irrigating and planting	10.00
Cultivation after irrigation	4.50
3 subsequent irrigations during the year	30.00
3 subsequent cultivations the first year	13.50
Total cost, first year	$1683.00

This estimate of cost of land is based on the price of the best lands in the San Gabriel valley. Fair lands can be bought in other sections at lower prices.

Second year.—An annual plowing in January	$25.00
Four irrigations during year	40.00
Six cultivations during year	27.00
Third year	125.00
Fourth year	150.00
Fifth year	200.00
Interest on investment	1000.00
Total	$3250.00

If first-class, healthy, thrifty budded trees are planted, they will begin to fruit the second year. The third year, a few boxes may be marketed. The fourth year, there will be an average yield of at least 75 oranges to the tree, which will equal:



BAGGING WOOL FOR TRANSPORTATION.

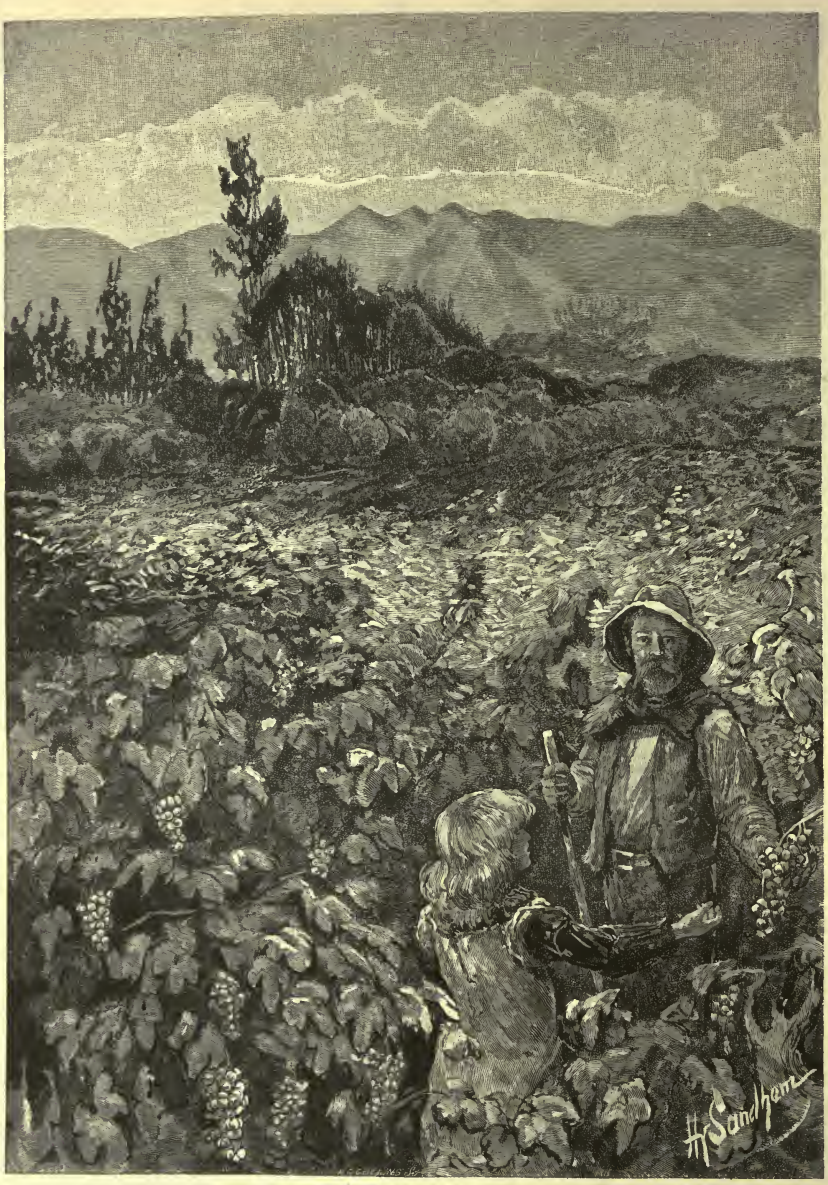
75,000, at $10 per thousand net	$750.00
The fifth year, 250 per tree, 250,000, at $10 per thousand	2500.00
Total	$3250.00

The orchard is now clear gain, allowing $1000 as interest on the investment. The increase in the volume of production will continue, until at the end of the tenth year an average of 1000 oranges to a tree would not be an extraordinary yield.

To all these formulas of reckoning should be added one with the algebraic x representing the unknown quantity, and standing for insect enemies at large. Each kind of fruit has its own, which must be fought with eternal vigilance. No port, in any country, has more rigid laws of quarantine than are now enforced in California against these insect enemies. Grafts, cuttings, fruit, if even suspected, are seized, and compelled to go through as severe disinfecting processes as if they were Cuban passengers fresh from a yellow fever epidemic.

The orange's worst enemy is a curious insect, the scale-bug. It looks more like a mildew than like anything alive; is usually black, sometimes red. Nothing but violent treatment with tobacco will eradicate it. Worse than the scale-bug, in that he works out of sight underground, is the gopher. He has gnawed every root of a tree bare before a tooth-mark on the trunk suggests his presence, and then it is too late to save the tree. The rabbit also is a pernicious ally in the barking business; he, however, being shy, soon disappears from settled localities; but the gopher stands not in fear of man or men. Only persistent strychnine, on his door-sills and thrust down his winding stairs, will save the orchard in which he has founded a community.

The almond and the walnut orchards are beautiful features in the landscape all the year round, no less in the winter, when their branches are naked, than in the season of their full leaf and bearing. In fact, the broad spaces of filmy gray made by their acres when leafless, are delicious values in contrast



A CALIFORNIA VINEYARD.

with the solid green of the orange orchards. The exquisite revelation of tree systems which stripped boughs give is seen to more perfect advantage against a warm sky than a cold one, and is heightened in effect standing side by side with the flowing green pepper trees and purple eucalyptus.

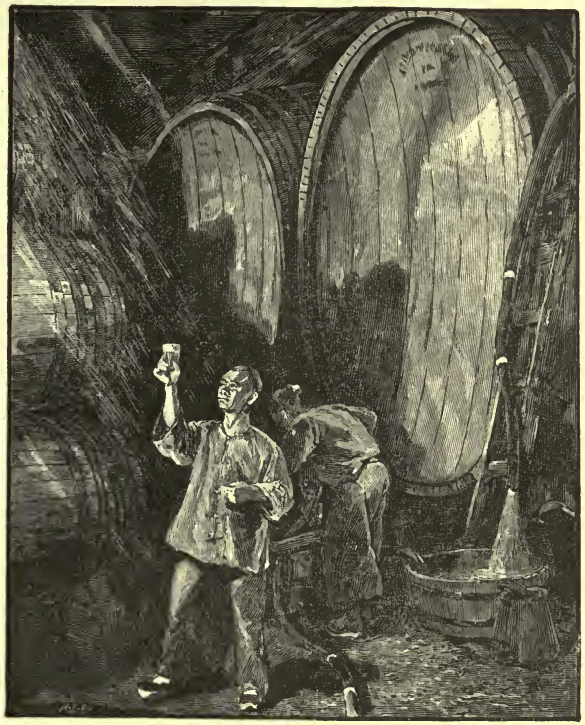
In the time of blossoms, an almond orchard, seen from a distance, is like nothing so much as a rosy-white cloud, floated off a sunset and spread on the earth. Seen nearer, it is a pink snow-storm, arrested and set on stalks, with an orchestra buzz of bees filling the air.

It is a pity that the almond tree should not be more repaying, for it will be a sore loss to the beauty of the country when the orchards are gone, and this is only a question of time. They are being uprooted and cast out. The crop is a disappointing one, of uncertain yield, and troublesome to prepare. The nuts must be five times handled: first picked, then shucked, then dried, then bleached, and then again dried. After the first drying, they are dipped by basketfuls into hot water, then poured into the bleachers—boxes with perforated bottoms. Underneath these is a sulphur

fire to which the nuts must be exposed for fifteen or twenty minutes. Then they are again spread in a drying-house. The final gathering them up to send to market makes really a sixth handling; and, after all is said and done, the nuts are not very good, being flavorless in comparison with those grown in Europe.

The walnut orchard is a better investment, and no less a delight to the eye. While young, the walnut tree is graceful; when old, it is stately. It is a sturdy bearer, and, if it did not bear at all, would be worth honorable place and room on large estates, simply for its avenues of generous shade. It is planted in the seed, and transplanted at two or three years old, with only twenty-seven trees to an acre. They begin to bear at ten years, reach full bearing at fifteen, and do not give sign of failing at fifty.

Most interesting of all South California's outdoor industries is the grape culture. To speak of grape culture is to enter upon a subject which needs a volume. Its history, its riches past and prospective, its methods, its beautiful panorama of pictures, each by itself is worth study and exhaustive treatment. Since the days of Eschol, the vine and the vineyard have been honored in the thoughts and the imaginations of men; they furnished shapes and designs for the earliest sacred decorations in the old dispensation, and suggestions and symbols for divine parables in the new. No age has been without them, and no country whose sun was warm enough to make them thrive. It is safe to predict that, so long as the visible frame of the earth endures, "wine to make glad the heart of man" will be made, loved, celebrated, and sung.



TESTING WINE.

To form some idea of California's future wealth from the grape culture, it is only necessary to reflect on the extent of her grape-growing country as compared with that of France. In France, before the days of the phylloxera, 5,000,000 of people were supported entirely by the grape industry, and the annual average of the wine crop was 2,000,000,000 gallons, with a value of $400,000,000. The annual wine yield of California is already estimated at about 10,000,000 gallons. Nearly one-third of this is made in South California, chiefly in Los Angeles County, where the grape culture is steadily on the increase, five millions of new vines having been set out in the spring of 1882.

The vineyards offer more variety to the eye than the orange orchards. In winter, when leafless, they are grotesque, their stocky, twisted, hunchback stems looking like Hindoo idols or deformed imps, no two alike in

a square mile, all weird, fantastic, uncanny. Their first leafing-out does not do away with this; the imps seem simply to have put up green umbrellas; but presently the leaves widen and lap, hiding the uncouth trunks, and spreading over all the vineyard a beautiful, tender green, with lights and shades breaking exquisitely in the hollows and curves of the great leaves. From this on, through all the stages of blossoms and seed-setting, till the clusters are so big and purple that they gleam out everywhere between the leaves,—sometimes forty-five pounds on a single vine, if the vine is irrigated, twelve if it is left to itself. Eight tons of grapes off one acre have been taken in the Baldwin ranch. There were made there, in 1881, 100,000 gallons of wine and 50,000 of brandy. The vintage begins late in August and lasts many weeks, some varieties of grapes ripening later than others. The vineyards are thronged with Mexican and Indian pickers. The Indians come in bands and pitch their tents just outside the vineyard. They are good workers. The wine-cellars and the great crushing-vats tell the vineyards' story more emphatically even than the statistical figures. A vat that will hold 1000 gallons piled full of grapes, huge wire wheels driving round and round in the spurting, foaming mass, the juice flying off through trough-like shoots on each side into seventy great vats; below, breathless men working the wheels, loads of grapes coming up momently and being poured into the swirling vat, the whole air reeking with winy flavor. The scene makes earth seem young again, old mythologies real; and one would not wonder to see Bacchus and his leopards come bowling up, with shouting Pan behind.

The cellars are still, dark, and fragrant. Forty-eight great oval-shaped butts, ten feet in diameter, holding 2100 gallons each, I counted in one cellar. The butts are made of Michigan oak, and have a fine yellow color, which contrasts well with the red stream of the wine when it is drawn.

Notwithstanding the increase of the grape culture, the price of grapes is advancing, some estimates making it forty per cent. higher than it was five years ago. It is a quicker and probably a more repaying industry than orange-growing. It is reckoned that a vineyard in its fourth year will produce two tons to the acre; in the seventh year, four; the fourth year it will be profitable, reckoning the cost of the vineyard at sixty dollars an acre, exclusive of the first cost of the land. The annual expense of cultivation, picking, and handling is about twenty-five dollars. The rapid increase of this culture has been marvelous. In 1848, there were only 200,000 vines in all California; in 1862, there were 9,500,000; in 1881, 64,000,000, of which at least 34,000,000 are in full bearing.

Such facts and figures are distressing to the advocates of total abstinence; but they may take heart in the thought that a by no means insignificant proportion of these grapes will be made into raisins, canned, or eaten fresh.

The raisin crop was estimated at 160,000 boxes for 1881. Many grape-growers believe that in raisin-making will ultimately be found the greatest profit. The Americans are a raisin-eating people. From Malaga alone are imported annually into the United States about ten tons of raisins, one-half the entire crop of the Malaga raisin district. This district has an area of only about four hundred square miles. In California, an area of at least 20,000 square miles is adapted to the raisin.

A moderate estimate of the entire annual grape crop of California is 119,000 tons. "Allowing 60,000 tons to be used in making wines, 2000 tons to be sent fresh to the Eastern States, and 5000 tons to be made into raisins, there would still remain 52,000 tons to be eaten fresh or wasted—more than one hundred pounds for each resident of California, including children." *

The California wines are as yet of inferior quality. A variety of still wines and three champagnes are made; but even the best are looked on with distrust and disfavor by connoisseurs, and until they greatly improve they will not command a ready market in America. At present, it is to be feared that a large proportion of them are sold under foreign labels.

Prominent among the minor industries is honey-making. From the great variety of flowers and their spicy flavor, especially from the aromatic sages, the honey is said to have a unique and delicious taste, resembling that of the famous honey of Hymettus.

The crop for 1881, in the four southern counties, was estimated at three millions of pounds; a statistic that must seem surprising to General Fremont, who, in his report to Congress of explorations on the Pacific coast in 1844, stated that the honey-bee could not exist west of the Sierra Nevadas.

The bee ranches are always picturesque: they are usually in cañons or on wooded foot-hills, and their villages of tiny bright-colored hives look like gay Lilliputian encampments. It has appeared to me that men becoming guardians of bees acquire a peculiar calm philosophy, and are superior to

* John G. Hittell's "Commerce and Industries of the Pacific Coast."

WIND-BREAK OF EUCALYPTUS TREES TO PROTECT ORCHARDS.

other farmers and outdoor workers. It would not seem unnatural that the profound respect they are forced to entertain for insects so small and so wholly at their mercy should give them enlarged standards in many things; above all, should breed in them a fine and just humility toward all creatures.

A striking instance of this is to be seen in one of the most beautiful cañons of the San Gabriel valley, where, living in a three-roomed, redwood log cabin, with a vine-covered booth in front, is an old man, kings might envy.

He had a soldier's warranty deed for one hundred and sixty acres of land, and he elected to take his estate at the head of a brook-swept gorge, four-fifths precipice and rock. In the two miles between his cabin and the mouth of the gorge, the trail and the brook change sides sixteen times. When the brook is at its best, the trail goes under altogether, and there is no getting up or down the cañon. Here, with a village of bees for companions, the old man has lived for a dozen years. While the bees are off at work, he sits at home and weaves, out of the gnarled stems and roots of manzanita and laurels, curious baskets, chairs, and brackets, for which he finds ready market in Los Angeles. He knows every tree and shrub in the cañon, and has a fancy for collecting specimens of all the native woods of the region. These he shapes into paper-cutters, and polishes them till they are like satin. He came from Ohio forty years ago, and has lived in a score of States. The only spot he likes as well as this gorge is Don Yana, on the Rio Grande River, in Mexico. Sometimes he hankers to go there and sit under the shadow of big oaks, where the land slopes down to the river; but "the bee business," he says, "is a good business only for a man who has the gift of continuance"; and "it's no use to try to put bees with farms: farms want valleys, bees want mountains."

"There are great back-draws to the bee business, the irregularities of the flowers being chief; some years there's no honey in the flowers at all. Some explain it on one hypothesis and some on another, and it lasts them to quarrel over."

His phrases astonish you; also the quiet courtesy of his manner, so at odds with his backwoodsman's garb. But presently you learn that he began life as a lawyer, has been a judge in his time; and when, to show his assortment of paper-cutters, he lifts down the big book they are kept in, and you see that it is Voltaire's "Philosophical Dictionary," you understand how his speech has been fashioned. He keeps a diary of every hive, the genealogy of every swarm.

"No matter what they do,—the least thing,—we note it right down in the book. That's the only way to learn bees," he says.

On the outside wall of the cabin is fastened an observation hive, with glass sides. Here he sits, watch in hand, observing and noting; he times the bees, in and out, and in each one of their operations. He watches the queen on her bridal tour in the air; once the drone bridegroom fell dead on his note-book. "I declare I couldn't help feeling sort of sorry for him," said the old man.

In a shanty behind the house is the great honey-strainer, a marvelous invention, which would drive bees mad with despair if they could understand it. Into a wheel, with perforated spokes, is slipped the comb full of honey, the cells being first opened with a hot knife. By the swift turning of this wheel, the honey flies out of the comb, and pours through a cylinder into a can underneath, leaving the comb whole and uninjured, ready to be put back into the hive for the patient robbed bees to fill again. The receiving-can will hold fifteen hundred pounds; two men can fill it in a day; a single comb is so quickly drained that a bee might leave his

A LIVE-OAK GROVE.

hive on his foraging expedition, and before he could get his little load of honey and return, the comb could be emptied and put back. It would be vastly interesting to know what is thought and said in bee-hives about these mysterious emptyings of combs.

A still more tyrannical circumvention has been devised, to get extra rations of honey from bees: false combs, wonderful imitations of the real ones, are made of wax. Apparently the bees know no difference; at any rate, they fill the counterfeit full of real honey. These artificial combs, carefully handled, will last ten or twelve years in continual use.

The highest yield his hives had ever given him was one hundred and eighty pounds a hive.

"That's a good yield; at that rate, with three or four hundred hives, I'd do very well," said the old man. "But you're at the mercy of speculators in honey as well as everything else. I never count on getting more than four or five cents a pound. They make more than I do."

The bee has a full year's work in South California: from March to August inexhaustible forage, and in all the other months plenty to do,—no month without some blossoms to be found. His time of danger is when apricots are ripe and lady-bugs fly.

Of apricots, bees will eat till they are either drunk or stuffed to death; no one knows which. They do not live to get home. Oddly enough, they cannot pierce the skins themselves, but have to wait till the lady-bug has made a hole for them. It must have been an accidental thing in the outset, the first bee's joining a lady-bug at her feast of apricot. The bee, in his turn, is an irresistible treat to the bee-bird and lizard, who pounce upon him when he is on the flower; and to a stealthy moth, who creeps by night into hives and kills hundreds.

"Nobody need think the bee business is all play," was our old philosopher's last word. "It's just like everything else in life, and harder than some things."

THE sheep industry is, on the whole, decreasing in California. In 1876, the wool crop of the entire State was 28,000 tons; in 1881, only 21,500. This is the result, in part, of fluctuations in the price of wool, but more of the growing sense of the greater certainty of increase from agriculture and horticulture.

The cost of keeping a sheep averages only $1.25 a year. Its wool sells for $1.50, and for each hundred there will be forty-five

lambs, worth 75 cents each. But there have been droughts in California which have killed over one million of sheep in a year; there is always, therefore, the risk of losing in one year the profits of many.

The sheep ranches are usually desolate places: a great stretch of seemingly bare lands, with a few fenced corrals, blackened and foul smelling; the home and out-buildings clustered together in a hollow or on a hill-side where there is water; the less human the neighborhood the better.

The loneliness of the life is, of itself, a salient objection to the industry. Of this the great owners need know nothing; they can live where they like. But for the small sheepmen, the shepherds, and, above all, the herders, it is a terrible life,—how terrible is shown by the frequency of insanity among herders. Sometimes, after only a few months of the life, a herder goes suddenly mad. After learning this fact, it is no longer possible to see the picturesque side of the effective groups one so often comes on suddenly in the wildernesses: sheep peacefully grazing, and the shepherd lying on the ground watching them, or the whole flock racing in a solid, fleecy, billowy scamper up or down a steep hill-side, with the dogs leaping and barking on all sides at once. One scans the shepherd's face alone, with pitying fear lest he may be losing his wits.

A shearing at a large sheep ranch is a grand sight. We had the good fortune to see one at Baldwin's, at La Puente. Three thousand sheep had been sheared the day before, and they would shear twenty-five hundred on this day.

A shed sixty feet long by twenty-five wide, sides open; small pens full of sheep surrounding it on three sides; eighty men bent over at every possible angle, eighty sheep being tightly held in every possible position, eighty shears flashing, glancing, clipping; bright Mexican eyes shining, laughing, Mexican voices jesting. At first, it seemed only a confused scene of phantasmagoria. As our eyes became familiarized, the confusion disentangled itself, and we could note the splendid forms of the men and their marvelous dexterity in using the shears. Less than five minutes it took from the time a sheep was grasped, dragged in, thrown down, seized by the shearer's knees, till it was set free, clean shorn, and its three-pound fleece tossed on a table outside. A good shearer shears seventy or eighty sheep in a day; men of extra dexterity shear a hundred. The Indians are famous for skill at shearing, and in all their large villages are organized shearing bands, with captains, that go from ranch to ranch in the shearing season. There were a half dozen Indians lying on the ground outside this shearing shed at Puente, looking on wistfully. The Mexicans had crowded them out for that day, and they could get no chance to work.

A pay clerk stood in the center of the shed with a leathern wallet full of five-cent pieces. As soon as a man had sheared his sheep, he ran to the clerk, fleece in hand, threw down the fleece, and received his five-cent piece. In one corner of the shed was a barrel of beer, which was retailed at five cents a glass; and far too many of the five-cent pieces changed hands again the next minute at the beer barrel. As fast as the fleeces were tossed out from the shed, they were thrown up to a man standing on the top of the roof. This man flung them into an enormous bale-sack, swinging wide-mouthed from a derrick; in the sack stood another man, who jumped on the wool to pack it down tight.

As soon as the shearers perceived that their pictures were being drawn by the artist in our party, they were all agog; by twos and threes they left their work and crowded around the carriage, peering, commenting, asking to have their portraits taken, quizzing those whose features they recognized; it was like Italy rather than America. One tattered fellow, whose shoeless feet were tied up in bits of gunny-bags, was distressed because his trowsers were too short. "Would the gentleman kindly make them in the drawing a little farther down his legs. It was an accident they were so short." All were ready to pose and stand, even in the most difficult attitudes, as long as was required. Those who had done so asked, like children, if their names could not be put in the book, so I wrote them all down: "Juan Canero, Juan Rivera, Felipe Ybara, José Jesus Lopez, and Domingo Garcia." The space they will fill is a little thing to give, and there is a satisfaction in the good faith of printing them, though the shearers will most assuredly never know it.

The faces of the sheep being shorn were piteous; not a struggle, not a bleat, the whole of their unwillingness and terror being written in their upturned eyes. "As a sheep before her shearers is dumb" will always have for me a new significance.

The shepherd in charge of the Puente ranch is an Italian named Gaetano. The porch of his shanty was wreathed with vines and blossoms, and opened on a characteristic little garden, half garlic, the other half pinks and geraniums. As I sat there looking out on the scene, he told me of a young man who had come from Italy to be herder for him, and who had gone mad and shot himself.

"Three go crazy last year," he said. "Dey come home, not know noting. You see, never got company for speak at all."

This young boy grew melancholy almost at once, was filled with abnormal fears of the coyotes, and begged for a pistol to shoot them with. "He want my pistol. I not want give. I say, You little sick; you stay home in house; I send oder man. My wife she go town buy clothes for baptism one baby got. He get pistol in drawer while she gone." They found him lying dead with his catechism in one hand and the pistol in the other. As Gaetano finished the story, a great flock of two thousand shorn sheep were suddenly let out from one of the corrals. With a great burst of bleating they dashed off, the colly running after them. Gaetano seized his whistle and blew a sharp call on it. The dog halted, looked back, uncertain for a second; one more whistle, and he bounded on.

"He know," said Gaetano. "He take dem two tousand all right. I like better dat dog as ten men."

On the list of South California's outdoor industries grain stands high, and will always continue to do so. Wheat takes the lead, but oats, barley, and corn are of importance. Barley is always a staple, and averages twenty bushels to the acre.

Oats average from thirty to forty bushels an acre, and there are records of yields of considerably over a hundred bushels.

Corn will average forty bushels an acre. On the Los Angeles River it has grown stalks seventeen feet high and seven inches round.

The average yield of wheat is from twenty to twenty-five bushels an acre, about thirty-three per cent. more than in the States on the Atlantic slope.

In grains, as in so many other things, Los Angeles County is far in advance of the other counties. In 1879, there were in the county 31,500 acres in wheat; in 1881, not less than 100,000; and the value of the wheat crop for 1882 was reckoned at $1,020,000.

The great San Fernando valley, formerly the property of the San Fernando Mission, is the chief wheat-producing section of the county. The larger part of this valley is in two great ranches. One of them was bought a few years ago for $275,000, and $75,000 paid down, the remainder to be paid in installments. The next year was a dry year; crops failed. The purchaser offered the ranch back again to the original owners, with his $75,000 thrown in, if they would release him from his bargain. They refused. The next winter rains came, the wheat crop was large, prices were high, and the ranch actually paid off the entire debt of $200,000 still owing on the purchase.

From such figures as these, it is easy to see how the California farmer can afford to look with equanimity on occasional droughts. Experience has shown that he can lose crops two years out of five, and yet make a fair average profit for the five years.

The most beautiful ranch in California is said to be the one about twelve miles west of Santa Barbara, belonging to Elwood Cooper. Its owner speaks of it humorously as a little "pocket ranch." In comparison with the great ranches whose acres are counted by tens of thousands, it is small, being only two thousand acres in extent; but in any other part of the world except California, it would be thought a wild jest to speak of an estate of two thousand acres as a small one.

Ten years ago this ranch was a bare, desolate sheep ranch,—not a tree on it, excepting the oaks and sycamores in the cañons. To-day it has twelve hundred acres under high cultivation; and, driving from field to field, orchard to orchard, one drives, if he sees the whole of the ranch, over eleven miles of good made road. There are three hundred acres in wheat, one hundred and seventy in barley; thirty-five hundred walnut trees, twelve thousand almond, five thousand olive, two thousand fig and domestic fruit trees, and one hundred and fifty thousand eucalyptus trees, representing twenty-four varieties; one thousand grape-vines; a few orange, lemon, and lime trees. There are on the ranch one hundred head of cattle, fifty horses, and fifteen hundred sheep.

These are mere bald figures, wonderful enough as statistics of what may be done in ten years' time on South California soil, but totally inadequate even to suggest the beauty of the place.

The first relief to the monotony of the arrow-straight road which it pleased an impatient, inartistic man to make westward from Santa Barbara, is the sight of high, dark walls of eucalyptus trees on either side the road. A shaded avenue, three-quarters of a mile long, of these represents the frontages of Mr. Cooper's estate. Turning to the right, through a break in this wall, is a road, with dense eucalyptus woods on the left and an almond orchard on the right. It winds and turns, past knolls of walnut grove, long lines of olive orchard, and right-angled walls of eucalyptus trees shutting in wheat-fields. By curves and bends and sharp turns, all the time with new views, and new colors from changes of crop, with exquisite glimpses of the sea shot through here and there, it finally, at the end of a mile, reaches the brink of an oak-canopied cañon. In the mouth of this cañon stands the house, fronting south on a

sunny meadow and garden space, walled in on three sides by eucalyptus trees.

To describe the oak kingdom of this cañon would be to begin far back of all known kingdoms of the country. The branches are a net-work of rafters upholding roof canopies of boughs and leaves so solid that the sun's rays pierce them only brokenly, making on the ground a dancing carpet of brown and gold flecks even in winter, and in summer a shade lighted only by starry glints.

Farther up the cañon are sycamores, no less stately than the oaks, their limbs gnarled and twisted as if they had won their places by splendid wrestle.

These oak-and-sycamore-filled cañons are the most beautiful of the South California cañons; though the soft, chaparral-walled cañons would, in some lights, press them hard for supremacy of place. Nobody will ever, by pencil, or brush, or pen, fairly render the beauty of the mysterious, undefined, undefinable chaparral. Matted, tangled, twisted, piled, tufted—everything is chaparral. All botany may be exhausted in describing it in one place, and it will not avail you in another. But in all places, and made up of whatever hundreds of shrubs it may be, it is the most exquisite carpet surface that nature has to show for mountain fronts or cañon sides. Not a color that it does not take; not a bloom that it cannot rival; a bank of cloud cannot be softer, or a bed of flowers more varied of hue. Some day, between 1900 and 2000, when South California is at leisure and has native artists, she will have an artist of cañons, whose life, and love, and work will be spent in picturing them: the royal oak canopies; the herculean sycamores; the chameleon, velvety chaparral; and the wild, throe-built, water-quarried rock gorges, with their myriad ferns and flowers.

At the head of Mr. Cooper's cañon are broken and jutting sandstone walls over three hundred feet high, draped with mosses and ferns, and all manner of vines. I saw the dainty thalictrum, with its clover-like leaves, standing in thickets there, fresh and green, its blossoms nearly out on the first day of February. Looking down from these heights over the whole of the ranch, one sees for the first time the completeness of its beauty. The eucalyptus belts have been planted in every instance solely with a view to utility: either as wind-breaks to keep off known special wind-currents from orchard or grain-field, or to make use of gorge sides too steep for other cultivation. Yet, had they been planted with sole reference to landscape effects, they could not better have fallen into place. Even out to the very ocean edge the groves run, their purples and greens melting into the purples and greens of the sea when it is dark and when it is sunny blue—making harmonious lines of color, leading up from it to the soft grays of the olive and the bright greens of the walnut orchards and wheat-fields. When the almond trees are in bloom, the eucalyptus belts are perhaps most superb of all, with their dark spears and plumes waving above and around the white and rosy acres.

The leading industry of this ranch is to be the making of olive oil. Already its oil is known and sought; and to taste it is a revelation to palates accustomed to the compounds of rancid cocoanut and cotton seed with which the markets are full. The olive industry will no doubt ultimately be one of the great industries of the whole country: vast tracts of land which are not suitable or do not command water enough for orange, grape, or grain culture, affording ample support to the thrifty and unexacting olive. The hill-slopes around San Diego, and along the coast line for forty or fifty miles up, will no doubt one day be as thickly planted with olives as is the Mediterranean shore. Italy's olive crop is worth thirty million dollars annually, and California has as much land suited to the olive as Italy has.

The tree is propagated from cuttings, begins to bear the fourth year, and is in full bearing by the tenth or twelfth. One hundred and ten can be planted to an acre. Their endurance is enormous. Some of the orchards planted by the friars at the missions over a hundred years ago are still bearing, spite of scores of years of neglect, and there are records of trees in Nice having borne for several centuries.

The process of oil-making is an interesting spectacle, under Mr. Cooper's oak trees. The olives are first dried in trays with slat bottoms, tiers upon tiers of these, being piled in a kiln over a furnace fire. Then they are ground between stone rollers, worked by huge wheels, turned by horse-power. The oil, thus pressed out, is poured into huge butts or tanks. Here it has to stand and settle three or four months. There are faucets at different levels in these butts, so as to draw off different layers of oil. After it has settled sufficiently, it is filtered through six layers of cotton batting, then through one of French paper, before it is bottled. It is then of a delicate straw color, with a slight greenish tint—not at all of the golden yellow of the ordinary market article. That golden yellow and the thickening in cold are sure proofs of the presence of cotton seed in oil,—the pure oil remaining limpid in a cold which will turn the adulterated oils white and thick. It is estimated that an acre of

olives in full bearing will pay fifteen hundred dollars a year if pickled, and two thousand dollars a year made into oil.

In observing the industries of South California and studying their history, one never escapes from an under-current of wonder that there should be any industries or industry there. No winter to be prepared for; no fixed time at which anything must be done or not done at all; the air sunny, balmy, dreamy, seductive, making the mere being alive in it a pleasure; all sorts of fruits and grains growing a-riot, and taking care of themselves;—it is easy to understand the character, or, to speak more accurately, the lack of character, of the old Mexican and Spanish Californians.

There was a charm in it, however. Simply out of sunshine, there had distilled in them an Orientalism as fine in its way as that made in the East by generations of prophets, crusaders, and poets.

With no more curiosity than was embodied in "Who knows?"—with no thought or purpose for a future more defined than "Some other time; not to-day,"—without greeds, and with the unlimited generosities of children,—no wonder that to them the restless, inquisitive, insatiable, close-reckoning Yankee seemed the most intolerable of all conquerors to whom they could surrender. One can fancy them shuddering, even in heaven, as they look down to-day on his colonies, his railroads, his crops—their whole land humming and buzzing with his industries.

One questions also whether, as the generations move on, the atmosphere of life in the sunny empire they lost will not revert more and more to their type, and be less and less of the type they so disliked. Unto the third and fourth generation, perhaps, pulses may keep up the tireless Yankee beat; but, sooner or later, there is certain to come a slacking, a toning down, and a re-adjusting of standards and habits by a scale in which money and work will not be the highest values. This is "as sure as that the sun shines," for it is the sun that will bring it about.

H. H.

HIS QUEST.

WHAT seek'st thou at this madman's pace?
"I seek my love's new dwelling place;
Her house is dark, her doors are wide,
There bat and owl and beetle bide,
And there, breast-high, the rank weeds grow,
And drowsy poppies nod and blow.
So mount I swift to ride me through
The world to find my love anew.
I have no token of the way;
I haste by night, I press by day.
Through busy cities I am borne,
On lonely heights I watch the morn
Climb up the east, and see the light
Of waning moon gleam thwart my flight.
Sometimes a light before me flees;
I follow it, till stormy seas
Break wide before, then all is dark.
Sometimes on plains, wide, still, and stark,
I hear a voice; I seek the sound,
And ride into a hush profound.
To find her dwelling I will ride
Worlds through and through, whate'er betide."

To find her dwelling rode he forth,
In vain rode south, in vain rode north;
In vain in mountain, plain, and mart
He searched, but never searched his heart.

L. Frank Tooker.

CHARACTERISTICS OF LONDON.

WHAT survives of the seven wonders of the world may mainly be seen in London, itself the eighth and greatest, not only for what of the Old World and older times it holds, but for the living, growing marvel that it is, the highest achievement of the agglomerating human spirit. With all the years I have known it, and the times I have been in and out of it, I find at every return that I scarcely know how great it is, or realize how wise and how wicked, how noble and how degraded. Mighty and wealthy beyond any dreams of Arabian Nights; wrapping in its tortuous folds all extremes of human existence; by turns, a city of palaces, and the nest of the highest and divinest human impulse, and the smoke-blackened, fog-wrapped, dingy, gloomy capital of Cimmeria; plague latent in its alleys, and utter destitution driving its people to death and all degradation in clouds like the flies that perish,—it seems the very focus of life-and-death ferment, quickening and releasing at once what is divinest and most infernal in the human heart, and ripening both, as no other city built by human hands can do.

Visit it for the first time from the south, if possible—in the autumn, and towards the close of day, when the gray incertitude lies on the mighty city. You will have come through the lovely country of Kent and Surrey,— garden of England,— the little compact villages twinkling by the railway side, the ever-green fields chasing the parks, and the parks following the downs, in an unbroken succession of lovely landscapes; then the villages come closer together, and you see the houses begin to lose their pagan aspect and grow up stories higher—villas—suburb houses, miles of suburbs with intervals yet to become city; and then you come on the outskirts of the world's metropolis, no longer suburbs pushing off for better air, but low, dingy haunts of labor and poverty, packed and involved in economic leaseholds on earth's surface—scarcely more than grave-yard room. You look down into the streets —into the windows, down chimney-pots even; and the din of unnumbered streets, the smoke of myriad chimneys, and the twinkle of lamps as the very stars of heaven for their multitude, come up to you whirling along dizzily above it all. You hear the hum of the world below you, and, as far as the eye can catch the gleam of gas-light through the space around, there is an unbroken, endless wilderness of houses. Wider streets yawn and send up a sudden, stronger pulsation of sound, but no change beyond. Lights burn dimmer, smoke grows denser, the indefinite grows more and more indefinite. You wonder what would happen if a broken rail should send your train off that line of arches which overstretches London,—the highway of the age of mechanism bringing you into the capital and working center of the modern mechanical system; and while you wonder still, your train flashes out as into mid-air, and you see on both sides a gray and hazy tide, twinkling with wavy lights and spanned with bridges, either vista ending in mystery. This is Father Thames; after the Tiber, greatest of rivers. Here the history of modern civilization centers; and from Cæsar to William of Orange the possession of this water-course has been a main motive in struggles which have widened, deepened, and established human rights and wise government more than those of all other civilized countries in the same epoch. For the Thames made London, and the salt sea which ebbs and flows at its doors has kept alive liberty and prosperity through disasters which would have destroyed an inland town many times; and that municipal independence which has never failed London is the source of all that is healthiest and most truly conservative in our modern political organization.

As the river vanishes from sight, your train slows within the vast and mysterious structure, last creation of architecture, where sight and hearing are alike confounded; calls and cries, whistles and bells, a score of locomotives coming and going, trains entering and trains departing, a ceaseless flood and ebb of passengers, bewildering, confusing to every sense but their own, yet each ticketed to his destination and surely directed to his train. The system, the consummate order with which the demands of a commerce so vast are met and satisfied, the want of bustle and fussiness, impress a stranger more than anything else in this first impression of London. One can but recall the Romans, the great builders and organizers, the masters of all good system of civic things in the old time as these are in our day.

This is the side of English character which imposes on me, compels me to, a deference and respect which deepen as I know the

more of it. In taste, they are barbarians; in comprehension of the principles of political or social science, they are *arrières* and blindly conservative; but they build better than they know, by an intuition; and the gravitation of the national character is, in spite of their prejudices against progress, carrying them to the best and safest form of civilization—that based on an inborn morality, love of justice, and respect for human rights. It seems strange, looking at the history of England,—at her imperial policy of to-day, at such huge violations of both justice and human rights as are involved in her church system, at her rule in India, at her arbitrary and, at times, wicked domineering over weak and disorganized nations,—to talk of love of both justice and human rights as traits of English character. But no man can live in London long and not understand the problem. The acts which in his government the Englishman consents to, in his individual capacity he abhors; and while his fleets beat down the unoffending gates of China and his armies commit huge fillibusterings in India, there is no great city in the world where a stranger is so certain of justice, or the weak are so effectually upheld against the strong, as in London. The law is blind, crooked, and perverse, but sure and equal; its administration is on the practice of by-gone ages, slow, reticular, complicated; but where it is a question of justice, no human jurisprudence is more effective or impartial. It is too much a city of shop-keepers,—but of great shop-keepers, with a mercantile morality such as accounts for a commercial power and prosperity unrivaled since the world began. What London does, it does slowly but well. English civilization is not full of fine-spun theories and declamatory recognitions, but is, in all the personal relations, profoundly moral, and (if sometimes mistakenly) religious as well; and if the morality be of a rather uncharitable type, and the religion brings out now and then its Juggernaut car, it is at least something that they maintain their steady pursuit of human well-being.

All that is hard and unsympathetic, ugly and unsentimental, in England, you see as you drive or walk from the station to your hotel; all that is servile and snobbish, and respectable and extortionate, after you have got there; and as you sit by your window in the dim November evening, waiting for your coal fire to break the chill which begins to enter your soul, I misdoubt much if you do not begin to forswear England.

All that man has done for London has been to the eye ill done; nature has been bounteous to her as to few cities. Illimitable liberty of growth, equal facility of access, a plain country round, and the sea at its gates; the railway radiating and the tide ebbing and flowing with the traffic sustained by the wealth accumulated in centuries. No one knows how rich she is, and no one who has not wandered about her for weeks can conjecture how huge. We may talk of our western empire and our admirable ports, of our growth and our growing wealth; but here is, and will remain for generations, the center of the commercial and political world, the focus of intellectual activity, and the mint of thought. Here ferments the largest and most highly developed humanity which as yet the universal mother has given birth to, and here the whole world's intellect comes to pay its homage. We boast, but out of this mint of London comes most of what is newest as well as of what is rarest in human work. "Solitude is the nurse of great thought," but society is its mother; and, in London, society is most complex and solitude most easy of access in any of all the aggregations of men. The seclusion of the backwoods is not more complete, so far as intellectual or social influences are concerned, than lodgings in some of the out-of-the-way quarters of London. The extremes meet—the publicity of the court journal and a privacy which defies the detective police; a wealth, not of individuals, as with us, but of classes, which suspends the laws of political economy, and a concomitant poverty which threatens one day to subvert them; vortices of prosperity and misery, into which society at its extremes rushes with accelerating and concentrating velocity; here a quarter where, in teeming filth, humanity is crowded out of existence, hour by hour, with a destitution and degradation of woe uniquely the property of London,—a bottomless pit of misery, emergence from which into anything by death must be light and life; and then a region of palaces, with a luxury and profusion such as England's kings, even three hundred years ago, would have held as fabulous: whatever there is of most opposite and extreme in life or death, in power or utter impotence, in having or want, is here.

London is one of the few perennial sensations of this world,—like the sea, a primeval forest, Sahara, or the multitude of stars, all measurable, doubtless, but in terms between which and the infinite we can no more perceive the distinction than we can from the top of St. Paul's perceive the margin of the city. You enter it not knowing exactly where, and when you leave it you do so by so fine degrees that you have not been able to say where the town ended and the country began. It draws all England to it. It pervades the realm. Even the cabmen do not

know the whole of it. When you have spent months exploring it, you find some day a new quarter opening to your eyes. I believe that no one can appreciate it fully but an American thoroughly versed in English history and in the practical knowledge of his own country. To him all the historical associations have the mingled charms of novelty and antiquity; there is the delightful surprise of seeing a real and vitalized antiquity, which strikes him much like going into Barbarossa's cavern and finding the middle ages just waking up. In his picture gallery nothing is cheapened by common uses, and nothing lost by contradictory associations; Henry VIII.'s palace has not been forever a barber's shop, or the Strand a tide-way of shop-keeping. Familiarity breeds contempt, indeed, and no London-bred boy can have a reverence for an antiquity he saw white-washed yesterday. We come to the old scenes with an ancestral reverence for objects which are not only England's but ours — in which we have the romantic interest of historical cause without the galling burden of political effect. English associations are to us utterly delightful, and London especially a huge romance, a bazaar of the Arabian Nights, in which at one time we encounter Cromwell, and at another Dick Whittington.

But do not imagine that you can get the characteristic impression of London by running over it. When curiosity is satisfied and such familiarity as a stranger can get is attained, it will still be reserved for some moment of a sublime quiet and removal from details to give you the key-note of its greatness. As I write, sitting by my study window, full five miles from the city proper, I hear the roar of the traffic like the sea on a rocky shore — the rush of incessant trains along the iron ways, the rumble of myriads of drays along hundreds of miles of stone-paved streets (for which wood is now being in part substituted), each no more to the general symphony than the hum of a gnat to the sounds of a summer day — a volume of sound unintermitting from dawn till dark. Yet I am bowered in green trees, with cowslip and daisy-flecked fields spread out under my eyes — not a spire, not a chimney-stack of the metropolis visible; and the carols of larks and thrushes, the song of the nightingale, run through the web of sounds like gold and silver threads through a dingy fabric, with the twitter of scores of sparrows like tiny spangles thrown on at random. Out of the monotone flashes the individual roar of a nearer train, the scream of a whistle, and the roar dies away again into the sullen monody. This is audible London.

If you want to see what the traffic of London is like, go to Clapham junction, where the great railway systems connect. The rails lie together like the wires of a grand piano. System and organization have done their best, and sixteen hundred trains a day run over them. It is a bewilderment. In and out, coming, going, slow trains and fast trains: one side of you halts a train, and while you watch its wheels slowing, an express rushes past on the other side like a tornado of iron; no shrieking of whistles or clanging of bells as on our railways — they keep their signals for their officials, and outsiders must expose themselves at their own risks, — only a rush, a blast of wind that almost takes your breath or draws you into its eddy when it has gone by, a torrent of carriage windows, and you see the rear of the last carriage shrinking before your eyes as it leaves you; and the fast express has come and gone in a space of time which you could hardly find on the dial of your watch. Up and down the lines you see signal-posts and semaphores — arms working; by night lamps green, red, white, the language of the railway, but no confusion; every man knows his place, or forgets it at his bodily peril. You ask the official when your train is due: "In two minutes"; and as the clock hands point, the train comes. He knows to the second when it left the last station, whether it be on table-time or behind it; every movement is recorded, and every train has its place and moment. A tunnel-way for passengers connects the whole, so that no one is allowed to cross the rails except the officials, who grow foolhardy and now and then come to grief. The guard at the junction told me one day of the killing of one of the porters, who undertook to cross the line in front of the fast express, and was struck midway the rails by the full front of the locomotive. He was knocked like a ball twenty feet, and when they reached him there was no quiver even in his flesh. If a shot from a twenty-inch Rodman gun had hit him, it would not have expunged life more completely and instantaneously. It is a saying of the denizens about Clapham junction, that, on the average, one man is killed every six weeks. One wonders, after having watched the traffic a half hour, that some one is not killed every day. Look cityward and see the trains flying — diverging eastward, westward, northward, line under line three deep, crossing each other, diving under or going over, but never on the same level, and then sweeping by long curves round the huge circumference of suburban London, a girdle of iron, meeting, crossing, uniting, separating again on the opposite side.

Neither the sounds nor the sights of London

impressed me as did its labyrinth of railways; no other evidence of the power and intelligence of England has ever seemed to me like this stupendous accumulation of engineering accomplishment: tunnels under the river and bridges over it; the long arcades of the railway approaches, and the still more surprising vaults of the underground tunneling under the dense houses, with an inner circle of communication,—the most surprising engineering feat in the world, and perhaps the most costly, considering its extent, the cost being £1,000,000 per mile, and all to help you get about the city quicker. If the enterprise be astonishing, how much more the need which impelled it and maintains it.

But, imperial as London is in all that pertains to industrial and commercial power, it is in the architectural manifestations of metropolitanism (except size) as provincial as New York or Boston. It is impossible to say that artistic feeling is exotic in England, not knowing with absolute certainty whether they were Englishmen who built the magnificent old cathedrals or not; but it does seem that, since the race was what it is, anything æsthetic is a chance flower, and of so rare occurrence that its exceptionality — its want of visible cause and effect in precedent or succession — proves the rule more clearly than though no example had ever been found. The cities of the civilized and half-civilized world will not furnish another such collection of hideous public edifices, with so little originality, so little sense of fitness or artistic insight, as the capital of England shows. A man who could develop artistic fire in such surroundings must be of a genius irrepressible by any compression of circumstance. St. Paul's is a squat parody on St. Peter's, with everything that is ugly of the original and no advantage of position like it — no approaches, no *ensemble*, a petrified infraction of common sense and æsthetic judgment. The British Museum is an ill-harmonized *pot-pourri* of Greek motives; Trafalgar square, a curious antithesis to the *Place de la Concorde*, with the elaborate imitation of that freak of some barbarous Roman, "Pompey's Pillar," instead of the obelisk, and that ludicrous combination of the shut-up and elongated, the National Gallery, crowning it. Even most of the later buildings, when there is a determined effort to be original, impress the stranger as ghastly evolutions of the stuff of which nightmares are made. All things impress one with an immense sense of solidity and stolidity, and, if I am not over-fanciful, with a latent contempt of the outside as compared with the inside of the house, inherent in the English nature. What that most characteristic defect of London — its smoke — may have to do with this utter want of sympathy with the exteriors of their buildings in the minds of modern Londoners, I can only conjecture; but if the city were another Venice, it could only be kept beautiful by pouring its canals daily over its buildings.

I recall some of those dreary days of my first November, when, sitting by my window in the City, I used to look out into the midday gloom under the impenetrable veil, with a shadowless world before me, and recall the oppression of this inversion of fantastic elements, where by day the air was thick and oppressive, and when night fell the stars came out with their little consolations for the loss of the greater luminary, and have seen the black flakes of condensed coal-smoke come drifting, floating down like the first flakes of a snow-fall — a snow of soot, visible, palpable, disastrous to gloves and linen as to stonework and to color in all things. And what is odd, too, this comes from the very love of brightness and cheeriness at home. Offer to the Englishman to-morrow a fuel which would heat his house without flame or smoke; give him furnaces which would consume all his fuel in some subterranean recess, like our own, and he would utterly and peremptorily refuse the boon. To him his open grate and its cheerful flame, pitchy and smoke-evolving as it is, are the roc's egg to his home. London may be dingy and smoky, Stygian in darkness and diurnal in its Egyptian curse, but *his* glad hearth shall glow while soft coal comes from the mine. It shall darken and gloom until it is a new Pompeii of drifting soot from its million chimney-volcanoes, before the individual love of light and comfort shall become civic, and London burn her own smoke!

Civilization and Christianity are in all intermediate stages at odds; the former in the highest ferment does but disengage the latter as a volatile essence. Civilization brings out by inexorable logic those extremes of human condition from both of which Agur prayed to be preserved. The rich grow richer and the poor poorer, and the laws of political economy go on asserting themselves by which we see that he who has the power has a law by which he may make it greater, and he who has it not shall lose even the little he seems to have; and as in London the laws of political economy and of progressive civilization have found their highest expression, we must expect to find men divided into the widest extremes of social condition — wealth fabulous and poverty incredible. To one who has tried the hard side of human existence and known how little will keep a man or woman from the grave, it is enough to say

that men and women die statistically in London from starvation,—not the sudden death of men shut in a dungeon so to die, but with long and unrelieved deprivation just sufficient to make them waste away with intolerable craving, mocked by the merest dalliance with alimentation. Some such in their involuntary apotheosis I have seen—with their gaunt faces glued to those flaming windows of the Cheapside chop-houses, looking with hungry eyes and tremulous lips at the piles of luscious steaks and saddles of prime mutton, the hell of Tantalus without his sin, for these are mostly the honest, as honesty goes in London streets—stand with unmoving faces and unconscious of whatever goes on around them, like fascinated beings unable to break away from the charm. I remember especially a young girl—not over twelve,—whose face I saw pressed against the window-pane of a restaurant where I was lunching one day, a grave, hollow-eyed creature, who, without a smile or a change of any feature save the rolling of her eyes from one dainty to another during the whole of my lunch time, fed her only available sense on this phantom banquet, but who, when on going out I offered her a huge piece of plain cake, refused it in fright and with crimsoned cheeks, as though I had caught her in theft; and it was only after repeated insistence, and on my telling her to take it home to the little ones (for there are always little ones in this case), that she took it, bewildered, and went her way.

Spiritual gravitation is as irresistible as physical, and men fly to its center as grains of sand to the earth; the weaker and the less individual they are, the sooner they obey the law; only the few who have the centrifugal power of self-assertion can live content away from others. The clod-hopper who digs and never dreams or knows what lies beyond his farm rests rustic; but once he has come within the attraction of the aggregate humanity of the city, he drifts helpless into the vortex, and rots and dies in the mass of corrupted humanity,—helpless in himself, because he has not strength to stand alone, and hopeless, because there are so many like him that no human prevision could care for the poor of a great city like London. It is no place for the helpless and the friendless, and yet it is precisely those who drift most readily to it. There seems to be a universal belief among the very poor that help is only in great cities. Dick Whittington entertained a very common superstition and strengthened it; and Heaven only knows how many, with this golden dream in their hearts, have gone to London to die in its dirt or drown in its tide. And once in the city, the deluded never leave it; the company in misery which it offers to them is better than any emigration; the fascination of crowds is stronger, even with better men and women, than any good in solitary independence. This and the innate laziness of mankind, the insanity to escape all bonds of labor, are more the causes of the destitution and misery of London than any social wrong or want of charity and benevolence in the wealthy. These great cities will always be crowded to the last limits of their capacity. Relieve the importunate and improvident of to-day by a determinate provision, and to-morrow there will appear mysteriously as many new improvidents and unfortunates, candidates for the same provision; the whole realm of beggary and imprevision will make a hitch forward, and the serried line will still stand like that at the post-office windows or theater doors at times, waiting for another vacancy and pushing on, always as long, always as miserable, and all the more improvident as provision is made by others. This is the poverty of London: not a chance-come misfortune which some sad widow may have in a country village, her support and provider being suddenly gone and struggling with a new and straiter living to which in time she adapts herself or dies; not a sudden cutting away of the small margin and a distress in the house for rent, which hard working sometimes gives a laborer, but an habitual living on what may come through picking up by chance,—pilfering and stealth to the worse and slow starvation to the better natures, with gradual extinction of all that is human to all,—squalor, filth, a sinking till sense of degradation is lost and the poor soul slides into utter vice as a boat adrift goes down into the sea.

Look into the quarters of this poverty: for convenience, in some of the streets about Seven Dials or Clare street, or down in Goodman's Fields, swarming like ant-hills: shoals of children of all ages below four or five encumbering the road-way, careless of carriage wheels, for no vehicle ever enters here except the huckster's cart or the parish hearse; frowsy, sodden, beer-soaked faces of women thrust out at the windows, cursing their brats who cry in the dirt below; sauntering men who look at you, if you are decently dressed, as if your personal safety were a wrong and injustice to them; young girls, filthy, slatternly, leering, jeering, and ogling, imagination can readily conceive what for. Men do not grow to manhood in such slums and sunless ways, or women to virtue or dignity. All is squalor and filth and utter degradation of the divine image. And this is one of the inevitable results of the highest civilization, as certainly as

that London is greatest and most civic of all great cities.

For the other great result you have not far to go. In that region of grim and forbidding palaces, which, like Ali Baba's cave, are nothing to him who has not, but everything for him who has the "open sesame," any one will answer our purpose—this one, for instance, with a covered way from the door to the street, lest its dainty inmates should catch a drop of rain on the way to their carriage. Within all is order and decorous silence. The foot falls on deep-piled carpets. In the intonation of the low-toned command is the highest expression of that incommunicable, indescribable, and, except by generations of cultivation, unattainable quality we call *high* breeding. In the reply to it is that perfect antithesis in breeding, which we ought to call *low*—the profound, unquestioning, and unhesitating prostration of self of the traditional hereditary "flunky," disciplined like a soldier, who, as his master never permits himself to express a disturbing emotion, never allows *himself* an expression of surprise or a word of comment; whose self-command is as great as his master's, perhaps greater,—a well appareled statue, save when an order is given; whose bows and deference for his master's guests are graduated by the distance at which they sit from the head of the table; a human creature that sees nothing, knows nothing, and believes nothing which his master does not expect him to see and know and believe; who, if he thinks of a heaven at all, never dreams that it can be the same thing for his master and himself: he hopes to meet his father and grandfather and great-grandfather in the servants' hall of that celestial abode where his master and all the family for countless generations will dwell in their mundane state; his brains could no more take in the parable of Dives and Lazarus than the laws of Kepler, and the most insensate chartist or radical could never inspire in him an ambition to be anything beyond butler in his master's mansion.

All the gorgeousness and luxury about them—master and servant—are the fit trappings of the gentleman's estate. They two make one, a kind of social Centaur, a single brain and a double body. The civic mechanism necessitates other grades of mankind, but this is the summit level. The Centaur may be the highest expression of human culture; he may be a mere vehicle of pleasures—betting, horse-racing, with no conception of or respect for that culture. He is to all the world the personation of human dignity, and the King or Queen is only the head of his order. He may enjoy the refinements his wealth has gathered round him and justify his position, or he may bury himself deeper in stultifying indulgences by the weight of it,—be the best or worst of men; he is still the cynosure of the Old World regards—*milord Anglais*. In his sphere the echo of social wants and wrongs dies away; the tenants on his estate are as well cared for as his favorite flocks, and he does his duty to all who depend socially on him. Beyond, all is ignored which disturbs the serenity of that earthly heaven in whose immobility he abides. For his existence, civilization, law, order, the church, army, and navy are the guaranties and prerequisites. It is for him, according to the original theory of the British constitution, that the state exists.

In other European countries of approximate civilization, his congener has gone under; he, wiser, draws up to him the social elements that might menace his supremacy, and which, by their necessity to the state, are necessary to him,—the banker, the successful administrator, soldier, admiral; and even the church, whose power is not of this world, is led in by its lord bishops. So that the Centaur, being the governing and the governed in one, wins over from any possible opposition whatever elements may be assimilated to his class, which outside its limits might be dangerous, and so fights off the fate which has befallen his congeners of the Continent.

In the strictest social creed of the Centaur, it is held as an essential to this assimilation that the candidate shall not only never have done anything useful for its due compensation, but that society shall not be able to remember when one of his ancestors did so, the bluest blood being that of him whose remote forefathers did but follow the original centaurial proposition of taking all that they wanted wherever they found it, and, by levying contributions on all the classes of society, enabling his remotest heirs and successors to enjoy the proceeds in complete and reputable abstention from gain by any useful employment,—useless labor, such as breeding and running race-horses, etc., being perfectly allowable.

Although socially dominant in all England, the Centaur is only to be known in London in perfection, or the extent of his dominance to be recognized. He must have his residence in London, no matter how many others he may have, and it must be worthy his position. There are here and there certain literary and intellectual heresies and heretics refusing to recognize Centaurdom as the highest of human good; but in general the people accept the distinction by which, when they are overridden by the Centaurs, they are privi-

leged to override some one else in the grade below them, and each one in the long file of social gradation is permitted and expected to be a toady to the superior and a bully to the inferior grades. And down to the very substratum of beggars and crossing-sweepers, there is a keen recognition of the social stamp of "useless" and "useful," and an inherent contempt of the individual as such. I have noticed scores of times that, when I was carrying a package through the streets of London, the beggars and sweepers paid no attention to me. The Centaur and the beggar agree in one thing, that a man who carries his own parcels is beneath their social recognition.

It is to London, as the center of all that England is or can be, that these two classes gravitate—the poles of civilized humanity; nowhere but in London could they find their commensurate importance, and here they attain their highest perfection and greatest development. Beggary and aristocracy are the productions *par excellence* of the metropolis of civilization; the traits which, even more than its size and wealth, distinguish it from all the cities of the earth.

And from all this antagonism of extremes, from all the heat and ferment of this alembic of humanity, there comes not only much refuse—dead matter which goes back to decay and first disorganization—but there distills the truest, divinest spirit humanity can embody. Here does but disengage more quickly and more perfectly what may be of better than aristocracy and more beautiful than court or state. If the individual is securest in his individuality, if the one talent is best buried in the retirement of rustic life, if philosopher and poet find in their hearts to say with their Roman confrère, "*Procul, procul este profana*," and float tranquilly down the stream of life alone, yet in the thickest mêlée is the most strength won; and in spite of the terrible perversion of Christianity, and the palsying condition of social organization, one can find here the rarest types of Christian and of mankind. Who escapes humanity shuns God.

I am not a lover of great cities; their ambitions and ideals, their vulgarities and their urbanities, are alike distasteful to me; but I must say that I have known in London the most angelic natures that it has ever been in my lot to encounter. Perhaps I should have seen still better if my eyes had been open wider.

And it is in this very class which I have, in no disparaging sense, termed Centauric, the aristocracy, where social independence has reached its highest, that we find here and there, cased like the flower and fruit of this mighty growth, in extraneous and deciduous leafage, that best type of humanity as the world knows it, the true English gentleman,—a being whose exterior decorum may be counterfeited by his emulator, whose inmost gentleness and courtesy may be shadowed forth in peer or peasant,—who loves his kind, and feels the common bond of divine birth, but whose most perfect union of noble demeanor and large-heartedness can only be found where the best type of mind has been permitted the largest and richest culture and the completest freedom of hereditary development in the most favorable external circumstances. There are nobles and noblemen—men who seem to be conscious only that surrounding men are lower than they, and others whose illumination pervades every one near them and brings all up into the same world of light and sweetness. The prestige of nobility is founded on a true human instinct; occasionally one finds an English nobleman who justifies its existence, and makes us snobs in spite of our democracy.

I could, I am certain, point to Americans who, in every substantial trait of the gentleman, will stand comparison with any aristocrat born—men in whom gentlehood has grown to hereditary ripeness; the third and fourth generations of men who have cultivated on American soil the virtues of honesty, morality, sincerity, courtesy, self-abnegation, humanity, benevolence; men and women whose babyhood was cradled in those influences which make what we call "good breeding," and to whom the various vulgarities of our parvenu princes are as foreign as to the bluest-blooded heir of Norman fortune; and this is to me a more grateful and sympathetic type of humanity than that of its English congener. But to this will always be lacking one grace which that may possess—the majesty of the born legislator and ruler; the air of habitual command and control, hereditary as are all generic traits, good or bad, and which imposes itself on the consciousness of all men. This, be it for the bettering or the worsering of the type, is to our democratic, ruled, leveled, and ballot-boxed civilization forbidden forever; and the fustian heredities of quickly and perhaps ill-made millionaires, for ever so many times told, will never be other than a curious caricature of it. Theoretically, we must gainsay it; but when all is said, be it of our original paradise-planting, or a devil's graft got among the thorns and thistles of our exile, the growth of a certain reverence for a time-honored nobility has become a part of every gentle nature, which only time and assiduity can, but which they certainly will eradicate,—but not to-day, nor while the English nobility is

what, as a whole, it is. We may prefer, in our struggles of race, the independence of the Athenian hoplite, of the quick-footed runner; but the Centaur had his side of the story, and the same marble immortalizes them both.

We Americans are fond of talking of being our own masters; but the man who is his own master is also his own servant. A well disciplined army is the type of highest human development,— compassionate, unflinching, strategy in its head, intelligent, unhesitating and unquestioning obedience in its body. He who in an army will exercise his own judgment and will, is a mutineer. Independence means isolation and incompletion; association is the true life, social political, and spiritual.

London is indeed a microcosm, not merely that it is large, but because everything is in it; and with all its intense commonplaceness and humdrum conservatism, there is a degree of unexpectedness which keeps one on an intellectual alert. No city grows like it; yet you pass from quarters of new palaces, on ground which even I remember as once an expanse of kitchen-gardens, as remote from metropolitanism as the hop-fields of Kent, to others where the dinginess of the middle ages seems to linger, and where the only change of the century past must be of deaths and births; into "no thoroughfare" squares, round which the flood of improvement has swept without entering; into places that impress one with the idea of antiquity far more than does the Parthenon or the Colosseum, dusty, grassy, and silent, where, if you chance to see a merry, playing child, it startles you as an anachronism. One day, perhaps, the republic and the proletary and the boulevard will come: be sure that they will be to the breaking of many hearts grown old in a world of circumstance and association which will not suffer change.

But to a passenger London's most attractive point is her suburban wealth — the lovely wedding of city and country in Richmond, Twickenham, and Barnes, and so all round by Clapham, Dulwich, Norwood, and the Crystal Palace, but especially near the Thames, whose lovely windings, with frequent villages and luxuriant meadows, always green with that vivid greenness which no climate besides this can boast of, remind me of the early summer Mohawk in its most gentle portions. Great glades of oak and elm come down to the water's edge, and a sward that all the year round is like a carpet, with a river-fringe of willows and flags, and the swans going in and out undisturbed, following the ebb down to the city even, and the flood back to their homes, running the gauntlet of steamer and wherry, with none to make them afraid; and the lazy, picturesque barges drift down from their inland markets, catching the ebb while it serves, and waiting at anchor till it comes again, their rusty tackle and tawny sails so unlike what our seafaring man would settle his fancy to, and yet so beloved by painters and etchers.

Yes, London ends as it began, with the Thames. The dreamy reaches of its upper course, with their framing of rural picturesqueness, their wealth of park and villa, the meed and stimulus at once of the greatest of commercial communities, run by insensible degrees of change into those so unlike in all surroundings, so stirring and vibrant with commerce and speculation; and the two extremes, corresponding as heart and brain the one to the other, or as root and branch, are what makes the life and immensity of London, and, in one sense, of England. Above the river in which the miserable perish and on which the fortunate grow rich, runs the other tide whose flood leads on to fortune, whose sources are in the sea empire, and which debouches in the lands of the little island; above the river of the painters and poets, winding through the downs and meadows of the rarest of cultivated landscape, out by the reaches where the melancholy sea breeds its fogs and damp east winds, is that of the merchant and politician, having its springs in the uttermost parts of the earth, and pouring out its golden tribute on the lands whence the other steals its drift and ooze. Father Thames! Father Thames! God only knows if thy commerce and the world's tribute be worth the sighs and tears and blood thy muddy waters carry into the oblivion of the unremembering and unforgiving ocean! He only can balance the values of thy better and worser worlds, or tell if hell or heaven finds most gain in your ebb and flood.

W. J. Stillman.

EXTRAVAGANZAS.

BY ROGER RIORDAN.

THE RENAISSANCE.

All cold and stiff the hill-tops stand
Against the eastern sea of pearls;
All cold and dark the meadow land
Through which the glimmering river swirls;
The branches, too, all crooks and twirls;
All stark and stiff the rocks also;
The fern holds stiffly up its curls.
Hist! hear the morning breezes blow;
Still! see the waving to and fro;
The river runs, the trees wave slow:
The nightmare clouds float up and go:
Fiat lux—the old command
Renewed—sets all the east aglow.

Tantara! the horn! the horn!
The hunt is up. Quick! there's the deer;
See his dark antlers 'gainst the morn,
See his dun hide convulsed with fear.
He bounds; he's lost! Close on his rear
The hounds, the hunters tear their way;
Over the brow they disappear,
But still we hear their music gay,
The horns, the shouts, the hounds' deep bay;
Swifter than panic and dismay,
Swifter than springing of the day,
The hunted and the hunt are borne,
Mere shades and echoes, far away.

Let us not after them digress.
The morn proceeds; the vocal breeds
Try preludes as their plumes they dress;
And then what *aves* and what *creeds*,
Sung as with skill that knowledge feeds,
Welcome the sun's sheer edge of fire;
With joyous song the woodland bleeds,
The leaves to voice themselves aspire,
The rocks resound like stricken wire;
All join the ear-assailing choir!
Each outburst stronger, deeper, higher,
As up he sways with heat and stress,
The great god of the flaming lyre.

Sound trumpets, cymbals, Latium! Greece!
Since when did sons of yours abstain
To praise your king of deities,
To swell the universal strain?
Since when did human hearts disdain
With nature's heart to beat in time,
To join in nature's grand refrain,
With nature's carillons to chime?
Out, men and women! think no crime
To taste the splendors of the prime;
Salute the sun before he climb
Too high, before his heats increase
And dry the founts of thought and rhyme.

WHERE TO WALK.

A crowd of Loves from sea and land
Come buzzing, twinkling, all about me,
Whene'er I take my stick in hand,
Declaring none will leave without me.

But one pulls this way and one that,
And sore perplexed am I among them;
For if I go with this pert brat,
The others all will swear I wrong them.

"Think of the Pines," one urchin cries,
"A sighing in yon perfumed hollow."
"Nay, think of my dear Fount's blue eyes,"
Another says, "and me you'll follow."

The Sea that shows her laughing teeth,
The Rivulet that runs to meet me,
The Bramble-bank that throws its wreath,
Thorn-set, about my knees to greet me,—

Each an ambassador will send
Instructed not to leave without me.
So to some new retreat I'll wend
And take them fluttering all about me.

I AND THOU.

Mossy rocks and, deep between,
Dark recesses chill and green;
Stumbling pathways, pitfalls, caves,
Yielding mounds like hollow graves;
Leaning trunks with boughs all wrecked,
Scraps of sky with storm-clouds flecked:
Oh, tis in truth the enchanted forest
Which I detest, which thou abhorrest.

Far beyond its borders, thou,
On a hill's ne'er-frowning brow,
Thy home hast, whence seest the seas,
Whither comes the unspoiled breeze,
Where small weeds their varying plan
Unfold in true dimensions can;
Whence you may with speed of thought
To wilds or peopled towns be brought;
Where at evening and at dawning
Graceful shapes steal toward you, fawning.

Here I struggle, sink or climb,
Grasp at rotten twigs and slime;
Or, slipping, falling, leaping, dash
Down some ghastly cavern's gash,
With stones and earth and broken branch,

A clanking, thunderous avalanche,
To reach at last the high-flung surges
That a furious tempest urges.

There, thou need'st but turn thy head,
Without rising from thy bed;
O'er thy lawns come fay and god,
Treading flowers from out the sod;
Sphinxes, hydras, bound with silk,
Tigresses, with cubs at milk.
Adonis comes, his blood is spilled,
The drops a floweret's petals gild;
And Venus' dove-drawn car comes speeding,
And Venus' own hand stops his bleeding.

Here, in truth, is no such chance,
But, whichever way I glance,
Gothic monsters, fierce and grim,
Tear each other limb from limb;
Or, gathering with crimsoned claws,
Against my life make common cause.
If fays flit by or gods look toward me,
Malicious scowls they all afford me.

I cannot reach you. Here I stay.
There art thou still far away.
Harping sprites fly o'er thy couch;
Hags and witches by me crouch.
At thy head spry Morning throws
The yellow-hearted, red-leaved rose.
Each breath thou drawest thy soul inflames,
Till universal space it claims.
Ere long thou'lt soar from earth in glory,
Then leave to me to tell thy story.

INSCRIPTION FOR THE GATES OF PARADISE.

Pass not by, but enter. Here
Is what you've sought for many a year:
Love and hate, caressing, fighting,
All that mortals may delight in;
Broils and quarrels, serenading,
Kisses, moonlight promenading,
Roaring fun and shrieks of laughter,
Quick repentance following after;
Nothing ordered or in reason,
All things monstrous, out of season,
Overdone, extravagant,
Just the very thing you want!
See, there's neither lock nor bar,
But the door-leaves stand ajar;
And when mellow moonlight falls
On the green and crumbling walls,
If you wait you'll see a maiden
With delicious flowers laden.
Nightly she comes in and out;
Her rose-leaves she throws about
On the earth: to blood some turn,
Others soon as blushes burn.
Heaven is so full of them,
It never misses leaf nor stem.

IN THE FOOTSTEPS OF THACKERAY.

I.

Thackeray does not give the same opportunities for the identification of his scenes as Dickens. The elaboration with which the latter localizes his characters, and the descriptive minutiæ with which he makes their haunts no less memorable than themselves, are not to be found in the works of the author of "Vanity Fair." No faculty was stronger in Dickens, or of more service to him, than his power of word-painting. He reproduces the objects by which the persons he describes are surrounded with a fidelity which would be tedious if it were not relieved by the humor which humanizes bricks and imparts a grotesque sort of sensibility to articles of furniture; and it is not easy to think of any of his leading characters without being reminded of the neighborhoods in which they played their parts.

Thackeray, on the contrary, is not topographical. The briefest mention of a street suffices with him, and it is the character, not the locality, which has permanence in the reader's mind. Every feature of Becky Sharp is remembered with a vividness which disassociates her with fiction; but the situation of the little house in which the unfortunate Rawdon finally discovers her duplicity, in the famous scene with the Marquis of Steyne, escapes the memory. When the book is no longer fresh to him, the reader may recollect that after her marriage she went to live in Mayfair, and may picture to himself a small, fashionable dwelling in that aristocratic neighborhood; but he cannot remember that the author places it in Curzon street, nor that the Sedleys lived in Russell Square, Philip in Old Parr street, and Colonel Newcome in Fitzroy Square.

We have one example in Thackeray of the grotesquely humorous descriptive power of which Dickens was a master. It hits at the

absurd nomenclature of modern London suburbs, where every box of a house has some high-sounding name of the sort which ornaments the fiction of the "Chambermaid's Companion," and it describes the neighborhood into which the Sedleys moved after their failure—"St. Adelaide Villa, Anna Maria Road, West, where the houses look like baby houses; where the people looking out of the first floor windows must infallibly, as you think, sit with their feet in the parlors below; where the shrubs in the little gardens in front bloom with a perennial display of little children's pinafores, little red socks, caps, etc. *(polyandria polygenia);* whence you hear the sound of jingling spinets and women singing; and whither, of an evening, you see city clerks plodding wearily."

The fanciful supposition that persons in the upper stories must have their legs on the lower floor is richly characteristic of the manner in which Dickens would have indicated the smallness of the houses. It is a touch of that kind of humor which distinguishes all the work of the latter author, and which was one of his most serviceable resources; it gives facial expression to inanimate objects, and, as we have said, it individualizes the haunts of his characters no less than the characters themselves. But it is so rare in Thackeray that the exhibition of it in this fragment strikes us as remarkable.

It was not that Thackeray lacked the power of observation in the direction of externals,—though he certainly did not possess it in the same degree as Dickens,—nor that his characters were airy visions to him, requiring no other habitation than the chambers of his brain; they were indeed flesh and blood to him, and Miss Thackeray has told a friend of the writer's how, in her walks with her father, he would point out the very houses in which they lived. The difference was principally one of method. Thackeray's was the classic stage—a dais with a drapery of green baize, before the time of scenery. Dickens's was the modern stage, with lime-lights, trap-doors, and elaborate "sets."

Though his other scenes are misty, no reader of Thackeray who engages in a search for the places which he describes is likely, however, to overlook the Charter-house, the ancient foundation to which he refers again and again, dwelling on it with many fond reminiscences. It is the school in which he himself was educated, and he has associated three generations of his characters with it. Thomas Newcome received instruction here, also his son Clive, with Pendennis, Osborne, and Philip of the second generation, after whom came Rawdon Crawley's little son and young George Osborne; and, finally, the dear old Colonel, when broken down and weary, joined the poor brethren who are pensioners of the institution, and within its monastic walls cried *Adsum* as he heard a voice summoning him to the everlasting peace. Occasionally it is called Slaughter-house, once or twice "Smiffle" (after the boys' way of pronouncing Smithfield, where it is situated); but in Thackeray's later works he generally speaks of it as Grayfriars or Whitefriars. "It had been," he says in "Vanity Fair," "a Cistercian convent in old days when the Smith field, which is contiguous to it, was a tournament ground. Obstinate heretics used to be brought thither, convenient for burning hard by. Henry the Eighth seized upon the monastery and its possessions, and hanged and tortured some of the monks who would not accommodate themselves to the pace of his reform. Finally, a great merchant bought the house and land adjoining, in which, with the help of other wealthy endowments of land and money, he established a famous foundation hospital for old men and children. An extra school grew round the old, almost monastic foundation, which subsists still with its middle-age costume and usages; and all Christians pray that it may flourish."

The buildings form an irregular cluster spread over a prodigal area, and isolated by a wall of brick and stone, which many London fogs and long days of yellow weather have reduced to the dismalest of colors. None of them is lofty; some of them are of granite, and others of brick, upon which age has cast a smoky mantle. They are separated by wide courts and winding passages; and when I was there in the Easter vacation these open spaces were vacant, and the brisk twittering of the sparrows was the only sound that came from them. The quiet seemed all the greater, inasmuch as all around the walls is a busy neighborhood, full of traffic and voices. The courts are for the most part paved with small cobble-stones, and are cleanly swept; but some of them are grassy—grassy in the dingy and feeble way of London vegetation. These buildings look as sad as they are old; to the juvenile imagination the high walls and the severe architecture must be sharply distressing, and many a boy has felt his heart sink with misgiving as, for the first time, he has been driven through the old gate-way to be placed as a scholar on Thomas Sutton's famous foundation.

At this old gate-way, one day, I saw a very feeble old gentleman, strangely dressed in a scarlet waistcoat and bright blue trowsers, a brass-buttoned coat, and a high silk hat. He was very small and very weak, moving

slowly with the help of a stick, and coughing painfully behind his pocket handkerchief. To my question as to the admission of strangers, he said, quaveringly: "If you are a patron, you may see the buildings, but you had better ask the janitor; there he is. I," he added, with some hesitation, "I am one of the poor brethren."

The old head bowed down with years and sorrow, the white hair, the troublesome cough, the courteous amiability of manner, reminded me of Colonel Newcome—Codd Newcome, as the boys began to call him; and, indeed, this old gentleman had been a captain in the Queen's service, as the janitor afterward told us, though he was not as stately nor as handsome as we remembered our dear old Colonel to have been. None of the celebrities of Charter-house possesses the same vivid interest, the same hold upon our sympathies, the same command of the affections, as the brave, high-minded, large-hearted old soldier, who sacrificed all he had in the world to keep his honor spotless and to shield others from misery.

As the janitor took us from hall to hall in the dark, monastic buildings, Colonel Newcome was constantly before us, and his figure, even more than that of Thackeray himself, filled our minds and made us feel kindly to the old pensioners who were sunning themselves at the doors of their rooms, or were gathered in a quiet corner of one of the courts, chatting or reading.

The pensioners, of whom there are eighty, remain in the old buildings, in which each of them has a sitting-room and a bedroom, with a servant to wait upon him. Their table is a common one, in a grand old dining-hall, and twice a day they don their gowns to go to service in the little chapel to thank God for his manifold blessings and mercies. But the boys have been removed these ten years to a magnificent new school at Godalming, Surrey, thirty miles away from London fogs and the crowds of Smithfield, and they have taken nearly all the relics of Thackeray with them, including the little bed in which he slept while a scholar. Their part of the buildings is now occupied by the Merchant Taylors' School, which has added a large new school-room to the square. The ground is immensely valuable, and from an economic point of view it seems a waste to devote it to the obsolete buildings which fill the greater part of it. Soon, no doubt, another home will be found for the poor brethren, and when commerce takes possession of Charter-house Square, one of the most interesting piles in London town will disappear.

The cleanliness and orderliness which leave no scrap of waste, or wisp of straw, or ridge of dust visible in the approach, have also swept up every part of the interior; and though the smoke and dust have taken a tenacious hold, the charwoman's besom and scrubbing-brush have been vigorously applied. The buildings look quite as old as they are. The oaken wainscoting is the deepest brown; the balusters and groining are massive and carved; the tapestries are indistinct and phantasmal, like faded pictures, and the walls are like those of a fortress. It is easy in these surroundings to conjure up visions of the middle ages. The site of the dormitories of the Charter-house boys is now occupied by the new school-room of the Merchant Taylors; but looking upon it is a dusky cloister, once given to the prayerful meditations of the friars, which in Thackeray's time and later was used for games of ball, the gloom is everywhere. The ghosts of the silent brothers seem fitter tenants than the boys with shining faces and ringing voices. There are narrow, suspicious-looking passages, and heavily-barred, irresistible oaken doors. But these corridors and barriers against the unwelcome lead into several apartments of truly magnificent size and faded splendor. The dining-hall of the poor brethren has wainscoting from twelve to twenty feet high, a massively groined roof, a musicians' gallery with a carved balustrade, and a large fire-place framed in ornamental oak, over which the Sutton arms are emblazoned; while at the end of the room is a portrait of the founder, dressed in a flowing gown and the suffocatingly frilled collar of his time. Parallel to this, and accessible by a low door, is the dining-hall of the gown boys, a long, narrow room, with a very low ceiling, high wainscoting, a knotty floor, insufficient windows, and another large fire-place inclosed by an elaborate mantel-piece of oak. Here, almost side by side, these boys with life untried before them and the old men well-nigh at their journey's end, ate the bread provided for them by their common benefactor, and joined voices in thanksgiving; here still the old pensioners assemble, and in trembling voices murmur grace over the provision made for them. Upstairs there is a banqueting-hall which is not inferior in somber grandeur to that of the poor brothers, and was once honored by the presence of Queen Elizabeth. It also is wainscoted and groined, and hung with tapestries, out of which the pictures have nearly vanished. The fire-place is the finest of all, and above it some hazy paintings are lost in the shadow.

Thackeray was one of the foundation scholars, and lived in the school, and wore a gown. He was, from all accounts, an average

THE CHAPEL OF THE CHARTER-HOUSE. (ENGRAVED BY T. COLE, AFTER A DRAWING BY HUBERT HERKOMER.)

DINING-ROOM IN THE CHARTER-HOUSE.

boy, undistinguished by industry or precocious ability. He was very much like many of Dr. Birch's little friends: a simple, honest, and sometimes mischievous lad. Though he was never elected orator or poet, he wrote parodies, and was clever with a pencil, which he used with no little fancy and humor. The margins of books and scraps of paper of all kinds were covered with sketches, most of them caricatures; and it is said to have been a familiar thing to see the artist surrounded by an admiring crowd of his school-fellows while he developed, with grotesque extravagance and never-failing effect, the outlines of some juvenile hero or some notability of history. The head master of the school was severe, and as Thackeray was very sensitive, it is supposed that his school days were not of the happiest. But he bore the old foundation no ill-will; who, indeed, shall ever do it more honor than he has done?

Only a few weeks before his death, Thackeray was present on Founder's Day. He sat in his usual back seat in the old chapel. He went thence to hear the oration in the governor's room, and, as he walked up to the orator with his contribution, was received with hearty applause. At the banquet afterward, he sat at the side of his old friend John Leech; and Thackeray it was who, on that occasion, proposed the toast of the Charter-house.

Taking us through the grounds by the way of Wash-house Court, a quadrangle of very old and smoky buildings, the janitor conducted us into the cool and quiet cloister which leads into the chapel. Here is the handsome memorial of the Carthusians slain in the wars, and on the walls is a commemorative tablet to Thackeray. Next to Thackeray's is a similar tablet to the memory of Leech.

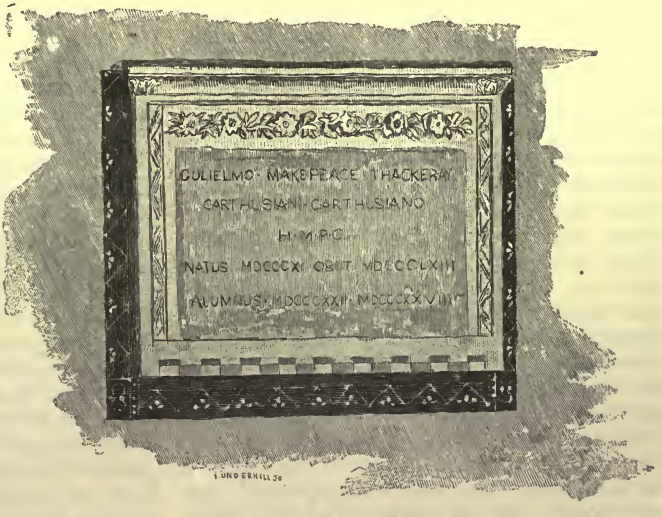
The little chapel is much as it was in their time and long before. The founder's tomb, with its grotesque carvings, monsters, heraldries, still darkles and shines with the most

CLOISTER LEADING INTO THE CHAPEL, WITH THE MEMORIAL TABLETS OF THACKERAY AND LEECH.

wonderful shadows and lights. There, in marble effigy, lies Fundator Noster in his ruff and gown, awaiting the great examination day. Just in front of this elaborate monument, Thackeray used to sit when a boy. The children are present no more; but yonder, twice a day, sit the pensioners of the hospital, listening to the prayers and the psalms,—fourscore of the old reverend black gowns, as Thackeray has described them. The custom of the school was that, on the twelfth of December, the head gown boy should recite a Latin oration; and, though the scholars are removed to Godalming, the ceremony is perpetuated. Many old Cistercians attend this oration; after which they go to chapel and hear a sermon, which is followed by a dinner at which old condisciples meet, old toasts are given, and speeches are made. The reader has surely not forgotten how Pendennis, himself a Grayfriars boy, came to the festival one day quite unaware of his friend's presence. "I chanced to look up from my book toward the swarm of black-coated pensioners, and among them—among them—sat Thomas Newcome." The noble old man had come to end his days here, and we know of no chapter in English literature more affecting than that in which his light is put out, and he softly murmers *Adsum.*

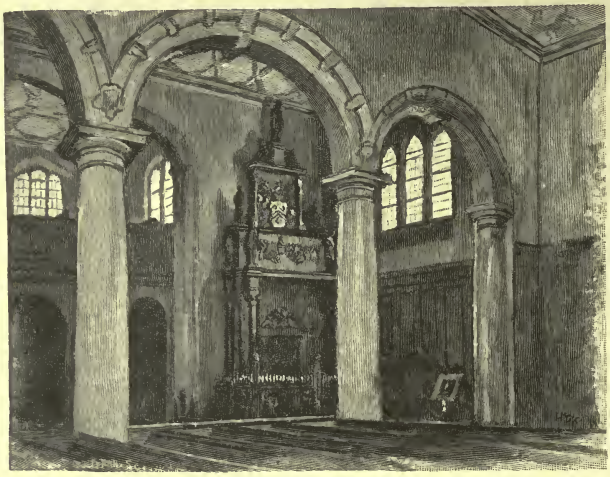
Charter-house is the center of a neighborhood which Dickens chose for many of his scenes, as the reader of this magazine knows. Only a wall, says Thackeray in "Mr. and Mrs. Frank Berry," separates the playground, or "green," as it was called in his time, from Wilderness Row and Goswell street. "Many a time have I seen Mr. Pickwick look out of his window in that street, though we did not know him then." Not only of Mr. Pickwick, but of many other characters, do we find reminiscences in Smithfield. The Sarah Son's Head, as John Browdy called it, Snow Hill, Saffron Hill, Fleet Lane, and Kingsgate street are not far away. The buildings with the ancient fronts, the idlers at the corners, and the confusing little alleys, which lead where no one would expect them to lead, all belong to Dickens's London. The miserable associations of his early life, his interest in the poor, and his relish for the grotesque drew him into the shady and disreputable quarters of the city; and the student of his works can track him with greater ease and ampler results in neighborhoods like Smithfield than in the West End. With Thackeray, the reverse is the case; and, excepting Charterhouse, the reader who desires to identify his localities finds little to reward him in a search east of Pall Mall or south of Oxford street.

On the site of the Imperial Club in Cursitor street, Chancery Lane, stood a notorious "sponging house," to which Rawdon Crawley was taken when arrested for debt immediately after leaving the brilliant entertainment given by the Marquis of Steyne, and from which he wrote an ill-spelled letter to his wife (who



MEMORIAL TABLET TO THACKERAY.

had appeared triumphantly in some charades at that entertainment), begging her to send some money for his release. The reader remembers how the faithless little woman answered,—assuring him of her grief and



OLD CHAPEL, WITH THE FOUNDER'S TOMB—CHARTER-HOUSE.

anxiety, and telling him that she had not the money, but would get it; though, as poor, blundering, soft-hearted Rawdon discovered afterward, she had a very large sum at the moment she wrote to him, and did not send him any of it because she wished to keep him in jail that she might intrigue with the licentious old marquis; and the reader will remember that Rawdon was released at the instance of his cousin's wife, and went to the little house in Curzon street, where he surprised his deceitful spouse, and nearly murdered her companion, the same old Marquis of Steyne, knight of the garter, lord of the powder-box, trustee of the British Museum, etc.

When we come to the end of that passage, we put the book on our lap and lean back in the chair, and, while we are still glowing with the excitement of the scene, we are filled with admiration of the genius which produced it. How did Thackeray achieve his effects? Becky Sharp is a unique and permanent figure in literature, a subtle embodiment of duplicity, ambition, and selfishness. She is avaricious, hypocritical, specious, and crafty. Though not malignant nor to a certainty criminal, she is a conscienceless little malefactor, whose ill deeds are only limited by the ignoble dimensions of her passions. She lies with amazing glibness, is utterly faithless to her hulking husband, and utterly indifferent to her child. Her mendacity is superlative, and double-dealing enters into all her transactions. But she is so shrewd, so vivacious, so artful, so immensely clever and good-humored, she has so much prettiness of manner and person, that, while we despise her, and have not the least pity for her when retribution falls heavily upon her, our indignation against her is not so great as we feel that it ought to be, principally because her sins have a certain feminine archness and irresponsibility in them which keeps them well down to the level of comedy. When we close the book we know her through and through, and thoroughly understand all the complex workings of her strategic mind. How do we know her so well? Thackeray is not exegetical, and does not depend on elaborate analysis for his effects. The actions of the characters are themselves fully expository, and do not call for any outside comments or enlargement on the part of the author. This is the case to such an extent that, when we examine the completeness with which the characters are revealed to us, we are inclined to believe that Thackeray's art is of the very highest kind, and that, though in form it is undramatic, intrinsically it is powerfully dramatic.

But we are straying from our purpose, which is simply to look for ourselves at the places which he has described. Across the way from the bottom of Chancery Lane is the Temple, to the interest of which he has added many associations. He was fond of its dark alleys, archways, courts, and back stairs.

In 1834 he was called to the bar, and for some time he occupied chambers in the venerable buildings with the late Tom Taylor. His rooms, which were at number 10 Crown Office Row, have disappeared before "improvements" that present a modern front to the

gardens and the river. Philip had chambers in the Temple, and there, also, in classic Lamb's Court, Pendennis and Warrington were located.

Though in the east end of the town and South London Thackeray has left few footsteps for us to follow, in ancient and comfortable Bloomsbury and the region to the west of it and north of Oxford street (called De Quincey's step-mother) we find much to remind us of him. It was in Russell Square that the Sedleys lived in the time of their prosperity, and thence, on the evening after the arrival of gentle Amelia from the boarding school at Chiswick, a messenger was sent for George Osborne, whose house was No. 96. Russell Square is the largest and handsomest of the chain of squares which extend, almost without a break, from Oxford street to the New Road — Bloomsbury Square, Woburn Square, Gordon Square, Tavistock Square, and Euston Square. The neighborhood has seen many strange shifts of fortune, and some of the finest of its mansions are debased to the uses of common boarding-houses and private hotels. There are streets and streets of houses with white cards in the windows announcing "Lodgings to let." Somber old houses they are, built of brick, with flat, uninteresting fronts, the sooty darkness of which is sometimes relieved by a yellowish portico, freshly painted, or a plaster shell of a drab color reaching from the basement to the second story. The cheeriness of the spreading trees in the little parks, the flowering shrubs, the shining fountains, and the grass are only a partial alleviation. Russell Square has deteriorated less than some of the other places in the neighborhood, however, and the houses around it would not be beneath the inclinations of a prosperous merchant such as old Sedley was. We look in vain for 96; the numbers do not go so high as that; but we have no difficulty in singling out the respectable dwelling on the western side in which poor Amelia sighed for her selfish lover and Becky Sharp set her cap at the corpulent Mr. Jos.

It was in Hart street, two blocks nearer Oxford street than Russell Square, that little George Osborne went to school at the house of the Rev. Laurence Veal, domestic chaplain to the Earl of Bareacres, who prepared young noblemen and gentlemen for the universities, the senate, and the learned professions, whose system did not embrace the degrading corporal severities still practiced at the ancient places of education, and in whose family the pupils found the elegancies of refined society and the confidence and affection of a home. Thither came poor Amelia, walking all the way from Brompton to catch a glimpse of her darling boy, who had been taken away from her by his obdurate grandfather.

RUSSELL SQUARE, WHERE THE SEDLEYS LIVED.

Great Russell street is next to Hart street, and in it fronts the classic portico of the British Museum, in the splendid reading-room of which Thackeray was often seen. It was in Great Coram street, adjoining the celebrated foundling hospital, that he lived when, one evening, he called on a young man who had chambers in Furnival's Inn, and offered to illustrate the works which were beginning to make "Boz" famous; and we can see him coming back to his lodgings in low spirits over the rejection of his proposal, for at that time Thackeray was poor, and neither literature nor art, which he loved the better, would support him.

About half a mile farther north, across Tottenham Court Road, is Fitzroy Square; and when we look for 120, we find that 40 is the highest number which the square includes. Though the little circular garden which it incloses is prettily laid out and is one of the leafiest of the oases between Euston and Bloomsbury, Fitzroy has degenerated more than some of the other squares in the neighborhood. It was not very fashionable when Colonel Newcome took No. 120 with James Binnie, and it is not fashionable at all now. One side is badly out of repair. There are two or three doctors' houses in it, several houses with announcements of apartments to let, and a private hotel. The particular house occupied by the Colonel and his old Indian friend cannot be easily identified by Thackeray's description. "The house is vast but, it must be owned, melancholy. Not long since,

it was a ladies' school in an unprosperous condition. The scar left by Madame Latour's brass plate may still be seen on the tall black door, cheerfully ornamented in the style of the end of the last century, with a funereal urn in the center of the entry and garlands and the skulls of rams at each corner." We fancy that it was on the south side of the square, near the middle of a row of heavy sepulchral houses built of stone, which, having been first blackened by the London smoke, has since been unevenly calcined by the atmosphere, so that, as in many other buildings, it looks as if a quantity of dirty whitewash had been allowed to trickle down it. Some of the ornaments have been removed, but the urn is still over the door.

The days spent here were the happiest in the lives of the good old Colonel and his son. The Colonel had just returned from India full of honors and riches, and with his old chum, James Binnie, he kept house with lavish hospitality and much originality. "The Colonel was great at making hot-pot, curry, and pillau," Pendennis tells us. "What cozy pipes did we not smoke in the dining-room, in the drawing-room, or where we would! What pleasant evenings did we not have with Mr. Binnie's books and Schiedam! Then there were solemn state dinners, at most of which the writer of this biography had a corner." The guests at these entertainments were not selected for their social position or their worldly prosperity, and it mattered not whether they were rich or poor, well dressed or shabby, if they were friends. Old Indian officers were among them, and young artists with unkempt ways from Newman street and Berners street; the genial F. B. waltzed with elderly houris and paid them compliments; Professor Gandish talked about art with many misplaced h's; and the Rev. Charles Honeyman sighed and posed and meekly received the adulation of the women. Despite the failure of the Bundlecomb Bank, the later part of the history of the Newcomes would have been less sad but for that accident to Mr. Binnie, in which he fell from his horse and was so much injured that Mrs. Mackenzie—the awful "campaigner"—was called in to nurse him with the aid of poor little Rosey. Fitzroy Square is so old that its gloomy houses must have known much sorrow; but we doubt if any of them has seen anything more pitiable than the humiliation of Colonel Newcome, or anything crueler than the remorseless tyranny of the "campaigner" and her fierce temper—the "campaigner," who was all smiles, coquetry, and amiability, until prosperity fled from those who had been her benefactors, when she suddenly revealed all the pettiness and harshness of her termagant soul.

DOOR-WAY OF 37 FITZROY SQUARE, WHERE COLONEL NEWCOME LIVED.

Three streets from the Square is Howland street, to which Clive removed with his weak little wife and his spiteful mother-in-law when disaster fell upon him; and every reader of Thackeray will remember how Pendennis, Clive, and Boy went out to meet the broken-hearted old man as he came along Guilford street and Russell Square from the Charterhouse to eat his last Christmas dinner.

II.

BEFORE Thackeray died, he had become as familiar a figure in the West End of London as Dr. Johnson was in Fleet street and its tributary courts and lanes. Any one who did not know him might have supposed him to be an indolent man about town; and those who could identify him generally knew where to find him if they wished to show the great author to a friend from the country. He was usually present in the Park at the fashionable hour; and if the Pall Mall of his day is ever painted, his face and form will be as insepara-

ble from a truthful picture as the mammoth bulk of the testy lexicographer is from the contemporaneous prints of old Temple Bar.

The lovableness of his character is well remembered at the Athenæum Club, and the old servants, especially, speak of his kindness to them. The club-house is at the corner of Waterloo Place and Pall Mall—a drab-colored, sedate, classic building, with a wide frieze under the cornice, in a line with the Guards, the Oxford and Cambridge, the Reform, the Travelers', and many other clubs. Opposite to it is the United Service Club, midway is the memorial column to the Duke of York, and only a few yards away are Carlton Terrace and the steps leading into St. James's Park. Marlborough House, the home of the Prince of Wales, and unpalatial St. James's Palace, are close by.

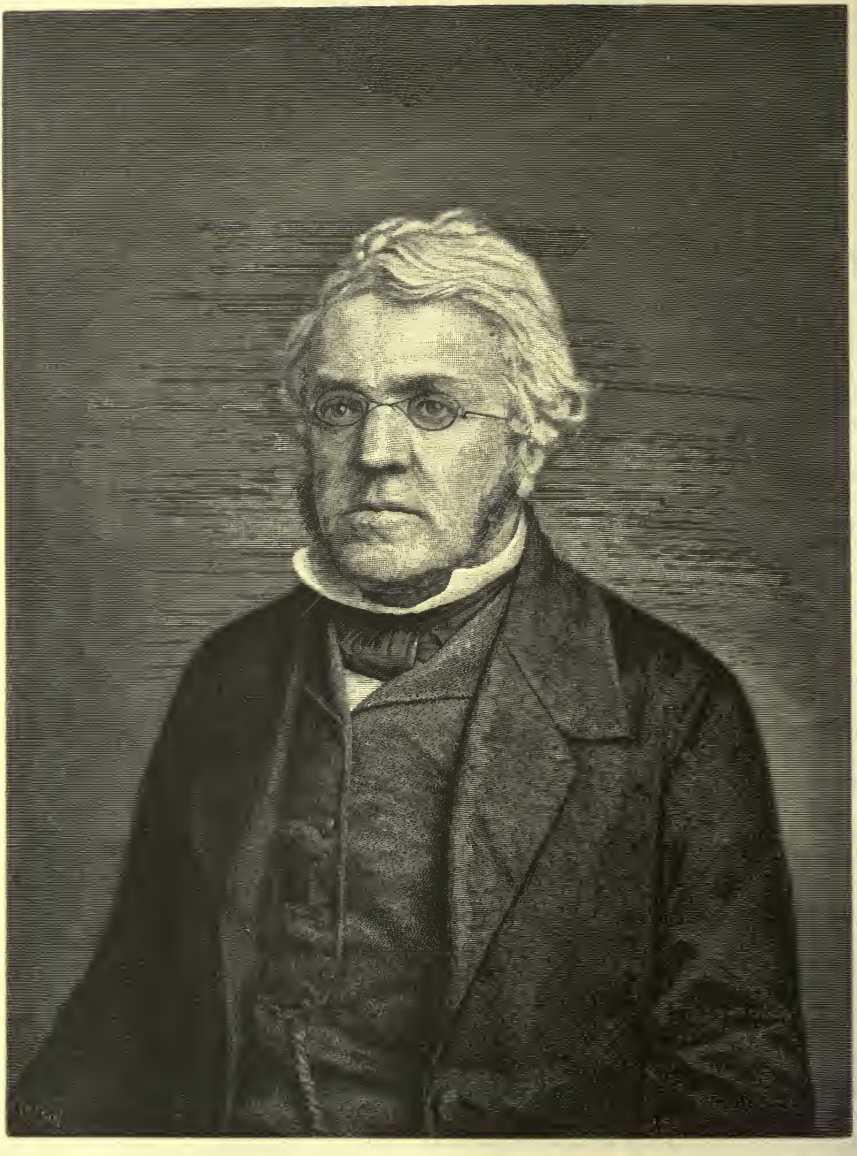
Thackeray's name appears on the roll of the Athenæum as that of a barrister, but he was elected in 1851 as "author of 'Vanity Fair,' 'Pendennis,' and other well-known works of fiction." He used the club both for work and pleasure, and there are two corners of the building to which his name has become attached on account of his association with them. The dining-room is on the first floor, at the left-hand side of the magnificent entrance; and he usually sat at a table in the nearest corner, where the sun shines plenteously through the high windows and makes rainbows on the white cloth in striking the glasses. Theodore Hook had used the same table, and uncorked his wit with his wine at it; but it was in a kindlier strain than the author of "Jack Brag" was capable of that Thackeray enlivened the friends who gathered around him.

From the club window he probably saw many of his own characters going along Pall Mall: little Barnes Newcome; Fred Bayham, with his big whiskers; cumbrous Rawdon Crawley; the sinister Marquis of Steyne; stylish little Foker; neat Major Pendennis; homely William Dobbin; and the dashing W. Brand Firmin, as he drove up or down the Haymarket to or from Old Parr street. Most of them belonged to the fashionable or semi-fashionable world, and the men were sure to be members of some of the clubs in this neighborhood. No doubt he also saw Arthur Pendennis, Clive Newcome, and Philip Firmin; but it is likely that they appeared with the greatest distinctness when the blinds were drawn and the reflection of his own face was visible in the darkened windows.

The south-west corner of the South library, on the second floor of the club, is filled with books of English history, and some of his work was done there. Therefrom, no doubt, some of the material of the lectures on the Georges was drawn; he could look out of the window on the very site of Carlton House, now a square of grass and flowers; and probably on the shelves, also, he found some help in completing "Esmond" and developing "The Virginians." He often left the library looking fatigued and troubled, and he was sometimes heard complaining of the perplexity he found in disposing of this character or that, and asserting that he knew that what he was writing would fail.

BECKY SHARP'S HOUSE, 22 CURZON STREET.

He divided his time between the Athenæum Club, the Reform, and the Garrick; contiguous to the first two is the neighborhood of St. James's, which principally consists of clubs, bachelors' chambers, and fashionable shops, and is associated with many of Thackeray's characters. By Bays' Club, to which he often refers, he probably meant White's in St. James's street; and at No.



Very faithfully yours
W. M. Thackeray

ENGRAVED BY W. B. CLOSSON, FROM A DAGUERREOTYPE TAKEN BY BRADY DURING THACKERAY'S VISIT TO AMERICA.

88 of that aristocratic thoroughfare, in a building now demolished, he himself once occupied chambers, and there began and finished "Barry Lyndon." Major Pendennis had chambers in Bury street, a narrow lane coming from Piccadilly parallel with St. James's street; and it was in them that the famous scene took place between the shrewd old soldier and Mr. Morgan, in which that rebellious flunky was brought whining to his knees by the strategic courage of his master. We have searched the neighborhood for the "Wheel of Fortune" public-house, which Mr. Morgan frequented to discuss with other gentlemen's gentlemen gentlemen's affairs. It is not to be found; and Bury street has scarcely a house in it that looks old enough to have been the Major's. But St. James's Church is here —a gloomy old building of smoky brick with lighter trimmings of stone; and the reader may remember how, one day, Esmond and Dick Steele were walking along Jermyn street after dinner at the Guards', when they espied a fair, tall man in a snuff-colored suit, with a plain sword, very sober, and almost shabby in appearance, who was poring over a folio volume at a book-shop close by the church; and how Dick, shining in scarlet and gold lace, rushed up to the student and took him in his arms and hugged him; and how the object of these demonstrations proved to be Addison, who invited Steele and Esmond to his chambers in the Haymarket, where he read verses of the "Campaign" to them, and regaled them with pipes and Burgundy. I never walk through Jermyn street or past the old church without seeing these three figures, and they are no more like shadows than any in the nineteenth century throng which fills the street.

Thackeray constantly mixes up real with fictitious names in his descriptions. Some disguise was often necessary, and sometimes even compulsory. He could not be as explicit or as literal as Dickens, because most of his characters represented a very different class. The latter could draw in detail the house he selected as most appropriate for the occupation of Sairey Gamp, because the actual tenants were not likely to find him out, or, if they ever read his description, to quarrel with it. But many of the clients whom Thackeray had to provide with dwellings were great people, and could only be placed in great neighborhoods, where the houses are large, conspicuous, and easily distinguished. He either had to omit any descriptive detail, or to mask the actual place he had in mind by locating it in some street or square with a fanciful name. Any student of his works will have no difficulty in finding Gaunt House, Gaunt Square, and Great Gaunt street, if he makes a personal search for them in Mayfair, though they are not indicated in any map or directory.

Mayfair (let me say for the benefit of the readers of this magazine who are so unfortunate as not to know London) is one of the three most fashionable neighborhoods of the great metropolis, and of the three it is the most aristocratic and most ancient. It is, as nearly as possible, a square, about half a mile wide and three-quarters of a mile long, bounded at one end by Oxford street, with its shops and plebeian traffic, at the other end by the most delightful of London streets, Piccadilly; at one side by Bond street, and at the other by Park Lane, the houses in which overlook the beautiful expanse of Hyde Park. The names of some of its streets have become synonymous with patrician pomp and the affluence of inheritance. It is the highest heaven of social aspiration, the most exalted object of worldly veneration. This is the house of the Duke of Hawksbury; this of the Earl of Tue-brook; that of Viscount Wallasey, and that of Lord Arthur Bebbington. It is preëminently the region of the "quality." But let not the reader suppose that it is a region of exterior splendor, of spacious architecture, of brilliant appearance. Belgravia is far grander to look at, and seems to possess greater riches and to use them more lavishly. Even Tyburnia, the neighborhood to the north of Hyde Park, is more suggestive of social eminence. Mayfair displays none of the signs of the rude enjoyment and proud assertiveness which spring from recent prosperity. It is old-fashioned, unchanging, and dull. It is little different from what it was at the beginning of the century, except that it is nearer decay, and that febrile irruptions of modern Queen Anne architecture occasionally vary the somberness of its original style. The physiognomy of its houses expresses a sort of torpor, as if familiarity with honors were as wearisome as continuous association with misfortune. They have an air of funereal resignation. Many of the streets are short and narrow; many of the houses are dingy. The ornaments are of a sepulchral kind, such as urns over the door-ways and funeral wreaths about the porticoes. The blazoned heraldry of the hatchments has been nearly extinguished by the smoke. At some doors there are two incongruous obelisks, joined to the iron railing which screens the basement, and the portico is extended to the curb. But ornaments even as unsatisfactory as these are not common, and most of the houses, with high fronts of blackened brick and oblong windows, are unadorned, except by a

few boxes of flowers on the sills. The lackeys, with crimson knee-breeches, white stockings, laced coats, buckled shoes, and powdered hair, blaze in this gloom with a pyrotechnic splendor. Occasionally, the uniform rows of smoky brick and painted stucco houses are overshadowed by a larger mansion, shut within its own walls, and some of the streets enter spacious squares where there are sooty trees and grass and chirping sparrows. It is possible that Thackeray had no exact place in mind when he wrote of Gaunt House and Gaunt Square, but it is not likely. The creatures of his imagination were flesh and blood to him, too vital to be left without habitations. "All the world knows," he says in "Vanity Fair," "that Gaunt House stands in Gaunt Square, out of which Great Gaunt street leads. * * * Gaunt House occupies nearly a side of the square. The remaining three sides consist of mansions which have passed away into dowagerism. * * * It has a dreary look, nor is Lord Steyne's palace less dreary. All to be seen of it is a vast wall in front, with rustic columns at the great gate." There is a square in Mayfair which almost exactly corresponds with this description. Here are the gloomy mansions, looking out on grass and trees which seem to belong to a cemetery, and here, immediately recognizable, is the palace, filling nearly a side of the square, and shut within high walls to hide what they inclose from the prying eyes of the passers, though the upper stories can be seen from the opposite side of the way. Here is the very gate, with heavy knockers, though the rustic columns of Thackeray's text have been replaced by new ones of a different shape. We do not find in the middle of the square the statue of Lord Gaunt, "in a three-tailed wig, and otherwise habited like a Roman emperor," but we can identify almost every other detail of the picture. Now, as this palace has long been occupied by a noble family, it would not be just for us to mention the name of the house, lest some undeserved reproach should thereby fall on the tenants; for, while Thackeray described the locality with such faithful elaboration, it is not to be inferred that he drew the character of Lord Steyne from an actual person living in the neighborhood; nothing, indeed, could be less probable.

He also speaks of the square as Shiverley Square, and briefly mentions it in describing Becky's drive to the house of Sir Pitt Crawley: "Having passed through Shiverley Square into Great Gaunt street, the carriage at length stopped at a tall, gloomy house between two other tall, gloomy houses, each with a hatchment over the middle drawing-room window, as is the custom in Great Gaunt street, in which gloomy locality death seems to reign perpetual."

Great Gaunt street is undoubtedly Hill street, which he mentions specifically in another place as the home of Lady Gaunt's mother. Sometimes it was necessary for him to invent a name, and when he did so he was peculiarly apt. Gaunt Square seems a more fitting and descriptive name than Berkeley Square, but he frequently varied the real with the fictitious name with playful caprice.

It was in another of these queer old streets in Mayfair that that wicked old fairy godmother, the Countess of Kew, lived, and there (in Queen street) Ethel Newcome visited her, and was instructed in the rigorous social code which unites fortune with fortune or fortune with rank, and which is by no means limited to Mayfair or Belgravia, but finds expositors and adherents under the bluer skies of America. Ethel herself lived with her mother in Park Lane, the western boundary of Mayfair, and assuredly the most attractive part of the region. Park Lane has all of Hyde Park before its windows,—all the variegated and plentifully stocked flower-beds of the Ring Road, the wide sweep of grassy play-ground, and the knots of patriarchal trees which give the Park one of its greatest charms. Unlike most of the region behind, it is cheerful; or, if not exactly cheerful, it has not the mopish signs of withdrawal from all natural human interests which are seen in many of the houses of Gaunt Square and the tributary streets. Some of the houses are small, with oriel windows and little balconies filled with flower-pots; some of them are palatial in size and decoration; but all of them are fashionable, and elderly bachelors are known to give incredibly large prices for the smallest possible quarters under the roof of the meanest of them. The exteriors are not of the sooty brick which characterizes Hill street, but of plaster, which is annually repainted in drab or cream color at the beginning of each season. What with the flowers of the Park and the gardens which lie before some of the houses, Park Lane seems a fitting abode for those who are fortunate both in birth and in wealth; it is as patrician as any other part of Mayfair, and it relieves itself of the gloom which seems to be considered an inevitable accessory of respectability elsewhere.

In one of these houses—which one it is not easy to say, as Thackeray has given us no clew—Lady Ann Newcome lived, and at it Mrs. Hobson Newcome looked from afar with an envy which betrayed itself in her constant reiterations of her contentment with her own circumstances. Mrs. Hobson lived

in Bryanston Square, a dingily verdant quadrangle north of Oxford street, near which Clive had a studio; and J. J. Ridley, Fred Bayham, Miss Cann, and the Rev. Charles Honeyman lodged together in Walpole street, Mayfair. The Rev. Charles Honeyman's chapel was close by, and before the story of "Vanity Fair" reached its end there was a charitable lady in the congregation who wrote hymns and called herself Lady Crawley, and from whom William Dobbin and Amelia Sedley, now united, shrunk as they passed her at the fancy fair, recognizing in that altered person the dreadful Becky.

In the eyes of the lover of Thackeray, no character of history or fiction has lent more interest to Mayfair than Becky, to which neighborhood she came with her husband some two or three years after their return from Paris, establishing herself in "a very small, comfortable house in Curzon street," and demonstrating to the world the useful and interesting art of living on nothing a year. There is more than one small house in Curzon street, but among them all Becky's is unmistakable. It is on the south side of the street, near the western end, and only a few doors farther east than the house in which Lord Beaconsfield died. It is four stories and a half high, and is built of blackish brick like its neighbors, with painted sills and portico. Its extreme narrowness, compared with its height, especially distinguishes it: the front door, with drab pilasters and a molded architrave, is just half its width, and only leaves room for one parlor window on the first floor. One can see over the railings into the basement and through the kitchen windows. Phantoms appear to us in all the windows —the ghost of Becky herself, dressed in a pink dress, her shapely arms and shoulders wrapped in gauze; her ringlets hanging about her neck; her feet peeping out of the crisp folds of silk—"the prettiest little feet in the prettiest little sandals in the finest silk stockings in the world." It was in this cozy little domicile that the arch little hypocrite entertained Lord Steyne, whose house in Gaunt Square is only a few hundred yards distant, and Rawdon fleeced young Southdown at cards. No one can help smiling at the remembrances that come upon him in looking at those basement windows. No one who has read "Vanity Fair" is likely to forget the picture of the sensual marquis gazing into the kitchen and seeing no one there just before he knocks at the door, where he is met by Becky, who is as fresh as a rose from her dressing-table, and who excuses her pretended dishabille by saying that she has just come out of the kitchen, where she has been making pie, to which palpable lie the marquis gives an audacious affirmation by adding that he saw her there as he came in!

This little house was chosen for that scene in which Thackeray's genius rises to its highest point of dramatic intensity; and so many literary pilgrims come to peep at it that the tenants must be annoyed, though the policeman on the beat has become so accustomed to them that he no longer eyes them cornerwise or suspects them of burglarious intentions.

The places with which Thackeray was personally associated are more interesting, perhaps, than the scenes of his novels. In 1834 he lived in Albion street, near Hyde Park Gardens, and it was there that he, a young man of twenty-three, began to contribute to "Fraser's Magazine." In 1837, then newly married, he lived in Great Coram street, close by the Foundling Hospital. As I have stated, he had chambers at No. 10 Crown Office Row in the Temple and at No. 88 St. James's street, both of which buildings are now demolished. When he had become a successful author, he lived in Brompton and Kensington, and at the latter place, to which he was greatly attached, he died. He was at No. 36 Onslow Square, Brompton, when he unsuccessfully offered himself as member of Parliament for Oxford, and also two years later, when he began to discover the thorns in the editorial cushion of the "Cornhill Magazine." Mr. James Hodder, his private secretary, has given us an interesting glimpse of him as he was while in Onslow Square:

> "Duty called me to his bed-chamber every morning, and as a general rule I found him up and ready to begin work, though he was sometimes in doubt and difficulty as to whether he should commence sitting, or standing, or walking, or lying down. Often he would light a cigar, and, after pacing the room for a few minutes, would put the unsmoked remnant on the mantel-piece and resume his work with increased cheerfulness, as if he gathered fresh inspiration from the gentle odors of the sublime tobacco."

Little wonder that he liked Kensington. It is the pleasantest of the many pleasant London suburbs. Though it is not four miles from Charing Cross, to which it is knitted by continuous streets and houses, it is like a thriving country town, old-fashioned, but prosperous, with shops as brilliant and as well stocked as those of Regent street, and with many evidences of antiquity, but none of decay. There are lofty new buildings and old ones, behind the modernized fronts of which you can see leaded dormer windows, angular chimney-pots, and bowed-down roofs of red tiles. There are many weather-worn but splendid mansions jealously shut within their own high walls, and some in less sequestered gardens. The place is famous for its fine old trees and open spaces of

verdure. Holland House is here, and the palace in which Queen Victoria was born, with the beautiful and deeply wooded gardens adjoining Hyde Park. The inhabitants of the old suburb have had many illustrious persons among them; and Thackeray is one of those best and most affectionately remembered.

His tall, commanding figure was often seen in the old High street, moving along erect, with a firm, stately tread, though his dress was somewhat careless and loose-fitting; his large, candid face was serious and almost severe as he walked on engaged in meditation, but, being awakened from his reverie by the voice of a friend, a glad smile quickly overspread it and illuminated it. He had many friends among his neighbors, and often sat down to dinner with them. He attended regularly the nine o'clock services in the old parish church on Sunday mornings.

From 1847 to 1853 Thackeray lived in the bay-windowed house known as the "Cottage," at No. 13 (now No. 16) Young street, and in it "Vanity Fair," "Esmond," and "Pendennis" were written. There are few houses in the great city which possess a more brilliant record than this. Most of his work was done in a second-story room, overlooking an open space of gardens and orchards; and the gentleman who at present occupies the house has placed an entablature under the window commemorating the genius that has consecrated it. Between the dates, 1847 and 1853, the initials W. M. T. are grouped in a monogram in the center of the entablature, and in the border the names of "Vanity Fair," "Esmond" and "Pendennis" are inscribed. Just across the street Miss Thackeray (Mrs. Ritchie) now lives, in full view of her old home; in her charming novel "Old Kensington," she affectionately calls Young street "dear old street!" There is no doubt that the happiest years of Thackeray's life were spent in the old, bow-windowed cottage.

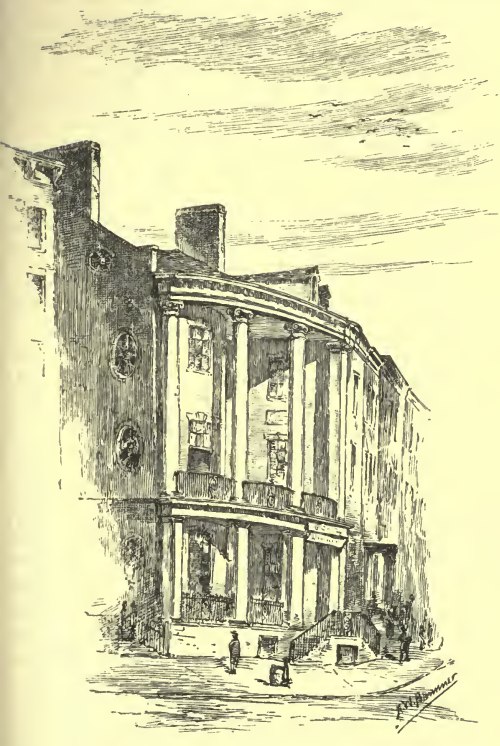
I have talked with many persons who knew him intimately and under various circumstances. All speak of him in one way,—of his gentleness, his kindliness, his sincerity, and his generosity. "That man had the heart of a woman!" fervidly said one who was his next-door neighbor for several years. This gentleman, Dr. J. J. Merriman, whose family has lived in Kensington Square since 1794, possesses a number of valuable souvenirs of the great author, including some unpublished letters, in one of which Thackeray regrets that he has not seen the doctor in some time, and characteristically adds: "I wish Vanity Fair were not so big or we performers in it so busy; then we might see each other and shake hands once in a year or so." On one occasion the doctor begged him to write his name in a copy of "Vanity Fair" which Thackeray had given him, and the latter not only did this, but made an exquisite little drawing on the title-page, than which the book could not have a more suggestive or appropriate frontispiece. A little boy and girl are seated on the ground, one blowing bubbles and the other hugging a doll, while behind them looms up the portentous mile-stone of life.

The "dear old street," as Miss Thackeray calls it, ends in Kensington Square, which is full of old houses, to each of which some historic interest belongs. The square was built in the latter part of the seventeenth century, and in one of the old houses Lady Castlewood, Beatrice, and Colonel Esmond lived, and there sheltered the reckless and unscrupulous Pretender.

In 1853 Thackeray left Kensington and went to live in Onslow Square, Brompton; but he came back to the old court suburb in 1861, and occupied the fine new house which he had built for himself in the Palace Gardens. It is the second house on the west side of the street, a substantial mansion of red brick, adjoining a much more picturesque and older house covered with ivy; and it was here that he died suddenly on December 23, 1863, in the room at the south-east corner of the second story. The last time that I saw it, an auctioneer's flag was hung out, and the broker's men were playing billiards in the lofty northern extension which Thackeray built for a library, and in which he wrote "Denis Duval."

Thackeray was buried in Kensal Green cemetery in the north-west of London, and was followed to the grave by Dickens, Browning, Millais, Trollope, and many who knew the goodness of the soul that had been called away. Kensal Green is as unattractive as a burial ground could be. It is like a prison-yard, with few trees, and inclosed by high brick walls. But its numerous tenantry include many who have worked faithfully and well in literature and art; and surrounded by the memorials of these is one of the simplest tombstones in the place, inscribed with two dates and the name of William Makepeace Thackeray.

William H. Rideing.



NUMBER 7 STATE STREET.

If the gay young people who now happen to live in New York, and who have their homes and their places of pleasure between Union Square and the Central Park, were told that, within the easy memory of people who have not ceased to be gay, and some of whom have few silver streaks or none in their hair, the Battery was a fashionable promenade, and some of the wealthiest and most socially distinguished people in the town lived in the lower part of Greenwich street, in State street, and around the Bowling Green, they would listen with incredulity. Not improbably many of them are ignorant where State street is, or even of its very existence. There is not a city in the world that within fifty years has so changed in its general appearance, in the aspect of particular neighborhoods, and in the character of its various quarters; and of these changes, the last fifteen or twenty years have seen some of the most deplorable and obliterative. A lad of fourteen or fifteen years of age who, born and bred in New York, had gone to Europe or to China in 1850, and had been detained there until now, would on his return be absolutely unable to recognize the place of his birth and his early education, except by the course of its principal streets, and by a very few public buildings and churches. He would come back not yet fifty years old to find the place of his nativity, although it was a great city when he left it, so changed that for him it had practically disappeared. Cities before this have been destroyed, or wrecked by war, by decay, or by convulsions of nature; and been rebuilt, but old New York has been swept out of existence by the great tidal wave of its own material prosperity. Other cities are changed chiefly by additions. New York not only adds to itself, but incessantly rends itself in pieces. Nor is this violence confined, as might be supposed, to the invasion of domesticity by trade; it goes unremittingly on in the oldest trading quarters. A man whose business life has been passed in and about the Rialto of Manhattan told me lately that within his memory Wall street had been three times entirely rebuilt, with the exception of about half a dozen houses. Such changes as these in a city which was a "metropolis," with a character of its own, more than a hundred years ago, are not in all respects advantageous, although, as has already been said, they are worked by the hand of prosperity. In such a city, adventurous men may push their fortunes, and they and the women and children who belong to them may lead a certain sort of prosperous life, accompanied by the enjoyment of certain sorts of pleasure. But such a city cannot be an assemblage of true homes; and it must lack certain admirable and respectable traits—outward, if not inward—which go with stability.

These transformations have not only changed the whole internal appearance of the town and its very look from the streets, even in the old quarters; they have affected the immediately surrounding country on all sides; and the very water seems unlike that over which now mature New Yorkers passed in the steam-boat journeyings of their early youth. The Bay of New York was once one of the famous natural objects of the world's admiration. It was the pride of those who dwelt about it; and traveling strangers who had seen the Bay of Naples and the Golden Horn did not stint their praises of the beauty

HOUSE CORNER OF BRIDGE AND STATE STREETS.

surrounded by which New York sat like a Western Venice upon the waters,—waters at once the source of her wealth and the occasion of her deterioration. But this is all no more. The European traveler no longer compares the Bay of New York to the Bay of Naples; and although even of old there was in this some element of surprise and some stretch of courtesy (for where is our Vesuvius and where our Capri?), it must be confessed that candor cannot condemn his silence. At the time when he was vocal with praise, the approach to New York on all sides was undeniably very beautiful. It had not grandeur, excepting that which always accompanies the visible inclosure of a vast expanse; and the flatness of the scene, even in the remote distance, caused a regret that the hills of Staten Island could not have been heaved up three or four thousand feet, instead of three or four hundred. This defect excepted, however, there was not, nor indeed does it seem that there could be, in the world a more delightful and inspiring sight than the approach to New York was formerly, whether from sea, or sound, or river. On a summer morning, it seemed nature's expression of a universe's joy; on an autumn evening, when the heavens mantled with ever-changing gold and color, and the woods and fields in their rich color were but a paler reflection of the sky, it was Queen-mother Earth in her imperial decoration; and even in winter, when frost-bound shores and surrounding country were white with snow, there was a vast splendor in its icy outlines. The same rivers, the same shores, the same islands are there; the same water in the same bay; but the beauty is gone, or, if not quite all departed, is sadly and meanly minished. Why, it should seem, need not be told. Mere water has no beauty, except as a substance. A spring has in its water the beauty of clearness, but no more; all the other beauty connected with it is that of its position and its surroundings. The blue expanse of the Mediterranean or of the Gulf of Mexico has all the possible charm of a monotone of color; but water of itself, without the beauty given of movement, is but a wet, flat surface, a dead level of dampness, a cruel threat of suffocation, at once a bore and a source of horror. This is depressingly felt on the great lakes—Ontario, for instance—and on the St. Lawrence, when it becomes so wide that its shores are hardly visible. Nothing in nature is drearier. The beauty of a lake is in the form and color of its shores; that of a river in its banks, and in the manner and direction in which the valley, great or small, that holds it determines it shall flow. And thus the beauty of a bay is merely that of the country upon which its waters have intruded, and the objects upon the land, of which an unobstructed view from the level surface of the water, accompanied by the sense of motion, gives a peculiar pleasure. Nothing that could be called a picture would be so wholly void of beauty and of interest as a painting of water without shores, without motion, without ship or boat, and with an unbroken sky; but any good painting of land, even the flattest and most uninhabited, may be beautiful, and full of interest and even of sentiment, which is shown by thousands of examples in landscape art. Obvious this, it should seem, and so unmistakable to every beholder as to be trite; and yet what we read and what we hear tell us that it is neither obvious nor unmistakable.

Now, within the last thirty or forty years, the beauty of the shores of New York bay has been utterly and hopelessly destroyed. Never grand or of a highly distinguished character, it yet had the charm of a pleasing variety of nature modified by human presence. It has become wholly artificial and monotonous, and, moreover, thoroughly and basely vulgar,—vulgar beyond the power of expression in language; because its very vulgarity is without any individual character, and is simply tame and commonplace. This change has been wrought by what is called the prosperity of New York,—prosperity meaning increase in wealth and size.

Before this happened, the traveler who sailed up through the Narrows saw on his right the green shores of Long Island almost in nature's beauty decorate, with here and there a farm-house or a villa; on his left, the hills of Staten Island in like verdure rose from a natural shore-line, broken only by the village

of Stapleton, with the buildings of the quarantine. On either side, the peaceful tone was relieved by the emphatic note of the two forts that guarded the harbor. Before him, as he advanced, the bay stretched out, opening

MANTEL IN A PAWN-SHOP. (NOW DEMOLISHED.)

like the mouth of a trumpet from the narrow strait through which he was passing. As his eye pierced the distance, he saw the verdure of the shores coming down to the water's edge, except where it was broken by a house or a rare clump of houses here and there. Some half a dozen tide-mills, brown with age, and two or three diligent, hard-working windmills, varied the scene with the most picturesque mechanical agents of thrift. Red Hook, so called from the color of the soil of its little grove-crowned promontory, curved around below Gowanus Bay; and on its point was an old red brick powder-house, which furnished ammunition to Governor's Island, and where the keeper, good-natured, like most soldiers and sailors, sometimes with gift of condemned cartridges made glad the hearts of Brooklyn school-boys who walked out so far upon their happy Saturdays; dreaming in their yet untroubled souls that heaven was something like one bright eternal Saturday,—surely not like one eternal Sunday of those times. Similar views continued on either side until Governor's Island was reached and passed; and Governor's Island was beautiful, with its great fort and sweeping green glacis, and the tiny south battery, and Castle William frowning in picturesque uselessness. Besides these there was little more than the commandant's house and the barracks; all else was grass

WINDOW IN WASHINGTON HOTEL, NUMBER 1 BROADWAY.

and trees. Along the shallow shores of Buttermilk Channel on either side, the lazy kine waded in on warm summer days, and stood cooling themselves and whisking with their tails the gently eddying tide. Then the city came in view, piercing the waters like a huge wedge of masonry at its point, Castle Garden, with the great elms of the old Battery. The dark, sharp spire of Trinity — old Trinity — shot up, and although only to a moderate height, yet with enough incisiveness and self-assertion to give character to the sky-line of the city, relieved still further on by the steeples of St. Paul's, St. John's, the Old North Dutch, the tower of St. George's, and the cupola of the City Hall. Both sides of the city were seen to bristle with a great multitude of masts, which stood so close that they looked like the canes of some Brobdingnagian brake. On the west, the broad Hudson, proudest of all domesticated rivers, separated the city by its calm expanse from the Jersey shores where little Hoboken stood, not yet unseparated by green meadows from its ambitiously named neighbor; and beyond were the Elysian Fields, and Weehawken Heights, with the serried front of the Palisades in the dim distance. At the east stood Brooklyn on its heights, from which it had not yet descended to spread itself over the sandy acres in all the ugliness of commonplace; becoming thus in size the third city in the Union, and remaining the least in importance. The effect which Brooklyn Heights then had upon the beauty of the Bay of New York is, and must remain, altogether unknown to those who did not see them before their hideous and deplorable transformation. That they should have been changed from what they were to what they are is a perpetual evidence to coming ages of the absolute control of Philistinism and Mammon-worship to which all things animate and inanimate in and about New York became then subjected. Some change was necessary for their regulation and orderly preservation; but such a change as they underwent would have shamed a community of Yahoos. They stood as nature had left them, rising in some places directly from a little road along the shore (then, as now, called Furman street); but they were partly broken by a natural terrace, green-swarded, as they were, along the top. On these heights stood handsome villas, half hidden in trees and shrubbery; but these were far back from the edge of the heights, between which and their garden palings there was grass, and then a road, and then grass again. At the southern end, near Joralemon street, was a thick grove of cedars. On or near the heights chiefly dwelt the small, refined, and very exclusive society then dominant in Brooklyn. These heights, notwithstanding their raggedness, formed, I believe, the noblest promenade in the world, and, I am sure, one of the most beautiful. Few in the world are so commanding. From the heights, the whole bay, from the Narrows to Hoboken, was visible; and at that time through the bay, and even through the East River, directly under the heights, great ships sailed in and out under canvas. The city itself was seen as in a bird's-eye view; and, looking over the city, the delighted eye rested upon the beautiful blue Orange hills in the far distance. At the foot of these heights toward the south there was a sandy, pebbled beach, where, however, bathing was not allowed, unless early in the morning and in the evening. The pebbled beach must needs have given place to the requirements of commerce; but the destruction of such a promenade and of such a noble feature of a great city's harbor, and the conversion of its sides into warehouses, and, worse, the crowning of its summit with Philistine domiciles is a sin against heaven.

Another beauty of the New York waters then was the view up the East River. There, beyond the Wallaboght, and at the turn of the river, lay the little village of Williamsburgh, a small cluster of houses in the midst of wide meadows, from which one spire rose so modestly that it seemed to shrink from the attention it provoked. Seen from the lower stretch of the river, as one was passing from brick-built shore to brick-built shore, this rural vista was like an embodied poem; and often,

A DINNER PARTY IN 1800.

nay almost daily, as I crossed the river twice a day on my way to school and college, I thought of the line,

"Green fields beyond the swelling flood," *

which had already (thanks to my elders) become one of the sweet treasures of my poorly dowered poetical memory. Now the East River, from Buttermilk Channel to Blackwell's Island, is merely a tug-vexed water-way between wharves and warehouses. Williamsburgh has disappeared as an individual, and has become, as the Eastern District, a part of the vast, sleepy dormitory by which it has been swallowed up; and from its loathed vicinage reek hideous smells and horrid fumes and greasy stinks.

What has befallen Williamsburgh has befallen the whole bay. Once largely, brightly, almost nobly beautiful, it has now become, save for its mere size, the most commonplace of scenes, a miserable panorama of wharves and warehouses, factories, breweries, shops, and shanties: everything that gave it charm and dignity has disappeared, to be replaced only by sordid ugliness. The very islands, which sat like little gems upon its waters, roughly enameled with bits of warlike masonry, are now concealed with shapeless brick and mortar, of which the only merit is that it protects something from the weather. And on one of these it is now proposed to erect a huge, sham-sentimental, melodramatic image of bronze, that will merely illustrate its own absurdity and light up the surrounding poverty of prosperity.

The aspect of the city itself has deteriorated, except for eyes in which bigness is beauty. For New York, no hope of the air-dwelling beauty of spire, and dome, and tower; and of the little it once had of this, there is now only a poor, crushed-down remembrance. Even the new and higher spire of Trinity, as well as the older and more modest Wren-steeples of St. Paul's and St. John's (Old St. George's and the North Dutch are gone), are rivalled and almost dwarfed by huge, formless structures that push their clumsiness up into the air with awkward and obtrusive impudence, to affront heaven with man-made deformity;

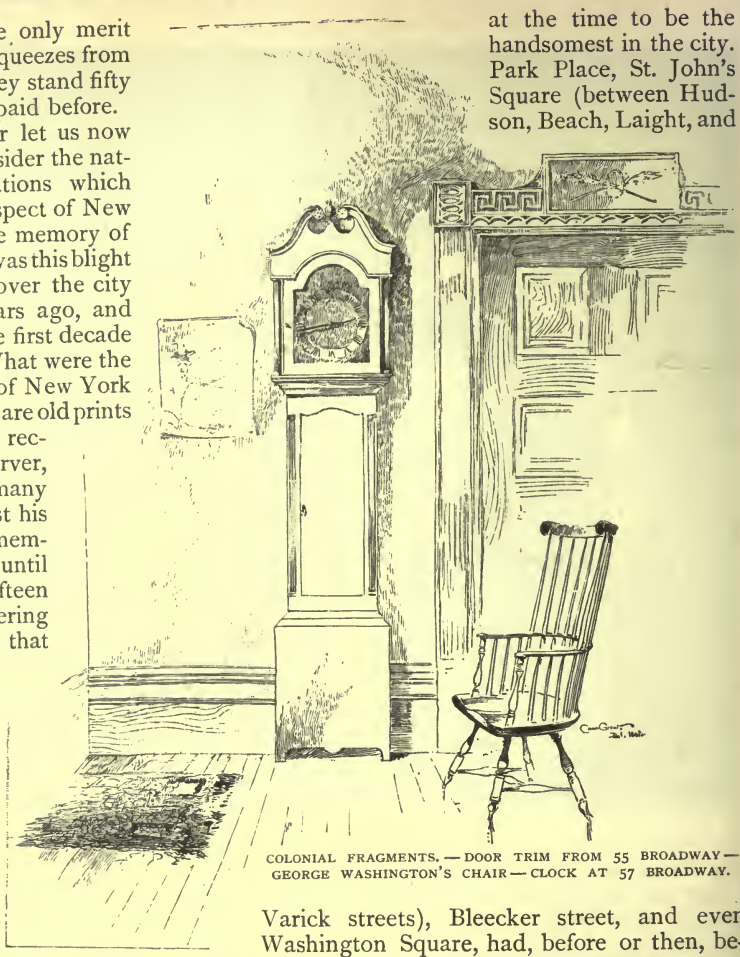
* From I know not what. I have gone on all my life with the notion that it was Milton's. To find that I am wrong troubles me not at all: for I care little about such knowledge — the line must be from some psalm or hymn.—AUTHOR.

[See Watts's hymn,

"There is a Land of Pure Delight."—ED.]

structures of which the only merit is that their gross bulk squeezes from the ground on which they stand fifty dollars for every one it paid before.

From sky and water let us now come to earth, and consider the nature of the transformations which have so changed the aspect of New York almost within the memory of one generation. What was this blight which began to pass over the city some forty or fifty years ago, and to pass away within the first decade after the Civil War? What were the houses and the streets of New York like in 1830–40? There are old prints enough to help out the recollection of a boy observer, who finds that after many years he can safely trust his observation and his memory. Nor, indeed, is it until within the last ten or fifteen years that a few lingering characteristic traces of that former time have been obliterated.



COLONIAL FRAGMENTS. — DOOR TRIM FROM 55 BROADWAY — GEORGE WASHINGTON'S CHAIR — CLOCK AT 57 BROADWAY.

Many circumstances united to make that part of the town about the beginning of Broadway the chosen residence of persons of fortune and social distinction. Three of these were of themselves all-sufficient: it was the oldest quarter; from the beginning it had been the place of residence of persons in authority; it was near the Battery, which very early in the history of New York became a delightful promenade. Considering the commercial character of the place, its rapid growth, and the great changes it underwent, the long period during which this quarter preserved its distinction is remarkable. It was not until between 1835 and 1840, more than a century and a half after the neighborhood became "the court end of the town," that there was any noteworthy modification of its character. Before that time, of necessity, elegant people began to live in other quarters; but this did not affect the status of the neighborhood of the Battery and the Bowling Green. The large granite dwelling-house on the Bowling Green (No. 17 Broadway) was built as late as 1845-50, by Mr. Robert Ray, then one of the wealthiest men in New York. He chose the site as the best that could be found for an elegant residence; and the house was thought at the time to be the handsomest in the city. Park Place, St. John's Square (between Hudson, Beach, Laight, and Varick streets), Bleecker street, and even Washington Square, had, before or then, become centers of fashion; but there was a clinging to the Battery. Even after the uptown movement began, which was about this time, people who were already housed near the Battery, or who could afford to get houses there, lingered lovingly around it. And well they might do so; for, except upon old Brooklyn Heights (and even then that was only "in Brooklyn"), a place of city residence more delightful or more convenient could not be found. Within five or ten minutes' walk of Wall street and of South street (where the great merchants—real merchants, who traded in ships with Europe and China and the South—had their counting-houses), it was yet entirely removed from business; and its surroundings made mere living there a pleasure. State street, which is the eastern boundary of the Battery, was unsurpassed, if it was ever equaled, as a place of town residence; for living there was living on a park with a grand water view. The prospect from the windows and balconies of the old State street houses across the green-

sward and through the elms of the Battery included the bay, with its islands and the shores of New Jersey. In summer, the western breezes blew upon these windows straight from the water. The sight here on spring and summer and autumn evenings, when splendid sunsets—common then, but rare now, because of changes in the surrounding country, which have affected the formation and the disposition of the clouds—made the firmament and the water blaze with gold and color, seemed sometimes in their gorgeousness almost to surpass imagination. It was matter of course that such a place should be chosen as the site of the homes of wealthy people. Of these houses, not a few are still standing. But how changed! Outside and inside they have been as much "translated" as Bottom found himself to be when his own wise poll gave place to an ass's head. Many of them are almost concealed by signs; all of them have been put to sordid uses, and fitted to their fate. These houses were most of them very simple in their exterior; but they had an air which will be sought in vain all along Fifth Avenue; an air of domesticity—of large and elegant domesticity, it is true; but still, they looked like homes, the homes of people of sense, and taste, and character. One of the last of these houses to be deserted as a residence was occupied during its later domestic life by a gentleman well known for his elegant taste and his patronage of art. It was attractively irregular in form, having a triangular porch, and above this a corresponding balcony, over which the roof of the house projected; the support being by pillars in front and pilasters at the side. Upon this porch and balcony, side windows as well as front windows opened. The entrance was approached by double lateral steps, guarded by wrought-iron railings. The effect of this was very elegant and yet very home-like. The house was almost noble in appearance; and within, it was even more attractive than it was without: ample, comfortable, highly

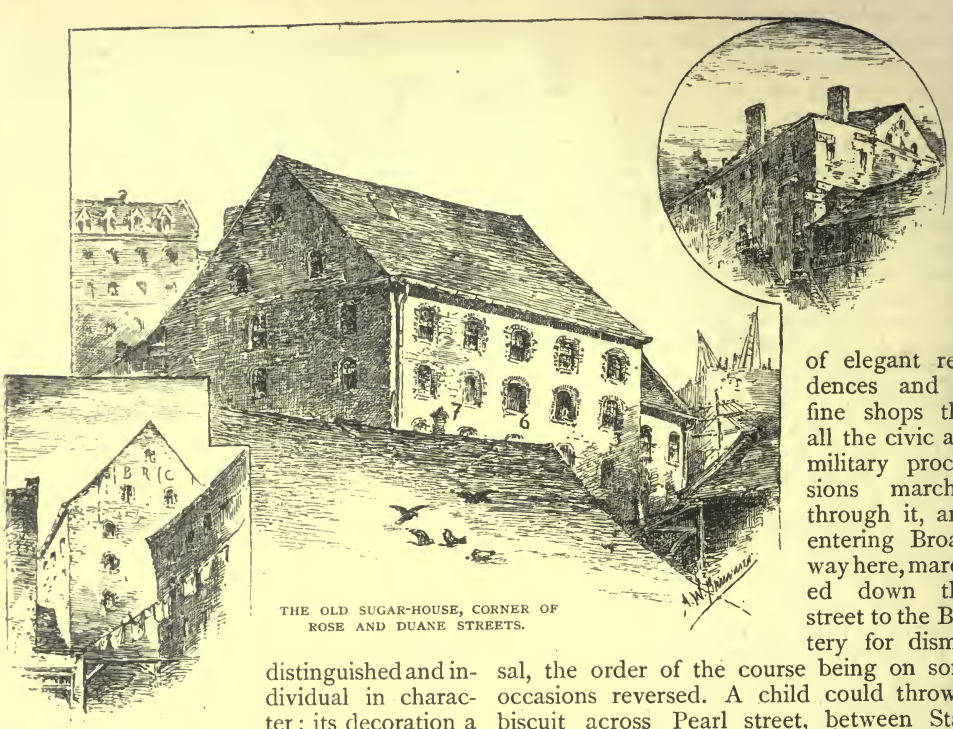
OLD MANTEL, IN A HOUSE IN ROSE STREET.



THE OLD SUGAR-HOUSE, CORNER OF ROSE AND DUANE STREETS.

distinguished and individual in character; its decoration a fine example of that which was prevalent in New York at the beginning of this century. Of this style, in which domesticity and chastened elegance are the dominating motives, existing examples are of very great rarity.

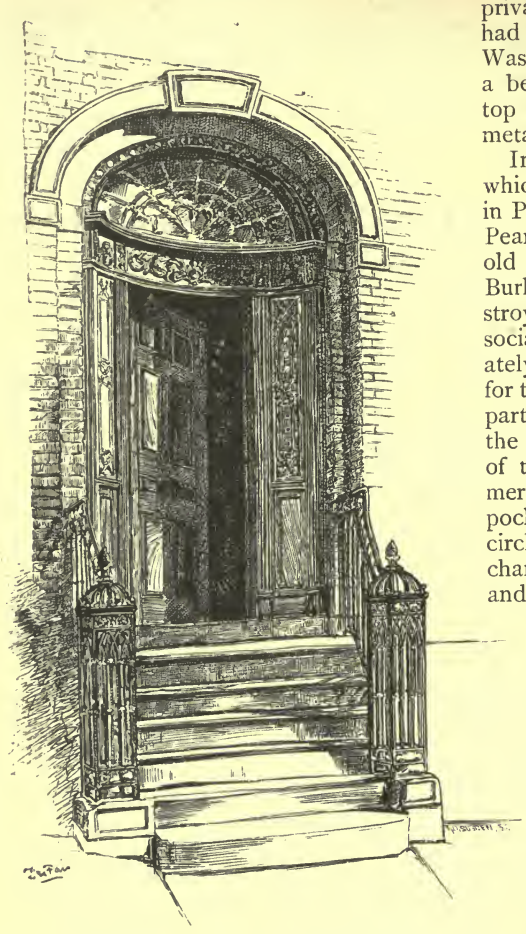
Trending due east from State street and cutting it at right angles are two little passageways, which in these days would be looked on almost as alleys. But one of them is the beginning of the once great thoroughfare, Pearl street, known first as Queen street,* which, starting here in a line with Broadway, and within a few yards of its head, curves round toward the East River (from which it was originally the first street westward, so much have the waters of the harbor been encroached upon), and, expanding, like a river in its pools, first at Hanover Square (formerly the great shopping center of fashion) and then at Franklin Square, enters Broadway next above Duane street, and directly opposite where the gray walls of the New York Hospital were seen only some sixteen or eighteen years ago, removed from the rush and roar of the great thoroughfare by an avenue through grass that seemed ever green and under elms that overtopped the highest houses. So late as 1830–35, Pearl street was so much a street of elegant residences and of fine shops that all the civic and military processions marched through it, and, entering Broadway here, marched down that street to the Battery for dismissal, the order of the course being on some occasions reversed. A child could throw a biscuit across Pearl street, between State street and Whitehall; yet there, until within a very few years, stood houses of a stately elegance which would now be sought in vain between Washington Square and the Central Park; albeit the carving within and without of some of these latter cost more than the entire construction of the others. Indeed, the house in the Fifth Avenue which is the most distinguished in appearance of all in that quarter, at once the most elegant, the most home-like, and the most suggestive of well-established wealth, is the plainest house there. It stands in that part of the avenue in which these qualities are most remarkable (that below Fourteenth street), on the north-western corner of Ninth street. The building of Chickering Hall removed from the Fifth Avenue some eight years ago the only other eye-pleasing and habitable-seeming houses it could boast; thousands must now remember with regret what they once looked upon with envy. Of the old houses in Pearl street which I have mentioned, two fine examples remained until within a few years. One was pilastered to the eaves; the other had at each story sunken arches and projecting cornices, which were supported by slender pillars. The cost could have been but very little, but the resulting effect was of singular elegance.

Little Bridge street was lined with houses of like structure, and of these a fine specimen still remains on the corner of State street.

* But between Whitehall and State streets (which themselves seem not to have received these names until after the Revolution), it was at the very first called Dock street.

It is of much larger dimensions than any of those already mentioned, larger even than the modern house on the corner of Fifth Avenue and Ninth street, and is truly worthy of the epithet "mansion," which is so freely and so absurdly misapplied in the newspapers. Its rising, well-spread roof; its inviting entrance, which seems to promise welcome and refined entertainment; its double-bowed front on either side, suggestive of the amplitude of space of which it really was the sign; its two balconies, whence we know fair women had often smiled upon brave men, give it a charm that does not sit ill upon its simple dignity. Look at it, and see if, in all New York, beyond the regions of trade, there is one house of which the outside shows such a promise of gentle breeding within. Then look upon the poles and wires which the artist, with hardy faithfulness — perhaps with vengeful motive — has preserved in his view, and see in this offensive incongruity one illustration of the spirit which seized upon New York some forty years ago, and left it a vast assemblage of engines of rapacity and architectural horrors. In the fine houses, of which this is a fair specimen, there were beautiful effects produced by approaches, stair-ways, and various uses of well-ordered space; of which this house is not without examples. Philadelphia is at present richer than any other city in houses thus ennobled. Here, too, we find a charming example of one of those elegant old mantel-pieces which were common in all our houses of a certain grade about the beginning of this century, but which are now as rare as the houses themselves. The elements of their beauty are exceedingly simple, but the eye never wearies of it; for it results merely from the harmonious disposition of straight lines and curves, without any

OLD MANTEL IN BEDROOM, HOUSE CORNER OF BRIDGE AND STATE STREETS.



DOOR-WAY OF A HOUSE IN OLIVER STREET.

pretension or implied significance. The design in all of them varied little, as will be seen by a comparison of one in the Bridge street house with two other examples, here illustrated: slender, fanciful pillars, surmounted with vase-form posts, which support a delicately molded shelf, and across the front only a decoration of geometrical figures with concentric lines; but the effect is that of a very winning union of elegance and homelikeness. A building which has long been too familiar to New York eyes to need illustration, and so well known even to those who have not seen it, as only to need mention, was the Washington Hotel, on the Bowling Green; the first house in Broadway; which within the last year has yielded place to the foundations of one of those hideous and perilous structures of many monotonous stories, which, within the last ten years, have risen to affront the heavens with their ugliness. In this house, which was a private dwelling of colonial date, and which had a historical interest as the residence of Washington, there remained to its last days a beautiful recessed, arched window, in the top of which the framing was of wrought metal work, of rich and pretty design.

In houses like this and its neighbors at which we have glanced in Bridge street and in Pearl street, and in the Walton House in Pearl street near Franklin Square, and in the old Glover House, also in Pearl street, near Burling Slip (the garden of which was destroyed when Platt street was cut through), the social entertainments of colonial and immediately post-colonial days had fair opportunity for the display of that courtliness of which the parting light and the fading aroma linger in the literature and the private correspondence of that period. No crushes, no rushes, no mere mob in good clothes with money in pocket; but a comparatively limited social circle who knew all about each other; culture, character; much courtesy, if some stiffness; and a sense of decency even in those whom excess sometimes led to violate decorum. The petty passions and the pettier ambitions which stimulate the strife for that bubble, social success, were doubtless forces in action in the society of those times, as they are now. But at this distance, at least, they appear, even as they were described by the actors in them, to have had an outside decoration of dignity and courtesy which concealed the worst of their deformity. One chair in many a house in Fifth Avenue costs as much as the worth of all the furniture of a room in one of those old houses; but the cost of the chair does not give grace to the sitter; nor will gilding, bright colors, and French polish compensate the eye of taste for the absence of well-ordered space and harmonious outlines.

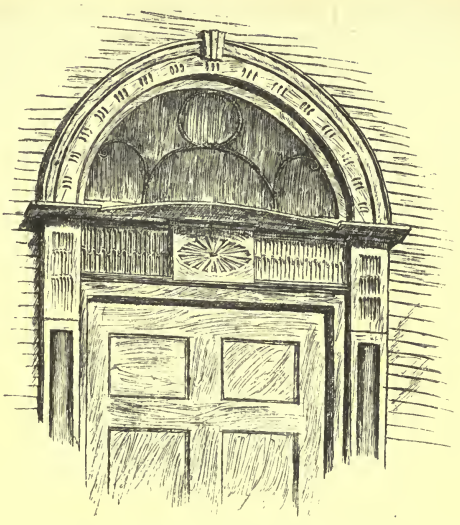
Nor were the interiors of these old houses lacking in the charm of beautiful decorative detail, as the young draughtsman saw who sketched the entablature of a door in the house of the third mayor of New York. Among the city's most distinguished architects, there is not one who might not gladly own this chaste and elegant design.

The neighborhood of the Battery and the Bowling Green could not, even in the earlier days of New York, continue to afford house room to all its inhabitants who were able and desirous to live handsomely; and before the beginning of this century* "fashion" had

* I need hardly say that I am writing very generally. I have neither the intention nor the wish to be particular. As to dates, within a few years, I do not profess to be exact.

gone "up-town," even so far as Park Place, a short street (still bearing that name) which ran from Broadway, opposite the middle of the old City Hall Park, to the Columbia College Green. This very pleasant little street (the oldest of New York "Places"), with the obscure little street on the west side of the College Green called College Place, continued to be the residence of people of wealth and social importance as late as the year 1845. On the east side of Broadway, people of condition, after living even in the upper part of Broad street,* in Wall street, in Pine and Cedar, in Maiden Lane, Gold, Cliff, and Fulton, seized upon Beekman street and filled it, from old St. George's to the City Hall Park, with houses in the best domestic style of London at that period. These houses were the homes of the most eminent merchants and professional men of the city. The street was quiet; it was not a thoroughfare for trade or any other purpose, on account of its nearness to Fulton street (the avenue to the Brooklyn Ferry) and the closure of the western end by the Park. Beekman street, like Park Place, retained its favor long. It was not until after 1845 that door-plates bearing some of the most honored names in New York's commerce and society disappeared from it: and no wonder; it was the embodiment of respectability and pleasant seclusion. I know this; for sleepy old St. George's, where my mother was married and I was baptized, was the first church in which my ears were fed with the music that I loved (it had a grand English organ and a famous English organist); and through Beekman street I went, some ten years later than the time of which I am writing, twice a day, as a school-boy, to and from Columbia College Grammar School. I observed those houses until I believe I knew every brick in the street. Their style and construction were distinctly different from those which prevailed around the Battery and the Bowling Green. Not less expressive of respectability and domesticity, they were less impressive and not so spacious. Already the crowding and flat-squeezing consequent upon uniform building plots of 25 feet by 100 had begun. But in some of the streets in this neighborhood such an arrangement was impossible.

Not far northward from Beekman street, and about a like distance eastward from the City Hall, is a little street, Rose street, the very name of which is probably not known to more than one in a thousand New Yorkers of to-day. Filled now with beer-houses and

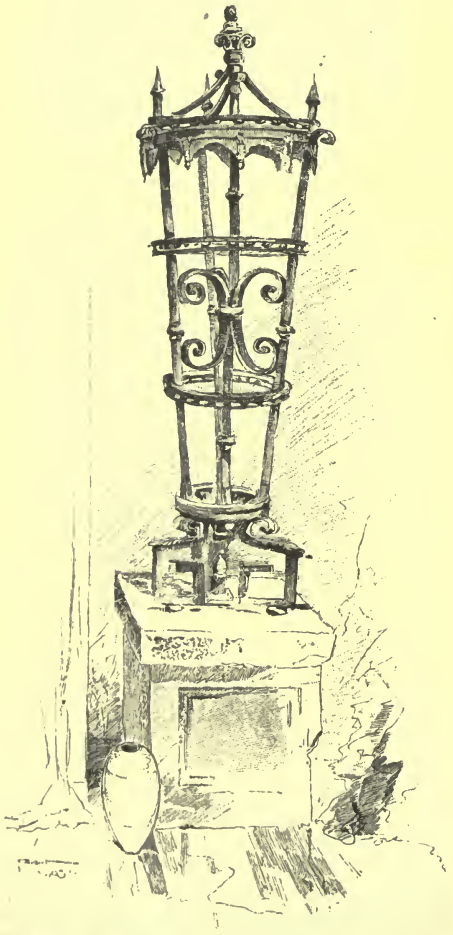


DOOR IN HOUSE CORNER OF BEDFORD AND MORTON STREETS.

tenement-houses, and the cheapest of cheap German boarding-houses, with huge factories, vast printing-offices, and finally crushed by the viaduct of the Brooklyn Bridge, which has shouldered its huge bulk in among the other coarse usurpers, so that it seems strange that the little place can hold them all,—reduced to this condition now, this little street (also a quiet no-thoroughfare) was, so late as 1830–35, filled with residences handsome for their day. Nor need I thus qualify my record. There still stands in Rose street a house, with a full-bowed front, which cannot have been built later than 1820, and which would at this day hold its own with any of the "place" houses of like size on cross streets between Eighth street and Union Square. One peculiarity of this street was that its course and the consequent shape of the plots of ground were such that most of the houses were not built in a line with it. Their fronts, being built at right angles with their sides, left a right-angled triangle vacant before each one of them; and the line of the houses along the street was like that of a rip-saw. In a town which soon was ruled off into rectangular uniformity, this variation of line was not without its charm. In one of these Rose street houses, one of our artists, on his quest for such examples of the style of interior building as might remain, found another of those beautiful old mantel-pieces which I have already mentioned; this one in a paneled room. It was this that first allured me when I saw this collection of sketches; and it touched me close; for it was the first mantel-piece I ever saw; it being in the house my father occupied in Rose street in my early

* Delmonico (the original) was early in business (if he did not begin) in a spacious and elegant old house, formerly a private dwelling, in Broad street, near Exchange Place.

boyhood. The artist supposes it to be a piece of colonial work, and has decorated his sketch with a chair of the period. Upon this point, however, I must venture to differ from him very decidedly—at my risk, I know; but I feel quite sure that those mantel-pieces did not come into vogue in America until about the beginning of this century, and that most of the very few existing examples of them date from 1790 to 1810. Another of them, and certainly not the least pleasing, was



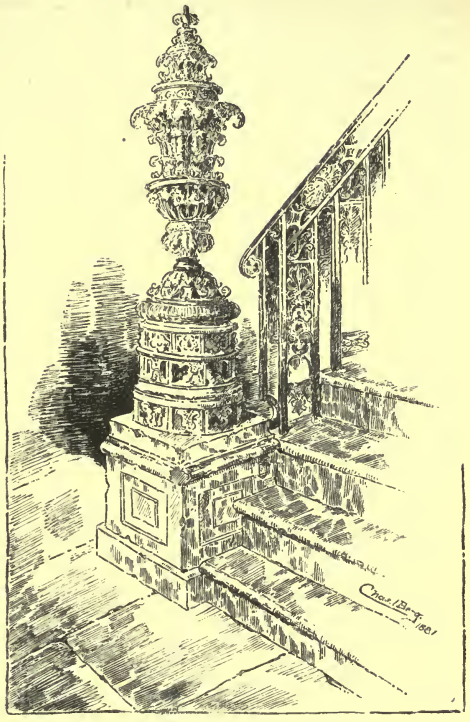
NEWEL NOW IN THE STUDIO OF WILLIAM M. CHASE

found in the back room of an old pawn-shop down-town. But in Rose street there was and is a colonial building, and one of some magnitude. It is the old prison-like stone structure (once, I believe, used as a prison) on the corner of Duane street, occupied by William Rhinelander & Sons, sugar-bakers. According to New York custom, this grim old structure ought long ago to have been pulled down; but the current of domestic life only eddied around it for a few years, and then flowed onward up-town; and thus the old sugar-house was left standing. It is now put to other uses, and is hardly visible from the street in which it was once a gloomy and unsightly, and I believe unsavory, object. A much more attractive one in this street, although equally plain and much less imposing, was the Friends' Meeting-house, which stood deeply recessed from the street in a large green plot on the western side, about halfway between the Rhinelander sugar-house and Pearl street. It remained there many years after Rose street ceased to be regarded as a desirable place of residence by those who could afford to live elsewhere; and it had in its plain and well-preserved exterior and its neatly kept inclosure the very same expression of simplicity, comfort, and respectable stability that now appear in the new meeting-house and school on the western side of Stuyvesant Square, opposite St. George's Church. It is somewhat and not unpleasantly remarkable that these old neighbors, in moving more than two miles up-town, have kept so close together.

In the neighborhood of the Rose street meeting-house lived not a few of the most respectable and wealthy of the Society of Friends, at that time proportionately a very much larger and more influential body than they are now. The position of this place of worship doubtless had some influence in determining a movement which began among the wealthier of them soon after 1825; for the Rose street Meeting was the Grace Church, and the Brick Church, and the North Dutch of Quakerdom. This movement led to the establishment of a neighborhood of Friends in the streets leading from Chatham Square; but not quite so early as the date just mentioned; for this quarter was first filled by the overflow from the region around Park Place and Beekman street. It had then not been decided that the course of the development of New York "society" would be by movement on a narrow, straight line northward. Nor, indeed, was that determined until many years afterward. There were various doubtful feelers put out in several directions, and some half a dozen very strong attempts were made by land-owners to influence the direction of this movement. But every attempt to stop, to allure, or to divert it was in vain, and resulted only in the erection of fine houses that remained standing in a waste of squalor, lonely monuments of loss and folly. At the time that I speak of, all the Grinnells, Henry, Joseph, and Moses H., lived in Market street, which runs from Division street to the East River, in now one of the most obscure quar-

ters of the town. Here, however, I saw, only a few weeks ago, a house which expressed in a simple way the very perfection of comfort and respectability, and which was even not without the tokens of wealth. It was well kept up, too, everything about it being neat and orderly, even to the brick wall of its old-fashioned garden and its handsome brick stable. And yet that stable was built when there were fewer private carriages in New York than there now are locomotive engines. In this quarter, in Oliver street, which runs eastward from the unmentionable purlieus of Chatham Square, one of my artists found a very fine example of a beautiful entrance-door which came in about this time. It curved inward, the door itself being sometimes curved, and it was crowned with an elliptical arch, under which was an arched fan-light. The lintel and the posts were delicately decorated. I know of late years only this one specimen of this beautiful entrance-door, and am not sure, as I write, that this one still exists. A plainer one, somewhat in the same style, but without the alluring curve and the graceful decoration, attracted another pencil at the corner of Bedford and Morton streets. This is on the west side in old Greenwich, a village which New York has swallowed up, name and all; a place to which people fled *from* New York to escape the yellow fever in 1822 (and as to which I find some testimony of protection, quarantinewise, by means of a *board-fence* at that time), and which yet in 1830 began to be the residence of well-to-do merchants whose counting-houses were in Water street and in Front street.

Some readers of The Century who are interested in the subject of this article will, I am sure, have observed the railings and the open posts, or newels, of the beautiful entrance-door of Oliver street. These were of wrought iron, all worked out with the hammer; and as I looked through these sketches, I saw that luckily my architectural friends had preserved traces of the various stages of development and of degradation through which this feature of semi-architectural decoration passed. One, of a considerably later date than that of Oliver street, has such beauty and such character that an artist has removed it to his studio. Its date is probably about 1840, not later, and it is at once a relic of excellence and a token of coming deterioration. The latter appears, literally full-blown, in the much befoliated newel from the house in Bleecker street,—a bastard thing, both in design and in construction. From this the fashion seems to have passed to the shapeless cast-iron caricature which supports the cast-iron hand-rail of a house in East Fourth street,



NEWEL IN BLEECKER STREET.

near Washington Square, and which looks like a pine-apple smitten stark with death as it was trying to rise into a column. It suits its place, and it is one of the not rare tokens of the architectural blights that fell upon New York some forty or fifty years ago, of which that neighborhood at the present day preserves vestiges in all degrees.

The course of the up-town movement at first included Broadway; in which great central thoroughfare fine houses and the finest shops in the city were alternated in groups, sometimes in blocks, sometimes singly, making it both a pleasant and a brilliant promenade. No street now exists which takes the place of old Broadway in this respect. In the afternoons of spring and autumn, and on fair days in winter, it was thronged with elegantly dressed people, including those of acknowledged fashion and social position, who now use no place as a promenade, and when they do appear in the street on foot dressed in the soberest and most unobtrusive style. Very few houses in old Broadway had any beauty or made any architectural pretension. Only two or three had striking architectural character, and that was very bad — either oppressively ponderous and dull, or else extravagant. Of the latter sort there is one remaining, directly opposite

Washington Place—a white marble house twenty-five feet wide, with two monolith Ionic pillars standing between its no-roof and something which is neither a vestibule nor a balcony. It is one of two which were built together, presenting to the admiring eye four Ionic pillars big enough for a Greek temple. A more absurdly uncomfortable, unhomelike, incongruous structure for a dwelling-house was never built. One of these houses has been taken down. When they were built there stood nearly opposite to them a large, old-fashioned, wooden country-house in a garden. Such contrasts were then, and even afterward, not uncommon, owing to the rapid growth of the city. Only a few years ago, a large old house stood on the west side of the town, much below Fourth street, surrounded by narrow brick buildings, its ragged old garden and grass-plots occupying half the ground between four streets. Some of the pleasantest houses of later days were in Walker street and White street, west of Broadway. Most of them were what is called "basement houses," with drawing-rooms on the upper floor, and double staircases. They were spacious and comfortable, and, notwithstanding their extreme plainness, were unmistakably the residences of elegant people. Here lived some of the most gay and fashionable as well as respectable families of the city.

DOOR-WAY IN WASHINGTON SQUARE, EAST FOURTH STREET.

The first formation of a large fashionable quarter, after Park Place and the neighborhood of Columbia College became insufficient for the growing demands of the city in this respect, was around St. John's Park. This, like Gramercy Park, was a private pleasure-ground; keys to its gates being perquisites of houses which fronted upon it or were in its immediate neighborhood. St. John's Church and the Park, which was filled with fine trees, made this a delightful place of residence; but none of the houses had any beauty or character. Their only architectural merit was that they were unpretending, seemed comfortable, and were not built in monotonous rows.

The next center of fashionable residence was Bleecker street, on both sides of Broadway, and Bond street, which latter was filled with costly houses, most of which are still standing. Their contrast of red brick with white marble basements, steps, and door-ways, made them glare horribly under our blazing sun. They were entirely devoid of character. Some attempt in this direction had been made in Leroy Place, a section of Bleecker street between Mercer and Greene streets. The stone-work was in gray granite; two houses in the middle of the row had high steps, and those on either side were "basement houses," entered on a level with the street. Symmetry was thus obtained, and the place had an eminently respectable air; but on the whole the effect was rather depressing.

A great architectural effort was made about this time in Lafayette Place, which (as it was next to Broadway, and yet, by closure at both ends, secure against being a thoroughfare,) was thought to be eminently suitable for a place of elegant residence. Wherefore Colonnade Row, with its formidable array of Corinthian pillars, was built. A gloomier, more forbidding, more ridiculous structure for domestic purposes could hardly be found. But one house in this neighborhood deserves honorable mention, that on the western corner of Great Jones street and Lafayette Place, which was recently occupied by the Columbia College law school. It is slightly tinged with the Philistinism of its period; but it is spacious, handsome, and not without character. It looks like the residence of a man of wealth and culture. It is to be deplored that houses like this must be abandoned to public or to inferior uses. Generations ought to succeed each other in such homes. In London they have done so in plainer, if larger, houses on St. James's Park, where families have had their city residence for more than two cent-

uries. Stability and long association are essential elements of a true home, whether it be large or small, plain or costly.

A notable effort in this direction was made in the building of Depau Row: in Bleecker street, two streets west of Leroy Place: a row of large, massive houses, all alike, intended to be stately, each having a *porte cochère*, or carriage entrance, through which, only, admission could be had. The intention was that these houses should be occupied only by people of a certain and identical social standing, and that they should be hereditary family residences. Most of their first occupants were connected more or less nearly by marriage; and it was seriously debated whether one of the first surgeons in the world—a man of wealth and character as well as talent, and of notably fine manners—was in a sufficiently elevated position to be received in one as a tenant. He was indeed accepted; and although then a middle-aged man, he lived to see the famous Row deserted by his critical neighbors as well as by himself, and given up to basest uses. Probably no neighborhood in New York was ever occupied by a more abandoned and disreputable horde of tenants than Depau Row within twenty years of its building. The attempt failed partly because of the uncontrollable movement of the various currents of population; partly because its social design was incongruous with the spirit of the country. Architecturally, it was far from admirable. It was indeed gloomy and peculiar, but not grand,—as undomestic a looking pile of brick and mortar as was ever put together.

The row of houses on the north side of Washington Square was built just fifty years ago. These houses have no external beauty or character, but their situation is incomparably fine (unless we could go back to the Battery), and within they are models of comfort. Even at this day the two most desirable houses in the city are those on the corners of Washington Square and the Fifth Avenue.

Nothing which could be brought within the limits of this article remains to be said about the older dwelling-houses of New York. From Washington Square upward began the endless succession of "places," and of houses in long, monotonous rows, and of that series of architectural horrors known as "brownstone fronts." Thrift, and the desire to meet the multitudinous demands of vulgar taste for show, were the guiding motives of the builders who covered the upper part of New York with houses the memory of many of which is like a brick and stone nightmare. Pretension is united with vulgarity; and the product in many cases seems to have been the result of a notion that architectural beauty is to be attained by an indefinite repetition of ugliness.

But, within the last ten years, a new spirit has manifested itself in the domestic architecture of New York. Among the houses built within that time are some which, according to their size and quality, are worthy of any country and any period. The fantastic monstrosity in external form which prevailed throughout the previous thirty or forty years is giving place to a sober but attractive and thoroughly congruous elegance; while internal decoration unites comfort and domesticity with a beauty of form and a richness of color to which even our old colonial houses and those of the earlier years of this century did not attain. The rapid accumulation of wealth is at last accompanied by the appearance of a few gifted architects, who promise within the next ten years to relieve modern New York from the reproach of being at once one of the largest and richest and one of the ugliest cities in the world; unfortunately, they cannot help its being the noisiest and one of the most unclean.

Richard Grant White.

A PRAYER.

How glad the heart beats, though the world has graves!
Ah, happy breath! in spite of care and strife!
Though lacking much, this only thing I crave:—
Make me love death, O Lord, as I love life!

Charlotte Fiske Bates.

MARTIN LUTHER. (FROM A WOOD-CUT BY LUCAS CRANACH, ENGRAVED IN 1546.)

MARGARET LUTHER, the mother of Martin, told Melanchthon that she recollected the day of the month and the hour when her son was born, but not the year. But James Luther, his brother, whom Melanchthon pronounces an honest and upright man, told him that it was 1483. This brother was conversant with the family history. His testimony, not to speak of other evidence, establishes the fact that the "modern Hercules," whose heroic qualities, as well as his achievements in the reform of religion, were on a level with the fabled labors and spirit of the son of Zeus, drew his first breath on the night of the 10th of November,—it was after the hour of eleven,—four hundred years ago. No man ever showed himself to the world more unreservedly than this mighty leader of the Teutonic revolt against Rome. He abhorred concealment. He was really incapable of disguise. He could not do otherwise than lay bare his heart and mind. His outspokenness was often a source of terror and anxiety to his friends, not less than of wrath to his enemies. If, on very rare occasions, he made the attempt to be shrewd and diplomatic, the effort was sure to be clumsy and abortive, and he was himself disgusted with the experiment. The secret fears and misgivings, from which even his clear and bold mind was not free, he had no inclination to hide. For example, we read in the "Table Talk": "A man must be plunged in bitter affliction when in his heart he means good and yet is not regarded. I can never get rid of these cogitations, wishing that I had never begun this business with the Pope. * * * But 'tis the frailty of our nature to be thus discouraged." Is he for the moment struck with weariness at being misunderstood

and rejected? Like a child, he expresses the transient regret that he ever undertook to set the world right. Even the inward temptations of the flesh he does not hesitate, in the most simple way, to refer to. Witness his letters from the Wartburg, which depict his bodily infirmities and the evil thoughts that at times tormented him in his solitary hours. His unguarded freedom of speech respecting himself was connected with an equal freedom and candor in speaking of others. His writings are not only multitudinous; they were composed so rapidly, in quick response to emergencies, that they are a transparent mirror of his thought and feeling. His personality is in them all to an extent that is, perhaps, true of no other writer on religion since the Apostle Paul. His correspondence, stretching through many volumes, is an endless source of information respecting him and his ways. The object of boundless interest in his own time, attracting the intense admiration of a part of mankind, and provoking the violent antipathy of another part, it was inevitable that numberless reports of his sayings and doings should become current. Devoted companions treasured up fragments of his spontaneous talk as he sat at the table with them, and their notes were subsequently compiled in a volume, one of the most suggestive and entertaining in this species of literature. By this time we ought to know Luther well. It demonstrates the richness and depth of his nature that men do not grow tired of him. They may dislike the fierce dogmatism, which became more boisterous in the battles which he waged and in the days of ill health and advancing age. The coarseness and occasional indelicacy of his language may repel readers who are not over-fastidious. But the originality of thought and the virility of expression, the insight into the deep things of the spirit, the vein of humor that mingles itself unbidden with the most profound and serious reflection, the play of imagination,—these qualities that belong to the utterances of Luther constitute an unfailing charm. A poet, and no less a poet than Coleridge, has said of him: "He was a poet, indeed, as great a poet as ever lived in any age or country; but his poetic images were so vivid that they mastered the poet's own mind. He was possessed with them as with substances distinct from himself: Luther did not write, he acted, poems."

As the world has ample means of acquainting itself with the personal traits of Luther, so is it with the circumstances of his career. A few errors or apocryphal incidents still cling to the story. His parents were not at Eisleben to attend a fair on the occasion of his birth. They had previously removed to that place from Möhra, a village in the Thuringian forest, not far from the spot where the English monk, Boniface, the apostle of Germany, first planted the Gospel among the Germanic tribes. Luther's progenitors, as he himself says, were all plain working people. His parents were quite poor; but they were self-respecting and religious, and set a proper value on intellectual and Christian training. John Luther, his father, became a magistrate in Mansfeld, the place to which he removed shortly after the Reformer's birth. Thanks to the filial regard of his son, John Luther passed his last days in comfort, and left behind him, for a man in his station, considerable property. It is characteristic of Luther that, in framing the form of marriage ceremony to be used by the clergy, he used the names of his father and mother, Hans and Gretha, to fill the blanks: "You, Hans, take Gretha," etc. There is no proof that, as commonly related, one of his friends was struck dead by lightning at his side. Melanchthon speaks of the sudden death of one of his intimate friends by some accident, the nature of which was not known to the narrator. He was probably murdered, or killed in a duel. Luther, however, had a terrific experience of some sort in a thunder-storm, when the lightning struck near him. Incidents of this character were not without an influence in determining him to take the vows of a monk; but the main causes, of course, lay deeper, in the whole bent of his thoughts and in the profound religious anxieties which were independent in their origin of any casual occurrence. Fervent admirers of Luther, or zealous Protestants, have occasionally suppressed remarks, or passed silently over events, which they have imagined to reflect some discredit on their hero. One instance is a phrase in the description which was given of his person and manners by Petrus Mosellanus, who was Professor of Greek at Leipsic when Luther was there at the public disputation with Eck,—a description which it is worth while to notice, as having an interest apart from the point referred to. This was in 1519, two years after the posting of the Theses, when Luther was thirty-four years old. Mosellanus writes to Julius Pflug: "Martin is of middle stature, thin and worn with anxiety and study, so that one may count almost all his bones, but of manly and fresh age, and with a clear and loud voice. His knowledge of Scripture is so great that he has all at his fingers' ends. He is so conversant with Greek and Hebrew that he can judge of the fidelity of interpretations. He possesses, too, a great abundance and command of words and facts, but somewhat

lacks, perhaps, judgment and discretion in the use of them." These last words have been omitted by several of the Lutheran authorities. Mosellanus proceeds: "In his manners he is courteous and friendly, and has nothing stoical or supercilious about him; he can accommodate himself to all occasions. In society he is a lively and pleasant jester,"—this word "nugator" (trifler) has likewise been sometimes left out in citations of the passage,—"always of bright and joyous aspect, let his opponent threaten him never so fiercely; so that one can scarcely imagine this man to have undertaken such weighty matters without the aid of God. But the fault which almost all find with him is that he is somewhat imprudent in reprehension, and more biting than is safe in an innovator in religious matters, or decorous in a theologian." This was the impression which Luther made on the Leipsic Greek professor. A year before, Cardinal Cajetan had bluntly said of him: "I will converse no more with this beast, for he has deep-set eyes and wonderful speculations in his head." Those who are familiar with Cranach's portraits know that as Luther grew older he became stout. On his stern and rugged, yet not ungenial face, were stamped the mingled determination and sincerity that were native to his character.

It is vain to seek to account for a personality like that of Luther by his environment. There is a mysterious personal force which has an origin independent of circumstances,—a vast force brought into the current of human affairs to modify its direction. Yet the conditions of the emerging of this personal power are furnished by the contemporary and previous situation. A man, however great, must mold himself on his times. It would be impossible for such a man to be transferred from one age to another. Luther owed much to his family, lowly as was their condition of life. There lay back of him the Latin Church, with its varied and mighty influences, active during more than a thousand years for the shaping of mind and character. He advanced beyond the experience of a priest and a monk, but without that experience he would not have been Luther. There was a development of conscience under the mediæval system of religion in which Luther partook to the full. The blood of the German race flowed in his veins. It is more than a fancy to suppose that he may have sprung from the tall warriors and stalwart chieftains who confronted the legions of old Rome and remained unconquered.

Luther was a German of the Germans,—the "Ur-Deutscher," the typical German, as he has been called. He knew his people thoroughly, and they recognized themselves in him. Foe as well as friend allows that no man ever did more for an entire nation or left a stronger mark upon it. The very language in which Germans have spoken and written since Luther is an indestructible monument of his influence. He created the language anew. He stands at the fountain-head of the modern literature of the "Fatherland." He has molded the minds of uncounted millions of his countrymen, on whom his image has been consciously or unconsciously impressed. His words have had a greater and more lasting effect on his countrymen than the words of any other man. When we look at the influence which has gone forth from his manuals of religious instruction, and from the hymns which have been sung in churches and households, and by armies on the march to battle, now for four centuries, the measure of his power is felt to be indeed incalculable. All this has been eloquently expressed by the ablest of the modern Roman Catholic theologians, Döllinger, who had spent a long life largely in withstanding Luther's doctrine. The failure, it may be here remarked, of the "Old Catholic movement," supported though it was by many scholars and by princes, brings out in stronger relief the gigantic power of the Reformer, who carried through what might appear to be an infinitely more formidable task.

Of all Luther's gifts to the German people, his translation of the Bible is, no doubt, the most valuable. In nothing are the resources of his intellect and the vigor of his character more manifest than in his ability, in the midst of a literary warfare with a hundred antagonists, to undertake most important works of a positive character, involving a great amount of thought and toil, for the upbuilding of the church. The translation of the Bible cost him a world of labor. He recognized the necessity of taking counsel in such a work. Besides the regular help of Melanchthon, Jonas, and his other coadjutors, he would discuss words and phrases at his own table with the friends and guests who happened to be with him. Imbued himself with the vernacular of the people, he still did not neglect to inquire of common men in cases where he was doubtful as to the right term to be chosen, or as to the precise significance of a popular phrase. For he meant to make a translation which should come home to the understanding and heart of the common man. It should be a *German* Bible that he would give to the people. Not that he undervalued accuracy: he claimed that, in cases where precision was necessary, he had secured it, sparing no outlay of thought and inquiry to achieve this

end. Still, he was determined to issue, not a colorless version, or a version enervated by idiomatic peculiarities of the Hebrew and the Greek, or a pedantic version, intelligible and interesting only to the cultivated, but rather a translation which should make the Bible appear to have been written in German. He gives amusing accounts of the struggles it cost him to make the sacred writers "speak German." In dealing with Job, especially, his patience was well-nigh exhausted. No one could understand what it had cost him to make Job "*reden Deutsch*." But he succeeded. In his version, the apostles and prophets "*reden Deutsch*,"— the Deutsch of the shop, the market, and the hearthstone. Luther's Bible is a living book. If the recent English revision of the authorized version, admirable in various particulars, fails at any point, it is just here. There is a lack of freedom in the incorporation of English idioms; in a word, there is an undue servility. So far as a translation fails to give the force and beauty of the original, it is incorrect. Close adhesion to grammar and lexicon, in many instances, may be the cause of greater loss than gain. We must have the spirit as well as the letter of the text. If we cannot have both, then better the spirit than the letter. Our recent revisers make the frightened disciples who saw Jesus walking on the sea cry out, "It is an apparition" (Matt. xiv. 26). Would such a company of fishermen, in a state of alarm, use this word? If not, some other should have been substituted for it. The juicy language of Luther's version, its sinewy vigor, its racy idioms, and the rhythmical charm which it has in common with the authorized English version, are literary merits which it is impossible to estimate too highly.

Full of patriotic feeling, Luther shared in the national aversion to the Italian spirit and to Italian domination. There is a lively dramatic interest in certain memorable interviews in which he was brought face to face with Italian prelates. One of these was the conference with Cardinal Cajetan at Augsburg, to which we have referred. Luther found him, he wrote, "a complete Italian." The wary and accomplished Italian, liberal-minded, too, as he proved himself in his subsequent career, found the monk whom he expected to convert much more ready to debate than to be instructed. In reply to the question where he would stand if the Elector failed to protect him, Luther answered, "*Sub cælo*" ("Under heaven"). Many years later, when the state of things had greatly altered, and Rome had learned that the Saxon insurrection was not easy to be suppressed, Vergerio, another trained and refined prelate, was sent by Pope Paul III. to negotiate with the Lutherans on the matter of a projected council. He arrived at Wittenberg on Saturday, November 6, 1535. On Sunday morning Luther summoned his barber, and jocosely informed him that, being about to meet the Pope's nuncio, he wished to make his best appearance; "that I may," he added, "be taken for a younger man than I am, and so terrify my enemies with the threat of a long life." Clad in his best apparel, with an ornament of gold hung upon his neck, he stepped into the carriage, with his companion, Pomeranus, exclaiming, "Here go the German Pope and Cardinal Pomeranus!" Luther frankly declared to Vergerio his disbelief in the sincerity of the Pope, his jubilant confidence in the soundness of his doctrine, his readiness to go to a council anywhere, adding that he would bring his "neck along with him." His hilarity, his cheerful tone of defiance, as well as his barbarous colloquial Latin, made a somewhat unpleasing impression on the polished Italian. It is remarkable, however, that Vergerio himself afterward joined the Protestants. The checkered career of this man is a remarkable illustration of the changes of opinion and of fortune that were not unfrequent in that revolutionary age.

Luther might have limited himself to the work of a national reformer, and have put himself at the head of a movement having no other end than to emancipate the German church from subservience to Rome. The connection of Germany and Italy in the middle ages, after the Roman Empire was established in the German line, was attended with perpetual jealousy and conflict. One might be tempted to judge that it would have been better if the Empire, with the long investiture struggle and all the contests and suffering which the imperial idea involved, had not existed, and Germany and Italy had been kept apart. But, as Ranke has sagaciously remarked, the course of history is not marked out—it is well that it is not—after these preconceived notions. Without the union of Germany and Italy, prolific of evil though it was, the "evolution" of Christendom could not have taken place. The loss from isolation would have been greater than the gain. It is true, however, that a national antipathy, which had been the growth of ages, had been developed through the abuses of papal administration in relation to Germany, until the German nation at the beginning of the sixteenth century was ripe for a united movement that should lay an effectual curb upon papal domination, and redress the grievances which had so long been a theme of loud complaint. In the councils of Constance and of

Basel, in the fifteenth century, Germany had nearly succeeded in organizing a national movement to secure a fair measure of ecclesiastical autonomy. The failure, and the continuance of abuses, only made the discontent deeper. The Emperor Maximilian thought of getting himself chosen Pope in order to remedy the evils complained of. He had never known a Pope, he said, who had dealt truly and faithfully with him. "Eternal God!" he once exclaimed, "if it were not that Thou art watchful, how bad it would be with the world which we rule,—I a miserable hunter, and that drunken and rascally [Pope] Julius." In the classification of his writings which Luther made at the Diet of Worms, in response to the comprehensive demand that he should retract what he had written, he made emphatic mention of the wrongs of Germany. "The sufferings and complaints of all mankind," he said, "are my witnesses that, through the laws of the Pope and the doctrines of men, the consciences of the faithful have been ensnared, tortured, and torn in pieces, while at the same time their property and substance have been devoured by an incredible tyranny, and are still devoured without end and by degrading means, and that, too, most of all in this noble nation of Germany." The extortion of money from the poor, by such emissaries as Tetzel, was only one item in a long catalogue of measures adapted to rouse the indignation of the German people. If Luther had confined himself to abuses of administration and flagrant stretches of prerogative on the part of Rome, and, for the most part, had let doctrine alone, there is little doubt that all Germany might have been rallied to his cause. It is not given to man to forecast the future; but, as we imagine this course to have been taken, the vision arises of a united Germany gradually shaking off ecclesiastical tyranny and advancing in a peaceful career on the upward path of culture and civilization. Instead of this result, what do we behold? The nation divided, and ultimately torn in twain: first the war of Smalcald, then the Thirty Years' War, with its pitiless barbarities, destroying arts and industry, liberty and independence, and making Germany for generations a prey to implacable factions and merciless foreign invaders.

The wisdom which reasons thus is plausible but shallow. Like remarks might be made respecting Christianity in its beginnings, and in its relation to the religion of the Jews and the gentile philosophy and worship. The Prince of Peace came "not to bring peace but a sword." It is the greatness of Luther that he was more than a German patriot; he was more than a reformer of ecclesiastical and civil polity. The perceptions and convictions that possessed his soul were of a more universal character. Religion, and the truth of religion, were to his mind the supreme concern. Hence, he laid the axe at the root of the tree. He went back to the fundamental truth of Christianity, which lay at the fundation of the Church in the intention of its Founder. He planted himself on principles which have to do with man's essential relations to God and to the invisible world.

The Christianity which Luther, after prolonged struggle for light and peace, learned from the New Testament, brought him into mortal conflict with the Scholastic Theology, which had been elaborated, on the basis of the Fathers, by the mediæval doctors, notably Thomas Aquinas, and had been sealed and sanctioned by the Church and the Popes. The principle of faith; the idea of the immediate connection of the receptive and dependent soul with God and Christ, with no human priest to intervene; the doctrine of gratuitous forgiveness without works or merits in man,—were as clear to Luther as if they had been written in letters of fire on the sky. Thomas Aquinas was the oracle of the Dominican order. It was this order which had in charge the sale of indulgences, the scandal which first provoked the indignation of Luther. Against the theology of Aquinas and of his followers, and the doctrine of salvation which Rome required him to preach, he prosecuted an unrelenting crusade. It was a part of Luther's endeavor to break down the overweening authority of Aristotle. This philosopher had ruled in the schools for several centuries. First, his logical method had been adopted with eager enthusiasm by the Schoolmen. At length his other writings, including his "Ethics," gained an almost equal sway. He was considered to have exhausted the powers of unassisted human reason in the quest for moral and religious truth. To disparage Aristotle was little short of heresy. Luther, in common with the Humanists, early contended against the supremacy of the Stagirite. But what inflamed Luther's antagonism was the ethical doctrine that good works make the habit or principle. That the work derives all its worth from the principle out of which it springs, this principle being faith, was Luther's cardinal maxim. The scholastic doctrine of works had really not been drawn from Aristotle. It had arisen independently, and then welcome corroboration had been sought and found in the master of heathen wisdom. Luther's exasperation against the obnoxious doctrine included in it, however, an antagonism to the philosopher

who was thought to stand as its sponsor. Every student of Luther knows, or ought to know, how to make a proper discount from his vituperative language, which, by utterances in some other connection, is often neutralized or at least qualified. But certainly he is unsparing in the denunciation which, in various passages, he pours out on the head of the heretical philosopher. "It grieves me to the heart," he says, "that the damned, arrogant, rascally heathen with his false words has seduced and befooled so many of the best Christians." * He reproaches his adversaries with having chosen for their master "a dead and damned heathen." (As the word "damned" is, in these places, a past participle and is literally meant, we give it a literal rendering.) This "dead heathen," he avers, "has well-nigh suppressed God's books." In the excess of his vehemence he asserts that even a potter knows more even of natural things than stands written in Aristotle's books. All this is sufficiently extravagant. It is merely one mode of indicating his extreme repugnance to a Pelagian theory of character, which makes a man merit his own salvation, and dispenses with God's help and grace in the building up of character, and with faith as the fountain of right conduct.

Luther could not make a distinct issue on doctrine with the Church without a direct collision with the Latin hierarchy, and with the Pope, their chief. This battle he did not seek. He would have been glad to avoid it. For a long time he had no idea that matters would be pushed to an extremity. He hoped that he would be allowed to believe and to preach what he read in St. John and St. Paul. More than once he refers to the long, anxious conflict in his own mind through which he passed before he could arrive at the resolve to take a stand against the Pope and the authoritative, traditional teaching of the Church. It was in no temper of foolhardiness, no spirit of bravado, from no impatience of just authority, from no conceit of his own wisdom, but from the deepest conviction that no other course was open to him, that he finally determined to throw off the yoke which it was impossible to wear longer with a good conscience. Long after the "Theses" were published, looking back to that time, he wrote: "What was I then! a poor, miserable little monk, more like a corpse than a man! for me to march against the majesty of the pontiff—of him whose nod was terrible not only to the princes of the earth, but, if I may so say, to heaven and hell! In what straits my soul was confined during the first and following year; to what submissions, by no means feigned or false, I descended; nay, in what despair I was all but involved, can be little conceived," etc. To whatever he might think or say, the reply was at hand, "Hear the Church!" "Here was my severest struggle, here my greatest difficulties; but at length I did, notwithstanding, overcome the obstacle through the grace of Christ. Indeed, at that time I had a much stronger reverence for the pontifical Church, and a much deeper conviction that it was the true Church, than those perverse men who are now so loudly extolling it in opposition to me." He believed that the Pope taught, and required others to teach, false doctrine. "Wickliffe and Huss," he says, in the "Table Talk," "assailed the immoral conduct of papists; but I chiefly oppose and resist their doctrine; I affirm roundly and plainly that they preach not the truth. To this I am called; I take the goose by the neck and set the knife to its throat." "Well, on in God's name; seeing I am come into the lists, I will fight it out. I know my quarrel and cause are upright and just." Luther has done more than any other man ever did to emancipate the human mind from usurped authority. But this was not his proximate aim. It was the indirect consequence of the movement which he originated. It was the second step which he took,—a step which he was compelled to take, which he took reluctantly but resolutely when the right moment came, although at first it had been far from his thoughts.

The fact that the religious interest was nearest Luther's heart determined his position in relation to "Humanism," and to the renowned leader in the world of letters, Erasmus. Luther was in cordial sympathy with the great literary movement which had already done so much to break down the sway of Scholasticism and the monkish type of piety. He was fond of the ancient classics; he was a student and admirer of Cicero; he took Virgil and Plautus into the cloister with him. Melanchthon, in the preface to the Wittenberg edition of Luther's writings, remarks that, if he had found at Erfurt competent teachers, he would have experienced more the softening influence of the philosophers and other authors of antiquity. As it was, he took a good rank among the Humanists, and partly on this account was made by the Elector professor at Wittenberg. He understood the great service which Erasmus had done in exposing superstition and in bringing forward the classical authors and the New Testament writings, as well as the fathers. But when it came to an open rupture with Rome, their ways parted. Not to dwell on the circum-

* "Works," Walch's ed., xxi. 345.

stance that, when Luther nailed his Theses to the church door and braved the Pope's bull, Erasmus had passed middle life, his temperament and taste were all at variance with everything that involved a direct conflict with ecclesiastical authority. He would do for reform what could be done by diffusing literature, by fostering the study of the Scriptures, and by clever satires on the vices of the clergy and the follies of monks. He dreaded a commotion. He dreaded theological war and division. This would interfere with the quiet pursuit of literary studies and the progress of intellectual enlightenment from which he hoped so much. He was right in this vaticination. The first effect of the Lutheran debate was to turn men's minds to distinctively religious and theological themes. The immediate consequence was not favorable to the literary culture which had gained so promising a start. No one can doubt that the cause of literature and science, in the long run, profited incalculably by the Saxon reform. No one can believe that Germany would have accomplished in this field what it has achieved had the Pope's dominion been kept up. But we are now adverting to the effect of the theological strife which immediately followed. The issue between Luther and Erasmus is a plain one. Here were abuses, like the hawking of indulgences. Erasmus would ridicule them; he would seriously argue against them; but he would go no further. If he were bidden to keep silent on pain of excommunication, he would obey, thinking it better to wait for the gradual effect of better influences. To Luther such practices were a damnable imposture. The victims appeared to him like lambs who were given up to be torn in pieces by wolves. He would not keep silent. He would speak out, be the consequences what they might. Luther believed in his inmost heart that the interpretation of the Gospel which he and the rest of the clergy were required to give to the people was false. Christ and the apostles had taught otherwise. The current teaching robbed Christian people of the comfort which Christ came to give, and to a large extent paralyzed the efficiency of the Gospel as a practical system. Erasmus partially, though not wholly, agreed with him. Could Erasmus have regulated the teaching of the Church, it would have been essentially altered, and in the same direction in which Luther altered it,—although Luther, he judged, made extravagant assertions relative to the bondage of the will under evil. But in doctrine Erasmus would have no rupture of Church ties, no division, no revolt against the councils and popes. On the other hand, Luther, filled to the center of his being with the conviction that religion is the supreme interest of man, and that it is a base wickedness to conceal the truth on the subject, could not do otherwise than declare war against the ecclesiastical authorities which commanded him to retract and enjoined on him silence. The verdict of history is on the side of Luther. Erasmus, with all his gifts and virtues, lacked the heroic element. We cannot deny him sincerity; but his beliefs did not take so strong a hold on him that it appeared to him worth while to proclaim them if the result was to be a mortal conflict and a division of the Church. There was truth in the saying that Erasmus laid the egg which Luther hatched. The answer of Erasmus was that the egg laid was the egg of a hen, and the product something quite different. Luther and Erasmus always interest us from the contrast which they present. The fine, sharply-cut features of Erasmus, as seen in Holbein's portrait, show us the face of the critic and keen iconoclast. He is the leader of the sappers and miners. The rougher outline of Luther's bold countenance shows us the pioneer whose vigorous arm breaks through the path from which a less courageous spirit would recoil in dismay. In the combat into which the two fell, it is doubtful which is the more effective weapon, the sledge-hammer of Luther or the rapier of Erasmus. Luther's advice to the chief of the literary school, that he should remain a spectator of a conflict in which he was evidently not fitted to be an actor, must have stung him to the quick. On the contrary, Erasmus was a master in retort. In answer to Luther's remark that some of his interpretations might fairly be thought to countenance Arianism, coming, as they did, from a "suspected person," Erasmus replied that it was diverting to hear Dr. Martin, who was denounced throughout Europe as a heretic, talk about "suspected persons."

Among the statues which surround that of Luther in the great monument at Worms, is that of another eminent Humanist, Reuchlin. Reuchlin was an older man than Erasmus. Born in 1455, he was fifty-two years old when Luther attacked the sale of indulgences. The long war from which this noble and venerable scholar had emerged successfully—the war with Pfefferkorn and Hoogstraten and their followers, who were incensed at his unwillingness to have all the writings of the Jews except the Bible burned—made him value repose. It was a satisfaction to him that the monks would be kept so busy with Luther as to let him alone. He never separated from the Catholic Church; but he gave his grand-nephew, Melanchthon, to the Wittenberg reformers. Ulrich von Hutten, and the

band who, by the *Epistolæ Obscurorum Virorum*, and by the dread of the carnal weapons which the knights were ready to wield in Reuchlin's defense, had helped on his cause, enlisted in behalf of Luther. Reuchlin died in 1522, having done a great service in the promotion of good learning, and in weakening the prestige of the Dominican inquisitors against whom Luther had to wage his battle.

Melanchthon was only twenty-one years old when he joined Luther as teacher of Greek in the Saxon university. For many years the relation of the two was like that of father and son. But in theology, as in ecclesiastical reform, Melanchthon's caution and moderation naturally inclined him to a middle path. In signing the Smalcald Articles, in 1531, he had the courage to append to his signature the statement that, if the Pope would allow the Gospel, he would, for the sake of peace and unity, concede to him, as a matter of human, not divine right, a superiority over the bishops of those Christians who might choose to live under his jurisdiction. This statement, occasioned by Luther's unstinted denunciations of the Papacy, indicates the leaning of Melanchthon to a more conciliatory course. In matters of ceremony, he would go far in his toleration of the old rites. In truth, at a later day, he was ready to carry his concessions to a dangerous extreme. In theology, he recoiled more and more from the assertions which he had himself made of the absolute control of the human will by the divine power. The arguments of Erasmus impressed him strongly. On the Lord's Supper, he could not sympathize with Luther's violence against the Zwinglians, and himself adopted a middle view closely akin to that of Calvin. As Luther grew old, his physical infirmities increased; he was tortured with ailments which heightened the natural vehemence and obstinacy of his temper. To live near him was like dwelling close to the crater of a volcano, which at any moment might burst forth in flames and streams of lava. His intolerance was quickened by fanatical admirers, who copied his faults without even appreciating his virtues. Consequently, the closeness of the tie between him and the younger associate whom he had so loved and cherished was in a degree loosened; yet not in such a degree that he ceased to love Melanchthon, or that Melanchthon ceased to hold in the highest esteem the noble qualities which had cast a spell over him in his youth. The wonder is that two men, so unlike each other in their mental and moral traits, could live together and cooperate in such a work as that in which they were engaged, with no greater disturbance of mutual confidence and esteem. Melanchthon was the "Preceptor of Germany." It was he who cemented the alliance of the religious reform and the new learning. His inaugural address, in his early youth, foreshadowed the work in behalf of learning which he so effectually performed.

Luther and Calvin never met. Calvin and Melanchthon had passed days together, and stood in relations of intimacy. Calvin was eight years old when Luther began his war on the Papacy. He appreciated the greatness of the Saxon leader, different as Luther was from him in the cast of his mind and in some of his theological opinions. Luther, to the generality of men who have no special interest in the controversies of theology, is much more engaging and attractive than the Genevan reformer. Luther's vocabulary of condemnation and abuse is more copious, and is stored with coarser material, than that of Calvin. But it is somehow felt that, in the case of Luther, to use a homely adage, "his bark is worse than his bite." In Luther, the deep wells of tenderness, the versatility of genius, the sympathy with all sorts and conditions of men constitute an inexhaustible charm. I have in my hand an old German book called "Dr. Martin Luther's Pastimes," or "Zeitverkürzungen." It is arranged methodically in fifteen chapters. Among them the quaint writer includes one bearing the title, "Luther burns the papal bulls and books." This is embraced in the catalogue of pastimes by which the reformer drove away dull care. Under the head of Luther's fondness for literature, including ballads and fables, mention is made of his translation of Æsop, made in the midst of pressing cares, at Coburg, while the Diet of Augsburg was in session. Luther himself composed fables. For "Reynard the Fox," and stories of that class, he had a cordial relish. Erasmus's "Praise of Folly" delighted him. He was eager to get a copy of More's "Utopia" when he heard of its appearance. On his journeys, he made up humorous poems and riddles. Many of his letters are in a vein of pleasantry. In music Luther had an unfailing source of pleasure. "Music," he says, "is a gift and present of God, and not of man. It drives away the devil and makes people joyous. Through it one forgets all wrath, impurity, superciliousness, and other vices. After theology, I give to music the next place and the highest honor." When weary with work, he would sing after supper or during the meal, and thus banish anxious thought. At times he would busy himself with joiners' tools. He writes for a lathe and other things of the sort to Nuremberg, where they were best made. Still more did he make his garden a refuge from the worry and vexation of brain-toil.

He liked to till the ground and watch the coming out of the blossoms. His favorite game was chess. This predilection he had in common with his contemporaries Leo X. and Charles V. John Frederic, the Elector of Saxony, was playing chess when the messenger brought him the sentence of death which the Emperor had pronounced; but the noble prince did not suffer the announcement to interrupt the game. Fortunately, the sentence was never carried out. In social and domestic life, Luther was an entertaining companion, mingling mirth and wisdom in a stream of talk of which no one ever grew weary. His marriage to a runaway nun was as bold a step as the burning of the papal bull. He followed his own judgment, letting his friends recover from their consternation as they might, and disregarding the invectives and scoffs of his enemies, which he considered to be inspired by the devil. To the German people he gave an example of domestic life which they could ill spare. His letters to his "Katy"—his "Doctress Katy," as he was apt to style her—form a diverting portion of his correspondence. When he was bereaved of a child, his heart was broken with sorrow. He could endure public calamities, he said, better than Philip, but not private afflictions of this sort. One of his letters to his children is of special interest,—that in which he pictures heaven as "a lovely and smiling garden, full of children dressed in robes of gold, who play under the trees with beautiful apples, pears, cherries, nuts, and prunes." There, he adds, are beautiful ponies, with golden bridles; musical instruments; the children dance and play with the cross-bow. It is all for good boys who pray and learn well. He has been told that his little son, John Luther, may come into this garden, and bring his sister Madeline. Such a picture, addressed to the imagination of a child, it is doubtful whether another divine of that age, trained to the study of Occam and Gerson, would have thought of painting.

To many who have never looked at the Commentary on the Galatians and the other writings in which the doctrine of Luther is presented in a continuous discussion, he is known through the "Table Talk." This compilation contains some things that Luther never said. Like nearly all similar publications, it requires to be critically sifted. Few Boswells are possessed of the accuracy of the biographer of Johnson. But, as it stands, the "Table Talk" of Luther discovers his peculiar genius on almost every page. His greatness and his limitations, his strong faith, and the superstitions, connected especially with demoniac agency, which he had inherited and which his vivid imagination kept alive, are fully and artlessly disclosed. There is a wonderful religious power in his expressions. In one place he says: "If I thoroughly appreciated the first words of the Lord's Prayer, *Our Father which art in Heaven*, and really believed that God, who made heaven and earth and all creatures, and has all things in his hand, was my Father, then should I certainly conclude with myself that I also am a lord of heaven and earth, that Christ is my brother, Gabriel my servant, Raphael my coachman, and all the angels my attendants at need, given unto me by my heavenly Father, to keep me in the path, that unawares I knock not my foot against a stone." Luther's egotism is seldom offensive. He speaks of himself as if he were a third person. There is so much in him that, when he touches on himself, the subject is always interesting. "Daniel and Isaiah," he said, "are most excellent prophets. I am Isaiah—be it spoken with humility—to the advancement of God's honor, whose work alone it is, and to spite the devil. Philip Melanchthon is Jeremiah: that prophet stood always in fear; even so it is with Melanchthon." As Goethe could claim to be a better poet than Tieck without any lack of modesty, seeing that he did not make himself, so Luther did not hesitate to rate himself at something like his proper value. Of the wholesome effect of anger, he remarked, in a familiar passage: "I never work better than when I am inspired by anger; when I am angry I can write, pray, and preach well, for then my whole temperament is quickened, my understanding sharpened, and all mundane vexations and temptations depart." No man ever felt more deeply the power of the Bible. "In it," he says, "thou findest the swaddling clothes and the manger whither the angels directed the poor simple shepherds; they seem poor and mean, but dear and precious is the treasure that lies therein." In his simplicity, he indulged the hope that, with the completion and diffusion of his version of the Bible, there would be very little need or call for other books, and was quite willing to have his own writings cast aside. Wherever Luther deals with his great doctrine of justification by faith, he is at his best. "But here one may say: 'The sins which we daily commit offend and anger God; how then can we be holy?' Answer: A mother's love to her child is much stronger than the distaste of the scurf upon the child's head. Even so God's love toward us is far stronger than our uncleanness. Therefore, though we be sinners, yet we lose not thereby our childhood, neither do we fall from grace by reason of our sins." The prayers of Luther are the spontaneous out-

pouring of his heart. Their familiarity of language has been censured; but, in this respect, they are on the level of the Psalms; and there was no lack of real reverence. "Prayer in Popedom," he exclaims, "is mere tongue-threshing; not prayer, but a work of obedience. Thence a confused din of *Horæ Canonicæ*, the howling and babbling in cells and monasteries, where they read and sing the psalms and collects, without any spiritual devotion, understanding neither the words, sentences, nor meaning." When he was a monk, he tells us, he used to lock himself up in his cell on Saturdays and make up the omitted prayers for the week. Luther confesses that he could not moderate his language. He had not the gift of Melanchthon. The impetuous flood of thought and emotion broke through all barriers. So his native bluntness and roughness he could not, and, it must be allowed, he did not much seek to, soften down. "Some one sent to know whether it was permissible to use warm water in baptism. The doctor replied: 'Tell the blockhead that water, warm or cold, is water.'" For moving eloquence in the pulpit no one excelled Luther. He not only knew how to preach, but he could tell the secret to others. One defect, he observes, may eclipse numerous gifts in a preacher. "Dr. Justus Jonas has all the good virtues and qualities a man may have; yet merely because he hums and spits, the people cannot bear that good and honest man." Let a preacher stick to his text, and not ramble: "A preacher that will speak everything that comes in his mind is like a maid that goes to market, and, meeting another maid, makes a stand, and they hold a goose-market." He despised the hunger for applause: "Ambition is the rankest poison to the Church, when it possesses preachers." "Cursed are all preachers that in the Church aim at high and loud things, and, neglecting the saving health of the poor, unlearned people, seek their own honor and praise, and therewith to please one or two ambitious persons. When I preach, I sink myself deep down. I regard neither doctors nor magistrates, of whom are here in this church above forty; but I have an eye to the multitude of young people, children, and servants, of whom are more than two thousand. I preach to these, directing myself to them that have need thereof. Will not the rest hear me? The door stands open unto them; they may begone." "An upright, godly, and true preacher should direct his preaching to the poor, simple sort of people, like a mother that stills her child, dandles, and plays with it," etc. "When they come to me, to Melanchthon, to Dr. Pommer, etc., let them show their cunning, how learned they be; they shall be well put to their trumps. But to sprinkle out Hebrew, Greek, and Latin in their public sermons, savors merely of show," etc. It is needless to say how large a place Satan filled in Luther's thoughts. On his last journey to Eisleben, the rivers were swollen by a freshet. He spoke in a letter of the delight it would give the Pope and the devil—two personages whom he often coupled together—if he and Dr. Jonas were to be drowned in the Saale. The tradition connected with the ink-spot at the Wartburg is in keeping with Luther's habitual ideas of Satanic interference and of the proper way to meet it. It is remarkable that Luther did not share with Melanchthon his faith in astrology. He ridiculed the pretensions of the star-gazers.

The large and comprehensive genius of Luther is more manifest as time goes on. His profound and absorbing reverence for the Word of God did not make him a slave to the letter. The freedom of his comments and criticisms has given rise to the imputation of "Rationalism." Against this aspersion, which was rashly sanctioned by Sir William Hamilton, Luther was triumphantly defended by Julius Hare. If Rationalism signifies a usurpation of the understanding, with disregard of the moral and spiritual function of our being, or if it implies incredulity as regards the Supernatural and Revelation, no one could be at a greater remove from the Rationalistic temper than Luther. But his insight into the treasure of truth in the Scriptures gave him a certain liberty and sense of safety in the treatment of incidental and less material elements in them. We even read in the "Table Talk": "Forsheim said that the first of the five books of Moses was not written by Moses himself. Dr. Luther replied: 'What matters it, even though Moses did not write it? It is, nevertheless, Moses's book, wherein is exactly related the creation of the world.'" Now that the period of Protestant Scholasticism that followed the first age of the Reformation is passing away, the spirit of Luther, even as a Biblical critic, whatever may be thought of the soundness of particular utterances of his, is more justly appreciated. He stands in closer sympathy with the Church of to-day, in its effort to recognize and define the human as well as the divine factor in the books of the Bible, than do the array of Protestant theologians in the century or two that followed him, whose orthodoxy was largely molded by the polemical interest, especially by antagonism to the creed of Trent.

George P. Fisher.

A FOREIGNER IN FLORENCE.*

One summer, at La Spezia, I met a lady well known throughout Europe,—I mean the great beauty, Countess Castiglione. She lived in Paris, but at the time I became acquainted with her she was visiting her mother. Madame Castiglione was certainly an exceptionally beautiful woman, a blonde, but not of the lightest type. The dictionary defines vanity as "an inflation of mind upon slight grounds"; therefore, she was not vain, for her grounds were strong, but her self-appreciation was enormous, and her frankness in regard to her beauty most amusing. She would receive in the evening, reclining on a sofa, in a graceful pose, very elaborately dressed, and in such a way as to show her neck and arms to the best advantage. A lamp was so placed near her as to throw the proper lights and shadows. Admiring guests would be seated in a row at a little distance, to gaze in respectful admiration. From time to time she would select one from this abject crowd, and signify, by a languid movement of her beautifully shaped hand, that he might be allowed to approach and gaze upon this loveliness from a nearer point of view. The honored one would reverentially advance, make a profound bow, kiss her hand, tell her how beautiful she looked, and then retire to his seat—but by another route!—taking a turn around the sofa, that he might see her from every point of view and in every light. When she entered a ball-room, the guests would crowd around the door to such an extent that many would stand on chairs to see her come in. These demonstrations never disturbed her equanimity,—she was so accustomed to adulation that she would probably have been more embarrassed by the lack of them.

After her return from England, where she went on a short visit, some one asked her if she had seen many handsome women. Her reply was of the briefest, and quite to the point: "None more beautiful than myself." I have heard it said that, on her way to the beach for her morning bath, she was so followed and looked at that she finally was obliged to send her maid to the door, to make sure that the road was clear, before she ventured out. But this I consider an improbable story, as she was accustomed to be stared at, and enjoyed it.

Her husband was in the marriage *cortége* of Maria Vittoria, Prince Amadeo's bride, and fell dead at her side, which unhappy event was attributed by the Italians to the "evil eye."

This curious superstition prevails in every class, and the unfortunate possessor of the disagreeable quality is avoided and disliked. They believe that misfortune follows the footsteps of the evil-eyed one, which can only be averted, when in his or her presence, by holding the first and little fingers stiffly pointed, while the other fingers and thumb are closed. This is the origin of the little coral charm so often seen, shaped like a hand in the position I have described. The Italians believe that the wearing of any kind of coral keeps one safe from the effects of the *jettatura*.

A servant who had been with me for a number of years, and who was above the average in education, was quite unhappy because I disregarded her repeated warnings. She implored me to put a coral necklace on my youngest child, of whom she had the especial charge, being firmly persuaded that the effects of the evil eye would otherwise overtake him. She had so exalted his personal appearance, in her affectionate heart, that she was sure there must be some one amongst the crowd staring at his beauty, as he toddled along the street at her side, who might injure him for life by a look.

One day he had a slight cold, at which she was almost distracted, being thoroughly convinced that the evil eye had caught him at last. She had a way of finding out, she said, and at the same time of convincing me, and I was actually made to assist in this most absurd ceremony. The child was seated in a high chair, while she held over his head for a few moments a tumbler of water into which three drops of olive-oil had been poured. Then this mixture was thrown out and the ceremony repeated twice again. If the drops of oil remained floating about on the top of the water, each one distinct and separate, everything was favorable; but if, alas! they blended, it was all over with the poor child, and his fate was sealed. I tried to look anxious and interested while this was going on, but I was so struck, suddenly, with my own absurdity, that I was seized with a fit of internal laughter which made it extremely difficult to keep up

* The present article (describing life in Florence many years ago from the point of view of an American resident) is by the author of the article on the same subject in this magazine for June, 1880.—Ed.

the agonized expression I had adopted as suitable to the occasion. Dear old Bettina! She did it all in good faith, and I believe that, had the verdict proved unfavorable, she would have cried her eyes out.

Hers was the strong, passionate love which belongs to her race, and she lavished it in its intensity on the family she had lived with for seven years. Our parting was truly tragic, and such as would never be seen in this part of the world, where all demonstration of feeling is carefully suppressed—the more's the pity! What kindly feelings might oftener be stirred, what warm, life-long friendships be cemented, if we could read a little clearer into each other's hearts, and let out a little of nature's warmth, instead of toning our manners down to the cool polish of a bland propriety! The child-like expression of feeling in the Italians is their most lovable trait, and the irrepressible glow of their warm hearts reflects a heat even into our colder natures.

I am quite sure that I was as dramatic as my poor Bettina when we parted, she so wrought upon me. She literally tore her hair—at any rate, she gave several decidedly hard pulls at it; she fell on her knees, and actually kissed the hem of my garment; she screamed; she covered my hands with kisses. Then, seizing the child, she moaned and sobbed over him, while pressing him tightly in her arms, and refusing to give him up. All the other servants in the house were present, and all in the depths of gloom, crying with sympathy, until I felt that I was taking a powerful part in the last act of an elaborate opera, surrounded by my chorus.

Before leaving my good Bettina, I will relate a remark of hers about sea voyages, as a specimen of the ignorance of her class. Thinking, at one time, that I would take her to America with me, I asked her if she thought she would be sick on the ocean.

"No, no, *signora*," she said, with the air of one who has traveled. "I was once on the Arno in a boat, and was not sick at all"—the Arno being what we would consider rather a stream than a river. In fact, in summer it is often only a bed where the stream ought to be.

I was about to say, when I fell upon the recital of Bettina's sayings and doings, that the reputation of the evil eye always stuck to poor Maria Vittoria. Whether it first arose from the death of Castiglione, or whether she had had it before, I do not know; but everything terrible that happened after that was put down to her account. The burning of a theater, a few evenings after she had been there, was one of the plagues attributed to that poor, persecuted princess; also, the destruction of a small town by earthquake, in less than twenty-four hours after she had left it. The fainting of a lady, upon whom she turned her fatal gaze as she entered a ball-room, was another; and so the report grew and spread until, at last, people dreaded the sight of her. The only redeeming point of this horrible gift is the unconsciousness of its possessor. The magical arrangement of the hand, therefore, is done with dire secrecy behind the back, or under a table. To point the fingers openly would be the greatest insult.

Although the Tuscans are a peaceable, good-humored race, if once aroused, their temper is uncontrollable; but only for a few minutes—just long enough, perhaps, to get out a knife and stick it into you. When you are dead they are very sorry, and bemoan their hastiness.

They are very prone to jealousy, which is the chief cause of quarrels that end so disastrously. An exciting scene took place in the house of a friend. She was sitting quietly at dinner, when her maid rushed wildly in, shrieking for help and protection. Before my friend had well collected her ideas, a former butler, whom she had dismissed, came dashing furiously into the room, pushed past Mrs. K——, nearly knocking her down, snatched up the carving-knife, and made for the maid. Fortunately, before he reached her, Mr. K—— succeeded in seizing him and pinioning him against the wall, while the police were sent for. So easy, however, is the law, *for natives*, that he was only locked up in the station-house half an hour.

"Mercy tempered with justice," and very slightly tempered, is the idea upon which the law acts in the punishment of Italian offenders. For the poor unfortunate foreigners, it is another thing.

I never got any satisfaction from the law but once, and that was owing to a sharp reprimand which I administered to the judge. But thereby hangs a tale: One summer, at Viareggio, I had a watch and chain stolen from my room. By a lucky concatenation of circumstances we were able to trace the chain to a pawnbroker's in Pisa,—only a few miles distant,—and shortly after, the thief was found and arrested, tried and condemned. At that point, I thought it time to get back the chain, as I had identified it and sworn to my ownership many and many a weary time. The Italians are a slow people and cautious, and very wearing at times to one's spirits and temper. I waited a week; then, no chain appearing, I sent to our lawyer for it; and to my amazement, he came to me with this surprising proposal: "I would like you to identify it." I suggested to him that I had done that thing, on a hasty calculation, say ten times. He calmly but

firmly stuck to his purpose, saying that I was to sign a paper, swearing it to be mine. Necessity knowing no law (I wish it knew no lawyers), I did as requested. I waited several weeks, but still no chain. Then I went to him, and we repeated the same ceremony, and I signed another paper. More months of waiting, still no chain; and I went again, this time taking two or three members of my family with me, in hopes of their being able to fathom the mystery. But this only complicated matters, and they were all made to sign a paper and swear to the chain; and we were told such a long and involved history about the process as regarded restoration of stolen property, that we fled from the office in dismay and utter despair, and our last hope of getting that chain vanished forever. Some years after that, one of my servants stole some pearls from me. He was also caught, and the pearls delivered into the Hands of the Law. As the trial was not to come off for some months, the judge came to my house for my deposition and identification of the pearls! I must explain here that judges of the criminal courts in Italy do not hold the high position they do in this country, ranking only a little above a tradesman, and with no social position, or my readers might be amazed at the fact of this promiscuous sort of visit from one so high in authority. When I swore to the pearls, I gave them a last long look, being persuaded that I should never see them again.

I made up my mind, however, that I would make a fight for them. Accordingly, when I saw this "grave and reverend signor" carefully tucking them away into his pocket, I said, mildly: "What are you going to do with those pearls?"

"Keep them to show at the trial, *signora*."

"Then," said I, with the sweetest smile, and a most polite inclination of the head,—"then I will bid good-bye to my pearls. I shall never see them again, for I know by bitter experience that what goes into a lawyer's pocket never comes out again."

Startled, he turned upon me, and said:

"What does the *signora* mean by that?"

Upon which, drawing myself up with regal dignity, I replied:

"Exactly what I say, sir. I lost a chain many years ago at Viareggio, and have sworn to it, and written about it, and signed quires of paper, but have never seen it since! And it is still in the hands of the lawyers!"

Upon this he started, and asked me how many years ago it was and the name of the thief, and, when I told him, he put on an immense show of astonishment, and said:

"Why, *signora*, I was the judge who condemned him! And do you mean to say that you never have had the chain restored to you?"

And I answered, "Never!"

Then he took out a note-book, made several elaborate entries therein, said he would inquire into the business, and, with a low bow, handed me my pearls!

But the chain I have never seen to this day.

Physicians have, like judges of the criminal courts, no social position, and no knowledge of medicine, according to our ideas. They are, as a rule, far behind the age. They still cling blindly to bleeding,—unless they have changed during the last few years,—and weaken their patients by the old system of dieting. I have seen cases conducted with such ignorance of the commonest laws of nature as would make any of our physicians faint with horror. Heat, starvation, and dirt are their general remedies for almost everything. In cases of scarlet fever,—which are not common, however,—they order the doors and windows to be carefully shut, that no breath of air may get to the patient—absolutely drawing the bed-curtains around them; forbid washing of any description, even to the hands and face, and no change of bed or body linen during the entire illness.

There is one malady prevalent in Italy which I sincerely believe to be produced, nine times out of ten, by their doctors, and that is miliary fever. Unless a patient's symptoms in the beginning of an illness indicate the disease very clearly, the doctor, on the principle of "when in doubt play trumps," pronounces it "miliare"; but there being no eruption, which is an evidence of that disease, they regard it as suppressed, and so, very dangerous. They then proceed to produce a rash by covering the poor sufferer with as many blankets as he can bear, excluding every breath of air from the room (canning him, so to speak), and then forbidding any nourishment saving the weakest of weak broths Now, as this special fever is usually brought on by overheating, and consequently should be treated by a cooling system, they succeed in producing the disease in its full glory, rash and all, and they then set about curing it, which, of course, becomes a doubtful undertaking, so weak is the patient from heat and fasting.

A friend of mine, spending a few weeks in Florence, was taken ill with what proved afterward to be an internal cancer. She sent for Doctor Z——, one of the most noted of the Florentine doctors. It was August and very hot, and his orders were not only to shut out the air and cover herself with blankets, but to remain entirely immovable—not to stir hand or foot. She carried his wishes

out faithfully for twenty-four hours,—not even raising her hand to brush a fly away,—and then, becoming nearly crazy with nervousness and weakness, she sent for an English physician. If you had seen his look of horror when he came into the room!

"Open the window," he almost shouted; "take off those coverings; get right up, and lie on the sofa. In a week you will be able to go on to Paris."

And in a week she did go on to Paris.

The Italians love medicine, and have the greatest faith in it. They take it not only for every little ailment, but after a fit of anger or grief.

From medical treatment we naturally and easily glide to the dead and dying—toward whom they show little or no respect, as we look upon it. But so differently are our ideas formed by custom and education, that they think us heartless and cold-blooded in the extreme for remaining with dying persons. As soon as all hope is over, every near relation of the poor creature rushes from the room, leaving only nurses and priests to witness his death-struggles and administer consolation.

A friend once described a scene she had witnessed herself, which she said was perfectly heart-breaking. It was the death of a young American, who had been married only a year to an Italian whom she devotedly loved. They said it was pitiful to see her wistful looks, and to hear her implore some one to make her husband come to her—"Only to bid him good-bye, and to give him her wedding-ring." Her friends at last succeeded in forcing him into the room by dint of persistent and earnest entreaties; but he was almost dragged to her bedside. After all, it was most unsatisfactory, as he would not look at her, covering his face with his hands, and behaving like a frightened child. Their conduct under such circumstances is partly owing to fear, but partly to their dread of being forced to realize the dark side of life. They are a gay and light-hearted people, living only in the present, thrusting aside everything gloomy and depressing.

The dead are carried to their last resting-place at night. No one must be shocked during the day, while in the midst of sunshine, and light, and gayety, by a reminder of our inevitable doom—by a thought of how some day there will be no sunshine or gayety for us in this bright world.

A funeral in Florence is one of the saddest of sad spectacles, with its procession of priests and boys in draggled gowns that once were white, carrying large candles, which drip their waxen tears along the road—or would do so, if they were not caught as they fall in little cups, carried by more boys and priests, chanting, or rather whining monotonously, as they step briskly along, with a most indifferent air. One can judge somewhat of the wealth of the departed by the number of candles furnished. The shorter the purse, the fewer the candles, until at last the very poor are thrown into a cart, carried outside the gates of the city, and shuffled into a pit, one on top of the other—a sight to make the angels weep!

One of the most grievous characteristics, to me, of a Florentine funeral is the absence of any relative or friend of the deceased. Not one creature who loved or cared for him to follow him to his journey's end, or to shed one tear over the grave of a lost companion; left, to be almost thrown into the ground by a few priests, who sometimes, it is to be feared, look upon the ceremony as a disagreeable, though profitable task, to be got over as soon as possible.

To be enveloped in a cloud of beggars during one's morning walk is not conducive to tranquillity of mind, but such, many years ago, was a daily trial. Of late years, begging in the streets has been forbidden, and the police are very strict and vigilant. A curious scene occurred soon after this law was made. A favorite resort of beggars was the hill leading to Fiesole, where a slow walk was the only means of getting to the top, and they could cling persistently to the weary traveler until, half-way up, he would almost, in desperation, fling to them his coat, hat,—anything,—to get rid of their importuning.

Now, one day, a detective in plain clothes sauntered carelessly along, humming a little gentle song of joy, as he thought of what was coming. The poor, unconscious beggars clustered about him, imploring his charity, showing him their crippled limbs, their blind eyes, and all their numerous ailments; but he strolled on, ever humming his little song. Still they grew in numbers as he ascended the hill; still they entreated, and swore to heaven they were all dying of hunger, or disease, or something. But the indifferent stranger rambled on, and the song continued. At last, the procession having become large and long, they reached the top of the hill, where was a very ominous omnibus, out of which stepped several *gens-d'armes* ready to pounce upon these indigent gentlemen. The sudden way in which the lame not only walked, but ran, the blind saw, the deaf heard, and the dumb spoke, and the amount of muscle developed by the consumptives, was a thing to strike the feeble mind of man with amazement and wonder. They scattered to the four winds of heaven, but those breezes declining to bear them far

on their way, they were captured, hustled ignominiously into the prison-wagon, and carried off under the surveillance of the tuneful stroller.

Nothing can startle the Italians out of their politeness. Not even the wild mistakes made in their language by the foreigner. I have seen a servant, when told to order "the spoon to harness the horses," receive his instructions as if spoons harnessing horses was a sight he had been accustomed to from childhood.

This sort of mistake is very commonly made by strangers, as coachman and spoon, in Italian, are words much alike. So, also, are "cabbage" and "horse," "hair" and "hats." But tell your coachman to harness the cabbage, or your valet to hang up your hair, and they would bow, and retire to carry out your absurd orders—which they perfectly understand, however—with most decorous solemnity. They would never presume to disagree with you, or openly to hold a contrary opinion, though I have known them very firm in the pursuance of their own views.

I once had a cook whose aversion to cats was as great as my fondness for them. I knew nothing, however, of this dislike for a long time, as he always agreed with me that they were most delightful animals, and charming to have about the house. At the same time, I used to notice that I never could keep one long. Not more than a week after the advent of each kitten, it would mysteriously disappear, which always threw Serafino into the depths of despair. It had either got run over, or had strayed away, or was "killed by a dog."

Almost anything amuses and interests this child-like people. Their excitement over the merest trifle is ludicrous.

All Florence was roused to a state bordering on frenzy, during one winter, because three sisters appeared always dressed alike, and with such close resemblance of feature that it was impossible to distinguish one from the other. They always drove together and went to the opera together, and no fourth person was ever seen with them. They seemed to know no one, nor wish to do so, and were rarely seen speaking to one another. All that was known of them was the fact that they were from Peru, and so they came to be known all over the city as "the three Peruvians." They could not stop for an instant at a shop-door without having their carriage instantly surrounded closely by men, who would stare into their faces in the most unblushing manner. Caricatures of them appeared in shop-windows, and, in fact, they were the sensation of the season.

Amusements are so cheap that the lower classes need never be without recreation. One of their favorite entertainments is the "Stenterello," a diversion not usually known by passing tourists. It is chiefly for the lower classes that this delightful person figures upon the stage, as his jokes are fashioned to their understanding. I can scarcely translate the word "Stenterello," but I think the nearest approach to it would be "clown." Whatever part he may take in the play, certain characteristics in his "get up" mark him as "Stenterello." Besides a very exaggerated vest or coat, he invariably appears to be minus one front tooth, and plus a long, curling cue at the back of his head. Even were he representing the most elegant and refined of men, the pig-tail must be there and the tooth must not. Of course, as my readers may infer, he is extremely comic, but always the protector of virtue and the triumphant annihilator of vice.

The gay season for the upper class is from Christmas to Lent, when balls and dinners fill up the evenings; but the real fun for rich and poor alike begins three weeks before Ash-Wednesday, when the streets and theaters are one wild, continuous scene of merriment. An American who has never had the good fortune to see an Italian masked-ball can form no idea of one from what he sees here. In this country they are stiff and spiritless, and every one is ill at ease, not knowing what is expected of him—wishing to be funny, and yet afraid of saying or doing more than is quite proper. Then the true enjoyment of mystification, in keeping some one ignorant of your name, while astonishing him by a real or pretended knowledge of all his actions, revealed by little facts that you have half-guessed at, perhaps, or really known, is lost here by the masking of both ladies and gentlemen. In Florence, men do not wear masks, but wait to be attacked and bewildered by the fair sex, and even made love to, which, under such circumstances, is not considered improper, it being only a part of the regular performances.

I knew an American lady who succeeded in deceiving her brother so completely, making him really believe that she had been violently in love with him for some time, although prevented by the usage of society from showing her affection, that he not only corresponded during the whole year with his *innamorata*, but, not being well acquainted with Italian, he actually made a confidante of his sister and got her to write his love-letters, addressing them with the name and direction she had given him when masked.

The craziness of the scene, as one enters a *veglione* (mask-ball), is beyond all description. The one high nasal note which all adopt as a disguise to the voice, and which is like no

other sound on earth,—a sort of combination of Punch and Judy and a parrot; the music crashing; the whirling, jumping, rushing mass of gayly dressed men and women; the creeping, stealthy step and manner of the black dominos, threading their way in and out, bent upon their mysterious plots,—all make it one of the most extraordinary, fantastic, bewildering sights in the world! One of the funniest of its many wild scenes is the bonneting of some unhappy wretch, who has had the audacity to wear one of those abominations of the fashionable world—a high beaver hat. In this guise he becomes fair game, and he knows no rest in body or mind until every vestige of his hat is scattered far and wide. A party of maskers will combine together, join hands around him, dancing, hooting, crushing his hat over his eyes! There is no escape for him. He remains the center figure of these whirling demons until his hat is in shreds. Through all this he must be perfectly good-natured, it being one of the inexorable laws of the *veglione* that no one must ever show vexation or rudeness to a masker. They are allowed perfect liberty, of a good-natured sort. Woe be to the hatted one should he attempt to resent their actions, or speak sharply to them! They would hustle him unmercifully, and perhaps push him out of the place altogether, and he would have no protectors. All the sympathy would be with the maskers. Another very amusing thing, in a different way, is to see the guileless, middle-aged Englishman or American enjoying his first masked ball in Florence. He is not to be mistaken in this mad jumble, as he stands surrounded by his family, motionless and dumb with astonishment and bewilderment, gazing on the shifting, screaming crowds around him, not quite sure that all this is entirely proper, and determined to protect his innocent daughters, should they be spoken to, at the risk of his life.

The last *veglione* takes place on the night of Shrove-Tuesday, ending at midnight, that the sacredness of Ash-Wednesday may not be broken; but into those few hours is crowded a concentrated pandemonium impossible to describe.

It is difficult to understand why tourists should always rush to Rome for the Corsos, which are inferior in many ways to the really beautiful ones in Florence. Instead of *confetti*, which hurt and sting, people throw bouquets and *bonbonnières* to one another. The ladies dress exquisitely for these occasions, and drive in their handsomest carriages, their horses gayly decorated with flowers and ribbons, coachmen and footmen in their most gorgeous liveries. Young men often dress in costume, and act the characters they represent as they ride or drive through the streets. One sees, for instance, a large boat on wheels, filled with sailors dropping *bonbons* and flowers from the ends of their fishing rods and lines into the ladies' carriages as they pass; or a long procession passes, representing an English hunting party, red-coated, some on horseback, some in dog-carts with their hounds, and others in wagons, with their trophies of game hanging around high poles. Children, too, are often dressed in character, and the prettiest sight I ever saw was a sweet little fair-haired couple dressed as bouquets, smothered to the chin in roses and lilies—their fresh young faces, prettier than any flower that ever grew, rising from the center of this sweet nosegay.

A frequent amusement during the last gay days of the Carnival is visiting a friend's house in mask. A party of six or eight, perhaps, will go together at night, rush into somebody's house, make themselves perfectly at home, dancing and hooting in a circle around the poor puzzled hostess, or sitting about the room, staring at her in grim silence, like so many horrible black fiends, embarrassing her to the last degree; or conduct themselves in any other pleasant fashion conducive to making their visit an agreeable one. In fact, at this season, the city is a large nursery of wild, gay, grown-up children, ripe for any mischief or sport, until Ash-Wednesday enters, in her solemn garb and with warning, uplifted finger, and brings the unruly establishment to order.

During the fifteen years that I was in Florence, I saw many changes and many interesting political events. The marriage entry of the Archduke Ferdinando, the abdication of the Grand Duke, the entrance of Victor Emanuel, the marriage procession of Prince Humbert and the sweet Princess Marguerite, and, finally, the departure of the King to take possession of Rome.

Through every change and at all times, Florence was Florence still, with its brightness and sunshine, its gay, pleasure-loving people, with their warm hearts and their good-natured faces, and their trick of drifting happily with the great tide of life, in easy disregard of coming clouds or shipwrecked hopes; cheerful and light-hearted always, in sickness, or adversity, or poverty,—enjoying the time that is, and letting the time that is to come take care of itself.

L. L. L.

THE PUPILS OF THOMAS BEWICK.

I.

WRITING to Mr. George Lawford in 1828, not many months before his death, and speaking of the first series of Northcote's "Fables," Bewick says: "Little did I think, while I was sitting whistling at my work-bench, that wood-engraving would be brought so conspicuously forward, and that I should have pupils to take the lead in that branch of the art in the great metropolis. Old as I am," he continues, "and tottering on the downhill of life, my ardor is not a bit abated, and I hope those who have succeeded me will pursue that department of engraving still further toward perfection." The accent of satisfaction in these words is not unnatural, and the progress of wood-engraving since they were penned has certainly been greater than Bewick ever anticipated. Still, it would be a mistake to suppose that its progress down to 1828, and, indeed, for some years subsequently, was either very rapid or very remarkable. Since the publication of the second volume of the "Birds," in 1804, Bewick himself had done nothing of importance, with the exception of "Æsop's Fables." Johnson and John Bewick had long been dead. Charlton Nesbit, the most distinguished of the elder pupils as an engraver pure and simple, had retired to his native village, and might practically be regarded as forgotten. Luke Clennell, the genius of the group, had been insane since 1817, and for some time before had transferred his energies to painting; while Harvey, Bewick's favorite, was fast acquiring a reputation as a designer. A few professed draughtsmen upon wood and half a dozen engravers seem to have sufficed to the demand. "The professors of wood-engraving [in Bewick's time]," says Fairholt, "might be counted by units." "There were not more than three masters in London who had sufficient business to employ, even occasionally, an assistant, and to keep an apprentice or two," says another writer. If we turn from these authorities to such treatises as Landseer's and Craig's "Lectures," the record of wood-engraving is meager and apologetic, and it is easy to see that it was scarcely regarded as a formidable rival to engraving upon metal. But its hour was not the less at hand in 1828. The publications of the recently established "Society for the Diffusion of Useful Knowledge" were already offering it a field which promised to be extensive. Then, in 1832, came the "Penny Magazine" and the "Saturday Magazine," which, aided by the improvements in stereotype founding, gave an extraordinary impetus to wood-engraving, and the names of Jackson and Branston and Landells, of the two Whympers and Sears, of Bonner, Baxter, Lee, began to be familiar. As with the decline of the "Annuals," engraving on steel and copper, for purposes of book illustration, gradually fell into disuse, engraving on wood increased in scope and popularity, and its advance since that time has been continuous and unchecked.

From what has been said above it will be gathered that Bewick had no "school," in the sense in which that word is used by those who inherit the manner and the methods of some individual artist. The pupils who quitted him to seek their fortunes in London, either made their way with difficulty or turned to other pursuits, and the real popularization of wood-engraving did not take place until some years after his death. Still, the careers of his principal apprentices are not wholly without interest; and, as a necessary supplement to the paper on Bewick, published in THE CENTURY for September, 1882, we propose to give some brief account of such of them as survived their venerable master.

II.

CHARLTON NESBIT, who comes first in order, has this in particular, that, unlike Harvey and Clennell, he lived and died an engraver. He was a draughtsman, as a matter of course; but we have found no record that he either painted or designed, at all events to any extent. Accident, moreover, appears to have favored this limitation of his functions, for the acquirement of sufficient independent means in middle life made it unnecessary for him to follow up very pertinaciously what, about 1810, was apparently a precarious calling, still less to turn to other departments of art for a subsistence. Little is known respecting his life that is unconnected with his work. He was the son of a keelman at Swalwell, a town in Durham, on the banks of the Tyne, and was born in 1775. About 1789 he was apprenticed to Bewick and Beilby; and it is alleged that the bird's nest which figures above the preface to Vol. I. of the "Birds," as well as the majority of the vignettes and tail-pieces to the "Poems of Goldsmith and Parnell," were engraved by him during his pupilage. In 1798 he executed a block of St. Nicholas's Church,

THE COCK, THE DOG, AND THE FOX. (ENGRAVED BY CHARLTON NESBIT FOR NORTHCOTE'S "FABLES.")

after a water-color drawing by Robert Johnson, which is still in the possession of a Newcastle collector. For this he received, not the "gold palette," as stated by Mackenzie, nor "a medal," as stated by Jackson and Chatto, but the lesser silver palette of the "Society of Arts," to whom he presented an impression of the cut, at that time one of the largest ever engraved, as it measured, with the border, fifteen inches by twelve. About 1799 he came to London. In 1802 he obtained a silver medal from the Society of Arts for "Engravings on Wood," being then described as "Mr. C. Nesbit, of Fetter Lane." In 1815 he returned to his native place, where he lived in retirement, working at rare intervals for the London and Newcastle book-sellers. He visited London again in 1830, and died at Queen's Elms, Brompton, in November, 1838.

The two principal designers upon the wood when Nesbit first came to London were John Thurston, originally a copper-plate engraver, and William Marshall Craig, a miniature painter, water-color painter, and artistic jack-of-all-trades. The former drew with exceptional skill, and thoroughly understood the requirements of his material; the latter, who designated himself "drawing-master to the Princess Charlotte of Wales," and in 1821 had acquired sufficient position to lecture before the "Royal Institution," was a person of greatly inferior abilities. From the fact that "Nesbit, sc." is to be found as early as 1800 upon the frontispiece of an edition of Bloomfield's "Farmer's Boy," published by Vernor and Hood, it is clear that he must have been employed almost immediately upon the work of Thurston, by whom this particular illustration was designed; and his (Nesbit's) name is also included among the other engravers engaged by Craig for the commonplace "Scripture Illustrated" issued in 1806. Many of the cuts to Wallis and Scholey's "History of England" also bear Nesbit's signature. But his best work about this date is to be found in the "Religious Emblems" published by Ackermann in 1808. This, according to the preface, was intended by its projector "to draw into one focus all the talent of the day"; and, as a landmark in the history of wood-engraving in England, its position is a conspicuous one. The designs—and the fact is significant after the foregoing

THE DAUGHTERS OF JERUSALEM. (ENGRAVED BY NESBIT FOR "RELIGIOUS EMBLEMS.")

THE SELF-IMPORTANT. (ENGRAVED BY NESBIT FOR NORTHCOTE'S "FABLES.")

announcement—were without exception supplied by Thurston. Regarded from an art point of view, and as designs alone, it is impossible to praise these very highly. Compared with Adrian van der Venne's illustrations to the emblems of Jacob Cats, or even with the efforts of the late C. H. Bennett, they show a poverty of invention which at times is almost beggarly. The "Destruction of Death and Sin" is typified by two prostrate figures at the foot of a cross; "Fertilizing Rills" is a landscape that might stand for anything; "Fainting for the Living Waters" is a limp female figure hanging Mazeppa-like upon a wounded stag; and Death felling trees is the only thing which the artist could think of to symbolize pictorially the common fate of humanity. These, however, are the least successful plates, and, setting imagination aside, they are nearly all distinguished by considerable skill in composition and the arrangement of light and shade. Besides those by Nesbit, the cuts are engraved by Branston, Clennell, and Hole,—the last two being also pupils of Bewick. Hole's solitary "Seed Sown" is one of the best pieces of work in the book. Clennell and Branston are about equal in merit, but the honors belong to Nesbit. His "Hope Departing," "Joyful Retribution," and "Sinners Hiding in the Grave," the first especially, are almost faultless examples of patient and accomplished execution. "The World Weighed," the "Daughters of Jerusalem," and "Wounded in the Mental Eye" are nearly as good; but as compositions they are less attractive than the others, and do not offer the same opportunities for the skillful opposition of black and white which seems specially to characterize Nesbit's manner. Yet, all things considered, they afford better examples of his abilities than either the large cut of "Rinaldo and Armida" or the illustrations—gems as some of them are—to Northcote's "Fables."

The "Rinaldo and Armida" is Nesbit's most ambitious block. It was engraved in 1818 for the "Practical Hints on Decoration and Design" of Savage, the printer, which, after long delays, was published in 1822. One feature of the book was to have been four highly-finished plates by the most eminent wood-engravers of the day. But Bewick (whose name appears on the list of subscribers) was too busy with "Æsop's Fables" to give any assistance; Clennell, who was to have engraved a drawing by Stothard, had already broken down; and Branston and Nesbit were the only contributors. They engraved three of Thurston's designs. Branston's subject was the "Cave of Despair," from Book I. of the "Faerie Queen," which ranks as one of the artist's most successful conceptions. Nesbit's were the "Female and Boy," of which an electrotype is given at page 69 of Linton's "Hints on Wood-Engraving," and "Rinaldo and Armida" in the enchanted garden, from the *Gerusalemme Liberata* of Tasso. As far as the execution of the background and accessories of the latter is concerned, we doubt if they could be excelled, even at this day; but the figures have a "dotted appearance," resulting from the fact that Thurston required the engraver to reduce the strength of the "lines, which were

IN THE STOCKS. (ENGRAVED BY NESBIT FOR BUTLER'S "HUDIBRAS.")

originally continuous and distinct." Apart from this, however, the knight and enchantress are poorly and even unpleasantly conceived. The "soft breast" of Armida, which recurs so often in the fine old translation of

CALL TO VIGILANCE. (ENGRAVED BY LUKE CLENNELL FOR "RELIGIOUS EMBLEMS.")

Fairfax, has the hardness and polish of metal; while the figure of Rinaldo is marked by a reposeless and over-accented muscularity, which seems to have been one of Thurston's besetting sins. To give rarity to this block, it was defaced by criss-cross saw-marks, and impressions taken after it had been so treated are given in Savage's book as an evidence of good faith. As might have been predicted, the block was later carefully repaired, and copies of it are still to be found in the market as "original impressions." Such a one (bought, alas! in a too confiding moment) lies now before us; and it must be admitted that the traces of the merciless steel have been filled in with remarkable ingenuity, although they are easily detected by an instructed eye.

The "Rinaldo and Armida" must have been executed during Nesbit's seclusion at Swalwell. Besides an admirable likeness of Bewick after Nicholson, prefixed to the "Select Fables" of 1820, the blocks for which he repaired, the only other works of importance that belong to this date are those he contributed to the first series of Northcote's "Fables," a book to which we shall return more at length in speaking of Harvey. The best of these is the "Self-Important." After his return to London, in 1830, he was employed upon the second series, which contains some of his most finished workmanship. The cut of the "Hare and the Bramble," p. 127, is one of the most beautiful of modern wood-engravings. Besides the above-mentioned books, he also engraved illustrations for "Hudibras," Somerville's "Chase," and the numerous reprints of Sir Egerton Brydges. A cut to the memory of Robert Johnson, after Johnson's own design, is also much sought after by collectors.

Nesbit's fifteen years' absence from activity, and the relatively small number of his productions, make the record of his life of the briefest; and—as must be confessed—we have not been able, after considerable pains, to add largely to the facts already collected respecting him. But the excellence of his work as a wood-engraver will always demand a record in the story of the revival of the art. In this respect, he was the best of Bewick's pupils, and his achievement was in all probability greater than that of his fellows, because he was not tempted beyond the limits of his craft.

III.

THE surname of Bewick's next pupil is a familiar one to Northumbrians. There is, in fact, a manor of Clennell on the east side of the river Alwine, not far from Alwinton; and there was even an actual Luke Clennell of that ilk who was high-sheriff of Northumberland in 1727. Whether the present Luke Clennell was in any way related to this family has not been chronicled. He was born at Ulgham, near Morpeth, on the 8th of April, 1781, being the son of a respectable farmer. After covering his slate with sketches instead of sums, an incident so persistently repeated in

artistic biography that it seems to be an almost indispensable preliminary to distinction, he began life, like Chodowiecki, as a grocer, or, as others say, as a tanner. Here, if tradition is to be believed, he got into trouble, owing to an ill-timed likeness of an unsympathetic customer rashly depicted *ad vivum* upon a convenient shop-door; and some of his other drawings having attracted attention, his uncle, Thomas Clennell of Morpeth, placed him with Bewick. This was in April, 1797. With Bewick he remained seven years, and during his apprenticeship is said to have transferred to the block, and afterward engraved, a number of Robert Johnson's designs, which were used as tail-pieces for the second volume of the "Birds." He speedily became an expert draughtsman and sketcher, and, like his master, was accustomed to make frequent excursions into the country in search of nature and the picturesque. His term of apprenticeship must have expired in April, 1804; and, either shortly before this date or immediately after it, he executed a number of cuts for the "Hive of Ancient and Modern Literature," a selection of essays, allegories, and "instructive compositions" in the "Blossoms of Morality" manner, made by Solomon Hodgson, Bewick's old partner in the "Quadrupeds." The third edition of this was published in 1806, and, according to Hugo, contains fourteen cuts by Bewick. This would give the majority of the illustrations to Clennell, who presumably designed as well as engraved them. That to the first part of the "Story of Melissa," a pretty little cut, bears his initials, and they are to be found on the "Northumberland Life-Boat." Some of the remaining cuts are also signed, and many of the rest may be confidently attributed to him; but those above mentioned are among the best. The blocks for this series, it may be added, are in the possession of Mr. Robinson, of Pilgrim street, Newcastle.

Besides the engravings for the "Hive," he continued, after his apprenticeship was concluded, to work for Bewick on the illustrations to Wallis and Scholey's "History of England," already referred to in our account of Nesbit. Finding, however, that Bewick received the greater part of the money, he put himself into direct communication with the proprietors, the result being that they invited him to London, where he arrived in the autumn of 1804; and one of the earliest indications of his residence in the metropolis is his receipt, in May, 1806, of the "gold palette" of the Society of Arts for "an engraving of a battle." Among other books upon which he was engaged were Craig's "Scripture Illustrated" and Beattie's "Minstrel," 1807, from the designs of the indispensable Thurston. Another volume belonging to this period was Falconer's "Shipwreck," 1808, which contains a well-known picture of a ship in a gale of wind, the manner of which is of itself almost sufficient to prove his authorship of some of the marine tail-pieces in Vol. II. of the "Birds." This cut was executed at Twickenham in September, 1807. In the same year as the "Shipwreck" appeared the "Religious Emblems," of which we have already given

ENGRAVED BY CLENNELL FOR FALCONER'S "SHIPWRECK."

a sufficient description. Clennell's best cuts in this are the "Call to Vigilance" and the "Soul Encaged," but the least successful of the series are also engraved by him.

DRAWN BY WILLIAM HARVEY FOR NORTHCOTE'S "FABLES."

Some time after his arrival in London, Clennell married; the exact date is not known. His wife was the eldest daughter of Charles Warren, the copper-plate engraver, a worthy rival of Abraham Raimbach, Finden, and the little knot of talented men who, at the beginning of the present century, emulated each other in producing the delicate book-embellishments issued by Sharpe, Du Rovery, and others. Clennell's introduction to this society had, no doubt, an important influence over his future career. After Ackermann's "Emblems," his next work of importance was a large block for the diploma of the Highland Society. For this, in 1809, he received the gold medal of the Society of Arts. Benjamin West made the design, which consists of a circular frame containing an allegorical group, and flanked by two larger figures of a fisherman and a Highland soldier. Thurston copied the figures within the frame on the wood; Clennell himself drew the supporters. After he had worked upon it for a couple of months, the block, which was of box veneered upon beech, had the same fate that befell the "Chillingham Bull"; it split, but irremediably, and history relates that the chagrined artist, in a fit of disgust, flung the tea-things into the fire. In a few days, however, he procured a fresh block, induced Thurston to redraw the figures, and this time successfully completed his work, an example of which may be seen in the collection of wood-cuts at the South Kensington. It is thoroughly characteristic of his style—a style rather energetic than fine, and more spirited than minutely patient. Fortune (it should be added) was once more unfavorable to the block, which was burnt in a fire at the printing-office; but the subject was subsequently engraved by John Thompson.

Clennell's last work of any moment as a wood-engraver is the series of cuts which illustrate Rogers's "Pleasures of Memory, with Other Poems." Jackson and Chatto date this 1812; but the copy before us, which has Clennell's name as engraver upon its title-page, bears the imprint of 1810. This little volume has an established reputation with collectors, and the excellence of the cuts as enlightened renderings of pen-and-ink sketches can scarcely be exaggerated. The touch and spirit of the originals is given with rare fidelity, thoroughly to appreciate which it is only necessary to contrast them with some of the later copies in the modern editions of Rogers. Many of the compositions have all the lucid charm of antique gems, and, as we have said elsewhere, may actually have been copies of them, since the "Marriage of Cupid and Psyche" is plainly intended for the famous sardonyx in the Marlborough collection.

Toward 1809 or 1810, and probably owing to the enlarged views of art acquired in his father-in-law's circle, Clennell seems virtually to have relinquished engraving for painting and designing. He had, in all likelihood, been preluding in this latter direction for some time, as there is an engraving by Mantin in the British Museum after one of his designs which dates as far back as 1803, and he made many of the sketches for Scott's "Border Antiquities." In the Kensington Museum there is a water-color drawing called the "Sawpit," dated 1810, which was shown at the Exhibition of 1862; and in the Art Library of the same institution there is a highly interesting volume containing thirty compositions in water-color, of which the majority were prepared for a series of "British Novelists," published by Sherwood, Neely, and Jones in 1810–11. Many of these lightly-washed, slightly-worked sketches have a freedom and certainty of handling which were not retained when they were transferred to the copper, while the situations selected are often realized with considerable insight. It is true that they have not the grace of Stothard, but they have greater vigor. Clennell's men and women are a strong generation; and in his hands Tom Jones becomes a broad-shouldered, north-country fox-hunter, and Pickle's Emilia a bouncing

HEAD-PIECE. (ENGRAVED BY CLENNELL FOR ROGERS'S "THE PLEASURES OF MEMORY." DRAWN BY T. STOTHARD, R. A.)

Tyneside lass. But they have at least one advantage, the lack of which is a common charge against most modern book-illustration,—they generally tell a story of some kind. "Trim in the Kitchen after Master Bobby's Death," from "Tristram Shandy," a subject which has exercised almost as many interpreters with the pencil as "Donec gratus eram" has found translators, is freshly treated, and can scarcely be said to fall much behind Stothard. This book of sketches contains some other drawings, and a few biographical particulars of which we shall hereafter make use.

HEAD-PIECE. (DRAWN AND ENGRAVED BY HARVEY FOR "HISTORY OF ANCIENT AND MODERN WINES.")

In 1812 Clennell was living at 9 Constitution Row, Gray's Inn Road, and he exhibited at the Royal Academy a lively picture of "Fox-hunters Regaling after the Pleasures of the Chace," which was engraved by his father-in-law, and later, in mezzotint, by T. Lupton. From this time forth he continued to exhibit drawings and paintings at the Academy, the British Institution, and the Exhibition of Painters in Water-colors at the "Great Room, Spring Gardens," to which last he sent the largest number of contributions. The "Baggage Waggons in a Thunder-Storm," exhibited in 1816 at the first-named place, and "The Day after the Fair," exhibited in 1818 at the British Institution, are notable examples of his work. Among the pictures which he sent to the water-color gallery were several clever marine subjects, some fishing scenes especially. One of these, the "Arrival of the Mackarel-Boat," is held to be among his best productions. A few of his sketches, the property of a Newcastle collector, were exhibited at the Arts Association of that town in 1878. Others have been exhibited at the Grosvenor Gallery and elsewhere.

But there are two pictures, not included in the above, which have special interest in the story of Clennell's career: one was his masterpiece as a painter, and the other has a tragic connection with the terrible misfortune of his later years. In March, 1815, the British Institution set apart 1000 guineas to be awarded in premiums for the best finished sketches in oil of subjects illustrating the British successes in the Peninsula. Clennell gained one of these premiums with a sketch, full of dash and fiery movement, representing the decisive charge at Waterloo. This was exhibited at the British Institution in 1816. The remaining picture was a commission from the Earl of Bridgewater to paint the "Banquet of the Allied Sovereigns in the Guildhall." When Clennell set to work upon this,—which it must be assumed he did after he had completed the aforementioned charge,—having grouped and lighted his composition, he took apartments in the west end of the town (his latest residence appears to have been in Pentonville), and waited patiently for the distinguished sitters who were to grace his board. But in this part of his task he experienced so much vexation, suspense, and fatigue, that, by the time he had obtained the necessary sketches and had commenced the picture in earnest, his intellectual powers, probably already strained to their utmost by his previous efforts, seem to have suddenly given way. This must have been early in 1817. The following account of the first indications of his malady, as related by one of his friends, is contained in a letter to Mr. Chatto.

DRAWN BY HARVEY FOR "HISTORY OF ANCIENT AND MODERN WINES."

"I regret to say I was the cause of the first discovery of his mind being affected. * * * I was on very friendly terms with the family of his father-in-law, Charles Warren, the engraver, as fine a hearted man as ever breathed. I was consequently well acquainted with Clennell, and frequently visited him at his house in Pentonville. I have sat for hours beside him whilst he was engaged in painting that fatal picture. One night, a large party of young folks had assembled at Mr. Warren's,—a very frequent occurrence, for everybody went there when they wished to be happy,—and we had spent a long night in junketting, and play, and games of all sorts, twirling the trencher being, as I well remember, one of them, and at last had gathered in a large circle round the fire. Clennell was seated next the fire on one side, and I sat next to him. I had remarked that for at least half an hour before he had been looking vacantly under the grate, paying no attention to the fun that was going on. In order to rouse him, I gave him a hearty slap on the thigh, and said: 'Why, Clennell, you are in a brown study!' He gave a faint laugh, and said, 'Indeed, I think I am.' He did not, however, become so much roused as to pay any attention to the *mêlée* of waggery that was going on. We broke up about one o'clock; and on my calling at Mr. Warren's next afternoon, I was shocked to hear from him that he feared Clennell's mind was affected; for that, about three in the morning, after having gone home with his wife and retired to bed, he started up and dressed himself, telling his wife that he was going to her father's on a very important affair. As his wife could not prevail on him to defer his visit to a more seasonable hour, she determined to accompany him. On arriving at Gray's Inn Road, he knocked violently, and on being let in by Mr. Warren, he said that he had been grossly insulted by *me*, and that he was determined on having immediate satisfaction. All Mr. Warren's arguments as to the impossibility of my having intended to insult him were met with positive assertions to the contrary. He said that he knew better; 'I had been placed next him on purpose, and it was a preconcerted thing.' Mr. Warren at last seeing how it was with him, humored him so far as to say that he would go with him, and have an explanation, an apology, *or* satisfaction! They accordingly set out for my house; but Mr. Warren, being now quite sensible on the subject, instead of proceeding toward my house, took a very different direction, and led him about till he became tired; he was at that time anything but strong. He also by degrees quieted his mind towards me by speaking of my friendship for him and my love of art; and by daylight he got him home and to bed. I need hardly say what exquisite pain this account gave me, for I really loved Clennell: he was always so mild, so amiable—in short, such a GOOD fellow."

Shortly after this, becoming mischievous, Clennell was placed in an asylum in London. Under the pressure of misfortune, his wife's mind also gave way, and she died, leaving three children. By the exertions of Sir John Swinburne (grandfather of the poet) and other benevolent persons, the Waterloo charge was engraved, in 1819, by W. Bromley. It was published by the committee of the Artists' Fund, to which institution Clennell had belonged, and the proceeds were vested in trustees for the benefit of himself and his family. The same body, says Pye, protected him to the day of his death, which took place in 1840.

During the long period which intervened between 1817 and 1840, Clennell never wholly recovered, though hopes appear to have been entertained that his reason might be restored. For some years he remained in London, but he was subsequently transferred to the care of his relations in the North. When Mackenzie wrote his "History of Newcastle," in 1827, he was living in this way at Tritlington; later, he was at St. Peter's Quay. Once he called upon Bewick and asked him for a block to engrave, but when, to humor him, he had been supplied with one, his efforts resembled those of an unskilled first beginner. His faculty for drawing appears to have less declined. We have now before us a bullfinch and a group of carnations, which he is stated to have drawn during his insanity; and, except that they are slightly exaggerated in size, the handling is unfaltering and effective. In his earlier days he had been acquainted with Burns, whose songs he sang; and one of the amusements of his vacant hours consisted in composing strange and half-articulate fragments of verse, a few specimens of which are reproduced in the "History of Wood Engraving." In the "Athenæum" for March 7, 1840, there are three more,—"Soleman," "A Floweret," and "The Lady upon her Palfrey Grey,"—and others have been published elsewhere. The following, which, as far as can be ascertained, have not appeared in any type save that of the rare leaflet on which they were first printed, are here given chiefly for that reason, and not for any special merit they possess as poetry:

DRAWN BY HARVEY FOR "HISTORY OF ANCIENT AND MODERN WINES."

A BALLAD.

THE hill it was high
As the maiden did climb,
And O she wished for her true love nigh,
And dearly she wished for the time
That she might be by
Her own true-love of the azure sky.

THE JAGUAR. (DRAWN BY HARVEY FOR "THE TOWER MENAGERIE.")

The hill it was fair,
And sweet was the air,
But her true love was not nigh;
The cowslips look gay,
Her love is on his way,
And they meet on the hill of the sky.

AN EPIC UPON WINTER.

In January or November's cold,
When stern winter his scepter doth hold
By farm, or common side, or village lane,
Or where the sturdy peasant
Doth drive a drain,
Cutting his way
Oft through the frozen clay;
Sometimes dressing a hedge,
Lopping away the cumbrous sedge —
There the fendifair, in numerous wing,
To taste, now fresh, the oozing spring,
And flock in the copse or on the bough,
In winter's merriment to dow.
Perhaps, near a gravel-pit,
Where doth the swiller boy
To carry sand his time employ,
The little sandybird doth sit
Upon a twig,
In expectation big —
Or robin or blackbird in haste
The new brown atom to taste,
And pick their welcome cheer,
In winter's month so often drear.

To attach any undue importance to these irregular verses would be absurd; but the inborn love of nature is still discernible in the disjointed imagery and the poor rudderless words. Both pieces bear the author's initials, "L. C.," and are dated from "St. Peters."

While at St. Peters, Clennell appears to have been harmless; but in 1831 he again became unmanageable, and was placed in an asylum, where he remained until he died. In 1844 a monumental tablet by R. Davies, a local sculptor, was erected to his memory in St. Andrew's Church, Newcastle.

It is difficult to determine the precise limits of talents so fatally interrupted, or to decide definitely whether their possessor should or should not be included among "the inheritors of unfulfilled renown." When attacked by his malady he was six-and-thirty; and if there be any truth in the axiom of Joseph le Maistre, that "he who has not conquered at thirty will never conquer," Clennell had already passed that critical stage. But we do not place much faith in the utterance in question; and, setting speculation aside, it may fairly be affirmed of him that he was, after Nesbit, the best engraver among Bewick's pupils; and that when his mind gave way he was beginning to show powers of a higher kind as an artist, particularly in the line of landscape and rustic scenes. His distinguishing qualities are breadth, spirit, and rapidity of handling, rather than finish and minuteness; and the former characteristics are usually held to be superior to the latter. His unfortunate story invests them with an additional interest.

IV.

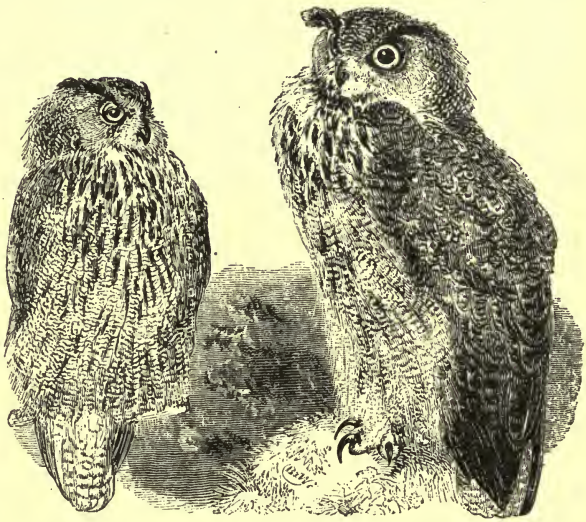
William Harvey, the third of Bewick's pupils who attained to any distinction, is known chiefly as a designer on wood, and for a considerable period held the foremost place in the profession. In these days, when artists of this class are so numerous, it is difficult to understand how one man could completely command the field; and yet it seems certain that, about 1830–'40, Harvey was the sole person to whom engravers could apply for an

THE SUMMER DUCK. (DRAWN BY HARVEY FOR "THE GARDENS AND THE MENAGERIE OF THE ZOÖLOGICAL SOCIETY.")

original design with security, and who devoted himself exclusively to the preparation of such designs. "The history of wood-engraving," says a writer in the "Art-Union" for 1839, "for some years past is almost a record of the works of his (Harvey's) pencil." It was the custom to say that he produced more than Stothard or Chodowiecki; but it would be more appropriate to compare his unflagging fertility to that of Doré or Gilbert.

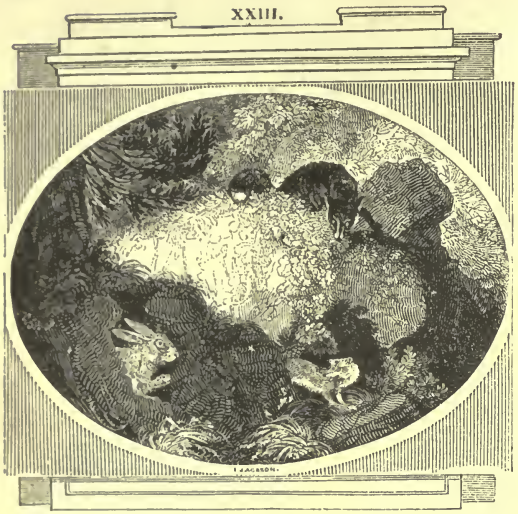
He was born at Westgate, July 13, 1796, his father being keeper of the Newcastle baths. At fourteen he was apprenticed to Bewick, with whom he became a great favorite, as may be gathered from the well-nigh parental letter, printed in Jackson and Chatto, which Bewick addressed to him in 1815. Harvey worked with Temple, another pupil, upon the "Fables" of 1818, and, it is alleged, transferred many of Johnson's sketches to the wood. In September, 1817, he removed to London. Here he studied drawing under B. R. Haydon and anatomy under Sir Charles Bell. While with Haydon (where he had Eastlake, Lance, and Landseer for fellow-pupils), he engraved the well-known block after that artist's "Assassination of Dentatus"—that ambitious attempt to unite color, expression, handling, light, shadow, and heroic form, of which, if report is to be believed, the proximate destination was a packing-case in Lord Mulgrave's stable. A section of Harvey's engraving was given in this magazine for April, 1880. It is, as Mr. De Vinne there says, "probably the largest, certainly the most labored, block that had then been cut in England"; but its manifest and misguided rivalry of copper-plate makes it impossible to praise it as highly as its exceedingly skillful technique would seem to warrant. As a work upon wood, it must be regarded as more ingenious than admirable.

Toward 1824, Harvey seems wholly to have abandoned engraving for design, his decision in this direction being apparently determined by the success of the illustrations he drew and in part cut for Henderson's "History of Ancient and Modern Wines." These are some of his most pleasing performances. As engravings, they are excellent; as designs, they have but little of the unpleasant mannerism which afterward grew upon him and disfigured his later work. To give an account of his labors as a designer subsequent to this time would be unnecessary, as well as tedious. About 1830 he had become prominently popular in this way; he was at the height of his reputation in 1840, and when he died, six-and-twenty years later, his work was still in request. His designs for the "Tower Menageries," 1828; "Zoölogical Gardens," 1830–31; "Children in the Wood," 1831; "Blind Beggar of Bethnal Green," 1832; "Story without an End," "Pictorial Prayer Book," "Bible," "Shakspere," * and a hundred other issues from Charles Knight's untiring press, attest his industry and versatility. Those who desire to study him to advantage, however, will do so in the two series of Northcote's "Fables," 1828 and 1833, to which we have already referred; and in Lane's "Thousand and One Nights," 1838–40. Northcote, indeed, takes credit for the illustrations in the former case; but from the accounts which exist of the way in which he prepared the merely indicatory sketches that Harvey subsequently elaborated and transferred to the block, and from the admission in the preface to Vol. I., that many of the designs have been "improved by his (Harvey's) skill," it is probable that most of the honors of the undertaking really belong to Harvey, though he again, no doubt, profited in some degree by having Northcote's first ideas to energize upon. The ornamental letters and vignettes were entirely his own. Taken as a whole, these two volumes are among the most interesting examples of wood-cut art in England. They were a labor of love to their projector, whose dying regret it was that he had not lived to see the publication of the second series; and some of the happiest work of Nesbit, Jackson, Thompson, and Williams



THE GREAT EAGLE-OWL. (DRAWN BY HARVEY FOR "THE GARDENS AND THE MENAGERIE OF THE ZOÖLOGICAL SOCIETY.")

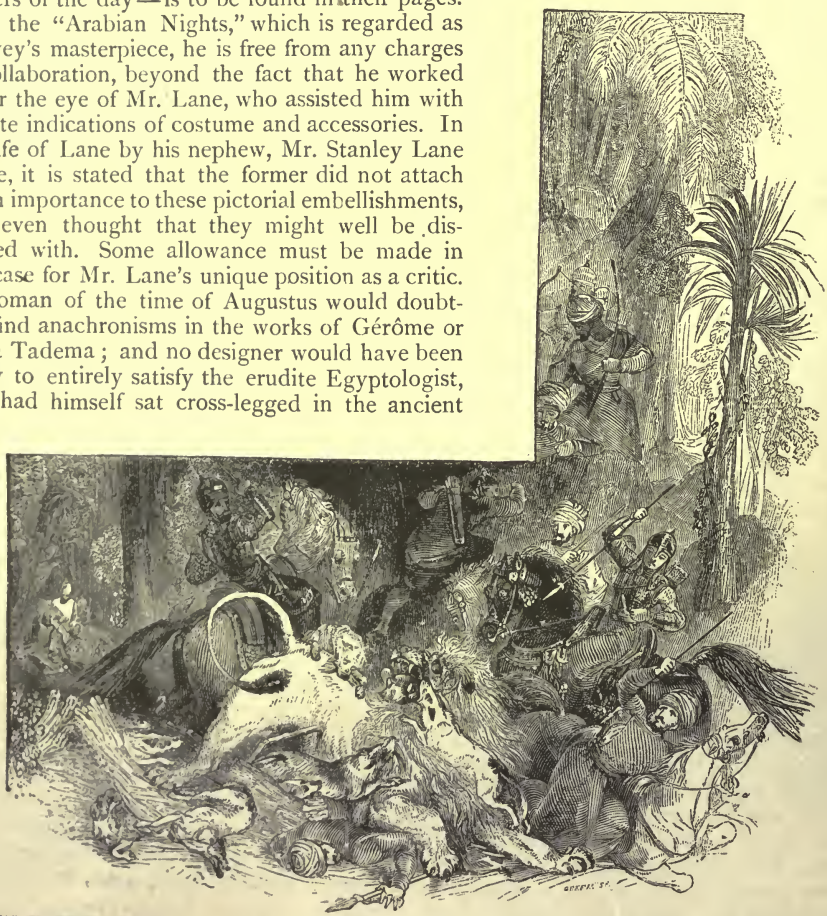
* Bogue's Bunyan's "Pilgrim's Progress," engraved by the Dalziels, is also one of Harvey's better efforts.



THE FOX, THE WEASEL, THE RABBIT. (ENGRAVED BY JOHN JACKSON FOR NORTHCOTE'S "FABLES.")

—that is to say, of the most successful wood-engravers of the day—is to be found in their pages.

In the "Arabian Nights," which is regarded as Harvey's masterpiece, he is free from any charges of collaboration, beyond the fact that he worked under the eye of Mr. Lane, who assisted him with minute indications of costume and accessories. In the life of Lane by his nephew, Mr. Stanley Lane Poole, it is stated that the former did not attach much importance to these pictorial embellishments, and even thought that they might well be dispensed with. Some allowance must be made in this case for Mr. Lane's unique position as a critic. A Roman of the time of Augustus would doubtless find anachronisms in the works of Gérôme or Alma Tadema; and no designer would have been likely to entirely satisfy the erudite Egyptologist, who had himself sat cross-legged in the ancient Arab city of Cairo, and who began each day's task with a pious dedication to Allah. That Lane's disciple, relative, and biographer should, under the circumstances, speak of Harvey's drawings as the "least excellent part of the book," and damn them with the faint praise of "in some slight degree catching the Oriental spirit of the tales," is perhaps to be anticipated; but the fact remains that the artist reached his highest point in these volumes, and the public of Charles Knight's time probably ranked them far above the text in importance. A certain florid and exuberant facility, which in Harvey's ordinary designs is monotonous or ill-timed, seems almost in keeping with Eastern subjects, and many of the head-pieces and vignettes, set tastefully in intricate arabesques, and beautifully engraved by Jackson and his colleagues, are gems of minute and deli-



TAJ EL-MOLOOK HUNTING. (DRAWN BY HARVEY FOR "THE THOUSAND AND ONE NIGHTS." BY PERMISSION OF CHATTO AND WINDUS.)

"PARTY QUARRELS." SECOND SERIES. (ENGRAVED BY JACKSON FOR NORTHCOTE'S "FABLES.")

cate invention. Speaking generally, the decorative and topographical examples, the glimpses of bazaar and street, of mosque and turreted gate and "latticed meshrebeeyeh," are superior to the picturesquely grouped but expressionless figure subjects. In drawing animals, Harvey was often singularly fortunate, although here, as always, his peculiar mannerism mars his work.

At his death, in 1866, he was Bewick's only surviving pupil. Beyond the fact that he was a thoroughly amiable and unpretentious man, and an unwearied worker, little of interest has been recorded respecting him. A new race of draughtsmen has sprung up since he laid down the pencil, but his name will always deserve to be remembered in the annals of his craft. He lies buried in the cemetery at Richmond.

V.

In addition to the pupils already mentioned, there were a few others, who either did not attain to celebrity, or whose relationship to Bewick was of a more incidental kind. Foremost among these comes John Jackson, who was born at Ovingham in 1811, and died in 1848. Redgrave says that he was a pupil of Armstrong (which is indefinite), and afterward of Bewick. With the latter he had some obscure disagreement which prematurely terminated their connection, Bewick, it is alleged, going even so far as to cut his own and his son's names out of the unexpired indentures. Jackson then moved to London, and worked for a time under Harvey, many of whose designs he subsequently engraved. He did, or superintended, much of the work on the "Penny Magazine" and other of Charles Knight's various enterprises; and between 1830 and 1840 was the busiest and best employed of London wood-engravers. His work for the two series of Northcote's "Fables" and Lane's "Arabian Nights" has already been mentioned. As an engraver, he was careful and painstaking, without any special show of genius. His name has, however, acquired more prominence than it perhaps actually deserves, from its connection with a book to which we have frequently made reference, and to which no student of wood-engraving can fail to be indebted, namely, the "History" of that art, currently known as "Jackson and Chatto." When this book first appeared, in 1839, an angry controversy arose as to the relative claims of the engraver and his colleague to the honors of authorship. We do not propose to stir the ashes of this ancient dispute. Still, it may be stated that Mr. Chatto appears to have had but scant justice done to him in the matter, for, with a few reservations, the composition and preparation of the book were entirely his. Indeed, Jackson was in no sense "literary," and could not possibly have undertaken it; and although he provided and paid for the illustrations, the attributing of them *en masse* to him personally is manifestly an error, as the major part of the fac-similes of old wood-cuts were the work of the late Mr. Fairholt, and were chiefly engraved by a young pupil of Jackson's named Stephen Rimbault. Others were executed by J. W. Whymper. Of the blocks actually from the graver of Jackson himself, the best are the "Partridge" and the "Woodcock," after Bewick, which are favorable specimens of his powers. Jackson's true position with regard to the whole book seems to have been rather that of contractor than of author; and it is satisfactory to know that in the third edition, which has been recently issued, due prominence has

THE VAIN BUTTERFLY. (ENGRAVED BY EBENEZER LANDELLS FOR NORTHCOTE'S "FABLES.")

SEED-SOWER. (ENGRAVED BY H. F. P. W. HOLE FOR "RELIGIOUS EMBLEMS.")

been given on the title-page to the hitherto insufficiently recognized labors of Mr. Chatto.

With the exception of Ebenezer Landells, the remaining pupils of Bewick are little more than names. Landells was an excellent engraver, who did good work on the "Illustrated London News" and "Punch," and succeeded admirably in rendering the animals of Thomas Landseer. He died in 1860. Hole, already referred to in connection with Ackermann's "Religious Emblems," and whose full name was Henry Fulke Plantagenet Woolicombe Hole, was the son of a captain in the Lancashire militia. He practiced as an engraver at Liverpool, but ultimately gave up the profession on succeeding to an estate in Devonshire. He did some of the cuts in the "British Birds." W. W. Temple, who assisted Harvey in "Bewick's Fables" of 1818, became a draper at the end of his apprenticeship. Henry White, who engraved Thurston's designs to Burns, as well as many of Cruikshank's squibs for Hone, and some of the best of the cuts in Yarrell's "Fishes," was an exceedingly clever workman. Of John Johnson, Robert Johnson's cousin, who designed the cut of the "Hermit" in Goldsmith's and Parnell's "Poems," we have no material particulars. Isaac Nicholson, Anderson, Willis, and the rest, may be dismissed without further mention.

TAIL-PIECE. (DRAWN BY HARVEY FOR NORTHCOTE'S "FABLES.")

Austin Dobson.

NOTE.—With the exception of the Head-piece for Rogers's "Pleasures of Memory," which is printed from an electrotype of the original, all the foregoing illustrations were reproduced by the photo-engraving process from early editions of the books for which they were made.—ED. C. M.

[Begun in the August number.]

THE BREAD-WINNERS.

IX.

A DRAMA WITH TWO SPECTATORS.

THE words of Bott lingered obstinately in Maud Matchin's mind. She gave herself no rest from dwelling on them. Her imagination was full, day after day, of glowing pictures of herself and Farnham in tête-à-tête; she would seek in a thousand ways to tell her love—but she could never quite arrange her avowal in a satisfactory manner. Long before she came to the decisive words which were to kindle his heart to flame in the imaginary dialogue, he would himself take fire by spontaneous combustion, and, falling on his knees, would offer his hand, his heart, and his fortune to her in words taken from "The Earl's Daughter" or the "Heir of Ashby."

"Oh, pshaw! that's the way it ought to be," she would say to herself. "But if he wont—I wonder whether I ever could have the brass to do it? I don't know why I shouldn't. We are both human. Bott wouldn't have said that if there was nothing in it, and he's a mighty smart man."

The night usually gave her courage. Gazing into her glass, she saw enough to inspire her with an idea of her own invincibility; and after she had grown warm in bed she would doze away, resolving with a stout heart that she would try her fate in the morning. But when day came, the enterprise no longer seemed so simple. Her scanty wardrobe struck her with cowardice as she surveyed it. The broad daylight made everything in the house seem poor and shabby. When she went down-stairs, her heart sank within her as she entered the kitchen to help her mother, and when she sat with the family at the breakfast-table, she had no faith left in her dreams of the rosy midnight. This alternation of feeling bred in her, in the course of a few days, a sort of fever, which lent a singular beauty to her face, and a petulant tang to her speech. She rose one morning, after a sleepless night, in a state of anger and excitement in which she had little difficulty in charging upon Farnham all responsibility for her trouble of mind.

"I wont stand it any longer," she said aloud in her chamber. "I shall go to him this day and have it out. I shall ask him what he means by treating me so."

She sat down by her bureau and began to bang and crimp her hair with grim resolution. Her mother came and knocked at her door. "I'm not coming to breakfast, I've got a headache," she said, and added to herself, "I sha'n't go down and get the smell of bacon on me this morning."

She continued her work of personal adornment for two hours, going several times over her whole modest arsenal of harness, before she was ready for the fray. She then went down in her street costume, and made a hasty meal of bread and butter, standing by the pantry. Her mother came in and found her there.

"Why, Mattie, how's your head?"

"I'm going to take a walk and see what that will do."

As she walked rapidly out of Dean street, the great clock of the cathedral was striking the half hour after nine.

"Goodness!" she exclaimed, "that's too early to call on a gentleman. What shall I do?"

She concluded to spend the time of waiting in the library, and walked rapidly in that direction, the fresh air flushing her cheeks, and blowing the frizzed hair prettily about her temples. She went straight to the reference rooms, and sat down to read a magazine. The girl who had prompted her to apply for a place was there on duty. She gave a little cry of delight when Maud came in, and said: "I was just crazy to see you. I have got a great secret for you. I'm engaged!"

The girls kissed each other with giggles and little screams, and the young woman told who *he* was—in the lightning-rod business in Kalamazoo, and doing very well; they were to be married almost immediately.

"You never saw such a fellow, he just wont wait;" and consequently her place in the library would be vacant. "Now, you must have it, Maud! I haven't told a soul. Even the Doctor don't know it yet."

Maud left the library and walked up the avenue with an easier mind. She had an excuse for her visit now, and need not broach, unless she liked, the tremendous subject that made her turn hot and cold to think of. She went rustling up the wide thoroughfare at a quick pace; but before arriving at Farnham's, moved by a momentary whim, she turned down a side street leading to Bishop's Lane. She said to herself, "I will go in by that little

gate once, if I never do again." As she drew near, she thought, "I hope Sam isn't there."

Sam was there, just finishing his work upon the greenhouse. Farnham was there also; he had come down to inspect the job, and he and Sleeny were chatting near the gate as Maud opened it and came in. Farnham stepped forward to meet her. The unexpected rencounter made her shy, and she neither spoke to Sam nor looked toward him, which filled him with a dull jealousy.

"Could I have a few moments' conversation with you, sir?" she asked, with stiff formality.

"Certainly," said Farnham, smiling. "Shall we go into the house?"

"Thank you, sir," she rejoined, severely decorous.

They walked up the garden-path together, and Sam looked after them with an unquiet heart.

She was walking beside Farnham with a stately step, in spite of the scabbard-like narrowness of the dress she wore. She was nearly as tall as he, and as graceful as a young pine blown to and fro by soft winds. The carpenter, with his heart heavy with love and longing, felt a bitter sense that she was too fine for him. They passed into the house, and he turned to his work with a sigh, often dropping his busy hands and looking toward the house with a dumb questioning in his eyes. After a half hour which seemed endless to him, they re-appeared and walked slowly down the lawn. There was trouble and agitation in the girl's face, and Farnham was serious also. As they came by the rose-house, Maud paused and looked up with a sorrowful smile and a question. Farnham nodded, and they walked to the open door of the long, low building. He led the way in, and Maud, looking hastily around, closed the door behind them.

"He's goin' to give her some more of them roses," said Sam, explaining the matter to himself. But he worked for some time with his blonde beard on his shoulder in his impatience to see them come out. At last, he could resist no longer. He knew a point where he could look through the glass and see whatever was taking place among the roses. He walked swiftly across the turf to that point. He looked in and saw Maud, whose back was turned toward him, talking as if she were pleading for her life, while Farnham listened with a clouded brow. Sleeny stood staring with stupid wonder while Maud laid her hand upon Farnham's shoulder. At that moment he heard footsteps on the gravel walk at some distance from him, and he looked up and saw Mrs. Belding approaching. Confused at his attitude of espionage, he walked away from his post, and, as he passed her, Mrs. Belding asked him if he knew where Mr. Farnham was.

"Yes," he answered, "he's in there. Walk right in;" and in the midst of his trouble of spirit he could hardly help chuckling at his own cleverness as he walked, in his amazement, back to the conservatory.

While she was in the house, Maud had confined herself to the subject of the vacancy in the library. She rushed at it, as a hunter at a hedge, to get away from the other matter which had tormented her for a week. When she found herself alone with Farnham she saw that it would be "horrid" to say what she had so long been rehearsing. "Now I can get that place, if you will help me. No earthly soul knows anything about it, and Minnie said she would give me a good chance before she let it out."

Farnham tried to show her the difficulties in the way. He was led by her eagerness into a more detailed account of his differences with the rest of the board than he had ever given to any one, a fuller narrative than was perhaps consistent with entire prudence. Whenever he paused, she would insist with a woman's disconcerting directness:

"But they don't know anything about it this time — they can't combine on anybody. You can certainly get one of them."

Farnham still argued against her sanguine hopes, till he at last affected her own spirits, and she grew silent and despondent. As she rose to go, he also took his hat to return to the garden, where he had left Sleeny, and they walked over the lawn together. As they approached the rose-house, she thought of her former visit and asked to repeat it. The warm breath of the flowers saluted her as she crossed the threshold, bringing so vivid a reminiscence of the enchantment of that other day, that there came with it a sudden and poignant desire to try there, in that bewitched atmosphere, the desperate experiment which would decide her fate. There was no longer any struggle in her mind. She could not, for her life, have kept silent now. She walked slowly beside him to the place where the pots of roses stood ranged on their frames, filling the air with dense fragrance. Her hands were icy cold and quick flushes passed through her, while her face reddened and paled like a horizon smitten by heat-lightning in a sultry night of summer. She looked at the moist brick pavement at her feet, her eyelids seemed too heavy to lift, and the long lashes nearly touched her cheeks.

"What sort will you have?" said Farnham, reaching for the gardener's shears.

"Never mind the roses," she said, in a dry voice which she hardly recognized as her own. "I have something to say to you."

He turned and looked at her with surprise. She raised her eyes to his with a great effort, and then, blushing fiery red, she said, in a clear, low voice, "I love you."

Like many another daughter and son of Eve, she was startled at the effect of these momentous words upon herself. Of all forms of speech, these three words are the most powerful, the most wonder-working upon the being who utters them. It was the first time they had ever passed her lips, and they exalted and inebriated her. She was suddenly set free from the bashful constraint which had held her, and with a leaping pulse and free tongue she poured out her heart to the astonished and scandalized young man.

"Yes, I love you. You think it's horrid that I should say so, don't you? But I don't care, I love you. I loved you the first time I saw you, though you made me so angry about my glasses. But you were my master, and I knew it, and I never put them on again. And I thought of you day and night, and I longed for the day to come when I might see you once more, and I was glad when I did not get that place, so that I could come again and see you and talk with you. I can tell you over again every word you ever said to me. You were not like other men. You are the first real man I ever knew. I was silly and wild when I wanted to be your secretary. Of course, that wouldn't do. If I am not to be your wife, I must never see you again; you know that, don't you?" and, carried away by her own reckless words, she laid her hand on his shoulder. His frown of amazement and displeasure shook her composure somewhat. She turned pale and trembled, her eyes fell, and it seemed for an instant as if she would sink to the floor at his feet. He put his arm around her, to keep her from falling and pressed her closely to him. She threw her head back upon his shoulder and lifted her face to him. He looked down on her, and the frown passed from his brow as he surveyed her flushed cheeks, her red full lips parted in breathless eagerness; her dark eyes were wide open, the iris flecked with golden sparks and the white as clear and blue-tinged as in the eyes of a vigorous infant; her head lay on his shoulder in perfect content, and she put up her mouth to him as simply and as sure of a response as a pretty child. He was entirely aware of the ridiculousness of his position, but he stooped and kissed her with hearty good-will.

Her work seemed all done; but her satisfaction lasted only a second. Her face broke into happy smiles.

"You do love me, do you not?" she asked.

"I certainly do not," he answered; and at that instant the door opened and Mrs. Belding saw this pretty group of apparent lovers on a rich background of Jacqueminot roses.

Startled more at the words of Farnham than at the entry of Mrs. Belding, Maud had started up, like Vivien, "stiff as a viper frozen." Her first thought was whether she had crushed her hat on his shoulder, and her hands flew instinctively to her head-gear. She then walked tempestuously past the astonished lady out into the garden and brushed roughly by Sleeny, who tried to detain her.

"Hold your tongue, Sam! I hate you and all men"; and with this general denunciation, she passed out of the place, flaming with rage and shame.

Mrs. Belding stood for a moment speechless, and then resorted to the use of that hard-worked and useful monosyllable,

"Well!" with a sharp, falling inflection.

"Well!" returned Farnham, with an easy, rising accent; and then both of them relieved the strained situation with a nervous laugh.

"Come, now," said the good-natured woman, "I am a sort of guardian of yours. Give an account of yourself."

"That is easily given," said Farnham. "A young woman, whose name I hardly know, came to me in the garden this morning to ask for help to get some lady-like work to do. After discussing that subject threadbare, she came in here for a rose, and, apropos of nothing, made me a declaration and a proposal of honorable wedlock, *dans toutes les formes*."

"The forms were evident as I entered," said Mrs. Belding, dryly.

"I could not let her drop on the damp floor," said Farnham, who was astonished to find himself positively blushing under the amused scrutiny of his mother-confessor. "Consider, if you please, my dear madam, that this is the first offer I have ever received, and I was naturally somewhat awkward about declining it. We shall learn better manners as we go along."

"You did decline, then?" said Mrs. Belding, easily persuaded of the substantial truth of the story, and naturally inclined, as is the way of woman, to the man's side. Then, laughing at Arthur's discomfiture, she added, "I was about to congratulate you."

"I deserve only your commiseration."

"I must look about and dispose of you in some way. You are evidently too rich and too fascinating. But I came over to-day to

ask you what I ought to do about my Lake View farm. I have two offers for it; if I had but one, I would take either—well, you know what I mean;" and the conversation became practical. After that matter was disposed of, she said, with a keen side-glance at Farnham, "That was a very pretty girl. I hope you will not be exposed to such another attack; I might not be so near the next time."

"That danger, thanks to you, is over; Mademöiselle will never return," he answered, with an air of conviction.

Mrs. Belding went home with no impression left of the scene she had witnessed but one of amusement. She thought of it only as "a good joke on Arthur Farnham." She kept chuckling to herself over it all day, and if she had had any especial gossip in the town, she would have put on her hat and hurried off to tell it. But she was a woman who lived very much at home, and, in fact, cared little for tattling. She was several times on the point of sharing the fun of it with her daughter, but was prevented by an instinctive feeling that it was hardly the sort of story to tell a young girl about a personal acquaintance. So she restrained herself, though the solitary enjoyment of it irritated her.

They were sitting on the wide porch which ran around two sides of the house just as twilight was falling. The air was full of drowsy calls and twitters from the grass and the trees. The two ladies had been sitting ever since dinner, enjoying the warm air of the early summer, talking very little, and dropping often into long and contented silences. Mrs. Belding had condescended to grenadine in consideration of the weather, and so looked less funereal than usual. Alice was dressed in a soft and vapory fabric of creamy bunting, in the midst of which her long figure lay reclined in an easy chair of Japanese bamboo; she might have posed for a statue of graceful and luxurious repose. There was light enough from the rising moon and the risen stars to show the clear beauty of her face and the yellow luster of her hair; and her mother cast upon her from time to time a glance of pride and fondness, as if she were a recovered treasure to which the attraction of novelty had just been added anew.

"They say she looks as I did at her age," thought the candid lady; "but they must flatter me. My nose was never so straight as that: her nose is Belding all over. I wonder whom she will care about here? Mr. Furrey is a nice young man, but she is hardly polite to him. There he is now."

The young man came briskly up the walk, and ran up the steps so quickly that he tripped on the last one and dropped his hat. He cleverly recovered it, however, and made very careful bows to both the ladies, hoping that he found them quite well. Mrs. Belding bustled about to give him a chair, at which Alice knitted her pretty brows a little. She had scarcely moved her eyelashes to greet her visitor; but when Mrs. Belding placed a light chair near her daughter and invited Mr. Furrey to take it, the young lady rose from her reclining attitude and sat bolt upright with a look of freezing dignity. The youth was not at all abashed, but took his seat, with his hat held lightly by the brim in both hands. He was elegantly dressed, in as faithful and reverent an imitation as home talent could produce of the costume of the gentlemen who that year were driving coaches in New York. His collar was as stiff as tin; he had a white scarf, with an elaborate pin constructed of whips and spurs and horseshoes. He wore dog-skin gloves, very tight and red. His hair was parted in the middle with rigorous impartiality and shed rather rank fragrance on the night. He began conversation with an easy air, in which there was something of pleasurable excitement mixed.

"I come to receive your congratulations, ladies!"

"What, you are engaged?" said Mrs. Belding, and even the placid face of Miss Alice brightened with a look of pleased inquiry.

"Oh, dear, no; how could you think so?" he protested, with an arch look at Alice which turned her to marble again. "I mean I have this day been appointed assistant cashier of our bank!" Napoleon, informing Madame de Beauharnais* that he was to command the army of Italy, probably made less ado about it.

Mrs. Belding made haste to murmur her congratulations. "Very gratifying, I am sure, —at your age;" to which Alice responded like a chorus, but without any initiative warmth, "Very gratifying, I am sure."

Furrey went on at some length to detail all the circumstances of the event: how Mr. Lathers, the president of the bank, had sent for him, and how he complimented him; how he had asked him where he learned to write such a good hand; and how he had replied that it came sort of natural to him to write well, that he could make the American eagle with pen and ink before he was fifteen, all but the tail-feathers, and how he discovered a year later that the tail-feathers had to be made by holding the pen between the first and

* Perhaps Josephine told Napoleon herself, but I think she was clever enough to let him imagine he owed the appointment to his merits.

second fingers; with much more to the like innocent purpose, to which Mrs. Belding listened with nods and murmurs of approval. This was all the amiable young man needed to encourage him to indefinite prattle. He told them all about the men in the bank, their habits and their loves and their personal relations to him, and how he seemed somehow to be a general favorite among them all. Miss Alice sat very still and straight in her chair, with an occasional smile when the giggling of Mr. Furrey seemed to require it, but with her eyes turned to the moonlit night in vagrant reverie, and her mind in those distant and sacred regions where we cannot follow the minds of pure and happy girls.

"Now, you would hardly understand, if I did not tell you," said Mr. Furrey, "how it is that I have gained the confidence——"

At this moment Alice, who had been glancing over Mr. Furrey's shoulder for a moment with a look of interest in her eyes, which he thought was the legitimate result of his entertaining story, cried:

"Why, there comes Mr. Farnham, mamma."

"So it is," said her mother. "I suppose he wants to see me. Don't move, Mr. Furrey. Mr. Farnham and I will go into the house."

"By no means," said that gentleman, who by this time had mounted the steps. "I was sitting all alone on my porch and saw by the moon that yours was inhabited; and so I came over to improve my mind and manners in your society."

"I will get a chair for you," said Mrs. Belding.

"No, thank you; this balustrade will bear my weight, and my ashes will drop harmless on the flower-bed, if you will let me finish my cigar." And he seated himself between the chair of Furrey and the willow fabric in which Alice had resumed her place. This addition to the company was not at all to the taste of the assistant cashier, who soon took his leave, shaking hands with the ladies, with his best bow.

"After all, I do prefer a chair," said Farnham, getting down from his balustrade, and throwing away his Reina Victoria, half smoked.

He sat with his back to the moonlight. On his left was Alice, who, as soon as Furrey took his departure, settled back in her willow chair in her former attitude of graceful ease. On the right was Mrs. Belding, in her thin, cool dress of gauzy black. Farnham looked from one to the other as they talked, and that curious exercise, so common to young men in such circumstances, went through his mind. He tried to fancy how Mrs. Belding looked at nineteen, and how Miss Belding would look at fifty, and the thought gave him singular pleasure. His eyes rested with satisfaction on the wholesome and handsome face of the widow, her fine shoulders and arms, and comfortable form, and then, turning to the pure and exquisite features of the tall girl, who was smiling so freshly and honestly on him, his mind leaped forward through coming years, and he said to himself: "What a wealth of the woman there is there—for somebody." An aggressive feeling of disapproval of young Furrey took possession of him, and he said, sharply:

"What a very agreeable young man Mr. Furrey is?"

Mrs. Belding assented, and Miss Alice laughed heartily, and his mind was set at rest for the moment.

They passed a long time together. At first Mrs. Belding and Arthur "made the expenses" of the conversation; but she soon dropped away, and Alice, under the influence of the night and the moonlight and Farnham's frank and gentle provocation, soon found herself talking with as much freedom and energy as if it were a girls' breakfast. With far more, indeed,—for nature takes care of such matters, and no girl can talk to another as she can to a man, under favoring stars. The conversation finally took a personal turn, and Alice, to her own amazement, began to talk of her life at school, and with sweet and loving earnestness sang the praises of Madame de Veaudrey.

"I wish you could know her," she said to Farnham, with a sudden impulse of sympathy. He was listening to her intently, and enjoying her eager, ingenuous speech as much as her superb beauty, as the moon shone full on her young face, so vital and so pure at once, and played, as if glad of the privilege, about the curved lips, the flashing teeth, the soft eyes under their long lashes, and the hair over the white forehead, gleaming as crisply brilliant as fine-spun wire of gold.

"By her fruits I know her, and I admire her very much," he said, and was sorry for it the moment afterward, for it checked the course of the young girl's enthusiasm and brought a slight blush to her cheek.

"I ought to have known better," he said to himself with real penitence, "than to utter a stupid commonplace to such a girl when she was talking so earnestly." And he tried to make amends, and succeeded in winning back her attention and her slow unconscious smiles by talking to her of things a thousand miles away. The moon was silvering the tops of the linden-trees at the gates before they thought of the flight of time, and they had

quite forgotten the presence of Mrs. Belding when her audible repose broke in upon their talk. They looked at each other, and burst into a frank laugh, full of confidence and comradeship, which the good lady heard in her dreams and waked, saying, "What are you laughing at? I did not catch that last witticism."

The young people rose from their chairs. "I can't repeat my own mots," said Arthur; "Miss Belding will tell you."

"Indeed I shall not," replied Alice. "It was not one of his best, mamma."

She gave him her hand as he said "Good-night," and it lay in his firm grasp a moment without reserve or tremor.

"You are a funny girl, Alice," said Mrs. Belding, as they walked into the drawing-room through the open window. "You put on your stiffest company manners for Mr. Furrey, and you seem entirely at ease with Mr. Farnham, who is much older and cleverer, and is noted for his sarcastic criticisms."

"I do not know why it is, mamma, but I do feel very much at home with Mr. Farnham, and I do not want Mr. Furrey to feel at home with me."

Upon this, Mrs. Belding laughed aloud. Alice turned in surprise, and her mother said, "It is too good to keep. I must tell you. It is such a joke on Arthur;" and, sitting in a low arm-chair, while Alice stood before her leaning upon the back of another, she told the whole story of the scene of the morning in the rose-house. She gave it in the fullest detail, interrupting herself here and there for soft cachinnations, unmindful of the stern, unsmiling silence with which her daughter listened.

She finished, with a loud flourish of merriment, and then asked: "Did you ever hear anything so funny in your life?"

The young lady was turning white and red in an ominous manner, and was biting her nether lip. Her answer to her mother's question was swift and brief:

"I never heard anything so horrid," and she moved majestically away without another word.

Mrs. Belding sat for a moment abashed. "There!" she said to herself, "I knew very well I ought not to tell her. But it was too good to keep, and I had nobody else to tell." She went to bed, feeling rather ill-used. As she passed her daughter's door, she said, "Good-night, Alice!" and a voice not quite so sweet as usual replied, "Good-night, mamma," but the door was not opened.

Alice turned down her light and sat upon a cushioned seat in the embrasure of her open window. She looked up at the stars, which swam and glittered in her angry tears. With trembling lips and clinched hands she communed with herself. "Why, why, why did mamma tell me that horrid story? To think there should be such women in the world! To take such a liberty with him, of all men! She could not have done it without some encouragement—and he could not have encouraged her. He is not that kind of a vulgar flirt at all. But what do I know about men? They may all be—but I did not think—what business have I thinking about it? I had better go to bed. I have spent all the evening talking to a man who—Oh! I wish mamma had not told me that wretched story. I shall never speak to him again. It is a pity, too, for we are such near neighbors, and he is so nice, if he were not—But I don't care how nice he is, she has *spoiled* him. I wonder who she was. Pretty, was she? I don't believe a word of it—some bold-faced, brazen creature. Oh! I shall hate myself if I cry;" but that was past praying for, and she closed her lattice and went to bed for fear the stars should witness her unwelcome tears.

X.

A WORD OUT OF SEASON.

ARTHUR FARNHAM awoke the next day with a flight of sweet hopes and fancies singing in his heart and brain. He felt cheerfully and kindly toward the whole human race. As he walked down into the city to transact some business he had there with his lawyer, he went out of his way to speak to little children. He gave all his acquaintances a heartier "Good-morning" than usual. He even whistled at passing dogs. The twitter of the sparrows in the trees, their fierce contentions on the grass, amused him. He leaned over the railing of the fountain in the square with the idlers, and took a deep interest in the turtles, who were baking their frescoed backs in the warm sun, as they floated about on pine boards, amid the bubbles of the clear water.

As he passed by the library building, Dr. Buchlieber was standing in the door. "Good luck," he said; "I was just wishing to see you. One of our young women resigned this morning, and I think there may be a chance for our handsome friend. The meeting, you remember, is this afternoon."

Farnham hardly recalled the name of the young lady in whose success he had been so interested, although recent intimate occurrences might have been expected to fix it somewhat

permanently in his remembrance. But all female images except one had become rather vague in his memory. He assented, however, to what the doctor proposed, and going away congratulated himself on the possibility of doing Maud a service and ridding himself of the faintest tinge of remorse. He was not fatuous or conceited. He did not for a moment imagine that the girl was in love with him. He attributed her demonstration in the rose-house to her "congenital bad breeding," and thought it only one degree worse than other match-making maneuvers of which he had been the object in the different worlds he had frequented. He gave himself no serious thought about it, and yet he was glad to find an apparent opportunity to be of use to her. She was poor and pretty. He had taken an interest in her welfare. It had not turned out very well. She had flung herself into his arms and been heartily kissed. He could not help feeling there was a balance against him.

As he turned the corner of the street which led to the attorney's office where he was going, he saw a man standing by the wall with his hat off, bowing to him. He returned the unusual salutation and passed on; it was some moments before he remembered that it was one of his colleagues on the Library Board. He regretted not having stopped and made the effort to engage his vote for Maud; but, on second thought, he reflected that it would be as well to rely upon the surprise of the three to prevent a combination at the meeting. When he reached the entrance of the building where his lawyer's offices were, he turned, with a sense of being pursued by a shuffling footstep which had hastened its speed the last few paces, and saw his colleague coming up the steps after him with a perspiring but resolute face.

"Hold on, Cap," he said, coming into the shade of the passage. "I was thinkin' o' comin' to see you, when I sighted you comin' round the corner."

"I am glad to see you, Mr. Pennybaker," said Arthur, taking the clumsy hand which was held out to him.

"Gettin' pretty hot, aint it?" said Pennybaker, wiping his brow with his forefinger and dexterously sprinkling the floor with the proceeds of the action.

"No danger of frost, I think," Arthur assented, admiring the dexterity of Pennybaker, but congratulating himself that the shake-hands was disposed of.

"You bet your life. We're going to have it just sizzling from now on."

"Were you wishing to see me about anything in particular?" asked Farnham, who saw no other way of putting an end to a meteorological discussion which did not interest him.

"Well, yes," answered Pennybaker, getting around beside Farnham, and gazing at the wall opposite. "I heerd this. mornin' that Minnie Bell was goin' to get married. My daughter is doing some sewing for her, and it slipped out that way. She was trying to keep it secret. Some girls is mighty funny that way. They will do anything to get engaged, and then they will lie like Sam Hill to make believe they aint. Well, that makes a vacancy." He did not turn his head, but he cast a quick glance sideways at Farnham, who made no answer, and Pennybaker resumed: "So I thought I would come to you, honor bright, and see if we couldn't agree what to do. That's me. I'm open and square, like a bottle of bitters."

Farnham gave no indication of his surprise at this burst of candor, but asked:

"What do you propose?"

"That's it," said Pennybaker, promptly. "I don't propose nothing—I *ex*pose. You hear me—I *ex*pose." He said this with great mystery, one eye being shut fast and the other only half open. He perceived that he had puzzled Farnham, and enjoyed it for a moment by repeating his mot with a chuckle that did not move a muscle of his face. "I'll tell you the whole thing. There's no use, between gentlemen, of playing the thing too fine." He took his knife from one pocket and from another a twist of tobacco, and, cutting off a mouthful, began his story:

"You see, me and Bud Merritt and Joe Dorman have most generally agreed on paternage, and that was all right. You are well fixed. You don't want the bother of them little giblets of paternage. We've 'tended to 'em for what there was in 'em and for the good of the party. Now Bud he wants to be auditor, and he's got Joe to go in with him, because, if he gits there, Joe's brother-in-law, Tim Dolan, will be his debbity. Bud is weak in the Third Ward, and he knows it, and he knows that Jake Runckel can swing that ward like a dead cat; and so they have fixed it all up to give the next vacancy to Jake for his sister. She's been turned out of the school for some skylarking, and weighs pretty heavy on Jake's hands. Very well. That's the game, and I'm a-kickin'! Do you hear me? I'm a-kickin'!"

Pennybaker pushed up his hat and looked Farnham fairly in the face. The assertion of his independence seemed to give him great gratification. He said once more, slowly closing one eye and settling back in his former attitude against the wall, while he aimed a

deluge of tobacco-juice at the base of the wall before him: "I'm a-kickin' like a Texas steer."

He waited a moment to allow these impressive words to have their full effect, while Farnham preserved a serious and attentive face.

"Well, this bein' the case," continued Pennybaker, "I comes to you, as one gentleman to another, and I asks whether we can't agree against this selfish and corrupt game of Merritt and Dorman. For, you see, I don't get a smell out of what they're doin'. I'm out in the cold if their slate goes through."

"I don't see that I can be of any service to you, Mr. Pennybaker. If I have any influence in the matter, it shall be given to Miss Matchin, whom I proposed once before."

"Exactly! Now you're talkin'. Miss Matchin shall have it, on one little proviso that wont hurt you nor me nor nobody. Say the word, and it's a whack."

And he lifted up his hand to strike the bargain.

"What is it?" asked Farnham, in a tone which was severe and contemptuous, in spite of him.

"Namely, just this," answered Pennybaker. "You aint on the make; you're fixed. You don't care about these d—— little things except to help a friend once 'n awhile," he said, in a large and generous way. "But I aint that kind yet. I've got to look out for myself—pretty lively, too. Now, I'll tell you what's my racket. You let me perpose Miss Matchin's name and then go and tell her father that I put it through, and it'll be done slick as a whistle. That's all solid, aint it?"

Farnham's brow clouded. He did not answer at once. Pennybaker repeated his question a little anxiously:

"That's all solid, aint it?"

"You will excuse me, Mr. Pennybaker, if I do not quite understand your racket, as you call it. I do not see how you make anything out of this. Matchin is a poor man. You surely do not intend——"

"To strike Saul for a divvy? Nothing of the sort," said Pennybaker, without the least offense. "The whole thing lies just here. Among gentlemen there's no use being shy about it. My brother wants to be assessor in Saul Matchin's ward. Saul's got a lot of influence among the boys in the planing-mills, and I want his help. You see?"

Farnham thought he saw, and, after assenting to Pennybaker's eager demand, "That's all solid?" he walked away, too much relieved by the thought that Maud was provided for to question too closely the morality of the proceeding which the sordid rascal had exposed to him.

In the afternoon, at the meeting of the board, the programme agreed upon was strictly carried out. Pennybaker proposed Miss Matchin's name as soon as the vacancy was announced, to the amazement of his late confederates. They moved a postponement, but to no purpose; Maud was elected; and the angry politicians had no better revenge than to say spitefully to Pennybaker on the stairs, as they went away, "How much did the Captain give you for that sell-out?"—a jeer which he met by a smile of conscious rectitude and a request to be informed the next time they organized a freeze-out against him. It must be said, however, that he lost no time in going to Matchin, informing him that he had succeeded in carrying Maud in by unheard-of exertions, and demanding and receiving on the spot five per cent. of her year's salary, which he called "the usual commission."

Saul announced the appointment that evening at supper. Maud flushed crimson, and the tears started to her eyes. She was about to declare she would not have it, when her father's next words put a different face on the matter. "And it's no thanks to Cap'n Farnham, neither. He tried it oncet, and couldn't make the riffle. But me and Joel Pennybaker got together and done it. And now I hope, Mattie, you'll behave yourself and save money. It's like a fortun' comin' to you, if you're smart."

Maud found no reply ready. She could not wholly believe her father's story. She still fancied the appointment came from Farnham, and there was a certain bitterness in it; but, on the whole, she received it not without a secret complacency. Mrs. Matchin's pleasure was checked by her daughter's morose confusion. Sam made no pretense of being pleased, but sat, unmoved by Matchin's speech, in scowling silence, and soon went out without a word of comment. The scene he had witnessed in the rose-house had poisoned his mind; yet, whenever he looked at Maud, or tried to speak to her, he was met with an air of such fierce and beautiful defiance, that his eyes fell and his voice stuck in his throat. So the piece of good fortune, so anxiously awaited in the household, brought little delight when it came. Maud reported for duty next day, and soon learned the routine of her work; but she grew more and more silent at home, and Saul's hope of a wedding in the family died away.

Arthur Farnham walked away from the meeting with the feeling of a school-boy who has finished a difficult task and who thinks he deserves some compensating pleasure. The day had been fine and warm, but the breeze of the late afternoon was already blowing in from the lake, lending freshness and life to

the air. The sky was filled with soft gray clouds, which sailed along at a leisurely rate, evidently on very good terms with the breeze. As Farnham walked up the avenue, he cast about in his mind for the sort of dissipation with which he would reward himself for the day's work and he decided for a ride.

But as he was drawing on his boots, it occurred to him, for the first time in his life, that it was a churlish and unneighborly proceeding for him to go riding alone day after day, and that he would be doing no more than his duty to offer his escort to Miss Belding. He said Miss Belding to his own thought—making it as formal and respectful as possible. So, sending an order to his groom to keep his horse at the stable for a moment, he walked over the lawn to the Belding cottage and asked for the ladies.

"I believe they are upstairs, sir. Walk into the drawing-room, and I will see," said the neat house-maid, smiling at Farnham, as indeed was the general custom of women. He took his seat in the cool and darkened room facing the door-way, which commanded a view of the stairs. He sat in a large willow chair very much at his ease, looking about the pretty salon, enjoying its pictures and ornaments and the fragrance of the roses in the vases, as if he had a personal interest in them. The maid came back and said the ladies would be down in a moment.

She had announced Farnham to Mrs. Belding, who had replied, "Tell him, in a moment." She was in the summer afternoon condition which the ladies call "dressing-sack," and after an inspection at the glass, which seemed unsatisfactory, she walked across the hall to her daughter's room. She found Alice standing by the window, looking out upon the lake.

"There, I am glad you are all dressed. Arthur Farnham has called, and you must go down and excuse me. I said I would come, but it will take me so long to dress, he will get tired of waiting. You run down and see him. I suppose there is nothing particular."

"Oh, mamma," said Alice, "I don't want to see him, and especially not alone."

Mrs. Belding made large eyes in her surprise. "Why, Alice, what has got into you?"

Alice blushed and cast down her eyes. "Mamma," she said, in a low voice, "do not ask me to go down. You know what you told me last night."

"There, that will do," said the mother, with a tone of authority. "Perhaps I was foolish to tell you that silly little story, but I am the judge of who shall visit this house. You are too young to decide these questions for me, and I insist that what I told you shall make no difference in your treatment of Mr. Farnham. You think too much of your own part in the matter. He has come to see me, and not you, and I wish you to go down and make my excuses for keeping him waiting. Will you go?"

"Yes, I will go," said the young girl. The blush had left her cheek and she had become a trifle pale. She had not raised her eyes from the floor during her mother's little speech; and when it was over and her mother had gone back to her room, Alice cast one glance at her mirror, and with a firm face walked down the stairs to the drawing-room. Farnham heard the rustle of her dress with a beating of the heart which filled him with a delicious surprise. "I am not past it, then," was the thought that came instantly to his mind, and in that one second was a singular joy. When she came in sight on the stairs, it was like a sudden enchantment to him. Her beautiful head, crowned with its masses of hair drawn back into a simple Greek knot; her tall, strong figure, draped in some light and clinging stuff which imposed no check on her natural grace and dignity, formed a charming picture as she came down the long stairs; and Farnham's eyes fastened eagerly upon her white hand as it glided along the dark walnut baluster. His heart went out to meet her. He confessed to himself, with a lover's instantaneous conviction, that there was nothing in the world so utterly desirable as that tall and fair-haired girl slowly descending the stairs. In the midst of his tumultuous feeling a trivial thought occurred to him: "I am shot through the heart by the blind archer," he said to himself; and he no longer laughed at the old-fashioned symbol of the sudden and fatal power of love.

But with all this tumult of joy in the senses waking up to their allegiance, there came a certain reserve. The goddess-like creature who had so suddenly become the mistress of his soul was a very serious personage to confront in her new majesty. He did not follow the impulse of his heart and rush forward as she entered the room. He merely rose and bowed. She made the faintest possible salutation, and, without taking a seat, conveyed her mother's excuses in a tone of such studied coldness that it amused Farnham, who took it as a school-girl's assumption of a grand and ceremonious manner suitable to a tête-à-tête with man.

"Thank you," he said, "but I did not come especially to see your mother. You were more the object of my quest." She did not smile or reply, and he went on, with a slight sensation of chill coming upon him from this

stony dignity, which, the more he observed it, seemed less and less amusing and not at all artificial. "I came to ask if you would not like to go to ride this afternoon. It is just gray enough for comfort."

"I thank you very much for being so kind as to think of me," she replied, "but it will not be convenient for me to go."

"Perhaps the morning will suit better. I will come to-morrow at any hour you say."

"I shall not be able to go to-morrow either, I think."

Even while exchanging these few words, Alice felt herself growing slightly embarrassed, and it filled her with dismay. "I am a poor creature," she thought, "if I cannot get this self-satisfied gentleman out of the house without breaking down. I can't stand here forever though," and so she took a seat, and, as Arthur resumed his willow chair with an air of content, she could not but feel that as yet the skirmish was not in her favor. She called her angry spirit to her aid, and nerved herself to say something which would promptly close the interview.

His next words gave her the opportunity.

"But you surely do not intend to give up riding altogether?"

"Certainly not. I hope to ride a good deal. Andrews will go with me."

"Ah! Your objection to me as a groom is entirely personal, then."

"Now for it!" she thought to herself, and she said firmly, "Yes."

But the effort was too great, and after the word was launched her mouth broke up into a nervous smile, for which she despised herself, but which she could not control for her life.

Farnham was so pleased with the smile that he cared nothing for the word, and so he continued in a tone of anxious and coaxing good-nature, every word increasing her trouble:

"You are wrong as you can be. I am a much better groom than Andrews. He has rather more style, I admit, on account of his Scotch accent and his rheumatism. But I might acquire these. I will be very attentive and respectful. I will ride at a proper distance behind you, if you will occasionally throw a word and a smile over your shoulder at me."

As he spoke, a quick vision flashed upon him of the loveliness of the head and shoulder, and the coil of fair hair which he should have before him if he rode after her, and the illumination of the smile and the word which would occasionally be thrown back to him from these perfect lips and teeth and eyes. His voice trembled with love and eagerness as he pleaded for the privilege of taking her servant's place. Alice no longer dared to interrupt him, and hardly ventured to lift her eyes from the floor. She had come down with the firm purpose of saying something to him which would put an end to all intimacy, and here, before she had been five minutes in his presence, he was talking to her in a way that delighted her ears and her heart. He went rattling on as if fearful that a pause might bring a change of mood. As she rarely looked up, he could feast his eyes upon her face, where now the color was coming and going, and on her shapely hands, which were clasped in her lap. He talked of Colorado as if it were settled that they were to go there together, and they must certainly have some preliminary training in rough riding; and then, merely to make conversation, he spoke of other places that should only be visited on horseback, always claiming in all of them his post of groom. Alice felt her trouble and confusion of spirit passing away as the light stream of talk rippled on. She took little part in it at first, but from monosyllables of assent she passed on to a word of reply from time to time; and before she knew how it happened she was engaged in a frank and hearty interchange of thoughts and fancies, which brought her best faculties into play and made her content with herself, in spite of the occasional intrusion of the idea that she had not been true to herself in letting her just anger die so quickly away.

If Farnham could have seen into the proud and honest heart of the young girl he was talking to, he would have rested on the field he had won, and not tempted a further adventure. Her anger against him had been dissipated by the very effort she had made to give it effect, and she had fallen insensibly into the old relation of good neighborhood and unreserved admiration with which she had always regarded him. She had silenced her scruples by the thought that in talking pleasantly with him she was obeying her mother, and that after all it was not her business to judge him. If he could have known his own best interest, he would have left her then, when her voice and her smile had become gay and unembarrassed according to their wont, with her conscience at ease about his faults, and her mind filled with a pleasant memory of his visit.

But such wisdom was beyond his reach. He had felt suddenly, and once for all, in the last hour, the power and visible presence of his love. He had never in his life been so moved by any passion as he was by the joy that stirred his heart when he heard the rustle of her dress in the hall and saw her white hand resting lightly on the dark wood of

the stairs. As she walked into the parlor, from her face and her hair, from every movement of her limbs, from every flutter of her soft and gauzy garments, there came to him an assertion of her power over him that filled him with a delicious awe. She represented to him, as he had never felt it before, the embodied mystery and majesty of womanhood. During all the long conversation that had followed, he had been conscious of a sort of dual operation of his mind, like that familiar to the eaters of hasheesh. With one part of him he had been carrying on a light and shallow conversation, as an excuse to remain in her presence and to keep his eyes upon her, and with all the more active energies of his being he had been giving himself up to an act of passionate adoration of her. The thoughts that uttered themselves to him, as he chatted about all sorts of indifferent things, were something like these: How can it have ever happened that such beauty, such dignity, such physical perfection could come together in one person, and the best and sweetest heart have met them there? If she knew her value, her pride would ruin her. In her there is everything, and everything else beside: Galatea, the statue, with a Christian soul. She is the best that could fall to any man, but better for me than for any one else. Anybody who sees her must love her, but I was made for nothing else but to love her. This is what mythologies meant. She is Venus: she loves laughter, and her teeth and lips are divine. She is Diana: she makes the night beautiful; she has the eye and the arm of an athlete goddess. But she is a woman: she is Mrs. Belding's daughter Alice. Thank heaven, she lives here. I can call and see her. To-morrow, I shall ride with her. She will love and marry some day like other women. Who is the man who shall ever kiss her between those straight brows? And fancies more audacious and extravagant fed the fever of his heart as he talked deliberate small talk, still holding his hat and whip in his hand.

He knew it was time he should go, but could not leave the joy of his eyes and ears. At last his thoughts, like a vase too full, ran over into speech. It was without premeditation, almost without conscious intention. The under-tone simply became dominant and overwhelmed the frivolous surface talk. She had been talking of her mother's plans of summer travel, and he suddenly interrupted her by saying in the most natural tone in the world: "I must see your mother before she decides. I hope you will make no plans without me. I shall go where you go. I shall never be away from you again, if I can help it. No, no, do not frown about it. I must tell you. I love you; my whole life is yours."

She felt terribly shocked and alarmed, not so much at his words as at her own agitation. She feared for a moment she could not rise from her seat, but she did so with an effort. He rose and approached her, evidently daunted by her inflexible face; for the crisis had brought a momentary self-control with it, and she looked formidable with her knit brows and closed lips.

"Do not go," he pleaded. "Do not think I have been wanting in respect and consideration. I could not help saying what I did. I cannot live without you any more than I can without light and sunshine. I ought to have waited and not startled you. But I have only begun to live since I loved you, and I feel I must not waste time."

She was deeply disturbed at these wild and whirling words, but still bore herself bravely. She felt her heart touched by the vibration of his ardent speech, but her maiden instinct of self-defense enabled her to stand on her guard. Though beaten by the storm of his devotion, she said to herself that she could get away if she could keep from crying or sobbing, and one thought which came to her with the swiftness of lightning gave her strength to resist. It was this: "If I cry, he will take me in his arms, and we shall repeat the tableau mamma saw in the rose-house."

Strong in that stimulating thought, she said: "I am too sorry to hear you say these things. You know how much we have always thought of you. If you forget all this, and never repeat it, we may still be friends. But if you renew this subject, I will never speak to you again alone, as long as I live."

He began to protest; but she insisted, with the calm cruelty of a woman who sees her advantage over the man she loves. "If you say another word, it is the end of our acquaintance, and perhaps it is best that it should end. We can hardly be again as we were."

Farnham was speechless, like one waked in the cold air out of a tropical dream. He had been carried on for the last hour in a whirlwind of emotion, and now he had met an obstacle against which it seemed that nothing could be done. If he had planned his avowal, he might have been prepared for rejection; but he had been hurried into it with no thought of what the result would be, and he was equally unprovided for either issue. In face of the unwavering voice and bearing of Alice, who seemed ten times more beautiful than ever as she stood before him as steady and unresponsive as a young Fate, his hot speech seemed suddenly smitten powerless. He only said:

"It shall be as you wish. If I ever offend you again, I will take my punishment upon myself and get out of your way."

She did not dare to say another word, for fear it would be too kind. She gave him her hand; it was soft and warm as he pressed it; and if he had only known how much softer and warmer her heart was, he would have covered her hand with a thousand kisses. But he bowed and took his leave, and she stood by the lattice and saw him go away, with eyes full of tears and a breast filled with the tenderest ruth and pity—for him and for herself.

XI.

THE SANTA RITA SHERRY.

FARNHAM walked down the path to the gate, then turned to go to his own house, with no very definite idea of what direction he was taking. The interview he had just had was still powerfully affecting his senses. He was conscious of no depression from the prompt and decided refusal he had received. He was like a soldier in his first battle who has got a sharp wound which does not immediately cripple him, the perception of which is lost in the enjoyment of a new, keen, and enthralling experience. His thoughts were full of his own avowal, of the beauty of his young mistress, rather than of her coldness. Seeing his riding-whip in his hand, he stared at it an instant, and then at his boots, with a sudden recollection that he had intended to ride. He walked rapidly to the stable, where his horse was still waiting, and rode at a brisk trot out of the avenue for a few blocks, and then struck off into a sandy path that led to the woods by the river-side.

As he rode, his thoughts were at first more of himself than of Alice. He exulted over the discovery that he was in love as if some great and unimagined good fortune had happened to him. "I am not past it, then," he said to himself, repeating the phrase which had leaped from his heart when he saw Alice descending the stairs. "I hardly thought that such a thing could ever happen to me. She is the only one." His thoughts ran back to a night in Heidelberg, when he sat in the shadow of the castle wall with a German student of his acquaintance, and looked far over the valley at the lights of the town and the rippling waves of the Neckar, silvered by the soft radiance of the summer moon.

"Poor Hammerstein! How he raved that night about little Bertha von Eichnolz. He called her *Die Einzige* something like a thousand times. It seemed an absurd thing to say; I knew dozens just like her, with blue eyes and Gretchen braids. But Hammerstein meant it, for he shot himself the week after her wedding with the assessor. But mine *is* the Only One—though she is not mine. I would rather love her without hope than be loved by any other woman in the world."

A few days before, he had been made happy by the thought that she was no longer a child; now he took infinite pleasure in the thought of her youth; he filled his mind and his senses with the image of her freshness, her clear, pure color, the outline of her face and form. "She is young and fragrant as spring; she has every bloom and charm of body and soul," he said to himself, as he galloped over the shady woodland road. In his exalted mood, he had almost forgotten how he had left her presence. He delighted in his own roused and wakened passion, as a devotee in his devotions, without considering what was to come of it all. The blood was surging through his veins. He was too strong, his love was too new and wonderful to him, to leave any chance for despair. It was not that he did not consider himself dismissed. He felt that he had played a great stake foolishly, and lost. But the love was there, and it warmed and cheered his heart, like a fire in a great hall, making even the gloom noble.

He was threading a bridle-path which led up a gentle ascent to a hill overlooking the river, when his horse suddenly started back with a snort of terror as two men emerged from the thicket and grasped at his rein. He raised his whip to strike one of them down; the man dodged, and his companion said, "None o' that, or I'll shoot your horse." The sun had set, but it was yet light, and he saw that the fellow had a cocked revolver in his hand.

"Well, what do you want?" he asked.

"I want you to stop where you are and go back," said the man, sullenly.

"Why should I go back? My road lies the other way. You step aside and let me pass."

"You can't pass this way. Go back, or I'll make you," the man growled, shifting his pistol to his left hand and seizing Farnham's rein with his right. His intention evidently was to turn the horse around and start him down the path by which he had come. Farnham saw his opportunity and struck the hand that held the pistol a smart blow. The weapon dropped, but went off with a loud noise as it fell. The horse reared and plunged, but the man held firmly to the rein. His companion, joined by two or three other rough-looking men who rushed from the thicket, seized the

horse and held him firmly, and pulled Farnham from the saddle. They attempted no violence and no robbery. The man who had held the pistol, a black-visaged fellow with a red face and dyed mustache, after rubbing his knuckles a moment, said: "Let's take it out o' the —— whelp!" But another, to whom the rest seemed to look as a leader, said: "Go slow, Mr. Bowersox; we want no trouble here."

Farnham at this addressed the last speaker and said, "Can you tell me what all this means? You don't seem to be murderers. Are you horse-thieves?"

"Nothing of the kind," said the man. "We are Reformers."

Farnham gazed at him with amazement. He was a dirty-looking man, young and sinewy, with long and oily hair and threadbare clothes, shiny and unctuous. His eyes were red and furtive. and he had a trick of passing his hand over his mouth while he spoke. His mates stood around him, listening rather stupidly to the conversation. They seemed of the lower class of laboring men. Their appearance was so grotesque, in connection with the lofty title their chief had given them, that Farnham could not help smiling, in spite of his anger.

"What is your special line of reform?" he asked,—"spelling, or civil service?"

"We are Labor Reformers," said the spokesman. "We represent the toiling millions against the bloated capitalists and grinding monopolies; we believe that man is better——"

"Yes, no doubt," interrupted Farnham; "but how are you going to help the toiling millions by stopping my horse on the highway?"

"We was holding a meeting which was kep' secret for reasons satisfactory to ourselves. These two gentlemen was posted here to keep out intruders from the lodge. If you had 'a' spoke civil to them, there would have been no harm done. None will be done now if you want to go."

Farnham at once mounted his horse. "I would take it as a great favor," he said, "if you would give me your name and that of the gentleman with the pistol. Where is he, by the way?" he continued. The man they called Bowersox had disappeared from the group around the spokesman. Farnham turned and saw him a little distance away directly behind him. He had repossessed himself of his pistol and held it cocked in his hand.

"What do you want of our names?" the spokesman asked.

Farnham did not again lose sight of Bowersox. It occurred to him that the interview might as well be closed. He therefore said, carelessly, without turning:

"A man has a natural curiosity to know the names of new acquaintances. But no matter, I suppose the police know you."

As he walked his horse away from the group, he came so near to Bowersox, who stood at the right of the path, that he almost touched him. He could not resist the temptation of striking his hand again with his clubbed whip. The weapon dropped and went off harmlessly as before, and Bowersox leaped to pick it up, cursing with rage and pain. But in an instant Farnham was out of sight in the thickly wooded path.

Bowersox turned to Offitt in his baffled fury. "Why in —— did you let him go? I could have knocked his head off and nobody knowed it."

"Yes," said Offitt, coolly, "and got hung for it."

"It would have been self-defense," said Bowersox. "He hit me first."

"Well, gentlemen," said Offitt, "that closes up Greenwood Lodge. We can't meet in this grass any more. I don't suppose he knows any of us by sight, or he'd have us up tomorrow."

"It was a piece of —— nonsense, comin' out here, anyhow," growled Bowersox, unwilling to be placated. "You haven't done a —— thing but lay around on the grass and eat peanuts and hear Bott chin."

"Brother Bott has delivered a splendid address on 'The Religion of Nature,' and he couldn't have had a better hall than the Canopy to give it under," said Offitt. "And now, gentlemen, we'd better get back our own way."

As Farnham rode home he was not much puzzled by his adventure in the woods. He remembered having belonged, when he was a child of ten, to a weird and mysterious confraternity called "Early Druids," which met in the depths of groves, with ill-defined purposes, and devoted the hours of meeting principally to the consumption of confectionery. He had heard for the past few months of the existence of secret organizations of working-men, and guessed at once that he had disturbed a lodge of one of these clubs. His resentment did not last very long at the treatment to which he had been subjected; but still he thought it was not a matter of jest to have the roads obstructed by ruffians with theories in their heads and revolvers in their hands, neither of which they knew how to use. He therefore promised himself to consult with the chief of police the next morning in regard to the matter.

As he rode along, thinking of the occurrence, he was dimly conscious of a pleasant suggestion in something he had seen among

the hazel brush, and searching tenaciously in his recollection of the affair, it all at once occurred to him that, among the faces of the men who came out of the thicket in the scuffle, was that of the blonde-bearded, blue-eyed young carpenter who had been at work in his library the day Mrs. Belding and Alice lunched with him. He was pleased to find that the pleasant association led him to memories of his love, but for a moment a cloud passed over him at the thought of so frank and hearty a fellow and such a good workman being in such company. "I must see if I cannot get him out of it," he said to himself, and then reverted again to thoughts of Alice.

Twilight was falling, and its melancholy influence was beginning to affect him. He thought less and less of the joy of his love and more of its hopelessness. By the time he reached his house he had begun to confront the possibility of a life of renunciation, and, after the manner of Americans of fortune who have no special ties, his mind turned naturally to Europe. "I cannot stay here to annoy her," he thought, and so began to plot for the summer and winter, and, in fancy, was at the second cataract of the Nile before his horse's hoofs, ringing on the asphalt of the stable-yard, recalled him to himself.

The next day, he was compelled to go to New York to attend to some matters of business. Before taking the train, he laid his complaint of being stopped on the road before the chief of police, who promised to make vigorous inquisition. Farnham remained ten days in New York, and on his return, one warm, bright evening, he found his table prepared and the grave Budsey waiting behind his chair.

He ate his dinner hastily and in silence, with no great zest. "You have not forgot, sir," said Budsey, who was his external conscience in social matters, "that you are going this evening to Mrs. Temple's?"

"I think I shall not go."

"Mr. Temple was here this afternoon, sir, which he said it was most particular. I asked him would he call again. He said no, he was sure of seeing you to-night. But it was most particular, he said."

Budsey spoke in the tone of solemn and respectful tyranny which he always assumed when reminding Farnham of his social duties, and which conveyed a sort of impression to his master that, if he did not do what was befitting, his butler was quite capable of picking him up and deferentially carrying him to the scene of festivity, and depositing him on the door-step.

"What could Temple want to see me about 'most particular'?" Farnham asked himself. "After all, I may as well pass the evening there as anywhere."

Mr. Temple was one of the leading citizens of Buffland. He was the vice-president of the great rolling-mill company, whose smoke darkened the air by day and lighted up the skies at night as with the flames of the nether pit. He was very tall and very slender, with reddish-brown hair, eyes, and mustache. Though a man of middle age, his trim figure, his fashionable dress, and his clean-shaven cheek and chin gave him an appearance of youth. He was president of the local jockey club, and the joy of his life was to take his place in the judges' stand, and sway the destinies of the lean, keen-faced trainers who drove the trotting horses. He had the eye of a lynx for the detection of any crookedness in driving, and his voice would ring out over the track like the trump of doom, conveying fines and penalties to the luckless trickster who was trying to get some unfair advantage in the start. His voice, a deep basso, rarely was heard, in fact, anywhere else. Though excessively social, he was also extremely silent. He gave delightful dinner-parties and a great many of them, but rarely spoke, except to recommend an especially desirable wine to a favored guest. When he did speak, however, his profanity was phenomenal. Every second word was an oath. To those who were not shocked by it there was nothing more droll and incongruous than to hear this quiet, reserved, well-dressed, gentleman-like person pouring out, on the rare occasions when he talked freely, in a deep, measured, monotonous tone, a flood of imprecations which would have made a pirate hang his head. He had been, as a boy, clerk on a Mississippi River steam-boat, and a vacancy occurring in the office of mate, he had been promoted to that place. His youthful face and quiet speech did not sufficiently impose upon the rough deck-hands of that early day. They had been accustomed to harsher modes of address, and he saw his authority defied and in danger. So he set himself seriously to work to learn to swear; and though at first it made his heart shiver a little with horror and his cheek burn with shame, he persevered, as a matter of business, until his execrations amazed the roustabouts. When he had made a fortune, owned a line of steam-boats, and finally retired from the river, the habit had been fastened upon him, and oaths became to him the only form of emphatic speech. The hardest work he ever did in his life was, while courting his wife, a Miss Flora Ballston, of Cincinnati, to keep from mingling his ordinary forms of emphasis in his asseverations of

affection. But after he was married, and thrown more and more into the company of women, that additional sense, so remarkable in men of that mold, came to him, and he never lapsed, in their presence, into his natural way of speech. Perhaps this was the easier, as he rarely spoke at all when they were by—not that he was in the least shy or timid, but because they, as a rule, knew nothing about stocks, or pig-iron, or wine, or trotting horses,—the only subjects, in his opinion, which could interest any reasonable creature.

When Farnham arrived at his house, it was already pretty well filled with guests. Mr. and Mrs. Temple were at the door, shaking hands with their friends as they arrived, she with a pleasant smile and word from her black eyes and laughing mouth, and he in grave and speechless hospitality.

"Good evening, Mr. Farnham!" said the good-natured lady. "So glad to see you. I began to be alarmed. So did the young ladies. They were afraid you had not returned. Show yourself in the drawing-room and dispel their fears. Oh, Mr. Harrison, I am so glad you resolved to stay over."

Farnham gave way to the next comer, and said to Mr. Temple, who had pressed his hand in silence:

"Did you want to see me for anything special to-day?"

Mrs. Temple looked up at the word, and her husband said:

"No; I merely wanted you to take a drive with me."

Another arrival claimed Mrs. Temple's attention, and as Farnham moved away Temple half-whispered in his ear, "Don't go away till I get a chance to speak to you. There is merry and particular bloom of —— to pay."

The phrase, while vivid, was not descriptive, and Farnham could not guess what it meant. Perhaps something had gone wrong in the jockey club; perhaps Goldsmith Maid was off her feed; perhaps pig-iron had gone up or down a dollar a ton. These were all subjects of profound interest to Temple and much less to Farnham; so he waited patiently the hour of revelation, and looked about the drawing-room to see who was there.

It was the usual drawing-room of provincial cities. The sofas and chairs were mostly occupied by married women, who drew a scanty entertainment from gossip with each other, from watching the proceedings of the spinsters, and chiefly, perhaps, from a consciousness of good clothes. The married men stood grouped in corners and talked of their every-day affairs. The young people clustered together in little knots governed more or less by natural selection—only the veterans of several seasons pairing off into the discreet retirement of stairs and hall angles. At the further end of the long drawing-room, Farnham's eyes at last lighted upon the object of his quest. Alice sat in the midst of a group of young girls who had intrenched themselves in a corner of the room, and defied all the efforts of skirmishing youths, intent upon flirtation, to dislodge them. They seemed to be amusing themselves very well together, and the correct young men in white cravats and pointed shoes came, chatted, and drifted away. They were the brightest and gayest young girls of the place; and it would have been hard to detect any local color in them. Young as they were, they had all had seasons in Paris and in Washington; some of them knew the life of that most foreign of all capitals, New York. They nearly all spoke French and German better than they did English, for their accent in those languages was very sweet and winning in its incorrectness, while their English was high-pitched and nasal and a little too loud in company. They were as pretty as girls are anywhere, and they wore dresses designed by Mr. Worth, or his New York rivals, Loque and Chiffon; but they occasionally looked across the room with candid and intelligent envy at maidens of less pretensions who were better dressed by the local artists.

Farnham was stopped at some distance from the pretty group by a buxom woman standing near the open window, cooling the vast spread of her bare shoulders in a current of air, which she assisted in its office with a red-and-gold Japanese fan.

"Captain Farnham," she said, "when are you going to give that lawn-tennis party you promised so long ago? My character for veracity depends on it. I have told everybody it would be soon, and I shall be disgraced if it is delayed much longer."

"That is the common lot of prophets, Mrs. Adipson," replied Farnham. "You know they say in Wall street that early and exclusive information will ruin any man. But tell me, how is your club getting on?" he continued disingenuously, for he had not the slightest interest in the club; but he knew that once fairly started on the subject, Mrs. Adipson would talk indefinitely, and he might stand there and torture his heart and delight his eyes with the beauty of Alice Belding.

He carried his abstraction a little too far, however, for the good lady soon perceived, from his wandering looks and vague replies, that she was not holding his attention. So she

pettishly released him, after following the direction of his eyes, and said, "There, I see you are crazy to go and talk to Miss Dallas. I wont detain you. She *is* awfully clever, I suppose, though she never took the trouble to be brilliant in my presence; and she is pretty when she wears her hair that way—I never liked those frizzes."

Farnham accepted his release with perhaps a little more gratitude than courtesy, and moved away to take a seat which had just been vacated beside Miss Dallas. He was filled with a boyish delight in Mrs. Adipson's error. "That she should think I was worshiping Miss Dallas from afar! Where do women keep their eyes? To think that anybody should look at Miss Dallas when Alice Belding was sitting beside her." It was pleasant to think, however, that the secret of his unhappy love was safe. Nobody was gossiping about it, and using the name of his beloved in idle conjectures. That was as it should be. His love was sacred from rude comment. He could go and sit by Miss Dallas, so near his beloved that he could see every breath move the lace on her bosom. He could watch the color come and go on her young cheek. He could hear every word her sweet voice uttered, and nobody would know he was conscious of her existence.

Full of this thought, he sat down by Miss Dallas, who greeted him warmly and turned her back upon her friends. By looking over her shining white shoulder, he could see the clear, pure profile of Alice just beyond, so near that he could have laid his hand on the crinkled gold of her hair. He then gave himself up to that duplex act to which all unavowed lovers are prone—the simultaneous secret worship of one woman and open devotion to another. It never occurred to him that there was anything unfair in this, or that it would be as reprehensible to throw the name of Miss Dallas into the arena of gossip as that of Miss Belding. That was not his affair; there was only one person in the universe to be considered by him. And for Miss Dallas's part, she was the last person in the world to suspect any one of being capable of the treason and bad taste of looking over her shoulder at another woman. She was, by common consent, the belle of Buffland. Her father was a widowed clergyman, of good estate, of literary tendencies, of enormous personal vanity, who had abandoned the pulpit in a quarrel with his session several years before, and now occupied himself in writing poems and sketches of an amorous and pietistic nature, which in his opinion embodied the best qualities of Swinburne and Chalmers combined, but which the magazines had thus far steadily refused to print.

He felt himself infinitely superior to the society of Buffland,—with one exception,—and only remained there because his property was not easily negotiable and required his personal care. The one exception was his daughter Euphrasia. He had educated her after his own image. In fact, there was a remarkable physical likeness between them, and he had impressed upon her every trick of speech and manner and thought which characterized himself. This is the young lady who turns her bright, keen, beautiful face upon Farnham, with eyes eager to criticise, a tongue quick to flatter and to condemn, a head stuffed full of poetry and artificial passion, and a heart saved from all danger by its idolatry of her father and herself.

"So glad to see you—one sees so little of you—I can hardly believe my good fortune—how have I this honor?" All this in hard, rapid sentences, with a brilliant smile.

Farnham thought of the last words of Mrs. Adipson, and said, intrepidly, "Well, you know the poets better than I do, Miss Euphrasia, and there is somebody who says, 'Beauty draws us by the simple way she does her hair'—or something like it. That Greek knot was the first thing I saw as I entered the room, and *me voici!*"

We have already said that the fault of Farnham's conversation with women was the soldier's fault of direct and indiscriminate compliment. But this was too much in Euphrasia's manner for her to object to it. She laughed and said, "You deserve a *pensum* of fifty lines for such a misquotation. But, *dites-donc, monsieur*"—for French was one of her favorite affectations, and when she found a man to speak it with, she rode the occasion to death. There had been a crisis in the French ministry a few days before, and she now began a voluble conversation on the subject, ostensibly desiring Farnham's opinion on the crisis, but really seizing the opportunity of displaying her familiarity with the names of the new cabinet. She talked with great spirit and animation, sometimes using her fine eyes point-blank upon Farnham, sometimes glancing about to observe the effect she was creating; which gave Farnham his opportunity to sigh his soul away over her shoulder to where Alice was sweetly and placidly talking with her friends.

She had seen him come in, and her heart had stood still for a moment; but her feminine instinct sustained her, and she had not once glanced in his direction. But she was conscious of every look and action of his; and when he approached the corner where she was sitting, she felt as if a warm and em-

barrassing ray of sunshine was coming near her. She was at once relieved and disappointed when he sat down by Miss Dallas. She thought to herself: "Perhaps he will never speak to me again. It is all my fault. I threw him away. But it was not my fault. It was his—it was hers. I do not know what to think. He might have let me alone. I liked him so much. I have only been a month out of school. What shall I do if he never speaks to me again?" Yet such is the power which, for self-defense, is given to young maidens that, while these tumultuous thoughts were passing through her mind, she talked and laughed with the girls beside her, and exchanged an occasional word with the young men in pointed shoes, as if she had never known a grief or a care.

Mr. Furrey came up to say good-evening, with his most careful bow. Lowering his voice, he said:

"There's Miss Dallas and Captain Farnham flirting in Italian."

"Are you sure they are flirting?"

"Of course they are. Just look at them!"

"If you are sure they are flirting, I don't think it is right to look at them. Still, if you disapprove of it very much, you might speak to them about it," she suggested, in her sweet, low, serious voice.

"Oh, that would never do for a man of my age," replied Furrey, in good faith. He was very vain of his youth.

"What I wanted to speak to you about was this," he continued. "There is going to be a Ree-gatta on the river the day after to-morrow, and I hope you will grant me the favor of your company. The Wissagewissametts are to row with the Chippagowaxems, and it will be the finest race this year. Billy Raum, you know, is stroke of the ——"

Her face was still turned to him, but she had ceased to listen. She was lost in contemplation of what seemed to her a strange and tragic situation. Farnham was so near that she could touch him, and yet so far away that he was lost to her forever. No human being knew, or ever would know, that a few days ago he had offered her his life, and she had refused the gift. Nobody in this room was surprised that he did not speak to her, or that she did not look at him. Nobody dreamed that he loved her, and she would die, she resolved deliberately, before she would let anybody know that she loved him. "For I do love him with my whole heart," she said to herself, with speechless energy which sent the blood up to her temples, and left her, in another instant, as pale as a lily.

Furrey at that moment had concluded his enticing account of the regatta, and she had quietly declined to accompany him. He moved away, indignant at her refusal and puzzled by the blush which accompanied it.

"What did that mean?" he mused. "I guess it was because I said the crews rowed in short sleeves."

Farnham also saw the blush, in the midst of a disquisition which Miss Dallas was delivering upon a new poem of François Coppée. He saw the clear, warm color rise and subside like the throbbing of an auroral light in a starry night. He thought he had never seen anything so lovely, but he wondered "what that oaf could have said to make her blush like that. Can it be possible that he—" His brow knitted with anger and contempt.

"*Mais, qu'est-ce que vous avez donc?*" asked Euphrasia.

Farnham was saved from the necessity of an explanation by Mr. Temple, who came up at that moment, and, laying a hand on Arthur's shoulder, said:

"Now we will go into my den and have a glass of that sherry. I know no less temptation than Tio Pepe could take you away from Miss Dallas."

"Thank you awfully," said the young lady. "Why should you not give Miss Dallas herself an opportunity to decline the Tio Pepe?"

"Miss Dallas shall have some champagne in a few minutes, which she will like very much better. Age and wickedness are required to appreciate sherry."

"Ah! I congratulate your sherry; it is about to be appreciated," said the deserted beauty, tartly, as the men moved away.

They entered the little room which Temple called his den, which was a litter of letter-books, stock-lists, and the advertising pamphlets of wine-merchants. The walls were covered with the portraits of trotting horses; a smell of perpetual tobacco was in the air. Temple unlocked a cupboard and took out a decanter and some glasses. He filled two, and gave one to Arthur and held the other under his nose.

"Farnham," he said, with profound solemnity, "if you don't call that the —" (I decline to follow him in the pyrotechnical combination of oaths with which he introduced the next words)—"best sherry you ever saw, then I'm a converted pacer with the ringbone."

Arthur drank his wine, and did not hesitate to admit all that its owner had claimed for it. He had often wondered how such a man as Temple had acquired such an unerring taste.

"Temple," he said, "how did you ever pick up this wine; and, if you will excuse the question, how did you know it when you got it?"

Temple smiled, evidently pleased with the question. "You've been in Spain, haven't you?"

"Yes," said Farnham.

"You know this is the genuine stuff, then?"

"No doubt of it."

"*How* do you know?"

"The usual way—by seeing and drinking it at the tables of men who know what they are about."

"Well, I have never been out of the United States, and yet I have learned about wine in just the same way. I commenced in New Orleans among the old Spanish and French creoles, and have kept it up since, here and there. I can see in five minutes whether a man knows anything about his wine. If he does, I remember every word he says—that is my strong point—head and tongue. I can't remember sermons and speeches, but I can remember every syllable that Sam Ward said one night at your grandfather's ten years ago; and if I have once tasted a good wine, I never forget its fashion of taking hold."

This is an expurgated edition of what he said; his profanity kept up a running accompaniment, like soft and distant rolling thunder.

"I got this wine at the sale of the Marquis of Santa Rita. I heard you speak of him, I don't know how long ago, and the minute I read in the paper that he had turned up his toes, I cabled the consul at Cadiz—you know him, a wild Irishman named Calpin—to go to the sale of his effects and get this wine. He cabled back, 'What shall I pay?' I answered, 'Read your dispatch again: Get means get!' Some men have got no sense. I did not mind the price of the wine, but it riled me to have to pay for the two cables."

He poured out another glass and drank it drop by drop, getting, as he said, "the worth of his money every time."

"Have some more?" he said to Farnham.

"No, thank you."

"Then I'll put it away. No use of giving it to men who would prefer sixty-cent whiskey."

Having done this, he turned again to Farnham, and said, "I told you the Old Boy was to pay. This is how. The labor unions have ordered a general strike; day not fixed; they are holding meetings all over town to-night. I'll know more about it after midnight."

"What will it amount to?" asked Farnham.

"Keen savey?" replied Temple, in his Mississippi River Spanish. "The first thing will be the closing of the mills, and putting anywhere from three thousand to ten thousand men on the streets. Then, if the strike gains the railroad men, we shall be embargoed. —— boiling, and safety-valve riveted down."

Farnham had no thought of his imperiled interests. He began instantly to conjecture what possibility of danger there might be of a disturbance of public tranquillity, and to wish that the Beldings were out of town.

"How long have you known this?" he asked.

"Only certainly for a few hours. The thing has been talked about more or less for a month, but we have had our own men in the unions and did not believe it would come to an extremity. To-day, however, they brought ugly reports; and I ought to tell you that some of them concern you."

Farnham lifted his eyebrows inquiringly.

"We keep men to loaf with the tramps and sleep in the boozing kens. One of them told me to-day that at the first serious disturbance a lot of bad eggs among the strikers—not the unionists proper, but a lot of loose fish—intend to go through some of the principal houses on Algonquin Avenue, and they mentioned yours as one of them."

"Thank you. I will try to be ready for them," said Farnham. But, cool and tried as was his courage, he could not help remembering, with something like dread, that Mrs. Belding's house was next to his own, and that in case of riot the two might suffer together.

"There is one thing more I wanted to say," Mr. Temple continued, with a slight embarrassment. "If I can be of any service to you, in case of a row, I want to be allowed to help."

"As to that," Farnham said with a laugh, "you have your own house and stables to look after, which will probably be as much as you can manage."

"No," said Temple, earnestly, "that aint the case. I will have to explain to you"—and a positive blush came to his ruddy face. "They wont touch me or my property. They say a man who uses such good horses and such bad language as I do—that's just what they say—is one of them, and sha'n't be racketed. I aint very proud of my popularity, but I am willing to profit by it, and I'll come around and see you if anything more turns up. Now, we'll go and give Phrasy Dallas that glass of champagne."

(To be continued.)

[Begun in the February number.]

A WOMAN'S REASON.*

BY W. D. HOWELLS,

Author of "Venetian Life," "A Chance Acquaintance," "A Modern Instance," etc.

XX.

At first, Fenton's arrival on the island had seemed—like the breaking of the steamer's shaft, the storm, the shipwreck, the escape to the reef, and the voyage in the open boat—one step in a series in which there was no arrest, and in which there was at least the consolation of movement from point to point. But this consolation ceased with his last glimpse of the sail, in which all hope of escape fainted and died; and it did not revisit him when he gathered courage to explore the fairy solitude of the atoll. It was so small as to have been abandoned even by the savages of those seas, who forsake their over-peopled islands and wander from reef to reef in search of other homes; and it would never be visited from the world to which he had belonged. The whalers that sometimes stop for water at the coral islands would not touch at this little point of land, lifted, like a flower among its thorns, above those perilous rocks. It had probably never been laid down on any chart; in a century which had explored every part of the globe, it must be a spot unknown to civilized men. The soil showed like snow through the vegetation that thinly covered it, and the perpetual green on white repeated itself in the trailing vines that overran the coral blocks, with narrow spaces of sea between, which Fenton leaped, in his round of the island, to find himself again and again on the white soil of the groves, through which the palm struck its roots and anchored itself fast to the reef. At the highest point, the land rose fifteen feet above the sea; at the widest place, it measured a hundred yards; and if he had fetched a compass of the whole, he would have walked less than two miles. They should not starve; the palms would yield them abundant fruit through the unvarying year; the sea, he knew, was full of fish. As he emerged from the grove at the point where he had started, Giffen called out to him, "What's that on the tree right by your shoulder?" Fenton looked round, and the bright blossom near him turned into a bird. He put out his hand; it did not move; and when he lifted it from its perch, it rested fearlessly on his palm. He flung it from him with a sickening sensation, and Giffen came running toward him.

"Hallo! what's the matter?" demanded Fenton.

"I thought mebbe it was poison!"

"There's nothing to kill us here," Fenton replied. "Come, we must begin to live."

The sailors had left behind the remnant of the bag of flour and the peas and beans. Giffen had carried them up to the hut, and one day Fenton found that he had made a garden and planted it with them. They came up quickly, and then, as if the soil lacked vitality, they withered away, all but a vine sprung from a seed that Giffen found among the peas. He tenderly cherished this vine, which he hoped would prove a musk-melon, or at least a cucumber; in due time it turned out a gourd. "My luck," he said, and gathered his gourds for drinking-cups.

In the maze which had deepened upon Fenton, the whole situation had an unreality, as of something read long ago and half forgotten, and now slowly recalled, point by point; and there were moments of the illusion in which it was not he who was imprisoned there on that unknown island, but the hero of adventures whom he had envied and admired in boyhood, or known in some romance of later life. The gun and the cartridges which they treasured so carefully after they found traces of a former savage habitation; the tools which they had brought from the wreck, and which they used in shaping the timbers for their hut; the palm-leaves they plucked for its thatch; the nuts they gathered for their food and drink; the fishing-lines they twisted from the fiber of the cocoa-bark; the hooks they carved from the bones of the birds they ate; and the traps they set for game when the wild things, once so tame, began to grow wary; their miserable economies of clothing; the rude arts by which they fashioned plates from shells, and cooking utensils from the clay they found in sinking their well; the vats they made to evaporate the sea water for its salt,—all these things

seemed the well-worn properties and stock experiences of the castaways of fiction; he himself the figment of some romancer's brain, with which the author was toying for the purposes of his plot, to be duly rescued and restored to the world when it should serve the exigency of the tale. Once, when this notion was whimsically repeating itself to Fenton in the silence and solitude, it brought a smile to his haggard face, and when Giffen asked him what the matter was, he told him.

"No," said Giffen, "it aint much like *us*."

That two modern men should be lost out of a world so knit together with telegraphs and railroads and steam-ships, that it seemed as if a whisper at any point must be audible at all others, was too grotesque a fact, too improbable for acceptance. It was not like them, and it was not like any one he could think of; and when he tried to imagine some contemporary and acquaintance in his case, it became even more impossible than when he supposed it of himself.

There were ironical moods in which he amused himself with the carefully ascertained science of the story-tellers as he recalled it, and in which he had a fantastic interest in noting how near and yet how far from the truth their study came. But there were other times when the dreary sense of the hackneyed character of the situation overpowered him, and he dropped his work and lay with his face in the sand, helpless and hopeless, for hours, sick of the repetition of such stale inventions. There was no greater reality in it all when he recalled the narratives of men actually cast away on desert islands, though there were moments when the sum of what they had suffered seemed to accumulate itself upon his soul, and his heart and hand were heavy with their sorrows.

Yet, in spite of all, the simple and wholesome conditions of his life were restoring him to physical health, which reacted upon his mind at last; and one morning he woke with a formless, joyful expectation that was like a hope. It was merely the habit of hope, reviving from a worn-out despair, but he sprang to his feet with a buoyancy of soul that he had not known since the storm first began to close round the *Meteor*.

Hitherto, the thought of Helen had been fruitless torment, which he banished when he could; but now, all at once, he found it an inspiration and an incentive; he thought of her gladly; she seemed to call him.

He left Giffen to kindle the fire for their breakfast, and ran down to the lagoon for a morning bath. The sun shone on a long black object that stretched across the main channel from the sea, and swimming out to it, he found it the trunk of a tree which had drifted to their island. With Giffen's help he got it inside the reef and floated it to their beach, and he could not rest till they had dragged it up out of the water. It was a message from the world they had lost and the promise of rescue and return to it. At the bottom of his heart, he knew that it might have drifted a thousand miles before it reached them, but it was as easy to believe that it came from land within a day's sail. It was of a timber unknown to the atolls; the pebbles that it held in the net-work of its roots were from shores where there were hills and rivers, from peopled shores that they might reach if they had any craft in which they could venture to sea.

Giffen walked up and down beside the log and examined it critically, stooping aside, and glancing at it as if to make sure of its soundness in every part.

"Well?" demanded Fenton.

"Chop it along the top, and shape it up at the ends, and dig it out; and maybe we can fix some sort of outrigger to it, like they use on their canoes around here. I've seen pictures of 'em."

He made the suggestion with melancholy diffidence; but Fenton caught at it eagerly. The wood was very hard, and it cost them weeks of labor, with the tools they had, before they were ready to launch their canoe upon the lagoon. But even in those placid waters it proved hopelessly unseaworthy. Some fatal defect of construction which their skill could not remedy disabled it, and it capsized with Giffen, who was caught in the outrigger, and with difficulty saved from drowning by Fenton.

"Well, sir," he said, as he walked dripping to their hut, "we've got a lot of good firewood in that thing. I believe if you hadn't had me around you could have made it go."

But the idea of escape had taken full possession of Fenton's mind, and the failure of the canoe turned it all upon another scheme which had begun to haunt it. They had kept a fire burning night and day ever since they had landed on the island to attract the notice of any ship that came in sight; but now Fenton determined to build a tower on the highest point, and light a beacon on it, so that no lookout on those seas could fail of the smoke by day or the flame by night.

"All right," assented Giffen; "it will kind of occupy our minds, any way."

"Don't say that!" cried Fenton, with a pang.

"Well, I wont," returned Giffen, penitently.

The tower was to be not only a beacon

for friendly sail, but a refuge from wandering savages who caught sight of it. They must make it the center of defenses to which they could resort if they were attacked and which they could hold against any such force as would probably land on their atoll.

Fenton drew a plan, and by night-fall they had dug the foundations of their fortress. They burnt some of the coral blocks, which they brought from the reef, for lime, and laid their walls strongly in mortar.

The days passed, and as they toiled together, Fenton had at last the heart to talk to his fellow-castaway of the world to which they were preparing to return. He found that to speak of his affairs in that world made it not only credible again, but brought it very near. He told Giffen that he was going to be married as soon as he got back to Boston, and that he was going to leave the navy and try to get into some sort of business ashore. He described Helen to his comrade and what she wore when he saw her last; and then he added that she must be in black now, for she had lost her father, who died very suddenly a few days after he sailed.

"I behaved badly," he added, with the feeling that always struggled for utterance when he thought of this, and which it was a relief to speak of now. "We had a misunderstanding, and I came off without saying good-bye to him."

"That was pretty rough," said Giffen. "But you can make it all right when you get back."

"Oh, it's all right now — with her," rejoined Fenton, quickly.

"And with him too, I reckon," suggested his comrade.

"Yes, it must be," sighed Fenton. If the situation was in anywise incomprehensible to Giffen, he did not try to explore it. He remained deferentially content with what Fenton had volunteered, and he was sympathetically patient when Fenton tried to make him understand where Mr. Harkness's house was, by a plan of the Common which he drew on a smooth surface of the plastered wall, with Park street running up one side, and Beacon street along the other, and Beacon Steps ascending from it into the quiet place where the house stood. He made a plot of the house, upstairs and down, with the different rooms marked off: Helen's room at the front; Mr. Harkness's room; the room that he used to have when he came home from school; the parlors, and the library. He lingered fondly on the details; and then he mapped the whole town for Giffen, accurately placing the principal streets and squares and public buildings. He marked the lines of railroad running out of the city, and the different depots. "This," he said, placing the Albany station, "is where you would have to start for Kankakee. It's a little south of Chicago, isn't it? — on one of the lines from Chicago to St. Louis? There's a Kankakee line, isn't there?" He laughed for joy in the assent which seemed to confirm the existence of the places; the sound of the names alone reëstablished them. At times, he stealthily glanced from this work at the rim of the sea, where, as he had been silently making believe while he talked, there *must* be a sail. But he bore the inevitable disappointment patiently and returned enthusiastically to his map; he projected another map in sections, on a larger scale, where the details could be more fully given.

Giffen did not speak much of his own life. It was nothing worth speaking of, he said; but sometimes at night he would drop a hint or scrap of his history, from which Fenton would infer what remained unspoken. It was the career of a feeble nature, constantly pushed to the wall in the struggle of a new country. All his life Giffen had failed. He had always had bad crops, bad partners, bad luck, hard times; if he went away from home to better his condition, he made it worse; when he came back, he found that he would have done better to stay away. He bought on a rising market and sold with the first fall in prices. When a crash came it found him extended; the return of prosperity overtook him without money or credit. He had tried all sorts of things with equal disaster: he had farmed, he had kept store, he had run a saw-mill, he had been a book-agent, and agent for many patent rights. In any other country, he would have remained quietly in some condition of humble dependence; but the unrest of the New World had infected him. He had spent his life in vain experiments and his last venture had been the most ruinous of all. He had sold everything to get the means of going to China, and when the common calamity, that could scarcely be said to have blasted any hopes of his, overtook him, he was coming home little better than a beggar.

Even in that solitude he made Fenton his ideal, with the necessity that is in such natures to form themselves upon some other, and appreciated his confidence and friendship as gratefully as if they had been offered in the midst of men where he must have been chosen out of a multitude for Fenton's kindness. On his part, Fenton learned to admire the fineness of spirit which survived all circumstance in this poor fellow; and when his hopes were highest, he formed plans of doing something for Giffen in the world.

When they had finished their tower and removed into it, he bade him make one more errand to the hut they had abandoned and get fire to light the beacon.

Giffen refused.

"No, sir; better not have any of *my* luck about it."

But he was off early in the day that followed to cut wood for their beacon; and it was he who discovered that they could make the densest smoke by day in drying the fuel for the flame by night.

"Don't you think we ought to do something with that canoe again?" he asked one day.

"No, not yet," answered Fenton. "There'll be time enough for that if the beacon doesn't succeed. But it will succeed." He formlessly felt the need of economizing all the materials of hope within him. If he turned so soon from the beacon to some other device for escape, he knew that he must lose his faith in it, and he could not bear the thought of this loss. He was passionately devoting himself to the belief that it must bring a ship to their rescue. He divided the day and night into regular watches, and whenever he came to relieve Giffen, he questioned him closely as to every appearance of the sea; when he lay down to sleep, he hastened to take upon himself the burden of disappointment with which he must wake by saying to himself: "I know that he will not see anything." He contrived to postpone the anguish of his monotonous failure to conjure any sail out of the empty air by saying, as each week began, that now they must not expect to see anything for at least three days, or five days, or ten days to come. He invented reasons for these repeated procrastinations, but he was angry with Giffen for acquiescing in them; he tried to drive him into some question of them by making them fantastic, and he was childishly happy when Giffen disputed them. Then he urged other and better reasons: if it was fine, he said that nothing but stress of weather would bring them a ship, and that they could only hope for some vessel blown out of her course, like the *Meteor;* when it was stormy, he argued that any vessel sighting their beacon would keep away from it till the storm was past, but would be sure to come back then and see what their fire meant.

"Yes," said Giffen; "but if we are going to keep that fire up at the rate we have for the last three months, we must begin to cut our cocoa palms."

"It isn't three months!" cried Fenton.

Giffen proved the fact by the reckoning he had kept on a block of coral in the tower: the tale of little straight marks, one for each day, was irrefutable.

"Why did you keep that count?" cried Fenton, desperately. "Let the time go, I say, and the quicker it goes, and the sooner we are both dead, the better! Put out the fire; it's no use."

He left Giffen in the tower, and wandered away, as far away as the narrow bounds of his prison would permit. He stopped at a remote point of the island, which he had not visited since the first day when he had hastened to explore the atoll. The hoarse roaring of the surf, that beat incessantly upon the reef, filled the air; the sea was purple all round the horizon, and the sky blue above it; flights of tern and petrel wheeled and shrieked overhead; the sun shone, tempered by the delicate gale, and all things were as they had been half a year ago, as they must be half a year hence, and forever. In a freak of the idle curiosity that sometimes plays on the surface of our deepest and blackest moods, he descended the low plateau to look at a smoother and darker rock which showed itself at the point where the reef began to break away from the white sand. A growth of soft sea-mosses clothed the rock, and it had a fantastic likeness to a boat in shape. The mosses waved back and forth in the water; the rock itself appeared to move, and Fenton fell upon it and clutched it, as if it had been some living thing struggling to escape him. He pulled it up on the sand, and then he sank down beside it, too weak to stir, too weak to cry out; the tears ran down his face like the tears of a sick man's feebleness.

Giffen found him beside the boat, which they righted together without a word.

"Well, sir," he said at last, "I'm glad *you* found her." He went carefully over the places where it had been patched, with a solemn and critical scrutiny. "That's our boat," he added.

"Yes, I thought so," assented Fenton.

"And those fellows—"

Neither of them put into words his conjecture as to the fate of the men who had abandoned them; they accepted in silent awe the chance of escape which this fate, whatever it was, had given them; but late that night, when they lay hopefully sleepless in their tower, Giffen said, "I don't know as they meant to leave us for good. I reckon, if they'd got through all right, they'd have come back for us."

"Yes, we *must* believe that," replied Fenton.

How the boat had reached their atoll, and when, remained the secret of the power that had given it back to them. It was enough

for them that the little craft was not beyond repair. It was thoroughly water-logged, and it must be some time before they could begin work upon it; but they spent this time in preparing material and gathering provisions for their voyage. They stocked it with nuts, and dried and salted fish sufficient to last them for six weeks; they filled Giffen's crop of gourds with water. "More of a tank than cucumbers or musk-melons would have been, after all; and better than cocoa-nuts," he quietly remarked. They were of one mind, whatever happened, never to return to their atoll; they had no other definite purpose; but they talked now as if their escape were certain.

"It stands to reason," said Giffen, "that it's meant for us to get back, or else this boat wouldn't have been sent for us;" and he began to plan a life as remote from the sea as he could make it. "When I put my foot on shore, I aint going to stop walking till I get where salt water is worth six dollars a quart; yes, sir, I'm going to start with an oar on my shoulder; and when some fellow asks me what *that* thing is, I'm going to rest, and not before!"

They built a fire on the tower that would last all day and night, and then they set sail out of the lagoon and through the breakers beyond the reef. The breeze was very light, but the sky was clear, with the promise of indefinite good weather; and before night-fall they saw the plumes of their palms form themselves into the tufts into which they had grown from the points they had first discovered on the horizon; they became points again, and the night softly blotted them from the verge of the ocean.

They had neither compass nor sextant; under strange stars and alien constellations, they were wandering as absolutely at the will of the winds and waves as any savages of those seas. For awhile they saw the light of their beacon duller and paler on the waters where their island had been. This, too, died away, and the night fell around them on the illimitable sea.

Fenton stood the first watch, and when he gave the helm to Giffen, he simply bade him keep the boat before the wind. In the morning, when he took it, he asked if the wind had shifted or freshened, and still kept the boat before it. Toward sunset they sighted a series of points on the horizon, which, as they approached, expanded into the plumage of palms; the long white beach of an atoll grew from the water, and they heard faintly the thunder of the surf along the reef. It looked larger than their own island, and they scanned it anxiously for some sign of human life. But there were no huts under the palms, and no smoke rose above their fronds.

The breeze carried their boat toward the shore, and Fenton decided to pass the night on the atoll. If it were, as it looked, larger than the atoll they had abandoned, it must be known to navigation, and sooner or later it might be visited by ships for water; or the bêche-de-mer, which abounds in the larger reefs, might bring American traders for a freight of the fish for China. They might find traces of European sojourn on the island, and perhaps some hint by which they could profit when they set sail again.

In the failing light they stove their boat on the reef, but the breaker that drove them upon it carried them beyond, and, once in the smooth lagoon, they managed to reach the shore before the boat filled. They pulled her up on the sand, and climbed to the top of the low plateau on which the palms grew; but it was now so dark that they could see nothing, and they waited for the morning to show them the familiar paths and trees of their own atoll and their tower gleaming white through the foliage in the distance. They walked slowly toward it in silence, and when Giffen reached it, he busied himself in searching the ashes of the beacon for some spark of fire. He soon had a blaze; he brought water from the well, and boiled the eggs of the sea-birds, which he gathered from their nests in the sedge. He broke some young cocoa-nuts and poured the milk into the shells they had made for drinking-cups, and then he approached Fenton, where he sat motionless and vacant-eyed, and begged him to eat, humbly, as if he expected some outbreak from him.

"No," said Fenton, quite gently. "But you eat. I'm not hungry."

"I reckon," said Giffen, piteously, "the wind must have changed in the night without my knowing it and brought us right back."

"Very likely," answered Fenton. "But it makes no difference. It was to be, any way."

He hardly knew how the days began to pass again; he no longer thought of escape; but a longing to leave some record of himself in this prison, since he was doomed never to quit it, grew up in his heart, and he wrote on the walls of his tower a letter to Helen, which he conjured the reader, at whatever time he came, to transcribe and send to her. He narrated the facts of his shipwreck and the barren history of his sojourn on the island, his attempt to escape, and his return to it. He tenderly absolved her from all ties and promises, and prayed for her happiness in whatever sort she could find it. In this surrender,

he felt the pang which the dead may be supposed to know when the soul passes into the exile of eternity and sees those it leaves behind inevitably committed to other affections and other cares. Sometimes it seemed to him as if he might really be dead and all his experience of the past year a nightmare of the everlasting sleep.

The tern that were nesting on the atoll when he first landed, and that visited it every six months to rear their young, were now a third time laying their eggs in the tufts of coarse, thin grass. He thought these visits of the birds were annual, and there was nothing in the climate to correct his error or group in fixed periods the lapse of his monotonous days. There was at times more rain, and again less rain; but the change scarcely divided the year into seasons; flower and fruit were there at all times; and spring, summer, autumn, and winter, with their distinct variety, were ideas as alien as hills and valleys and streams, in this little land, raised for the most part scarcely a man's height above the sea, where there could never even be the names of these things in any native tongue. Once or twice the atoll felt the tremor of an earthquake, that perhaps shook continental shores, or perhaps only sent its vibrations along the ocean floor, and lifted, or let fall beneath the waves, some tiny point of land like their own; and once there had fallen a shower of ashes from the clear sky, which must have been carried by a wind-current from some far-off volcano. This, with the log that had drifted to their reef, was their sole message from beyond the wilderness that weltered around them from horizon to horizon, and knew no change but from calm to storm, and then to calm again. The weather was nearly always fair, with light winds or none; and often they saw an approaching cloud divide before it reached their atoll and pass on either hand, leaving it serenely safe between the two paths of the tempest. At last, how long after their return Fenton could not tell, in his indifference to the passage of the weeks and days, a change came over the sky different from any that had portended other storms, and before night a hurricane broke from it that heaped the sea around their island, and drove it across the lagoon and high over the plateau. For two days and nights it beat against the walls of their tower; then the waters went down, and the ravaged atoll rose from the sea again. But when Fenton clambered to the top of the tower, and looked out, he saw that it could no longer be a refuge to them. The trees of the cocoa groves were blown down and flung hither and thither; their tops were twisted off and tossed into the lagoon; their trunks lay tangled and intertwisted, as if they had been straws in the frolic of a whirlwind. The smooth beach of the lagoon was strewn with fragments of coral, torn from the reef and tossed upon it; the grassy level where the sea-birds nested was scattered with their dead bodies, caught among the coarse herbage and beaten into the white sand.

He left Giffen cowering within and ran down from the tower to look for the boat. He found it lodged in a heap of cocoa fronds and wedged fast among some blocks of coral; and he hurrried back with his good news. He met Giffen at the door. "All right," he said to the anxious face. "The boat is safe, and we must get her afloat. You see, we can't stay here."

"No," said Giffen, "we can't stay." He looked drearily out over the wreck of their fairy isle, and then with a sigh he turned into the tower again, and crouched down in the corner where Fenton had left him.

"What's the matter? Are you sick, Giffen?" demanded Fenton.

Giffen did not answer, but rose with a stupid air, and came out into the sun. He shivered, but gathered himself together, and in a dull, mechanical way set about his usual work of getting breakfast. He ate little; but when Fenton had finished, he went with him and helped to cut the boat free. It was hard getting it out of the mass of rocks and boughs, and it was noon before they had dragged her back from the point where the sea had carried her to a free space where they could begin to repair her.

At the end of a week, they had her afloat in the lagoon once more and provisioned from the stores accumulated in the tower.

The morning when they were to set sail, Giffen could not rise from his bed of grass. "I can't go," he said; "I'm sick."

Fenton had seen that he was ailing, with a fear from which he revolted in a frenzy of impatient exertion. If they were but once at sea again, he had crazily reasoned with himself, then they could not help themselves, and, sick or well, they must make the best of it. This illusion failed him now, and he abandoned himself to a cynical scorn of all that had hitherto supported and consoled him. Every act of self-sacrifice, every generous impulse, seemed to him the part of a fool or a madman. Till now, he had thought that he had somehow endured and dared all things for Helen's sake; that anything less than he had done would have been unworthy of her; but now the devil that was uppermost in him mocked him with the suggestion that the best he could ever have done for her was to live for her, and do his utmost to return to

her. As he stood looking at the face of the poor wretch who had twice betrayed him to despair, and who, at last, in this supreme moment, had fallen helpless across the only avenue of escape that remained to him, he trembled with a strong temptation. He turned away and went down to the lagoon beach where the boat swung at anchor, and the sail, on which he had worked late the night before, lay on the sand ready to be stepped. The boat lightly pulled at its moorings on the falling tide, and he felt the strain as if it had been anchored in his heart. He drew it to the shore; he stepped the mast and ran up the sail, which filled and tugged in the morning breeze. He dropped it again and went back to Giffen.

As the days passed, he watched with the sick man, and brought him the water he craved and the food he loathed; there was nothing else to be done. One night, Giffen roused himself from the torpor in which he remained sunken for the most part, and asked: "Did you ever hear that people were not afraid to die when they came to it?"

"I've heard that—yes," said Fenton.

"I just happened to think of it; because this is the first time, since I can remember, that I wasn't afraid. I was awfully afraid to stay with you on that rock when the captain's boat went away; but I aint sorry for it now. No, sir, you've behaved to me like a white man from the start; and now, I'll tell you what I want you to do. I'm all right here—or I *will* be, pretty soon, I reckon—and I don't want you to lose any more time. The boat's ready and now's your last chance. Don't you mind me; I'd only bring you bad luck, any way. If you find land, or a ship picks you up, you can come back and see how I'm getting along."

What had been Fenton's temptation became the burden of the sick man's delirium, and he frantically urged him to go while there was still time. He seemed to wear this notion out through mere iteration, and at last, when he awoke one day, "I dreamt," he said, "that there was a ship!" That night, sleeping or waking, he raved of a ship that had come to take them away. The third morning after, he opened his eyes, and looked into his comrade's face with ominous recovery of intelligence. "Has it come?" he asked, eagerly. "The ship?"

"No, you dreamed it, Giffen," returned Fenton, with a tender compassion unalloyed by self-pity.

"My luck;" said Giffen. He gasped and made a mechanical effort to rise. He gave a sort of cry, and fixed a stare of wild demand on Fenton, who caught him in his arms.

Fenton covered up the dead face with a branch of palm and walked giddily out into the sun. It was rising, a red, rayless ball, and against this disk the figure of a ship seemed printed. He passed his hand over his eyes, but when he took it away, the specter remained. He thought he saw a boat lying at the lagoon beach and her crew advancing up the sand toward him, men with friendly, home-like faces. They wavered and glided in the vision his watch-worn eyes reported to his reeling brain.

Then one of them called out to the wild figure, with matted hair, and long beard, and haggard eyes, that had stopped as if with the impulse to turn and fly, "Hallo!"

A shudder went through Fenton as he stayed himself, and faced the men again. He could not speak, but the men waited. At last, "For God's sake," he gasped, "are you something in a dream?"

"No," replied the leader, with slow gentleness, as if giving the idea consideration. "We're a boat's crew from the whale-ship *Martha Brigham*, of New Bedford, come ashore to see what that smoke means. Who are you?"

XXI.

"I WISH to speak with you, Marian—instantly!" cried Helen, re-appearing at the Butlers'. Marian was alone in her room; Mrs. Butler was lying down, and the younger sisters were on the rocks by the sea, looking across the cove to the rocks on the Wilson place, as if they might hope to rend from them the secret of what had happened when Helen and Lord Rainford met in the Wilson cottage. With the inhumanity of their youth and inexperience they thought it very funny, and they had come away where they could enjoy this sense of it, apart from those to whom it seemed a serious affair.

It had become so serious to Marian, that she quaked in rising to meet Helen, as if she had been rising to meet Helen's ghost, and she no more thought of asking her to sit down than of offering a chair to an apparition.

"I didn't know he was to be there, Helen; indeed I didn't," she made out to say, after the moment in which she had remained fascinated by the intensity of the girl's face.

"Oh, it's long past, that!" cried Helen. "What I wish you to tell me is simply this, Marian Ray: Is your husband part of your whole life, and was he from the very first instant?"

"From the very first instant?"

"That you were married—so that you couldn't think, couldn't consider—whether you cared for him—loved him?"

"Of course! It was all settled long before. Did ——"

"I knew it! And if it isn't settled before, it's no time afterward?"

"What an idea! What *do* you mean, Helen?"

"And it's all false about girls that marry a man because they respect and honor him, and then have a romantic time finding out that they love him?"

"What nonsense! It's the most ridiculous thing in the world! But ——"

"I was sure of it! If there's anything sacred about marrying, it's the love that makes it so; and they might as well marry for money or position!" She hid her face in her hands, and then burst out again: "But I will never have such a hideous thing on *my* conscience—such a ghastly wrong to *him!* He said himself that if I wasn't sure that I cared for Robert, it would have been unjust to marry him; and now how is it better with *him?* It's worse! He said it to comfort me, and it seems monstrous to turn his words against him; but if the truth kills him, he had better die! Yes, a thousand times! And don't suppose I didn't see all the advantages of accepting him that you did; and that I wasn't tempted to persuade myself that I *should* care for him. I only blush and burn to think that I saw them, and that I've come away, even now, without crushing every spark of hope out of him! I *do* respect and honor him—yes, he *is* high-minded and good every way; but if I don't love him, his being so good is all the more reason why I shouldn't marry him. Hush! Don't say a word, Marian!" she cried, hastening to spoil her point, as women will, with hysterical insistence. "That dreadful old man who bought our house came, while you were gone, and offered himself to me one day; it makes me creep! How would it be any better to marry Lord Rainford, if I didn't love him, than to marry Mr. Everton?"

She did not wait for the indignant protest that was struggling through Marian's bewilderment at this extraordinary revelation and assumption. "I shall always say that you meant the kindest and best; but if you try to argue with me *now*, I shall never forgive you! Good-bye, dear!" She flew at her friend, and, catching her round the neck, convulsively kissed her, and ran out of the house, without seeing any one else. "To the station," she gasped, climbing into the Wilson phaeton. "And do hurry, please!"

Mrs. Butler came into Marian's room as soon as Helen had driven away.

"Well?" she said.

"Oh, she's refused him,—or just the same thing! How shall we meet him? What shall we do?"

"I'm not concerned about that. What will *she* do, poor thing? That's what wrings my heart. She has thrown away the greatest chance that a girl ever did: wealth, position, devoted goodness, the truest and noblest heart! Marian!" cried Mrs. Butler, abandoning herself for a moment to her compassionate impatience, "why did she do it?"

"She said she didn't love him," answered Marian, shortly, with a cast of contempt in the shortness.

"Well, well," said Mrs. Butler, with resignation.

She had found, as every woman must who lives to her age, that life has so many great interests besides love, that for the time she was confused as to the justice of its paramount claim in a question of marriage. In fact, Helen found her champions in two men.

When Mrs. Butler stated the case to the Captain, he promptly approved of Helen's decision.

Mrs. Butler stood surprised.

"Why, do you think that people ought to marry from a *fancy?*" she asked.

"I hope my girls will never marry without it," said the Captain.

Marian reported the result to Ray, with a vexation at Helen's ridiculous behavior, which he allowed her to vent freely, before he answered her a word, chewing the end of his cigarette, as they walked to the house together from the beach, where she found him pulling his dory up on the sand.

"It's not only that she's thrown away such a splendid chance, but she's thrown it away for the mere memory of a man who couldn't compare with Lord Rainford in *any* way—even if he were alive. And when Robert Fenton *was* alive, she wasn't certain, till it was too late, that she cared for him; and kept him waiting for years and years, till she could make up her mind, and had to quarrel with him *then* before she was sure of it. And now for her to pretend that she never can care for any one else, and that she can't marry Lord Rainford because she doesn't *love* him—as if she were a girl of seventeen instead of twenty-five! *Oh!* I've no patience with her!"

Ray said nothing for a moment. Then, "There's some difference between not being sure you do and being sure you don't," he remarked, quietly, "and the difference doesn't seem to be in Rainford's favor." After a moment, he asked, without looking at her, "What did you marry *me* for?"

"What nonsense! You know!"

"Yes, I always thought it was for love.

How would you like to have me think it wasn't?"

"Don't be absurd!" cried his wife.

But his words went deep, and at the bottom of her heart she felt in them a promise of the perpetual reconsecration of their marriage.

A STORY was at one time current (and still has its adherents among those who knew vaguely something of Helen's romance) to the effect that Fenton returned at a moment when his presence seemed a miracle, opportunely wrought to save her from further struggle and to reward her for all her suffering and self-sacrifice in the past. It fixed with much accuracy of date and circumstance the details of their dramatic meeting at the little house in the Port, where she found him waiting for her one hot, dusty afternoon in the summer, when she came back, broken in health and spirit, from a visit with some friends at the sea-side. If the story had been true, it would have brought them together the very day Helen refused Lord Rainford.

But, as a matter of fact, she went back to her work of making bonnets for cooks and second-girls in Margaret's cottage on Lime-kiln avenue, under conditions that would have caused an intelligent witness of it to wonder whether she were not expiating an error rather than enjoying the recompense of devotion to a high ideal. The rewards of principle are often scarcely distinguishable from penalties, and the spectator is confounded between question of the martyr's wisdom and a dark doubt of the value of living out any real conviction in a world so badly constituted as this. Helen, however, was harassed by neither of these misgivings. She never regretted her refusal of Lord Rainford, except for the pain it inflicted; she never blamed herself for anything but the hesitation in which she was tempted to accept him without loving him. Her sense of self-approval grew only the stronger and clearer with the trials which gathered upon her in what might have seemed to others a sort of malign derision. Her custom fell off, and the patrons who remained to her grew inevitably more and more into an odious mastery; their exactions increased as her health failed, and she could not always keep her promises to them; they complained that other people's bonnets were better made, and "more in the style."

One night she overheard, through the thin partition that separated her chamber from Margaret's, a tipsy threat from Margaret's husband that he was going to be master in his own house, and that he was going to turn that girl and her bonnets into the street. He went off to his work in the morning sullen and lowering, and she and Margaret could not look at each other. She fled to Boston for the day, which she passed in incoherent terror at Clara Kingsbury's. When she turned from this misery the next morning and ventured back to Margaret's, an explosion at the glass-works, so opportune that it seemed to her, for a black instant, as if she were guilty of the calamity through which she escaped, had freed her from all she had to dread from Margaret's husband.

But quite the same end had come to her experiment. Margaret could not live upon the little sum that Helen paid her for board; in spite of her impassioned devotion to her darling, and her good intention (witnessed again and again to all her saints), she was forced to break up her little establishment and find a servant's place; and Helen did not know where else to go.

In her extremity she appealed, of course, neither to the Butlers nor to Clara Kingsbury, but to Cornelia Root, and this proved to be the most fortunate as well as the most natural course. Zenas Pearson had just moved his photographic establishment up from Hanover street to the fashionable quarter of the town, and had applied to Cornelia for some pretty-appearing, respectable girl, to stay in the front room and receive people, and show them the different styles of photographs, and help them to decide in what shape and size they would be taken. There was nothing mean about Zenas Pearson, and he was willing, he told Cornelia, to pay the right girl ten dollars a week as a start-off, and to put it up to twelve within the year, if she behaved herself, and showed any sconce for the business.

Cornelia trembled with excitement and eagerness in laying the proposition before a person so perfectly adapted to the place in every respect as Helen, and they did not lose an instant in going to Zenas and closing with him. "Did she want to come right off?" he asked Helen; and at a little hesitation on her part he looked more closely at her worn face and said, "Well, take a week to recuperate, and come the 20th. I don't know that I'll be ready for you much before that time, any way."

She spent the week with the Butlers, who were now too well used to her eccentricity to attempt any protest against this new phase of it. They had all reconciled themselves to her refusal of Lord Rainford; even Marian Ray had accepted the inevitable, and she and Helen had a long quiet talk about the matter, in which they fully made up what had almost been a quarrel between them about it, and

Marian told her the latest news of him, and how splendidly he had behaved about her, justifying and applauding her with a manly self-abnegation which permitted no question of her conduct throughout.

"Yes, he is very generous," said Helen, with a sigh; and something happened that day which made her feel that the word was hardly adequate. She had gone with Marian, who wished to give some instructions about a picture she was having framed, to the shop where Helen had her memorable meeting with Lord Rainford; and when the business was finished, the proprietor said, with a certain hesitation: "Miss Harkness, you remember being in our place about a year ago with an English gentleman who was looking at some imitation Limoges in the window?"

Helen looked an amazed, and perhaps alarmed, assent.

"He came back and bought them after you went away, and said he would send his address; but we've never heard of him from that day to this, and we don't want his jars *and* his money. I thought perhaps you could tell me who he was."

"Yes," said Helen, "it was Lord Rainford. But he's in England now."

"Oh!" said the proprietor. And as she said nothing more, he presently bowed himself apologetically away.

"Why didn't you let *me* give his address?" asked Marian, who had been checked in a wish to do so by a glance from Helen.

"I don't believe he ever intended to take them away; he thought they were hideous," Helen answered. She added presently, "He must have gone back to buy them because I said that the poor wretch who painted them was to be pitied!"

Marian had now been at home more than six months, and her Anglo-mania had in some degree abated. She no longer expected to establish an hereditary aristocracy and a state church among us, whatever she secretly wished to do. She had grown resigned to the anomalies of our civilization in some degree. She had rediscovered certain traits of it that compared favorably even with those of England; but she cherished a conviction that an English noble was the finest gentleman in the world; that her own husband was still finer was a mystery of faith, easily tenable, though not susceptible of exegesis.

She now preserved the silence of one whose point has been sufficiently made for her, and left Helen to recognize it. Helen was not reluctant to do so. "Yes, Marian," she said, fervently, "considering what had just happened, that was very magnanimous in him. It was exquisite!"

"Oh, it was merely what he owed to himself as a gentleman," said Marian, with well-concealed triumph.

It seemed to be a day of trial for Helen. A gaunt, shabby man, coming down the pavement toward them, lifted his hand halfway to his hat at sight of her, and then, as if seeing himself unrecognized, dropped it to his side again and slunk by. Helen turned and stopped him. "Mr. Kimball! Is that you?"

"Yes, what there is left," answered Kimball, with a ghost of his old quizzical smile, and the specter of his municipal, office-holding patronage of manner, as he took Helen's extended hand.

"Why — why — what's the matter?"

"Well, I've been sick for a spell back. Just got to knocking around again," said Kimball, evasively. "You don't look over and above well yourself, Miss Harkness."

"No, no, I'm *not* well. But I'm better now. Are you ——" She stopped, with her eyes upon his conspicuous shabbiness, and, through an irresistible association of ideas, she added,—"Mr. Kimball, I hope you got the money that I returned to you, safely?"

Kimball hung his head, and kicked the pavement with his toe. "Well, no," he answered, reluctantly, "I didn't."

"You didn't *get* it?"

"It's all right. I told my wife at the time that I knew you sent it. But I guess somebody in the post-office got the start of me."

"Why *didn't* you tell me?" demanded Helen.

"Well, you know, I couldn't do that," said Kimball.

Helen took out her purse. There were only twelve dollars in it, and Marian had walked on, so that she could not borrow of her, and make up the whole sum at once. But she put the money in Kimball's hand, and said, "I will *bring* you the rest this very day. Shall I bring it to the custom-house?"

"Oh, no; there's been a change, you know. My collector was kicked out, and all our heads went into the basket together. I aint there any more. I guess we'll call this square now. I don't feel just right about taking this money, Miss Harkness, but I've been sick, and my wife aint very well herself; and — well, I guess it's a godsend." His lips twitched. "I feel kind of mean about it, but I'll have to stand it. There aint a thing in the house, or I *wouldn't* take it. My wife and me both said we *knew* you sent it."

"Who in the world is your shabby friend, Helen?" demanded Marian, when Helen had overtaken her at last.

"Oh, he used to be in the custom-house.

He's a character. He's the one who told Lord Rainford, when he offered to deposit money for the duties on those Egyptian things he brought me from you, that it wasn't necessary between gentlemen!"

"How amusing!"

"Yes, I thought it was amusing, too. But I don't think I can ever laugh at him again." She shut her lips till she could command her voice sufficiently to tell what had just passed between her and Kimball.

Marian continued to be amused by it. In the flush of her re-Anglicization, she said it was a very American affair. But she added that something ought really to be done for the chivalric simpleton, and that she was going to tell Ray about him.

During the week that Helen spent with the Butlers, before she was to take her place in Zenas Pearson's Photographic Parlors, as he called them, the wisdom of her decision was tested by another incident, or accident—one of those chances of real life which one must hesitate to record, because they have so much the air of having been contrived. From her life in the Port, she had contracted the suburban habit of lunching at restaurants, so alien to the Bostonian lady proper; and one day, when she was down-town alone, she found herself at a table in Parker's, so near that of two other ladies that she could not help hearing what they said. They were both dressed with a certain floridity, and one was of a fearless, good-humored beauty, who stared a great deal about the room and out of the window, and, upon the whole, seemed amused to realize herself in Boston, as if it were a place whose peculiarities she had reflected much upon, without being greatly awed or dazzled by them. "We used to see a great many Bostonians in California when the Pacific road was first opened. They came out there in shoals, and I afterward met them in Japan,—men, I mean, of course. I had quite a flirtation with one—the pleasantest one I ever met." The lady breathed, above the spoil of the quail-on-toast before her, a sigh to the memory of this agreeable passage of her life. "Yes, a regular flirtation. It was on the steamer coming to San Francisco, and he was on his way home to be married, poor fellow, and I suppose he thought, Now or never! The steamer broke her shaft, and had to put back to Japan, and he took passage home on a sailing vessel that we hailed, and she was lost, and the last that was known of him he was left on a reef in the Pacific with three others, while a boatful of people went off to prospect for land. When the boat came back they were gone, and nobody ever knew what became of them."

"And whatever became of the girl, Mrs. Bowers?"

"Oh, as to that, this deponent saith not. Consoled herself, I suppose, in the usual way."

The two women laughed together, and began to pull up their sacks, which had dropped from their shoulders into their chairs behind them.

Helen tried to speak, but she could not. She tried to rise and seize the woman before she left the room, to make her render some account of her words. But the shame of a terrible doubt crushed her with a burden under which she could not move. When the waiter, respectfully hovering near, approached at last, and, viewing her untouched plate, suggestively asked if he could bring her anything more, she said "No," and paid her check and came out.

It was a beautiful day, but she walked spiritlessly along in the sunshine that seemed to smile life into everything but her; and she feebly sought to adjust the pang of this last blow to some misdeed of her own. But she could not. She could only think how she should once have contrasted Lord Rainford's nobleness with Robert's folly, and indignantly preferred him. But now she was aware of not having the strength to do this—of not being able to pluck her heart from the idea to which love and loss had rooted it; and she could not even wish to wish anything but to die. In another world, perhaps—if there were any other world—Robert could explain and justify the weakness for which she could not do other than pity him here.

Her brain was so dull, and jaded withal, that when she dragged herself wearily up the steps at the Butlers' door, she felt no surprise that it should be the old Captain who opened it to her, or that he should seek to detain her in the drawing-room alone with him. At last, she felt something strange in his manner and a mystery in the absence of all the others, and she asked:

"What is it, Captain Butler?"

He seemed troubled, as though he felt himself unequal to the task before him.

"Helen," he began, "do you still sometimes think that those men's story about Robert wasn't true?"

"I know it wasn't true. I always knew they killed him. Why do you ask me that?"

"I didn't mean that," returned the Captain, with increasing trouble, "but that perhaps he——"

She turned upon him in awful quiet.

"Captain Butler, don't try to soften or break any bad news to me! What is it I haven't borne, that you think I must be spared

now? You will make it worse, whatever you are keeping back. Did they leave him there to starve on that rock—did ——"

"No, no. It isn't that. Mrs. Butler thought that I could prepare—we've had news ——"

"News?—prepare? Oh, how can you mock me so? For pity's sake, what is it?"

The Captain's poor attempt to mediate between her and whatever fact he was concealing broke down in the appeal, with which he escaped from Helen through the open door, and called his wife. She came quickly, as if she had been waiting near; and, as on that day when she had told the girl of her father's death, she took her fast in her arms. Perhaps the thoughts of both went back to that hour.

"Helen—Helen—Helen! It's life this time! You have borne the worst so bravely, I know you can bear the best. Robert is here!"

The papers of that time gave full particulars of Fenton's rescue from the island on which he was cast away, and the reader can hardly have forgotten them. It is unnecessary even to record the details of his transfer, after several months, from the whaler which took him off, to another vessel homeward bound, and of his final arrival in San Francisco. When the miracle of his resurrection had become familiar enough for Helen to begin to touch it at a point here and there, she asked him why he did not telegraph her from San Francisco as soon as he landed, and instantly answered herself that it would have killed her if he had done so; and that if he had not been there at once to help her bear the fact of his being alive, she could not have borne it.

They were married, and went to live in a little house in a retired street of Old Cambridge, and Margaret came to live with them. She sacrificed to this end an ideal place in an expressman's family in East Somerville, where she had the sole charge of the housework for twelve persons; but it was something that Miss Helen kept no other girl, and it was everything that she could be with her when Lieutenant Fenton should be ordered away to sea again. He had six months' leave, and he tried to find some occupation which would justify him in quitting the navy. He found nothing, and in the leisure of this time Helen and he concerned themselves rather with their past than their future. They rehabilitated every moment of it for each other; and, as their lives came completely together again, he developed certain limitations which at first puzzled her. She did not approach that passage which related to Lord Rainford without trying to establish defenses from which, if necessary, she could make reprisals; and she began by abruptly asking, one day:

"Robert, who is Mrs. Bowers?"

"Did *she* turn up?" he asked in reply, with a joyous guiltlessness that at once defeated and utterly consoled his wife. "That was very kind of her. But how did she find you out? I never told her your name."

"She never turned up—directly," said Helen.

And then she told him how she happened to know of Mrs. Bowers, and of the bad half-hour that lady had given her.

"Well, she might call it a flirtation," said Fenton, "but I didn't know it was one. I thought it was just walking up and down the deck and talking about you."

"I'd rather you wouldn't have talked to that kind of people about me," returned Helen, with a retrospective objection which she tried in vain to make avail her.

"How should *I* know what kind of person she was? *I* never took the least notice of anything she did or said."

This was heavenly hopeless, and Helen resolved that for the present, at least, she would not inculpate herself. But she found herself saying:

"Well, then, I'm going to tell you about something that all came from my being desperate about you, and flirting a little one day just after you sailed."

She went on to make a full and free confession, to which her husband listened with surprisingly little emotion. He could not see anything romantic in it at all. He could not see anything remarkable in Lord Rainford.

"You can't," he said, finally, "expect me to admire a man who came so near making an Enoch Arden of me."

"Oh, you know he never came near doing anything of the kind, Robert."

"He came as near as he could. Do you wish me to admire him because you refused him? You refused *me* three times."

"I wish you to—to—appreciate him."

Fenton laughed.

"Oh, well, I do that, of course. I've no doubt he was a very good fellow, and I dare say he's behaving more sensibly than I did. From what you tell me, I think he'll get over his disappointment. Perhaps he'll end by marrying some one who will help him to complete his reaction, and cure him of *all* his illusions about us over here. But his buying that pottery was nothing. He would have been a very poor creature if he had resented your refusal. I know that from my own experience."

He would not be serious about Lord Rain-

ford; he made her share in the good-natured slight with which husband and wife always talk over the sorrows of unlucky pretendants. He professed to find something much more admirable in Kimball's quiet acceptance of the loss he had incurred through Helen. That, he said, was fine, for Kimball was supported by no sentimental considerations, and had no money to back his delicacy. He looked Kimball up, and made friends with him; and a man who could do nothing to advance his own fortunes had the cheerful audacity to suppose that he might promote another's. He wrote to Washington and tried to get Kimball appointed assistant keeper of one of the light-houses on Cape Ann; but pending the appointment of a gentleman who had "worked" for the newly elected congressman, Kimball found a place as night watchman in a large clothing-house, where he distinguished himself when off duty one day by quelling a panic among the sewing-girls at an alarm of fire and getting them safely out of the building. The newspaper *éclat* following this affair seemed to have silently wrought upon the imagination of a public-spirited gentleman who about that time was maturing his plans for the establishment of our well-known Everton Institute of Industrial Arts for Young Ladies. The Institute was opened on a small scale in the residence of Mr. Everton at Beacon Steps, which he devoted to it during his life, and at his death it was removed to the new building at West Newton; but from the first, Kimball was put in charge as janitor, and still holds his place from the trustees.

He came rather apologetically to announce his appointment to the Fentons.

"I don't seem to feel," he said, "as if it was quite the thing to go in there without saying 'By your leave' to *you*, Mrs. Fenton. I haint forgot the first time I was in the house; and I don't suppose I ever passed it without lookin' up at them steps and thinkin' of you, just how you appeared when you came runnin' up that day with your bag in your hand, and I let you in."

"Yes, I remember it, too, Mr. Kimball. But you mustn't think of it as my old home, and you mustn't feel as if you were intruding. If the place could be anything to me after Mr. Everton had lived there, I should be glad to think of you and Mrs. Kimball in it, looking after those poor girls, as I know you will."

"I guess we shall do the best we know how by 'em. And, whatever Mr. Everton is,—and I guess least said's soonest mended, even among friends, about him in *some* respects,—you can't say but what it's a good object. If he can have girls without any dependence but themselves taught how to do something for their own livin', I guess it's about equal to turnin' the house into a church. And I *guess* the old gentleman's about right in confinin' it to girls brought up as ladies. I aint much on caste myself, as I know of, but I guess that's the class of girls that need help the most."

"Oh, yes, indeed!" cried Helen, fervently. "Of all helpless creatures in the world, they are the most to be pitied. I know you'll be kind to them, Mr. Kimball, and save their poor, foolish feelings all you can, and not mind their weak, silly little pride, if it ever shows itself."

"I guess you can depend upon me for that," said Kimball. "I understand girls pretty well—or I ought to—by this time. And once a lady, always a lady, I say."

Helen even promised to come with her husband to see the Kimballs in her old home. She courageously kept her promise, and she was rewarded by meeting Mr. Everton there. He received her very cordially, showing no sort of pique or resentment,—no more, Fenton suggested, than Lord Rainford himself,—and took her over the house, and explained all his plans to her with a flattering confidence in her interest. There were already some young ladies there, and he introduced Helen to them, and, in the excess of his good feeling, hinted at the desirability of her formally addressing them, as visitors to schools are expected to do. She refused imperatively; but to one of the girls with whom she found herself in sympathy she opened her heart and told her own story.

"And oh!" she said at the end, "do learn to do something that people have *need* of, and learn to do it well and humbly, and just as if you had been working for your living all your life. Try to notice how men do things, and, when you're at work, to forget that you're a woman, and, above all, a young lady."

After she came away, she said there was one more thing she wished to say to that girl.

"What was that?" asked Fenton.

"Not to omit the first decent opportunity of marrying any one she happened to be in love with."

"Perhaps it wasn't necessary to say that," suggested her husband.

"No," sighed Helen; "and that's what undoes all the rest."

When the Butlers heard of this visit of hers to her old home, it seemed to them but another instance of that extraordinary fortitude of spirit which they had often reason to admire in her. Marian Ray could not suffer it to pass, however, without some expression of surprise that Fenton should have allowed her to go: she was a little his rival on behalf of

Lord Rainford still, and she seized what occasions she could for an unfavorable comparison of their characters. In fact, now that he had really come back, she had not wholly forgiven him for doing so; but the younger sisters rejoiced in him as a thoroughly satisfactory equivalent for the romance they had lost in the nobleman. If Helen was not to be Lady Rainford, it was consoling to have her the wife of a man who had been cast away on a desert island, and had been mourned for dead a whole year and more. They were disappointed, however, that he should not be always telling the story of his adventures, but should only now and then drop bits of it in a scrappy way, and once—but once only—when he and Helen were at Beverly, they pinned him down to a full and minute narration.

"Ah, but," said Jessie Butler, when all was told, to the very last moment of his meeting Helen after his return, "you haven't said how you *felt*, any of the time."

"Well, you know," answered Fenton, rising, and going over to where Helen sat dwelling on him with shining eyes, "I can look back now and see how I *ought* to have felt at given points."

"But—but how *did* you feel," pursued one of his rapt auditors, "when ——"

"No, no," said Fenton, "that will do! I've given you the facts; you must make your own fiction out of them. And I think, while you're at it, you'd better get another hero."

"Never!" exclaimed Jessie Butler. "We want *you*. And we want you to behave something *like* a hero, *now*. You can, if you will. Can't he, Helen?"

"I never can make him," said his wife, fondly.

"Then that's because he doesn't appreciate his own adventures properly. Now——"

"Why," explained Fenton, "the adventures were merely a lot of things that happened to me."

"Happened to you!" cried his champion against himself, in generous indignation. "Did it merely *happen to you* to put that rope round you and swim ashore with it when the ship struck? Did it merely *happen to you* to stay there, and let the others go off in the boat?"

Fenton affected to give the argument serious thought. "Well, you know, I couldn't very well have done otherwise under the circumstances."

"You needn't try to get out of it in that way! You have every attribute of a real hero," persisted his worshiper.

The hero laughed, and did his best to bear the part like a man. Another of the young girls took up the strain.

"Yes, you would be entirely satisfactory if you had only had some better companion in misfortune."

"Who,—Giffen?"

"Yes. He seems so hopelessly commonplace," sighed the gentle connoisseur of castaways.

"He was certainly not more than an average fellow-being," said Fenton, preparing to escape. "But he was equal to his bad luck."

When he and Helen were alone, he was a long time silent.

"What is the matter, Robert?" she asked tenderly at last.

"Oh, nothing," he said. "But whenever it comes to that point, I'm afraid that Giffen *knew* I wanted to leave him to die alone there!"

"You *didn't* want to!" she protested for him.

"Ah, don't put it that way!" he cried. "The best you can say for me is that I didn't do it."

She could only tell him that she loved him more dearly for the temptation he confessed than if there had been no breach in his armor. He had a simplicity in dealing with all the incidents of his experience which seemed to her half divine. When she hotly invoked justice upon the wretches who had stolen the boat and abandoned him and Giffen on the island, he said, "Oh, what could atone for a thing like that? The only way was for them to escape altogether." He would not even let her denounce them as cowards; he contended that they had shown as much mere courage in remaining to rifle the ship as he had in anything. Giffen, he said, was the only one to be admired, for Giffen was afraid all the time, and yet remained to share his fate. But Helen contended that this was nothing wonderful; and again she wished to praise him for what he had suffered.

"Ah, don't!" he said, with tragic seriousness. "There's nothing in all that. It might all have happened to a worse man, and it has happened to many a better one. It hurts me to have you value me for it. Let it go, and give me a little chance for the future." He was indeed eager to escape from all that related to that passage of his life, and Helen learned to believe this. At certain moments, he seemed to be suffering from some strange sort of mental stress which he could not explain, but which they both thought must be the habit of anguish formed in his imprisonment on the atoll. It sometimes woke

him from his sleep—the burden, but not the drama, of nightmare—a mere formless horror, which they had to shape and recognize for themselves.

It grew less and less as the time passed, and when his orders came to report for duty at Washington they had strength for the parting. He supposed that he was to be sent to sea again, but he found that he was to be put in charge for the present of the revenue cutter for provisioning the light-houses on the Rhode Island coast; and when removed from this service, he was appointed to a post in the Narragansett Navy Yard. It is there that Helen still finds her home, in a little house overlooking the bay, on the height behind the vast sheds, in which two frigates of obsolete model, begun in Polk's time, are slowly rotting on the stocks, in a sort of emblematic expression of the present formidable character of the American navy.

In the meantime, Fenton is subject to be ordered away at any moment upon other duty; but till his orders come he rests with Helen in as much happiness as can fall to the share of people in a world of chance and change. The days of their separation have already faded into the incredible past; and if her experience ever had any peculiar significance to her, it is rapidly losing that meaning. She remains limited in her opinions and motives by the accidents of tradition and circumstance that shape us all; at the end she is neither more nor less than a lady, as she was at the beginning. She has acquired no ideals of woman's work or woman's destiny; she is glad to have solved in the old way the problems that once beset her; and in all that has happened she feels as if she had escaped rather than achieved. She is the same, and yet not quite the same, for one never endures or endeavors to one's self alone; she keeps her little prejudices, but she has accumulated a stock of exceptions to their application; her sympathies, if not her opinions, have been enlarged; and above all, her unconsciousness has been trained to meet bravely and sweetly the duties of a life which she is content should never be splendid or ambitious.

THE END.

SNIPE-SHOOTING.

THE Wilson's snipe is, in habits and appearance, very unlike his near relative the woodcock. While the latter is a rather heavily built, thick-set bird,—stocky, so to speak,—the snipe is much more slim and elegant in form. It is much smaller, too, weighing only about four ounces. It very closely resembles the jack snipe of Europe,—whence its usual appellation, "English,"—of which it is, according to the present views of ornithologists, only a variety (*Gallinago media Wilsoni*). In length it almost equals its cousin, already referred to, measuring from nine to eleven inches. The crown of the head is black, with a median stripe of cream color, the neck speckled with brown and gray, back variegated with black, reddish brown, and tawny, the latter forming longitudinal stripes on the inner long feathers of the shoulders. The tail is barred with black, white, and chestnut brown, the sides are waved with dusky, and the lower breast and belly are white. The bill is dark, and the feet and legs are pale greenish.

This species has a very wide distribution, and is found throughout the whole continent. It only insists on moist feeding-grounds, and so may be taken on the borders of streams and about the sloughs of the Western plains, around the edges of the alkaline lakes of the great central plateau of the Rocky Mountains, and in the marshes and along the river bottoms of California, as well as in the East and the Mississippi valley.

It passes the winter in the Gulf States, where at that season it is extremely abundant, and begins its northward migration early in February. By the last of that month it has reached the marshes of North Carolina, and sometimes Virginia; and it usually makes its appearance in New Jersey and New York about the last of March or the first of April, though the date of its arrival depends almost entirely on the weather, and the consequent condition of its feeding-grounds. As long as the meadows are ice-bound it is useless to look for snipe; but as soon as the frost has come out of the ground, especially if the last thaw be followed by a soft, warm rain, the shooter may, with some prospect of success, visit the little spots of wet land, or the more extensive marshes, where his experience of former years tells him that the birds are likely to be found. At this time of the year they do not tarry long; but the places of those which pass on are at once filled by later comers, who are in turn

replaced by others, so that snipe are usually found in greater or less abundance until after the first of May.

This species does not ordinarily breed with us in any considerable numbers, most of the birds passing the season of reproduction north of the United States line. Still, many rear their broods in the State of Maine, and their nests have been found in Connecticut, New York, Pennsylvania, and even further south. The nest is built on the high ground near some wet meadow,—or sometimes on a dry one if a tiny brook murmurs through the grass near at hand,—and is even of slighter construction than that of the woodcock, being little more than a depression in the ground lined with a few blades of grass. Four pointed eggs are laid in this, yellowish-olive in color, thickly spotted with black and dark umber. The young leave the nest as soon as they are hatched and follow the mother, or, as the naturalists would say, they are præcocial.

The snipe is essentially a bird of the open, and is rarely found in cover. Occasionally in the spring, when a late fall of snow occurs after the birds have come on, covering for a day or two the meadows where they feed, they may be found in alder or willow swamps near their usual haunts, probing the mud about the warm springs where the snow has melted; but as soon as the ground is again bare they leave such retreats and at once repair to the open. Sometimes, too, when persistently pursued on the marshes, they will take refuge among woods or even in dry and dusty corn-fields, but will only remain there for a few hours.

A WILSON'S SNIPE FAMILY. (FROM SPECIMENS IN THE COLLECTION OF DR. E. B. WHITINGHAM, MOUNTED BY DAVID B. DICKERSON.)

The favorite feeding-grounds of the snipe are fresh meadows where the ground is always moist and the soil rich. One can tell as soon as he steps on the meadow whether the birds have recently been here, for in the cattle paths or in places where the hogs have been rooting, or on the bare side of a tussock where no grass grows, the soil will be perforated by numerous tiny holes, showing where the bill has been inserted in the mud in the search for food. The presence of high grasses or reeds may sometimes keep the birds away from marshes to which they would resort in numbers if it were not for the luxuriance of the vegetation. They do not like to alight among such thick cover, and besides, they cannot easily get at the ground. It is therefore customary, in the early spring before their arrival, to burn over such tracts, and places that have been treated in this way are favorite resorts for the travelers.

At present the Wilson's snipe is shot at all times and seasons, and has no protection under the law. The result of this unwise destruction is clearly seen in the greatly dimin-

ished numbers of the birds which annually visit our more accessible meadows. If a female snipe, killed in April or May, be dissected, she will be found to contain eggs in an advanced stage of development, varying in size from a marble to an egg nearly ready for exclusion. Many of the birds are paired long before they leave us in spring. They certainly should not be shot at this season, just as they are about to rear their young. Snipe-shooting in autumn is much more satisfactory, and the birds appear to be more numerous than in the spring, because at this season their feeding-grounds are more contracted, and they concentrate on the meadows that are always wet, and about ponds and marshes which have margins of black mud, in which they delight to bore. The prospect of finding them is thus much better than when they are dispersed over a much greater area.

The main body of the snipe leave us by the latter part of November, but a few prolong their stay into December, lingering as long as their feeding-grounds remain open. As with the woodcock, the cold is only indirectly the cause of their departure; the impossibility of their longer obtaining food being the immediate motive which drives them south. On the Laramie Plains, where in winter the temperature falls sometimes to —30° and even —40° Fahrenheit, a few snipe are to be found throughout the winter, about certain warm springs which never freeze.

Few of our birds are so poor in local names as this one, for it is almost everywhere known either as the "English" or the "jack" snipe. Along the New England coast, however, it has an appellation which is rather curious. As the bird arrives about the same time as the shad, and is found on the meadows along the rivers where the nets are hauled, the fishermen, when drawing their seines at night, often start it from its moist resting-place, and hear its sharp cry as it flies away through the darkness. They do not know the cause of the sound, and from the association they have dubbed its author the "shad spirit."

The snipe is either a bird of weak mind, deplorably vacillating in character, or else he is much more shrewd and profound than any one thinks. At all events, he is notorious among sportsmen for two characteristics, denoting either high intelligence or lamentable indecision:

Most birds when they rise from the ground appear to have some definite idea of the direction in which they wish to go, and having started in a particular line of flight, keep to it, unless turned by some alarming apparition before them. Not so with the snipe, however. He springs from the ground uttering his curious squeaking cry, darts a few yards one way, changes his mind, and turns almost at right angles to his original course; then he appears to think he has made a mistake, and once more alters his direction, and so twists off, "angling" across the meadow until he is safely out of gunshot. He then either rises high in the air and swings about for a while, looking for a desirable spot to alight, or else settles down into a straight, swift course, which he keeps up until his fright is over, or he has come to a spot which is to his liking, when he throws himself to the earth, and with a peculiar toss of his wings checks his progress and alights. The eccentric zigzag flight of this species is very puzzling to many sportsmen; and some who are capital shots at other birds appear never to be able to calculate the movements of the snipe. The secret of success in killing these birds consists, we believe, in great quickness,—that is, in wasting no time in an attempt to follow their flight, but in pulling the trigger at the moment the gun is on the object. The peculiar cry which is uttered at short intervals during its flight is sometimes extremely irritating, especially after one has missed with both barrels. What appeared when first heard to be only an expression of fright, or a call of warning to its companions, sounds to the disappointed shooter, as it comes back to him more and more faintly from the distance, very much like a note of derision.

The other characteristic for which the snipe is noted is the eccentricity and irregularity of its arrival and stay with us during the migrations. That snipe are "uncertain birds" is a proposition which has universal acceptance among those who shoot over the wet meadows. As a rule, more dependence is to be placed on their coming in the fall than in the spring. But even in autumn they cannot be counted upon. Sometimes they arrive singly, or a few at a time, and those which are killed to-day are at once replaced by others; or again, for a week or two at a time, the meadows may be worked over without starting a bird, and then all at once they will be found in great numbers, and will then as suddenly and as completely disappear. A piece of ground which at evening affords splendid sport, may be visited at dawn next day, and it will be found that the birds which were there have all departed. Happy is the man, therefore, who finds the snipe plenty, and he is wise who shall take advantage of the present opportunity. The advice, *Carpe diem*, applies with more force to snipe-shooting than it does to a good many others of the affairs of life.

As early as the last of August, an occa-

sional snipe may be found on the meadows; but it is not until the latter part of September that the migrants begin to arrive in any numbers. They are now in good order—often very fat—and are lazy, and lie well to a dog

EGG OF WILSON'S SNIPE.

if the weather is right. The pleasantest time to shoot them is during the warm days of October and November.

At such a time the birds are loath to rise, and will permit the dog to approach quite close to them before taking wing. On dark, cloudy days, on the other hand, especially if the wind be high, there is no such thing as getting a point on them, for they will rise at a distance of thirty or forty yards, and often the flight of the first one and his sharp *skeap*, *skeap* will be the signal for every snipe on the meadow to rise into the air and circle around for five or ten minutes before pitching down again. In such weather as this the only chance of getting within shot of them is to work down the wind,—thus reversing the usual order of things in shooting,—and to keep the dog close in. Snipe always rise against the wind, and by advancing on them with it at your back, they are forced to fly toward you for some little distance, thus giving you an opportunity to get a shot at them at fair range.

Where birds are scarce a good dog is invaluable, because of the amount of laborious walking that he saves the shooter; but there are times and places where a dog is very much in the way. Such are some of our Western snipe grounds, marshes where these birds are sometimes so abundant that they rise from the ground a dozen at a time, and where, perhaps for hours, the sound of their bleating cry is heard almost continually. Under such circumstances a dog is only an annoyance; for the ground is so foiled by the scent of the many birds that have run over it that the poor animal is confused, and is constantly false-pointing and wasting his master's time. Here the only use to which the dog can be put is that of retrieving. There are some cunning old dogs that, when they find such a condition of things existing, will come in to heel without orders, and pay no further attention to the birds which are rising around them, only occupying themselves with the securing of those that may be shot.

This bird does not give forth a strong scent, and as it is often very little disposed to lie well, a dog of unusual keenness of nose, as well as caution and steadiness, is required in its pursuit. A very faint scent should be enough to cause him to stop until his master has come up to him, and he should then draw on very carefully until, if it will wait, he can locate his bird. There are days, to be sure, when snipe will permit the dog to get his nose within a few inches of them, but this is the exception rather than the rule.

It is always a convenience, however, to have a retriever with one while snipe-shooting, for without considerable practice it is not easy to mark down the dead bird so accurately that you can walk direct to it. This becomes especially difficult when several birds rise together, or nearly so, and you shoot first one and then another, and then perhaps try to mark down the remainder of the whisp. You have a general idea of the direction in which the first one fell, and are sure that the second dropped close by a certain little bunch of grass; but when, after having strained your eyes after the living and marked them down, you turn your attention to the dead, you are likely to find yourself somewhat perplexed. You see now that there are a dozen little bunches of grass near where the second bird fell, any one of which may be that by which you marked him; and as for the first, you feel very hopeless about being able to go within twenty yards of where it dropped. So you may lose half an hour of valuable time in searching for the dead. Practice in marking and a quick eye will, after a while, enable you to retrieve your own birds successfully. As a matter of fact there is always something—a bunch of grass, a bit of drift stuff, a flower, a leaf, or a weed stalk—near your bird, which is unlike anything else close to it; and you must see this object, whatever it is, and remember it, in the instant's glance that you have. Of course some birds will be lost,—that is inevitable; but it is wonderful to see how, by practice, the memory and the eye can be trained in a matter of this kind.

The snipe, although often very wary, appears to be quite devoid of that cunning which distinguishes so many of our game birds. When wounded it rarely attempts to hide, but either runs off quietly in a straight course, or, if only wing-tipped, springs again and again into the air in its attempts to fly

and constantly utters its singular squeak of fright.

There is one feature of snipe-shooting which makes it very attractive, and this is that you have your dog constantly within sight; you can see all his graceful movements and enjoy his intelligent efforts to find the birds, — to locate without flushing them. To our notion, more than half the pleasure of field shooting of any description is derived from seeing the dog work, and this can be done better on the open snipe meadows than under almost any other circumstances. Beating for snipe, however, is usually, from the nature of the ground, very laborious work. The walking is often through mud and water up to the knees, or perhaps one is obliged to pick his way through an unusually soft marsh, springing from tussock to tussock, with every prospect of tumbling, now and then, from those unsteady resting places into mire of unknown depth. This mode of progression requires some muscular exertion and constant attention; and besides this, the dog must be constantly watched, and unexpected birds, which he may have passed by, must be shot at and marked down.

It is, therefore, essential that the snipe-shooter should carry no extra weight. His gun should be light, and his cartridges need not hold more than an ounce of No. 12 shot; for this bird is easily killed, and as it is so small, and often rises at a considerable distance, it is important that as many of the leaden pellets as possible should be sent after it. Rubber boots reaching to the hip are of course necessary, and the clothing should be gray or brown in color — inconspicuous, at all events. The places in which the snipe are found are often resorted to by some species of our ducks as well. The little pools and creeks, which are sure to be found in extensive snipe marshes, furnish food for the blue and green winged teal, the black duck, mallard, baldpate, and woodduck. It will, therefore, be advisable for one who is about to visit such grounds to put in his pocket half a dozen cartridges, loaded with three and a half drams of powder, and an ounce of No. 8 shot; for although No. 12 may prove effective against the ducks at short range, it is well to be prepared for longer shots.

As between woodcock and English snipe, the preference would be given with but few dissenting voices to the larger bird. Snipe-shooting, from the erratic movements of the bird, is something that cannot be depended on, while if the conditions of weather and feeding-grounds are favorable, one may count with some certainty at the proper season on having sport with the woodcock. As regards delicacy of flavor, there is nothing to choose between the two. For birds so nearly related they are wonderfully unlike in appearance and habits, and the snipe is certainly much better able to take care of himself than his rusty-coated cousin.

George Bird Grinnell.

AT TWILIGHT.

I WONDER if I love thee yet — but oh!
I love thee not as once. . . . The eyes are clear
That vexed my heart then with their ready tear,
The voice is glad and full that faltered so
When thou and I loosed hands long years ago.
Those outward signs are changed; but, musing here
'Neath the broad spaces of the twilight sphere,
Rapt thoughts of thee rise in my heart and glow,
And every wiser deed or tenderer mood
Of mine appears a heritage of good,
A clear reflection of the daylight gone,—
Dear, vanished day, that was my Orient
Of strength and purity and deep content,
Restful as mountains, solemn as the dawn!

Edna Dale.

LONGFELLOW.

I.

Our poet of grace and sentiment left us in the after-glow of an almost ideal career. He had lived at the right time, and with the gift of years; and he died before the years came for him to say, I have no pleasure in them. Not all the daughters of Music were brought low. He scarcely could have realized that people were calling his work elementary, that men whose originality had isolated them, like Emerson and Browning,—and even metrical experts, the inventors of new modes,—were gaining favor with a public which had somewhat outgrown him; that he was to be slighted for the very qualities which had made him beloved and famous, or that other qualities, too long needed, were to be overvalued as if partly for the need's sake.

But they are wrong, it seems to me, who now make light of Longfellow's service as an American poet. His admirers may form no longer a critical majority, yet he surely helped to quicken the New World sense of beauty, and to lead a movement second only to that which begets a national school. I think that the poet himself, reading his own sweet songs, felt the apostolic nature of his mission,—that it was religious, in the etymological sense of the word, the binding back of America to the Old World taste and imagination. Our true rise of Poetry may be dated from Longfellow's method of exciting an interest in it, as an expression of beauty and feeling, at a time when his countrymen were ready for something more various and human than the current meditations on Nature. It was inevitable that he should first set his face toward a light beyond the sea. Our poet's youthful legend aptly was *Outre-Mer*. An escape was in order from the asceticism which two centuries had both modified and confirmed. How could this be effected? Not at once by the absolute presentation of beauty. A Keats, pledged to this alone, could not have propitiated the ancestral spirit. Puritanism was opposed to beauty as a strange god, and to sentiment as an idle thing. Longfellow so adapted the beauty and sentiment of other lands to the convictions of his people, as to beguile their reason through the finer senses, and speedily to satisfy them that loveliness and righteousness may go together. His poems, like pictures seen on household walls, were a protest against barrenness and the symptoms of a new taste.

They made their way more readily, also, by their response to the inherited Anglo-Saxon instincts of his own region. His early predilections, strengthened during a stay in Germany, were chiefly for the poetry and romance of that land. He read his heart in its songs, which he so loved to translate for us. A new generation may be at a loss to conceive the effect of Longfellow's work when it first began to appear. I may convey something of this by what is at once a memory and an illustration. Take the case of a child whose Sunday outlook was restricted, in a decaying Puritan village, to a wooden meeting-house of the old Congregational type. The interior—plain, colorless, rigid with dull white pews and dismal galleries—increased the spiritual starvation of a young nature unconsciously longing for color and variety. Many a child like this one, on a first holiday visit to the town, seeing the vine-grown walls, the roofs and arches, of a graceful Gothic church, has felt a sense of something rich and strange; and many, now no longer children, can remember that the impression upon entrance was such as the stateliest cathedral now could not renew. The columns and tinted walls, the ceiling of oak and blue, the windows of gules and azure and gold,—the service, moreover, with its chant and organ-roll,—all this enraptured and possessed them. To the one relief hitherto afforded them, that of Nature's picturesqueness,—which even Calvinism endured without compunction,—was added a new joy, a glimpse of the beauty and sanctity of human art. A similar delight awaited the first readers of Longfellow's prose and verse. Here was a painter and romancer, indeed, who had journeyed far and returned with gifts for all at home, and who promised often yet to

> "—— sing a more wonderful song
> Or tell a more marvelous tale."

And thus it chanced that, well as he afterward sang of his own sea and shore, he now is said to have been the least national of our poets. His verse, it is true, was like a pulsatory cord, sustaining our new-born ideality with nourishment from the mother-land, until it grew to vigor of its own. Yet he was more widely read than his associates, and seemed to foreigners the American laureate. His native themes, like some of Tennyson's, were chosen with deliberation and as if for their

availability. But from the first he was a poet of sentiment, and equally a craftsman of unerring taste. He always gave of his best; neither toil nor trouble could dismay him until art had done its perfect work. It was a kind of genius,—his sure perception of the fit and attractive. Love flows to one whose work is lovely. Besides, he was a devotee to one calling,—not a critic, journalist, lecturer, or man of affairs,—and even his prose romances were unrhymed poems. A long and spotless life was pledged to song, and verily he had his reward. Successors may find a weakness in his work, but who can rival him in bearing and reputation? His worldly wisdom was of the gospel kind, so gently tempered as to breed no evil. His life and works together were an edifice fairly built,—the House Beautiful, whose air is peace, where repose and calm are ministrant, and where the raven's croak, symbol of the unrest of a more perturbed genius, is never heard. Thus the clerkly singer fulfilled his office,—which was not in the least creative,—and had the tributes he most desired: love and honor during his life-time, and the assurance that no song of his took flight but to rest again and again "in the heart of a friend."

II.

Poets, like the cicalas, have occasion to envy those who compass their song and sustenance together. Few can pledge with Longfellow their lives, or even frequent hours, to the labor they delight in. There was, in fact, an "opening,"—a need for just the service he could render. The circumstances of his birth and training were propitious and worked to one end. Neither he nor Hawthorne was the mere offspring of an environment. There was nothing special in the little down-east school of Bowdoin, sixty years ago, to breed the leaders of our imaginative prose and verse. But the time was ripe; there was an unspoken demand for richer life and thought, to which such natures, and the intellects of Channing and Emerson, were sure to respond. And the concurrence certainly was special: that Longfellow, descended from Pilgrim and Puritan stock, the child of a cultured household, should be born not only with a poet's voice and ear, but with an aptitude for letters amounting to a sixth sense,—a bookishness assimilative as that of Hunt or Lamb; that he should be reared in a typical Eastern town, open alike to polite influences and to the freshness and beauty of the northern sea; that such a youth, buoyant and manly, but averse to the coarser sports, gentle, pure,—one who in France would have become at first an abbé,—should in New England be made a college professor at nineteen, and commissioned to visit Europe and complete his studies; that ten years later, having ended the pleasant drudgery of his apprenticeship, he should find himself settled for life at Harvard, the center of learning, and under few obligations that did not assist, rather than impede, his chosen ministry of song. Here he was to have health, friendship, ease, the opportunity for travel, abundant and equal work and fame, with scarcely an abrupt turn, or flurry, or drought or storm, to the very end. Even his duties served in the direction of a literary bent, confirming his mastery of languages whose poetry and romance were his treasure-house. He wrote his text-books at an age when most poets go a-gypsying. When twenty-six, he made his translation of the "Coplas de Manrique,"—a rendering so grave and sonorous that if now first printed it would be caught up like Fitz-Gerald's "Rubaiyat of Omar," instead of going to the paper mill. It indicated, more than his original work of this period, that a true poetic method was forming in a country where Berkeley's muse thus far had made no course of empire. A few essays, always on literature or the languages, complete the round of his miscellanies, the last being contributed to a review in 1840. After that time he gave up all critical writing whatsoever.

"Outre-Mer," a young poet's sketch-book, reports his first transition from cloister life to travel and experience. It is a journey of sentiment, if not a sentimental journey, and made in the blithesome spirit of a troubadour. All the world was Arcady,—a land of beauty and romance; and these he found, caring for nothing else, in sunny nooks of France, Italy, and Spain, as deftly as the botanist picks out his ferns and forest flowers. Our poet's herbarium had a gift to keep its blossoms unfaded. His road-glasses illuminate the wayside: our modern travelers use stronger lenses, and see things through and through, but with the old illusions we have lost the best of all things—zest. "Hyperion" showed what changes four years can bring about while still the man is young: it is the thoughtful, and somewhat too fond, fantasy of the same pilgrim after more knowledge of the verities of life. The atmosphere of this book is that of Switzerland and Germany; but its shadows came from the maker's heart. He had been bereaved. The opening phrase is grief, a poet's grief, that consoles itself with imagery: "The setting of a great hope is like the setting of the sun. * * * We look forward into the coming lonely night. The soul withdraws into

itself. Then stars arise, and the night is holy." This precise, epicurean touch, the application of art to feeling, was new in our authorship. Void of real anguish or passion, it still suggested an ideal,—a purpose beyond mere book-craft. The sketches, diversified with not too frequent musing, the wedding of sound to sense, the daintiness of words, the feeble plot, all bear witness that "Hyperion" is the work of an idyllist. The vague manner, with its impression of rest sought in restlessness, and even the broken story, were borrowed, doubtless, from "Titan." The book naturally became the companion of all romantic pilgrims of the Rhine, for the true German spirit is here; its sentiment and fancy alike are seized by a master of the picturesque. He "knew the beauteous river all by heart,—every rock and ruin, every echo, every legend. The ancient castles, * * * they were all his; for his thoughts dwelt in them, and the wind told him tales." With Jean Paul we have Heine, also, who might have conceived the grotesque episode of Frau Kranich's "tea" in Ems. The romance and spooning of "Hyperion," and its moral conclusions, are food for adolescents; but it is easier to laugh at youth than to possess it. And this is Longfellow's youth throughout,—the frankest of confessions. Paul Fleming "buried himself in books; in old dusty books." Read the list of them, from the Nibelungenlied down, and see the diet that he garnished with grapes and Liebfrauenmilch and love-making and moonlight dreams. "How beautiful it is to love!" Ah! how happy to be young, and in love; to have known sorrow, and to use it as a foil; to visit and read the great world, yet not to be corrupted by it, still to keep a pure heart that has no taste for recklessness and vice; through all to recall one lesson: "Look not mournfully into the Past. It comes not back again. Wisely improve the Present. It is thine. Go forth to meet the shadowy Future, without fear, and with a manly heart."

The chief import of the poet's romances was their bearing upon his own purpose. He fixed his rules of life by writing them down. His second maxim is found in "Kavanagh," a tale with less freshness than "Hyperion," but fashioned with the hand of greater cunning, that of a writer in his prime. Its personages are more distinctly drawn, and it was his brief and nearest approach to a novel. We have a transcript of New England village life, an atmosphere of breeding and refinement, and some pertinent criticism on literary and social topics. As before, the gist of the tale is in a text, placed, with due regard to convention, at the beginning:

> "The flighty purpose never is o'ertook
> Unless the deed go with it."

This bit of wisdom had been deeply considered by the author. By way of strengthening himself against a dreamer's temptation to be derelict, he worked it, one might say, into this "sampler" of a tale. Those who are fond of citing the formula, that Genius is only a talent for persistent work, have reason to place our poet well in the van of their examples. Yet I fancy that only men of talent will heartily subscribe to this definition. Be this as it may, Longfellow's prose tales show us his equipment, and give the clew to his well-adjusted life. It was plain, also, that he was a born romanticist, in full sympathy with the German school. We shall see that, as a poet, he followed a romantic method, to the disapproval of those who feel that nothing in the New World should be done as it has been done elsewhere. It is difficult, however, to explain why even things at home should not be treated according to the genius of the designer. After strange experiments, we just now are discovering that the colonial architecture, so much like that of Cromwell's England, is of all our styles the best adapted to the Atlantic States; and it still becomes us to be modest in defining the types that American art and poetry finally will assume. The critical question, I take it, is not what fashion should be outlawed, but whether the thing done is good of its kind.

Nothing afterward tempted Longfellow from poetic composition, except the illustrations of the "Poetry of Europe," many of which were his own translations, and, late in life, the diversion of editing "Poems of Places," and the heroic labor of his complete version of "The Divine Comedy," a work to which I shall refer again.

III.

LONGFELLOW'S juvenile poems have been collected recently. Those printed, before his graduation, in the "Literary Gazette," resemble the verse of Bryant and Percival, the former of whom he looked upon as his master. Tracings of browsing in the usual pasture grounds are strangely absent: I sometimes wonder if he had an early taste for the Elizabethan poets, or, indeed, for any English worthy, since no modern author has shown fewer signs of this in youth. The "Voices of the Night," his own first collection, was postponed until after a long experience of translation and prose work. It appeared in his thirty-third year, and met with instant favor. Only nine new pieces were in

the book; these, with the translations following, have characteristics that his verse continued to display. The Prelude recalls that of Heine's third edition of the "Reisebilder" (*Das ist der alte Märchenwald*), then just published. Later pieces show that Longfellow caught the manner of this poet, whose principles he severely condemned. The German's rhythm and reverie were repeated in "The Day is Done," "The Bridge," "Twilight," etc., but not his passion and scorn. The influence of Uhland is equally manifest elsewhere. Prototypes of Longfellow's maturer work are found in "The Reaper," "The Psalm of Life," and "The Beleaguered City." "The Midnight Mass for the Dying Year," against which Poe brought a mincing charge of plagiarism, is as strong and conjuring as anything its author lived to write. The Translations deserved high praise. The stately "Coplas" re-appears. Various renderings from German lyric poets, such as "The Happiest Land," "Beware," and "Into the Silent Land," were new originals, examples of a talent peculiarly his own. Given a task which he liked,—with a pattern supplied by another,—and few could equal him. He made his copies in various measures and from many tongues. An essay in hexameter, the version of Tegnér's "Children of the Lord's Supper," preceded his original poems in that form. Even after completing his "Dante," he loved to toy with such work. I have heard him say that he longed to make an English translation of Homer, upon the method which Voss had used to such advantage.

His volume of 1841, "Ballads and Other Poems," may be likened to Tennyson's volume of the ensuing year, in that it confirmed its author's standing and indicated the full extent of his genius as a poet. It was choice in its way, suggesting taste rather than fertility; choicely presented, also, for with it came the fashion, new to this country, of printing verse attractively and in a shape that seeks the hand. The poet's matter, if often gleaned from foreign literatures, was novel to his readers, and his style distinct from that of any English contemporary. The book contains examples of all the classes into which his poems seem to divide themselves, and may be examined with its successors. One sees, forthwith, that Longfellow's impulse was to make a poem, above all, "interesting." He was no word-monger, no winder of coil upon coil about a subtle theme. He changed his topics, for some topic he must have, and one that suited him. A cheerful acceptance of the lessons of life was the moral, suggested in many lyrics, which commended him to all virtuous, home-keeping folk, but in the end poorly served him with the critics. He often is judged by his least poetic work,—verse whose easy lessons are adjusted to common needs; by the "Psalm of Life," "Excelsior," "Prometheus," and "The Ladder of St. Augustine,"—little sermons in rhyme that are sure to catch the ear and to become hackneyed as a sidewalk song. He often taught, by choice, the primary class, and the upper form is slow to forget it. Next above these pretty homilies are his poems of sentiment and twilight brooding. "The Reaper and the Flowers," "Footsteps of Angels," "Maidenhood," "Resignation," and "Haunted Houses" came home to pensive and gentle natures. Lowell has written a few kindred pieces, such as "The Changeling" and "The First Snowfall." A still higher class, testing Longfellow's eye for the suggestive side of a theme and his art to make the most of it, includes "The Fire of Drift-Wood," "The Lighthouse," "Sand of the Desert," "The Jewish Cemetery," and "The Arsenal." In poems of this sort he was a skilled designer, yet they were something more than art for art's sake. Owing to the tenderness seldom absent from his work, he often has been called a poet of the Affections. It must be owned that he was a poet of the Tastes as well. He combined beauty with feeling in lyrical trifles which rival those of Tennyson and other masters of technique, and was almost our earliest maker of verse that might be termed exquisite. "The Bells of Lynn" and "The Tide Rises, the Tide Falls," show that the hand which polished "Curfew" and "The Arrow and the Song" was sensitive to the last.

Among obvious tests of a poet are his voice, facility, and general aim. Longfellow's verse was refined and pleasing; his purpose, evidently not that of a doctrinaire. The anti-slavery poems did not come, like Whittier's, from a fiery heart, or rival Lowell's in humor and disdain. They simply manifest his recognition and artistic treatment of an existing evil. The ballad of "The Quadroon Girl" is a poem, not a prophecy, with a pathos beautified by certain "values," as a painter might term them,—the tropic shore, the lagoon, the island planter's daughter and slave. Of the higher tests of poetic genius,—spontaneity, sweep, intellect, imaginative power,—what examples has he left us? At times the highest of all, imagination, in passages where he outleaps the conceits and fancies that so possessed him. We have it in the "Midnight Mass"; in "Sir Humphrey Gilbert"; in "The Spanish Jew's Tale," when

> "——straight into the city of the Lord
> The Rabbi leaped with the Death-Angel's sword,
> And through the streets there swept a sudden breath
> Of something there unknown, which men call death."

At times also we have what is of almost equal worth, imaginative treatment. This is felt in the effect of his very best lyrics, a series of Ballads, with "The Skeleton in Armor" at their front both in date and in merit. This vigorous poem opens with a rare abruptness. The author, full of the Norseland, was inspirited by his novel theme, and threw off a ringing carol of the sea-rover's training, love, adventure. The cadences and imagery belong together, and the measure, that of Drayton's "Agincourt," is better than any new one for its purpose. Even the poet's conceits are braver than their wont:

> "Then from those cavernous eyes
> Pale flashes seemed to rise,
> As when the northern skies
> Gleam in December;
> And, like the water's flow
> Under December's snow,
> Came a dull voice of woe
> From the heart's chamber."

Elsewhere he is as resonant as the bard of England's "King Harry":

> "And as to catch the gale
> Round veered the flapping sail,
> Death! was the helmsman's hail,
> Death without quarter!
> Midships with iron keel
> Struck we her ribs of steel;
> Down her black hulk did reel
> Through the black water!"

To old-fashioned people this heroic ballad, written over forty years ago, is worth a year's product of Kensington-stitch verse. A few others, mostly of the sea, count high in any estimate of Longfellow. "The Wreck of the Hesperus," though not without blemishes, "Sir Humphrey Gilbert," "Victor Galbraith," and "The Cumberland" are treated, I think, imaginatively. Boker's noble stanzas on the sinking of the Cumberland follow more closely the old ballad style, but Longfellow plainly found a style of his own. His "occasional" poems were equally felicitous: witness the touching, sympathetic imagery of "The Two Angels," the joyous grace of the chanson for Agassiz's birthday. "Hawthorne," "Bayard Taylor," and "Killed at the Ford" are examples of the fitness with which his emotion and poetic quality corresponded, each to each. But neither war nor grief ever too much disturbed the artist soul. Tragedy went no deeper with him than its pathos; it was another element of the beautiful. Death was a luminous transition. "The Warden of the Cinque Ports" is all melody and association. He made a scenic threnody, knowing the laureate would supply an intellectual characterization of the Iron Duke. His fancy dwells upon the ancient and high-sounding title, the mist and sunrise of the Channel, and the rolling salute from all those rampart guns, that yet could not arouse the old Field-Marshal from his slumber. Tennyson fills his grander strophes with the sturdy valor and wisdom of the last great Englishman, but within our poet's bounds the result is just as undeniably a poem.

Longfellow, employing regular forms of verse, was flexible where many are awkward, —at ease in his fine clothes. "Rain in Summer," "To a Child," and a few longer poems yet to be examined, such as "The Building of the Ship," are written with a free hand. In his latter period he often used an anapestic movement, first discoverable in "The Saga of King Olaf" and "Enceladus," afterward in "Belisarius," "The Chamber over the Gate," and "Helen of Tyre." The impression conveyed is that we listen to one whose day for elaborate song is past, but whose voice still warbles in the fresh break of spring or the melting twilight of thankfulness and rest. With age, his natural tenderness grew upon him, as men's traits will for good and bad. "The Children's Hour" is one of the inimitable fireside songs that made this "old moustache" the children's poet. Another delightful lyric, "My Lost Youth," was the utterance of a man who in middle age looked in his own heart to write, and found it warm and true. To comprehend its charm and sincerity, one, perchance, must also have loitered in youth along the piers, sending his hopes far across the whispering ocean to the untried world; must himself remember

> "—— the black wharves and the slips,
> And the sea-tides tossing free;
> And Spanish sailors with bearded lips,
> And the beauty and mystery of the ships,
> And the magic of the sea."

Some breezy dome of trees, with sounds and shadows like those of Deering's woods, must still haunt his memory, if he would recall

> "The song and the silence in the heart,
> That in part are prophecies, and in part
> Are longings wild and vain;
> And the voice of that fitful song
> Sings on, and is never still:
> 'A boy's will is the wind's will,
> And the thoughts of youth are long, long thoughts.'"

Of all these poems, the swallow-flights of many seasons, not one falls short of a certain standard of grace and correctness; and the same may be said of the author's more pretentious works, to which we now come. Meanwhile it is to be noted that he was the

first American to compose sustained narrative-poems that gained and kept a place in literature. In fact, since the Georgian period, there has been no other poet of our tongue, save Tennyson, whose longer productions have been greeted by the public with the interest bestowed upon the successive works of novelists in the front rank.

IV.

"EVANGELINE," the first of these tales in verse, was written—as I have said of "In Memoriam," that very different production—when its author had reached the age of forty, with his powers in full maturity, and remains his typical poem. Like "Hermann and Dorothea," it is composed in hexameter, as befits a bucolic love story. Longfellow's choice of this measure, in defiance of a noble army of censors, proves that he had, much as he shrank from discussion, the full courage of his convictions upon a point in literary art. He lived for poetry; his tastes were definite, and he felt himself justified in respecting them.

Within a recent period several noteworthy extensions have been made to the technical range of English verse. Among these are: the use by Tennyson of the stanzaic form of "In Memoriam"; the example of a long poem in unrhymed trochaics, by Longfellow; Swinburne's forcible handling of anapestic measures; more recently, the revival of elegant romance-forms, by the new English school. Preceding these in date we have Longfellow's success in familiarizing the "English hexameter," the measure of "Evangeline" and "Miles Standish." The popularity of those idyls assuredly proved that the common folk, in spite of critics, do not find the verse a stumbling-block. They read it, when gracefully written, without suspecting that it is not a musical and natural English form. The question of hexameter has been argued to little purpose, in consequence of a mist which has hid the true issue from the perception of both parties to the dispute. The verse usually is examined, by its friends and opponents, from the scholar's point of view. To Mr. Swinburne, hexameters are "ugly bastards of verse"; even those of Mr. Arnold have "no metrical feet at all," but sound like "anapests broken up and driven wrong"; Clough's are admirable "studies in graduated prose"; Hawtrey's, "faultless, English, hexametrical," but only "a well played stroke," not continuable; Kingsley's "Andromeda," the "one good poem extant in that pernicious metre," and even Kingsley's feet are but "loose, rhymeless anapests." Now "Andromeda," a delicious poem for poets, never will commend its measure to the multitude, since it never will reach them. But if such lines as these,

> "Far through the wine-dark depths of the crystal, the gardens of Nereus,
> Coral and sea-fan and tangle, the blooms and the palms of the ocean,"

are essentially anapestic, it is because one chooses to read them so; and any dactylic verse of Homer may be transposed in the same way by reading it accentually and ignoring the first and last syllables. When Mr. Swinburne adds, "Such as pass elsewhere for English hexameter, I do hope, are impossible to Eton," he strikes the key-note of the misunderstanding. The same premise is always implied, to wit: that classical analogies should govern our opinion of this measure. Unfortunately, I say, even the arguments of its defenders are based on the notion that the modern verse may approximate to the antique, in which effort, of course, it always must fail. Poe, in his turn, opposed Longfellow's hexameters because they were not classical; yet he unconsciously paid tribute to them as an English form of verse, when he said that their admirers were "deceived by the facility with which some of these verses may be read!" Lord Derby anticipated Mr. Swinburne's "pernicious metre," in denouncing "that pestilent heresy of the so-called English hexameter," which "can only be pressed into the service by a violation of every rule of prosody." Whether or not the noble translator, deprived of rules of prosody, would have found it hard to write verse at all, it is plain that here again crops out the fallacy of the discussion. Fixed rules of quantitative or classical verse must be put out of mind. The question ought to be, simply: Is the verse, in six feet, of "Evangeline" or "Andromeda" a good and readable measure for an English poem?

Bryant, a good writer of blank verse, disliked a measure which he found unsuited to his slow and dignified movement. Professor Lewis took the ground of Mr. Bryant, whose Homer he so much praised. Mr. Lang is on the same side, and has said that not even Professor Arnold can alter his opinion. Yet the late Professor Hadley, an almost matchless scholar, advocated this verse for Homeric translation. Messrs. Lowell, Higginson, and Stoddard are among its friends. Matthew Arnold, in the delightful papers "On Translating Homer," has made his strongest plea for the English hexameter by unconsciously

granting that its close approximation to the antique type must be the result of adroit labor, not of unstudied expression. Such a result justly might be deemed an artifice, distinct from natural English verse. And Mr. Arnold, in view of the reception awarded "Evangeline," also sees that the dislike of our present English hexameter is "rather among the professional critics than the general public." A liking for it, on the part of many poets, is evident from their successive experiments. Longfellow's foreign studies influenced his own decision in its favor; since then we have had Kingsley's "Andromeda," Clough's "Bothie," Howells's "Clement" Taylor's rhythmic "Pastorals," and, more recently, Mr. Munby's idyl of "Dorothy" in the elegaic measure, and its Hellenic counter-type, the "Delphic Days" of Mr. Snider. But while there are both faith and practice in favor of the hexametric verse, it is still in a stage of growth. Mr. Arnold a second time reaches the mark when he implies that its capabilities are not yet evident; that, "even now, if a version of the Iliad in English hexameter were made by a poet who, like Mr. Longfellow, has that indefinable quality which renders him popular,—something *attractive* in his talent which communicates itself to his verses,—it would have a great success among the general public." He expected yet to see an improved type of this verse, which should excel Voss's by as much as Shakspere's blank verse excels that of Schiller. This may or may not be; but the capabilities of the measure will not be understood until some fine poet—combining the simplicity of Longfellow and the vigor of Clough, and free from the sing-song of the one and the roughness of the other—shall make it the vehicle of passion, incident, imagination. To bring out its full rhythm, while depending chiefly on accent,—the natural basis of English verse,—the ear will pay regard to such effects of quantity as the language proffers. Purely quantitative English verse, at any length, is out of the equation. To the samples of it often printed by amateurs in "Blackwood" and elsewhere, Canning's outburst, "Dactylics call'st thou them? God help thee, silly one!" may be justly applied, but not to the hexameter of Kingsley and Bayard Taylor. Call the new measure what you will—something else, if possible, than the term applied to the verse of Homer and Lucretius, for it assuredly is not composed of quantitative dactyls and spondees. But it will have six feet, and natural breaks and cæsuras, and will be more or less dactylic; it may also have anapestic variations, and trochees quite as often as spondees. To sum up all, its music, sweep, and inspiriting effect will depend entirely upon the genius of the poet who writes it.

The use of this measure for translation from the Greek and Latin poets I have discussed in a notice of Bryant. Longfellow could not be the supreme translator of Homer; but if there was nothing of the Grecian in him, there was much of the Latinist, and with Virgil's polished muse he might have been quite at ease. Meanwhile, the popularity of our new hexameter with simple readers who know little of the Homeric roll, the Sicilian *psithurisma*, or Virgil's liquid flow, has been demonstrated against all theorists by the record of "Evangeline." The poet's friends told him he must take a familiar meter, that hexameters "would never do." He found, as reported by David Macrae, that his "thoughts would run in hexameter," and declared that the measure would "take root in English soil." "It is a measure," he said, "that suits all themes. It can fly low like a swallow, and at any moment dart skyward. * * * What fine hexameters we have in the Bible: *Husbands, love your wives, and be not bitter against them;* and this line, *God is gone up with a shout; the Lord with the sound of a trumpet.* Nothing could be grander than that!" Over-dactylic, and therefore monotonous, as Longfellow's hexameters often are, they have the merit of being smooth to read without analysis, like any other English verse. This primary, easy lilt was needed for an introduction, until, stage by stage, the popular ear shall be wonted to more varied forms, and the scholar brought to realize that here is a true and idiomatic English verse, however distinct from that which he learned in the classes.

Notwithstanding its primitive and loose construction, the verse of "Evangeline" is at times vigorously wrought and sonorous:

> "Wild through the dark colonnades and corridors leafy the blast rang,
> Breaking the seal of silence, and giving tongues to the forest.
> Soundless above them the banners of moss just stirred to the music.
> Multitudinous echoes awoke and died in the distance,
> Over the watery floor, and beneath the reverberant branches."

And with the measure that came to him, the poet had chanced upon an idyllic story, seemingly made for its use, and wholly after his liking. A beautiful, pathetic tradition of American history, remote enough to gather a poetic halo, and yet fresh with sweet humanities; tinged with provincial color which he knew and loved, and in its course taking on the changing atmospheres of his own land; pastoral at first, then broken into action, and

afterward the record of shifting scenes that made life a pilgrimage and dream. There are few dramatic episodes; there is but one figure whom we follow,—that one the most touching of all, the betrothed Evangeline searching for her lover, through weary years and over half an unknown world. There are chance pictures of Acadian fields, New World rivers, prairies, bayous, forests, by moonlight and starlight and midday; glimpses, too, of picturesque figures, artisans and farmers, soldiery, trappers, boatmen, emigrants, priests. But the poem already is a little classic, and will remain one, as surely as "The Vicar of Wakefield," "The Deserted Village," or any other sweet and pious idyl of our English tongue; yet we find its counterpart more nearly, I think, in some faultless miniature of the purest French school. Evangeline, as she

> "Sat by some lonely grave, and thought that perchance in its bosom
> He was already at rest, and she longed to slumber beside him,"

though the subject of artists, needs no other painter than her poet, through whose verse the music of her name and the legend of her wanderings will be so long perpetuated. There are flaws and petty fancies and homely passages in "Evangeline"; but this one poem, thus far the flower of American idyls, known in all lands, I will not approach in a critical spirit. There are rooms in every house where one treads with softened footfall. Accept it as the poet left it, the mark of our advance at that time in the art of song,—his own favorite, of which he justly might be fond, since his people loved it with him, and him always for its sake.

The advantage of a new field, to which later authors, like Harte and Cable, are somewhat indebted, was of full service to our poet, not only on his provincial excursions, but also in the one successful attempt that has been made to treat in numbers the customs and legends of our Indian tribes. This gain was strengthened by the novelty of the rhymeless trochaic dimeter used for "Hiawatha," a measure then practically unknown to English verse. He probably would not have ventured to compose his Algic Edda in this monotonous time-beat, had he not made sure of its effect in the Norse literatures, and mainly, as was noted at the time, in the Finnish epic of "Kalevala." The result, on the whole, justified his course. "Hiawatha" is a forest-poem; it is fragrant with the woods, fresh with the sky and waters of the breezy north. The Indian traditions, like those of the Scandinavians, are the myths of an untutored race; they would seem puerile and affected in any but the most primitive of chanting measures. As it is, one feels that the nicest skill was required to protect the verse from gathering an effect of burlesque or commonplace; yet this it never does. The fable is not of a stimulating kind. Grown-up readers, I suspect, seldom go through it consecutively. To read here and there and at odd times, it is in every way pleasurable. It was, in a sense, the poet's most genuine addition to our native literature. Previous endeavors to make imaginative verse from aboriginal material had signally failed: witness the ludicrous heroics of the Knickerbocker poets, whose conventional ideals were utterly discarded by Longfellow. He alone had the gift to blend the kindred myths of Indian fancy in mellow and artistic simplicity; to cull from Schoolcraft what was really essential, and make it more charming for us than a sheer invention possibly could be. He made the field his own, with little room for after-comers. "Hiawatha" is the one poem that beguiles the reader to see the birch and ash, the heron and eagle and deer, as they seem to the red man himself, and to join for the moment in his simple creed and wonderment. Such is the half-dramatic merit of the work, and it was only by a true exercise of the imagination that a poet, himself no familiar of the wild-wood life, could sit in his study and utilize the books relating to it: an equally true exercise, I think, though upon a less majestic basis, with that of the poet who mastered the Arthurian legends of his own historic race and island, and wrote the "Idylls of the King." Longfellow's use of the Indian dialect and names is delightful. These cantos remind us that poetry is the natural speech of primitive races; the "song" of Hiawatha has the epic quality that pertains to early ballads, the highest enjoyment of which belongs to later ages and to the creature that Whitman terms the civilizee. He alone can relish to the full the illusions which the poet has recaptured for his episode of "The Building of the Canoe," the death of Minnehaha, and Hiawatha's mystical farewell.

When a companion-piece to "Evangeline" appeared, every one made haste to acquaint himself with the love experience of the demure Priscilla, loyal John Alden, and bluff Captain Miles. Even now, if we had some young Tennysons and Longfellows, poetic ideals might not wholly give way to the novelist's photographs of every-day life. The author's tact guided him to the prettiest tradition of Pilgrim times. We have a romantic picture of the Plymouth settlement, with its far-away round of human life and action, through

which the tide of love went flowing then as now. The bucolic wedding-scene at the close is a fine subject for the pastoral canvas. "The Courtship of Miles Standish" was an advance upon "Evangeline," so far as concerns structure and the distinct characterization of personages. A merit of the tale is the frolicsome humor here and there, lighting up the gloom that blends with our conception of the Pilgrim inclosure, and we see that comic and poetic elements are not at odds in the scheme of a bright imagination. The verse, though stronger, is more labored than that of "Evangeline"; some of the lines are prosaic, almost inadmissible. There are worse, however, in the poet's last example of hexameter, the Quaker story of "Elizabeth,"—which was written rather to fill out the "Tales of a Wayside Inn" than from any special inspiration. Nor does the Plymouth idyl show much sympathy on the part of the author with the ancestral environment, but chiefly a cavalier perception of what romance and grace there might have been in the good old colony time.

His works in dramatic form plainly represent the craving of a versatile poet to win laurels in every province of his art. But to compose a living drama requires just that special faculty, if not the highest, which is denied to nine out of ten. Longfellow, perchance, might have made himself either a dramatist or a novelist, if he had gone into training as doggedly as others, born essayists or poets, who have gained the secret of novel-writing through practice, aided by popular encouragement. He made a fair beginning as a romancer with "Hyperion," and even as a dramatist by the clever play of "The Spanish Student,"—equipped with the properties of a country and literature so well understood by him. As a drama, that remains his best achievement. When the desire to better it possessed him, the outcome was a motley series of writings in the form under review: one, a frigid contribution to the pseudo-antique verse at which all college-bred poets feel competent to try their hands. Nothing with the true Grecian flavor could come out of his Italian and Gothic tendencies. "Pandora," besides reminding us of Taylor's version of the Second Part of Faust, is in every way a forced effort, and, like "Judas Maccabæus," would go a-begging if the work of a new man. The Trilogy of "Christus," as a whole, is a disjointed failure. Parts First and Third, "The Divine Tragedy" and "The New England Tragedies," exhibit the skill to choose imposing subjects and build a framework, but little of the power required for their treatment. We have the form, the personages, and situations, rarely the action and noble fire. The author's shortcomings are even more conspicuous than Tennyson's, and by as much as his intellectual power was the less absolute. His theory that the Scriptural language should be reproduced grew out of the fact that he could invent no other, and resulted in a barren paraphrase of what is fine in its own place. What sublime themes!—the life and passion of Christ, the Golden Legend of Christendom, the tragedy of Puritan superstition,—and how tamely the first and last of these are handled! Their consolidation was manifestly an after-thought, to give a semblance of strength to the whole. Where we have the poet's own style, as in the soliloquies of Mary, Simon, Helen, it is a subjective utterance of the Cambridge scholar at his desk. The Interludes are put in to brace the effect, like the sham buttresses of a faulty building. He should not have preëmpted the sable field of the Quaker and witch persecutions, unless he felt in his utmost fiber the nerve to occupy it. The temptation was strong; the result, contrasted with Hawthorne's prose treatment of kindred subjects, is deplorable.

"The Golden Legend," however, should be judged by itself, and is an enchanting romance of the Middle Age cast in the dramatic mold. Brought out years before the "Tragedies," it finally was merged in the "Christus" by way of toning up the whole, the poet well knowing that this was his choicest distillation of Gothic mysticism and its legendary. It is composite rather than inventive; the correspondences between this work and Goethe's masterpiece, not to speak of productions earlier than either, are interesting. There is decided originality in its general affect, and in the taste wherewith the author, like a modern maker of stained glass, arranged the prismatic materials which he knew precisely where to collect. The Prologue, not wholly a new conception, is none the less imaginative: a scene of night and storm, with Lucifer and the Powers of the Air vainly assaulting the Strasburg Cross, baffled by the voices of the Bells, which repeat the sacred words graven on their sides. The Legend is a striking instance of an effort by which mediæval rituals, chants, and wonder-tales are boldly seized and molten to an alloy, whose color and tensile qualities are due to the solvent of the alchemist. Here and there are unmistakable lusters of the poet's own vein. This would be recognized at sight:

> "His gracious presence upon earth
> Was as a fire upon a hearth;
> As pleasant songs, at morning sung,
> The words that dropped from his sweet tongue
> Strengthened our hearts."

And this, also, is after his best fashion:

> "I have my trials. Time has laid his hand
> Upon my heart, gently, not smiting it,
> But as a harper lays his open palm
> Upon his harp, to deaden its vibrations."

The humor of Lucifer's soliloquies, in the Church and elsewhere, is characteristic of both Goethe and Longfellow, and therefore German with a difference. But all phases of our poet's verse and fancy are to be observed in this brilliant conglomerate. And what rare materials are brought together! Here are revived the oft-told jest of Brother Felix, Walter the Minnesinger, Lucifer and the Black Paternoster, the monkish chants and anthems, the Miracle Play, the disputes at the School of Palermo! The richest passages are those contrasting the Cellar and Refectory scenes with the prayer-like labor of Brother Pacificus illuminating the Gospel in the Scriptorium above. These, with many beautiful counterparts, lighting page after page, move one to accord with those who regard "The Golden Legend" as a piece in which the poet's versatile genius is seen at its best. Though not the work of a natural dramatist, it is vastly superior to the prosaic fabrics which are attached to it, and which fail to grow upon the reader in spite of this forced association.

A posthumous drama, "Michael Angelo," while having the dignity that becomes its theme, does not change our view of the author's limitations. It contains elevated passages, mostly the soliloquies of the great artist, of whom in his old age it may be termed a sympathetic study, and is worth pursuing, even for something more than the perfect sonnet which forms the Dedication.

Were I to select one from the poet's long succession of books to fitly illustrate his traits, I might name the little volume of 1849, with its two divisions, "By the Seaside" and "By the Fireside." "The Building of the Ship" is the best example of his free-hand metrical style,—musical, wholesome, and suggestive of an imagination that takes heat from its own action. This celebration of a manly and poetic form of handicraft is simply cast, yet full of energy and spirit. At the close, a sunburst of patriotism, the superb apostrophe to the Union, outvies that ode of Horace on which it was modeled. In conception and structure the poem, while thoroughly national, is akin to Schiller's "Lay of the Bell." I think that the minor lyrics in this volume, from "Chrysaor" to "Gaspar Becerra," warrant my liking for it, and are peculiarly representative. The author long afterward supplied companion-pieces, "The Hanging of the Crane" and "Keramos," to his idyl of the ship-yard. His reputation now made the production of each of these a literary event; just as any late and brief work of a favorite composer sends a murmur of interest through the musical world. Such afterpieces earn for artists, in the ripeness of their fame, a more sudden reward than greater efforts which preceded them. All things come around at last, and often come too late. But Longfellow again and again received his crown of praise; and this the more frequently in return for service in which he was easily first,—the art which gained for an old-time minstrel a willing largess, that of the recounter, the teller of bewitching tales. His station as a poet was not advanced by the different installments of the "Tales of a Wayside Inn," but it was much to have the delight of giving delight, as often as each appeared, to a host of unseen readers. And so in the end they formed his most extended work: a series of short stories, mostly gathered from older literatures, translated into his varying and crystalline verse, and linked together, like the tales of Boccaccio and Chaucer, by a running commentary of the poet's own. The selections are good of themselves, and the conceit of the gathering of the poet's friends at the Sudbury Inn brought them near to the interest of his audience. Nothing could be better than the prelude. A transfiguring portraiture from life is that of the musician, Ole Bull. The tales here told in song for the first time, all of them Colonial, are but four in number,—few indeed, among so many gleaned from the Decameron, the Gesta Romanorum, "the chronicles of Charlemagne," and "the stories that recorded are by Pierre Alphonse." Here is the semblance of a master effort, but in fact a succession of minor ones; we perceive that no great outlay of imaginative force was required for this kind of work. With Longfellow's lyrical facility of putting a story into rippling verse, almost as lightly as another would tell it in prose, we find ourselves assured of as many poems as he had themes. Less subtle and refined than Morris, he was a better recounter. This was due to a modern and natural style, the sweet variety of his measures, and to his ease in dialogue. He intersperses many realistic passages, and by other ways avoids the monotony of the "idle singer of an empty day." As for poetic atmosphere and all the essentials of a select work of beauty, the "Tales" cannot enter into comparison with "The Earthly Paradise." Longfellow's frequent gayety, and constant sense of the humanities, make him a true story-teller for the multitude; not, like Morris, an exquisite, dreamy singer for companions of his own guild.

His version of "The Divine Comedy" is one of the most signal results of American labor in the department of translation. There was nothing in the work of his predecessors to prevent the task from being not only a matter of attraction, but a duty; no one, on the score of talent or acquirements, was better fitted to renew an attempt which from its conditions never can be perfectly successful. His life-long study of Dante's text had brought to this natural translator that knowledge of it which was more than half the achievement. The theory of his version was the modern one (which it helped to confirm), —that of recent and noted English translations, and of Taylor's "Faust,"— to wit, a literal and lineal rendering. Unlike Taylor, Longfellow had but one measure to reproduce, and he discarded the rhymes altogether, while striving to convey the rhythm and deeper music of the sublime original. It was fitting that the neighborhood of Cambridge, whose poets and scholars were for the most part sympathetic lovers of Dante, should furnish a new translation of the Commedia, and that Longfellow—less brilliant than Lowell, whether as a poet or a student, but his superior in patient industry and evenness of taste—should be the one to make it. We are told that his work received, from time to time, the criticism of a pleiad of his friends. Certainly it was brought to birth with heralding by Norton,—the classical translator of "Vita Nuova,"—Howells, Greene, and others of the group. As for the discussions which ensued upon its merits, my impression is that points were well taken on both sides. Various other translations of Dante were appearing about this time—the six-hundredth anniversary of the Tuscan's birth: in Great Britain, those of Dayman, Ford, and Rossetti; in America, Dr. Parsons's "Inferno" was before the public,—seventeen, cantos in the rhymed pentameter quatrain not so literal as Longfellow's, but the noble performance that one might expect from the author of the "Lines on a Bust of Dante." The best of the English triad was that of Rossetti. It bears the stamp of a master-hand, yet has so many blemishes, and is here and there so awkward, as to be on the whole less satisfactory than Longfellow's, to which it is kindred in principle and method.

The reader of Longfellow's pages is secure of a faithful reproduction of the original order and meaning and of Dante's manner—so far as the latter depends on linear arrangement. All these are of the highest value, if the vital and pervading style of the lofty Florentine can likewise be transferred. The ideal translator will reproduce all these—the sense, the metrical arrangement, the grandeur of tone. Until his arrival, if one of these must be sacrificed, it cannot be the first, and it should be, I think, the second rather than the third. One would prefer a prose rendering of the same rank with Mr. Lang's "Homer" and "Theocritus" to a feebly correct transcription in English verse. Longfellow certainly aimed to meet all the foregoing requirements, and in his case a complete failure was scarcely possible, even with respect to the third. But his gifts as a translator never were more conspicuous than when, in youth, he paraphrased and almost recreated so many lyrics from the German and other tongues. Applying a literal method to the Commedia, his genius is less evident than his talent and conscientious self-restraint. What he did was to translate the whole work, line for line, almost as literally as a class recitation, and this, barring a few archaisms, with much simplicity and smoothness. Except in the more abstruse cantos, the appearance of ease is so marked that one gives credit to the story that the poet, with his facility and mastery of the text, accomplished his task in a few years by writing a stated number of verses each morning, while waiting for his coffee to boil. If this were the fact, it would not do to estimate the feat by it. Where a man's genius lies, there he works with ease, and often undervalues the result; elsewhere, he "labors." There is nothing labored in Longfellow's translation; the fault is of another kind: we lose, amid all its simplicity, the "grand manner," as Mr. Arnold would call it, of the divine master. A neophyte misses what he expected to realize of the unflinching strength and terror of the Inferno, the palpitating splendor of the Paradiso. The three divisions seem leveled, so to speak, to the grade of the Purgatorio, midway between the zenith and nadir of Dante's song. This shortcoming is to be felt, rather than proved, and tells in favor of Parsons's translation, and of others greatly inferior to this as a whole. Even Cary's old-fashioned paraphrase, full of Miltonic inversions and epithets, and thoroughly open to Bentley's strictures on Pope's "Homer," has exalted passages that justify its survival to our day. Longfellow's genuine scholarship led him to pursue his method, once determined on, without the slightest protrusion of skill and learning. Grace is added by the frequent use of feminine endings,—a habit natural to Longfellow, and increasing the likeness of his own to the original verse. But his rendition of many Italian words by English derivatives, which often have quite lost the etymological meaning, is an error made in the interest of extreme fidelity and really

telling against it. A kindred one is the use of derivatives in which the primitive meaning is not lost, but which do not translate the text to English ears so effectively as their Saxon synonyms. For instance, most of the translators—Wright, Cayley, Ford, Rossetti, etc.—have made havoc with the inscription over the gate of hell:

> "Per me si va nella città dolente;
> Per me si va nell' eterno dolore;
> Per me si va tra la perduta gente."

Longfellow's rendering is superior to all the rest:

> "Through me the way is to the city dolent;
> Through me the way is to eternal dole;
> Through me the way among the people lost."

Yet here is a forced translation of the word "dolente" by a derivative which, to English readers, is not an *equivalent*. Besides, a more effective expression of anguish can be gained by the use of a Saxon word. One step further would have made Mr. Longfellow's rendering perfect: he might have escaped an inversion, and have matched the verbal repetition in the first two lines, after this wise:

> "Through me the way is to the woful city;
> Through me the way is to eternal woe."

Reading the whole work, and accepting the late Mr. Greene's opinion that the characteristics of Dante are Variety and Power, I think that the evenness of Longfellow's method robs us of the former; and as for the latter, it is the one thing which the lay reader of this translation, unrivaled as it is in many respects, does not adequately feel.

The reflex influence of this labor was apparent in the elevated nature of his later poems. It is true that he occasionally used his new diction in a prosaic or weary manner. Of this, such a line as "The spiritual world preponderates," from the sonnet to Whittier, is an extreme instance. Otherwise, a firmer poetic quality was observable after this date. The sonnets which he now wrote, few as they are, entitle him to a place in the most select circle of modern poets. They rank with the best written in our century. Where, in fact, throughout the whole galaxy of English sonnets, is there a group surpassing the six which accompanied the Dante volumes? Rhythmic, perfect in structure, and full of beauty, they have captured the spirit of the Divine Song. A series written in the poet's old age, his tributes to the memory of comrades gone before, has a pathetic charm. Still later was composed the sonnet "Nature," which must be accounted one of the choicest in any language upon the theme to which its title is but a pass-word:

> "As a fond mother, when the day is o'er,
> Leads by the hand her little child to bed,
> Half willing, half reluctant to be led,
> And leave his broken playthings on the floor,
> Still gazing at them through the open door,
> Nor wholly re-assured and comforted
> By promises of others in their stead,
> Which, though more splendid, may not please him more;
> So Nature deals with us, and takes away
> Our playthings one by one, and by the hand
> Leads us to rest so gently, that we go
> Scarce knowing if we wish to go or stay,
> Being too full of sleep to understand
> How far the unknown transcends the what we know."

This is, however, singularly like the translation, by Leigh Hunt, of Filicaja's sonnet on Providence, quoted by Longfellow himself in the notes to the Paradiso. With lessening use, the poet's touch lost little of its delicacy and poise. The few pieces brought together in "Ultima Thule" indicate that his ruling sense of art was clear as ever; nor was it finally dulled, like Emerson's bright intelligence, by a veil of darkness slowly drawn. He ceased from service almost without forewarning, and because his work was done.

V.

Few poets have been more restricted to fixed habits of composition. His mode was perfectly obvious and unchanged, save by greater refinement, during fifty years. Everything suggested an image, except when his imagery suggested the thought of which he made it seem a reflection. He tells us that

> "Bent like a laboring oar that toils in the surf of the ocean,
> Bent, but not broken, by age was the form of the notary public";

and we feel that the image really grew out of a poet's conception of his personage. But again, looking upon "drifting currents of the river," or finding the day "cold and dark and dreary," or listening to the belfry-chimes, he hunts about for some emotion or phase of life which these things aptly illustrate. This process not seldom becomes a vice of style. He constantly applied his imagery in a formal way,—the very *ut . . . ita* of the Latins, the *as . . . so* of the eighteenth century. But whether his metaphors came of themselves, or with prayer and fasting, they always came, and often were novel and poetic. A more trying habit was that inbred, as it seems, with the New England poets,

most of whom have preached too much in verse. He tacked a didactic moral, like a corollary of Euclid, on many a lovely poem. No one better knew that "nothing is poetry which could as well have been expressed in prose," but the habit formed in youth seemed beyond his control. Still, it was through this habit that he became the most popular of University poets, and as a moralist no one could make commonplace more attractive. Lastly, the bookish flavor of his work is at once its strength and weakness: the former, because the very life of his genius depended on it; the latter, because poetry that is over-literary is so much the less creative, and is otherwise open to the objections brought against literary art. Browning's fondness for black-letter is redeemed by dramatic vigor. In reading Longfellow, we see that the world of books was to him the real world. From first to last, if he had been banished from his library, his imagination would have been blind and deaf and silent. It is true that he fed upon the choicest yield of literature; his gathered honey was of the thyme and clover, not the rude buckwheat. Take, for instance, the "Morituri Salutamus," read before his surviving classmates on the fiftieth anniversary of their graduation. Was there ever anything more beautiful, in view of the occasion? Is not the title itself a stroke of genius? But the title also defines the method of the poem: there are more than twenty learned references in this piece of less than three hundred lines, including one entire tale from the "Gesta Romanorum." He had, we see, this way of working, and for once it resulted in a poem that is the model of its kind.

As for Nature, he usually saw it as polarized by reflection from the mirror Art. Whether in or out of his study, he had not Emerson's interpretative eye, and his report of landscape and the country life was less genuine than Lowell's or Whittier's, not to mention the younger poets. He rarely ventured beyond the simple outlook from his mansion door. The effect of the rain, the mist, the night-fall, upon his own spirit, is what he gives us, in the manner of some landscape of the French subjective school. A starry event, the occultation of Orion, at once becomes a glorious image of the triumph of Love over Force. In "Evangeline" there are refined pictures of scenery that was familiar to him, with just as pleasing descriptions of that which he knew only through his books. He painted the landscape of half Europe in the same way, always a cosmopolitan, never the genius of the place. The flower-de-luce, with its heraldic associations, is the emblem after which he names a volume. But with respect to still life and common life, the true *genre* touch of "The Old Clock" and "The Village Blacksmith" grows firmer in "Miles Standish," where he draws so well the Plymouth interiors, the Puritan maiden at her wheel, the elders, and men-at-arms. And look! how he describes what of all is nearest his heart, an olden volume:

> "Open wide on her lap lay the well-worn psalm-book of Ainsworth,
> Printed in Amsterdam, the words and the music together,
> Rough-hewn, angular notes, like stones in the walls of a church-yard,
> Darkened and overhung by the running vine of the verses.
> Such was the book from whose pages she sang the old Puritan anthem."

I more than half recant the statement that Longfellow was not a poet of Nature, bethinking myself how justly others have maintained that he was by eminence our poet of the Sea. He clung to the coast: looking inland, he cared most for the tide-meadows of his neighborhood; looking oceanward, his fancy throve upon the omens, the mysteries, the perpetual fascinations of "sea from shore." He loved his mighty rock-girt bay, the lights and beacons, the mist and fog-bells, the sleet and surge of winter, the coastwise vessels; and its memories were the drift-wood with which he kindled "thoughts that burned and glowed within." His imagination goes out to "the ocean old," the "gray old sea" of storms and calms; to its winged frequenters, the ancient galleons, the fleets of conquest and embassy and traffic. The names of sunny isles and far-off lands were music to him. If by chance our fireside magician drowned his books deeper than did ever plummet sound, and sang from a poet's heart alone, it was when he returned again and again to capture and repeat for us the haunting "secret of the sea."

Reviewing our survey of his work, I observe that each of his best known efforts has led to the mention of prose or verse by some other hand which it resembles. In view of the possible inference, we now may ask, Was Longfellow, then, with his great reputation and indisputable hold upon our affections, not an original poet? It must be acknowledged, at the outset, that few poets of his standing have profited more openly by examples that suited their taste and purpose. The evidence of this is seen not in merely three or four, but in a great number of his productions,—in his briefest lyrics, in his elaborate narrative poems. Like greater bards before him, he was a good borrower. Dependence on his equipment led to unconscious assimilation of its treasures.

But originality is of more than one kind. As we say of some people that they have a genius for friendship, so his sympathy with the beautiful, wherever he found it, was unique and tantamount to a special inspiration. The proof of his originality, however, even where he was least inventive, hardly requires this paradox: it did not consist in word or motive, but in the distinctive tone of the singer, the sentiment of voice which made his performances in a sense new songs; in an air, a suffused quality, which rendered every phrase unmistakable. If he borrowed freely, he was freely drawn upon by others in their turn. Scores of followers have caught a manner that shows to poor advantage when transferred; but his position for years, at the head of even a sentimental school, indicated that Longfellow was not without a genius of his own.

Apart from certain exceptions already noted, his bent was cosmopolitan. He had the Anglo-Saxon longing of the pine for the palm, a love for the softer winds and skies, the pliant languages, of Italy and Spain. Besides the example of his works, we have his written theory of what our literature should be. His Mr. Churchill, in "Kavanagh," declares that in literature "Nationality is a good thing to a certain extent, but universality is better. All that is best in the great poets of all countries is not what is national in them, but what is universal. Their roots are in their native soil; but their branches wave in the unpatriotic air that speaks the same language unto all men. * * * I prefer what is natural. Mere nationality is often ridiculous." And again, "Our literature is not an imitation, but a continuation of the English." He insists upon originality, but "without spasms and convulsions." * * * "A national literature is not the growth of a day. Centuries must contribute their dew and sunshine to it. * * * As for having it so savage and wild as you want it, * * * all literature, as well as all art, is the result of culture and intellectual refinement. * * * As the blood of all nations is mingling with our own, so will their thoughts and feelings finally mingle in our literature. We shall draw from the Germans tenderness, from the Spanish passion, from the French vivacity, to mingle more and more with our English solid sense. And this will give us universality, so much to be desired." With regard to all this, it may be said that Longfellow's service, important as it was in his time, is not that required of his successors. The greatest poets have been those who conveyed the spirit of their respective nationalities. That poetry is truest which is universal in its passion and thought, but national in motive and in all properties of the craft. The final outcome of American ideality will depend on conditions which our best thinkers are investigating, and which give rise to conflicting theories. Herbert Spencer's recent utterance is somewhat in accordance with Longfellow's views: "Because of its size, and the heterogeneity of its components, the American nation will be a long time in evolving its ultimate form, but its ultimate form will be high." And again: "From biological truths it is to be inferred that the eventual mixture of the allied varieties of the Aryan race forming the population, will produce a finer type of man than has hitherto existed." This agreeable prediction may seem too optimistic; but the future type of poetry certainly will represent the future type of man. Without debating the question whether we now are forming loam for a distinct growth, or whether our literature is to be a "continuation" merely, we may be sure that both here and in foreign lands new types of genius will appear, we know not how or why, and add new species to the world's *flora symbolica* of art and song. Longfellow, if not a prophet, was a pioneer,—by choice an apostle of the best traditional culture. His verse is not of a kind to make its admirers indifferent to any other,—an effect, whether for good or ill, sometimes produced by Browning's, Emerson's, and Whitman's,—but that which, however elementary, promotes a taste for higher ideals. It is due to such as he that we have passed the age of nursing, and are now less satisfied with what is not primarily our own. That the best equipped section of the country should produce him was in the order of events: other things being equal, that region is most American which has been so the longest, and the frontier steadily grows to resemble it.

In England, Longfellow has been styled the poet of the middle classes. Those classes include, however, the majority of intelligent readers, and Tennyson had an equal share of their favor. The English middle classes furnish an analogue to the one great class of American readers, among whom our poet's success was so evident. This was because he used his culture not to veil the word, but to make it clear. He drew upon it for the people in a manner which they could relish and comprehend. Would not any poet whose work might lack the subtlety that commends itself to professional readers be relegated by University critics to the middle-class wards? Caste and literary priesthood have something to do with this. Were it not for "Lucretius" and "In Memoriam," the author of "The May Queen" and "Locksley Hall" and "Enoch Arden" would be in the same category; as it is, he scarcely escapes it in the

judgment of both the psychologic and neo-Romantic schools. Yet the poetry of analytics has not outlasted, in the past, that which came without gloss or obscurity, and whose melody and meaning appealed to one and all. That a poet's verse should require a commentary in its own day is not, all things considered, the best omen for its hold upon the future. But the point taken with respect to Longfellow is not unjust. So far as comfort, virtue, domestic tenderness, and freedom from extremes of passion and incident are characteristics of the middle classes, he has been their minstrel. And it is true that a cold, or even temperate quality is deadening to the higher forms of art. The creative soul abhors ennui; it glows in dramatic self-abandonment. Poets "of passion and of pain" concentrate their lives in some burning focus whose dazzling heat devours them; they suffer, but mount on their own flame. Without passion and its expiations, without the mad waste of life, and even crime and terror, where are our noble tragedies, our high dramatic themes? The compensation of man's anguish is that it lifts him beyond the ordinary. Superlative joy and woe alike were foreign to the verse of Longfellow. It came neither from the heights nor out of the depths, but along the even tenor of a fortunate life. I do not mean that he was exempt from mortal ills; he had his dark experiences, but at the mature age that has learned "what life and death is," and of them he gave little sign. If sorrow and rapture are from within, rather than from without, it may be that our benignant poet, alike through circumstance and temperament, was spared the full extremity of discipline signified in the translation from Goethe:

> "Who ne'er his bread in sorrow ate,
> Who ne'er the mournful midnight hours
> Weeping upon his bed has sate,
> He knows you not, ye Heavenly Powers."

Not his the agony and bloody sweat. We may conjecture that, aside from one or two fierce episodes, he was less tried in the furnace than poets are wont to be. From the first he had what he desired,—congenial work and associations, advancement, the love of women and friends, appreciative criticism, the pure wheat and sweet waters of life in plenitude. He had lovely things about him, and gratified his artist nature to the full, while so many makers of the beautiful are condemned to Vulcan's cavern of toil and smoke. He had the best, as by right; and in truth the world, if it only knew it, can afford to keep a poet or artist in some luxury, like a flower for its perfume, a hound for beauty, a bird for song. If Longfellow's regard fell upon ugliness and misery, it certainly did not linger there. "The cry of the human" did not haunt his ear. When he avails himself of a piteous situation, he does so as tranquilly as the nuns who broider on tapestry the torments of the doomed in hell. He wrote few love poems, none full of longing, or "wild with all regret"; but this might come from the absolute content of his soul,—he had gained the woman whom he idolized, and songs of passion are the cry of unfulfilled desire. His song flows on an equal course, from sunny fountain-head to darkling sea; and even upon that sea he finds repose, for its billows rock to sleep, and no cradle is more peaceful than the grave. Thus fair, gentle, fortunate,—could such a poet answer to the deepest needs of men? Allowing for the factor of imagination, we still see that Longfellow shrank from efforts that would react too keenly upon his sensibilities. He touched the average heart by the sympathetic quality of a voice adjusted to the natural scale. People above or apart from the average—sufferers, aspirants, questioners—are irked by his acceptance of life as it is and his enjoyable relations to it. There is something exasperating to serious minds in his placid waiver of things grievous or distasteful. They ask what cause he has advanced, how has he enlarged the province of thought, what conflict has he sung? Where are his rapture, his longing, his infinitudes? They see his fellow-poet, less prosperous and accomplished, who defied obloquy, and rose to passion in denouncing wrong,—a man of peace, yet valiant as Great-Heart in behalf of freedom and the rights of man. Here was another, who sought out the inmost laws of spiritual life. But why expect a poet to be other than he is? Recognize the instinct that defined his range, and value the range at its worth. Longfellow spoke according to his voice and vision. The attempt to do otherwise ends all. A critic must accept what is best in a poet, and thus become his best encourager.

So far as good fortune may be supplemented by human wisdom, Longfellow was a man after the preacher's own heart. His was one of those happy natures which, as Thackeray says, are softened by prosperity and kindness. He was saved the torment that the envious feel:

> "He did not find his sleep less sweet
> For music in some neighboring street;
> Nor rustling hear in every breeze
> The laurels of Miltiades."

We have seen his tact in the choice and use of things pertaining to his work, his carefully restrained decoration, his knowledge of limitations, which prevented him, except in

the dramatic experiments, from groping for impracticable means and results. The forms which he introduced or revived were as successful as Tennyson's; in fact, his product represents the full advance of American taste and feeling, during the period covered by it, though not our most significant thought. He was a lyrical artist, whose taste outranked his inspiration; and assuredly, if he had been a Minister of the Fine Arts, he never would have abolished an École at the dictation of the "impressionists," nor have adopted as a motto the phrase "Beware of the Beautiful." We have noted his industry and the self-control with which he devoted his life to poetry alone. Yet the report of his library talk shows that his brain was alert upon many topics; that in private, at least, he did not reserve his talents for his publisher,— an economy which a French critic declares to be "a bad sign, and the proof that one makes a trade of literature, and that one does not really have the impressions he assumes to have in his books." His verse is peculiarly open to the test of Milton's requirement, that poetry should be simple, sensuous, passionate. Simple, even elementary, it manifestly is, despite the learning which he put to use. It is sensuous in much that charms the ear and eye, and in little else; for the extreme of sensuousness is deeply felt, and feeling results in passion, and passionate the verse of Longfellow was not, nor ever could be. His song was a household service, the ritual of our feastings and mournings; and often it rehearsed for us the tales of many lands, or, best of all, the legends of our own. I see him, a silver-haired minstrel, touching melodious keys, playing and singing in the twilight, within sound of the rote of the sea. There he lingers late; the curfew bell has tolled and the darkness closes round, till at last that tender voice is silent, and he softly moves unto his rest.

Edmund C. Stedman.

THROUGH WATERSPOUT AND TYPHOON.

We had just left the Philippine Islands,— the clipper *Wasatch*, bound for New York, with some fifteen hundred tons of sugar,— and were then bowling easily across the Celebes Sea toward the Straits of Macassar, with the last of the south-west monsoon. Very little wind seemed left in the bag, for as the ship lifted on the remnants of the long Pacific rollers, the sails lost their snowy fullness, and slapped shudderingly against the spars and rigging; the reef-points rattled like hail, the masts creaked in their fiddings, and the yards jerked uneasily at the braces. The whole ship had a rattling, unsteady, loose-jointed motion, until she rolled ponderously to windward again and tautened everything with a quick jerk that seemed powerful enough to carry away the lighter spars. We had a long voyage before us with much of this rattle-and-bang sort of sailing, until we reached the steady trade winds of the Indian Ocean; so all hands were busy making and putting on chafing-mats to protect those parts of the rigging most exposed to wear in this continual shaking. As we were only a few degrees north of the Line, the weather was decidedly warm. The hot sun overhead and not a cloud in the sky, the light reflected from the myriad ripples in the water as though from mirrors, the planks hot enough to blister our feet, with the pitch starting from the seams and knots, all combined to make the intermittent fanning of the shaking sails very acceptable.

The monsoon was about breaking up; and although the sky was now as serene as possible, unsettled weather, with violent squalls, was to be expected.

It was with such surroundings that I left the ship when I went below at eight bells, turned into my bunk, and soon fell asleep.

I was roused by the boatswain thrusting his head hurriedly in at the door and saying, "All hands shorten sail, Mr. Ratline. A water-spout to windward, sir!" Bounding up, I soon jumped into the few clothes necessary in that latitude, and ran on deck.

What a sight! To leeward the sky, air, and water were, as before, hot, breathless, and glittering; but to windward a vault of billowy black nimbus cloud, rent by incessant lightning and acting as an immense reverberator for the thunder which rolled along over the water, crash after crash, shaking the ship like a leaf, until it was almost deafening. The lower surfaces of the clouds were torn into white and ragged fragments, and these were spun and blown about by the resistless currents of the whirlwind, while in the center of the mass, like a sturdy Jewish column supporting the vast dome, writhed an enormous water-spout. Within a radius of many

rods about its twirling base the sea was lashed into boiling fury, and rose and fell in irregular tumultuous waves, whose crests were whipped off by the wind and blown hither and thither like smoke.

One accustomed only to the temperate zones can not appreciate the awful grandeur of the more violent atmospheric disturbances of the tropics. Man's puny endeavors seem so doubly unavailing against the infinite power of nature's forces, that the individual is almost overwhelmed by his own insignificance. So it was with us that day. There seemed to be no way of escape. The spout was dead to windward, and bearing down upon us with fearful speed. Already its roaring was in our ears. All hands were working for their very lives to get sail off the vessel, pulling and hauling like steam engines every one of them, and jumping aloft like monkeys to roll up the slatting canvas. For once, Captain Mason lost his habitual coolness and seemed almost beside himself with excitement and apprehension. When I came on deck, the ship was beginning to heel over from the effect of the outside currents of the whirlwind upon her bare spars and half-furled canvas. Our signal howitzer had been unlashed by the cabin-boy and the captain shouted, "Mr. Ratline, will you serve that gun." I sighted the piece and pulled the lock-string with such a trembling hand that the ball missed its mark, and called forth a cry of disappointment from those aloft, who had watched its ricochet course with the eagerness of men intent on a forlorn hope. "Load again!—quick, for God's sake!—load again!" This time the ball went crashing through the watery column, but with no more effect than if my piece had been a popgun. There was no time for another shot. The ship was now staggering under the violence of the wind. The men aloft, knowing the insecurity of the spars, came sliding down the back-stays in their haste to reach the deck. Every second the force of the wind was stronger, bearing the good ship down upon her beam ends as a skillful wrestler forces an antagonist to his knees. Slowly the cloud began to swing around, and we backed our bare main yards to deaden any headway the ship might now have, until we could get some little patch of sail up forward to pay her off from the wind, and thus escape the spout, which in its altered course we hoped would pass ahead of us. Suddenly the half-furled mizzen top-sail blew from the gaskets, and filling out like a balloon sent the ship spinning around toward the wind and tearing through the water as though she had all sail set. "Up helm, there—run up the foretop-mast stay-sail—keep her away!" shouted the captain wildly through his hands. One of the ordinary seamen was at the wheel, and I saw him jamming down the spokes in his vain endeavors to move the helm. Calling to one of my watch to follow, I sprang to the wheel, and with our united strength had the helm hard up, when the foretop-mast stay-sail they were trying to set forward blew clear from the boltroping at the first slap, and it became a certainty that all our endeavors were fruitless, and the water-spout must strike us. The ponderous fabric of the vessel, quivering like a whale at the stroke of the harpoon, was tossed like a cork on the seething base of the column. Her masts bent like coach-whips before they snapped. Great patches of canvas were torn from the yards, and spreading out, sped off like frightened ghosts, their long arms of tatters waving wildly as they vanished in the misty air. Each man almost involuntarily secured himself as best he might, and in an instant more the water-spout was upon us—with a roaring and bellowing as of a thousand demons, the cannon-like crash of breaking spars, the snapping of cordage, and the rending of timber. Then an irresistible rush of water poured down upon the deck, seemingly with the concussions of Niagara; it bore me back against the wheel-casing, and held me as in a vise, tore off my shirt and shoes, and pressed with such a weight upon my chest that my eyeballs almost started from their sockets, and I thought I had been caught under a falling spar.

A moment of deathlike stillness succeeded this awful pandemonium, and then the rain fell, not in drops, but in solid masses that beat us down upon the deck, filled our eyes, mouths, and nostrils, and nearly drowned us. The decks were afloat even with the tops of the demolished bulwarks; and ropes, and half-alive but struggling men were washing back and forth as the ship's bare hulk rolled about in the trough of the sea.

When I recovered from the shock of being half drowned and half crushed, and had succeeded in getting my breath and dashing the water from my eyes, I saw—instead of the gallant clipper of an hour before, whose graceful build and lofty spars excited the admiration of every seaman and made the *Wasatch* the "smartest" ship in port, wherever she went—instead of this, a dismantled wreck shorn of every semblance of her former beauty. Our fore and mizzen masts were gone close to the deck, and the mainmast had been taken out bodily from the stepping, tearing up the deck from rail to rail as it went. Of the forward house and forecastle, not a vestige remained. The bowsprit was twisted off

close to the stem, and both bulwarks were gone from the bows clear aft to the quarter-deck. The cabin was partly unroofed, and the body of the captain's son was visible, jammed into a corner of the companion way, broken and crushed into an almost unrecognizable mass. As soon as they were able, the remnant of the crew crawled aft to the quarter-deck. Instead of our complement of twenty-five, we only mustered eleven. The captain and mate were gone; the cook and steward had vanished with their galley. There were six of the men, one with a broken arm, the boatswain with a wound in his head deluging his face with blood, the carpenter, two of the boys, and myself left in command. Getting out the medicine chest, I at once began to dress the hurts of the wounded men, and gave the order to clear away the wreck. It was considerable of a surprise when the men returned saying that there was no wreckage to clear away. Such had been the force of the whirlwind, that all our heavy top-hamper had been entirely torn away. Not a spar or a timber, except a few odds and ends, was hanging by the ship, but pieces of both could be seen heaving about in the swell for a mile or so to leeward.

Where the mainmast had been torn out, the gaping decks revealed the hold half full of water, swashing around amongst the sugar bags, while at every roll of the shattered hulk tons of it burst in over the stumps of the demolished bulwarks. The pumps were nearly destroyed in the general upheaval of the decks in their vicinity. The carpenter immediately went to work upon them, while the rest of us broke out old sails from the locker to nail over the openings in the decks, and stretched life lines along fore and aft.

To the stump of the mizzen mast we lashed a studding-sail-boom, and on it spread an old try-sail. This kept the ship nearly head to wind, decreasing the rolling motion, and preventing the deluge of water upon the decks, so that we could work with greater safety and expedition. The afternoon was now well advanced, and we were sadly in need of food. The galley in which our dinner had been preparing was completely gone, and on further investigation we found that the mainmast in its fall had torn out the forward end of the store-room under the half deck, emptying overboard nearly all our provisions. What little of perishable goods remained were about spoiled by salt water. Hastily conveying this remnant of our former supply into the after-cabin, I detailed as steward a man who had served in that capacity on a former voyage, and told him to save all he could, and try to improvise a galley out of the cabin heater.

As I turned to go on deck, my eyes fell on the crushed body of little Ben — poor boy! He had begged to go to sea, and live among the incidents he had heard his father relate in his short visits to their Connecticut home; and much against his mother's wishes, the captain had taken him on this voyage. He was a bright, active lad of about twelve. I had taken a great fancy to him, and had endeavored to teach him all that a second mate could of seamanship and navigation. Tenderly taking up his lifeless form I placed it on the cabin table, and spread an ensign over it. Returning to the deck, I found that the sun was out again. The sky, air, and water were as placid and innocent-looking as they had been before the squall. The heavy sea had nearly subsided, and the wind, but a few hours ago a tornado, had now failed utterly. The ship rolled slowly but heavily in the trough of the sea, the water in her hold rushing back and forth through the cargo with a force that made the hulk tremble in every timber. Its rumbling and gurgling sounded as if we were over a volcano. By this time the men had covered all the breaks in the deck and sides, as far as possible, with plank and canvas, and water was no longer taken in in large quantities, although there must have been enormous leakage both there and through the vessel's seams, which had been opened by the awful strain to which she had been subjected. The carpenter reported that he had so far succeeded in repairing the pumps that two of the cylinders could be used. There were eleven of us all told; one was not able to work because of his broken arm, which, I fear, was badly set, and we had five men in a watch, one for the wheel and four for the pumps. As one watch would be weakened by the absence of the steward in preparing our meals, I placed him in my watch, because the boatswain, who, of course, was in charge of the other watch, was but little better able to work than the man with the broken arm, the jerking motion of the pumps making his wounded head very painful. There was fully eight feet of water in the hold, bringing our decks amidships nearly even with the surface of the sea. After working all hands at the pumps for about an hour and a half, we lowered it not quite a foot. It was very fatiguing work. Our pumps were of the old-fashioned pattern, with brakes and plungers like a hand fire-engine, but they were large and would raise about five gallons at a stroke. The falling mainmast had so thoroughly bent and twisted them, that it was with the greatest difficulty they were made to work at all, and then with so much friction that we could not give more than twenty strokes without a rest.

Larsen, the steward, now announced that he had a jury-meal rigged up in presentable shape. As little Ben lay on the cabin table, I told him to bring up the dinner, and we would mess on deck.

I now had leisure to question the survivors of the port watch about the water-spout, and ask how it happened that the ship was caught so unprepared. They said they were all seated on deck as I had left them when I went below, making mats, the mate and boatswain both among them giving directions, leaving, for the time, no one actually on the lookout except one of the boys at the wheel. He was somewhat green at steering, and consequently must have kept his eyes fast on the compass card. Our high bulwarks forward shut out the horizon from the men on the main deck, and the sky was so bright overhead that no one thought of the squall, which came up with exceptional rapidity, even for those latitudes, until they were called into action by a clap of thunder and the "old man" suddenly appearing on the poop and singing out, "Clew up the royals!" The squall had promised to be one of only ordinary severity, until the boys who had gone aloft to furl were down again, and standing by the top-gallant gear with the rest, when, as if by magic, the water-spout was formed. All hands were then called and set to work in earnest to take in the kites. It was almost laughable, in spite of the gravity of our surroundings, to see some of the men handling the cabin china, and their look of contempt upon the fancy stores—canned vegetables, sardines, and the like,—of which the greater part of our repast consisted; for the more costly supplies, having been kept in lockers, formed the bulk of what we had saved, and the steward informed me that the stock of salt beef was so scanty that we would need to be exceedingly careful of it. After dinner I tossed up with the boatswain for the watch, and as it fell to his lot I left him to do what he could toward rigging jury-masts, and went below. On the captain's desk I found the half-worked *Sumner's* sight of the morning, which I finished, and, allowing for our drift, found that we were in latitude 3 degrees 15 minutes north, longitude 163 degrees 41 minutes east, or almost the center of the Celebes Sea. Plotting down this position on the chart, it appeared that Cape Rivers, on the island of Celebes, was the nearest land, bearing S. by E. 125 miles. This was so nearly to windward that we could hardly hope to reach it under jury-masts.

The nearest islands of the Sooloo Archipelago bore about N. W. by W., nearly 200 miles away. There was every reason for trying to reach Celebes. The Bughis were semi-civilized and friendly to Caucasians, and their propensity for trading with the neighboring islands and passing ships would give us a good chance to reach some frequented port.

On the other hand, if we merely succeeded in keeping the wreck afloat without thought of progress or direction, we would eventually drift into the Sooloo Islands. Many of them were uninhabited, and in fact incapable of sustaining life, while the people of the fertile groups were cruel, piratical, and, by common report, cannibals.

At eight bells, when the watches were changed, we buried poor Benny, who had, in the meantime, been sewed up in his blanket. The loss of the captain, mate, and the missing members of the crew was taken by the survivors almost as a matter of course—as part of a seaman's lot. They had been washed overboard or taken up by the whirlwind, leaving nothing but vacant places as a reminder of their absence; but the crushed form of the captain's boy affected the men visibly. He was not properly part of the ship's company, and, as such, could not be expected to bear any of the hardships or dangers of the voyage. He had been a universal favorite among the crew, having won them by his manliness, kindness, and quickness in learning all matters pertaining to his father's profession. When the little bundle lying there on the wheel-grating, covered by the flag, was launched over the rail and fell with a dull splash into the leaden surface of the sea, the rough men turned away with a sob, and, brushing away the gathering tears, endeavored to hide their emotion by coiling down now useless ropes' ends or anything they laid hold of first, and I hurried below more to conceal my own weakness than to replace the prayer-book in its case.

I then called a council of the more intelligent of the men, and put before them my ideas concerning the best course to steer, etc. It was decided that working to windward was not to be thought of, and as the monsoon was late in changing we would have to take our chances and run for the Sooloo Islands. It would take us three or four days at least to rig any sort of sail that would give the ship a speed of two knots in a good breeze; so that we could not hope to reach land in less than ten days at the quickest, and it was a question if we could endure the labor of pumping for that length of time on no more stable food than cabin luxuries. My heart sank when I thought of how the ship might founder in a heavy squall, or how we might roll around for weeks in calms. Smart and fully equipped vessels were often a fortnight in crossing the Celebes

Sea, and I had personal knowledge of one fine ship, the *Titan* of Boston, that knocked about in these very waters for nearly forty days, and then only entered the Straits of Macassar to drift upon the Paternosters in a calm. Our stores too were scanty, and could not last us longer than three weeks by the strictest economy above short allowance. During all our consultations and work the steady clank of the pumps had continued, broken only by the occasional "Spell, oh!"

As soon as one gang became exhausted and were relieved by the others, they rested for a while, and then went to work at the rigging. In order to gain upon the leaks we had to keep the pumps going three hours out of four, and when the watch were relieved they were not slow in turning in. The lashings of one or two of our spare spars had held against the water-spout, and our light yards and booms, of which there was a good supply, we kept run in under the half deck through a port in the break of the poop, so that they had not been washed overboard. With these, by dint of hard labor and doing the heaviest work at eight bells, when all hands were temporarily on deck, we had succeeded on the fourth day in raising three jury-masts. On the fore we spread a main top-gallant sail, on the main an old spanker, and on the mizzen the try-sail we had set to keep the hulk head to sea. Not a very good or handy rig, we thought, but it was the best we could do with our limited resources. A breeze springing up in the evening, I was overjoyed to find that the old hooker actually made two and a half knots, and answered her helm tolerably well. The effect upon the men was surprising. They worked with twice the vim, joked, and even sang their "chanties" when pulling and hauling, a sure sign of a contented crew. One of these, which had been a favorite with them before, now had attached to it a melancholy interest by association. I recall a few verses:

"O Tom is gone, and we'll go too,—
Tom is gone for highlo!
O Tom was always brave and true,—
Tom is gone for highlo!
O Tom has his long watch below,—
Tom is gone for highlo!
He is not called out in calm or blow,—
O Tom is gone for highlo!"

and so on until the work was done and the word "Bela-a-y" stopped their hauling and song together.

I knew that there was a large fleet of vessels bound down from Manila, Iloilo, and Cebu, and momentarily expected to sight some one of them, but so far had been disappointed.

On the seventh day my observation showed that we had made barely ninety miles in all in the direction of the Sooloos. That day we all knew, by the actions of the barometer and the unmistakable appearance of the sky, that the scourge of the China seas, a typhoon, would be upon us in less than twenty hours. We were several degrees south of the probable path of its vortex, but still far enough within its influence to make it extremely probable that our shaky hulk would founder in its first stages; or if we did manage to keep afloat, we could hardly hope to escape being driven upon some of the reefs or iron-bound coasts surrounding the Sooloo Sea.

The remainder of the day we spent in securing with extra stays and lashings our pitiful jury-masts, putting new battens around the hatches and breaks in the deck, and endeavoring with but poor success to put the bilge pumps in order. That night the wind increased to a gale, with blinding lightning and scourging squalls of rain and electric hail that stung like whip-lashes. The ship was too water-logged to attempt successfully the seaman's usual maneuver in a heavy blow and lay her to. She only fell off again into the trough of the sea, which swept her decks completely, and drove us from the pumps. It soon became apparent that the hulk must in some way be kept head to sea. With the greatest difficulty we succeeded in overhauling enough of the chain cable, outside the vessel and in over the bows, to reach our jury foremast, and there lashed it. Securing to the chain all the spars, lumber, and old sails we could find, we let go the anchors easily, and, cutting away the steppings of the foremast, managed to slide the whole mass overboard with a heavy lurch of the ship, immediately paying out through the hawse-pipes fifteen or twenty fathoms more of chain.

The tangle of spars, chain, and rigging floated a hundred yards or so ahead, and, being almost under water, drifted much more slowly than the ship, so that by their action as a drag, together with the little rag of a mizzen hauled flat aft, the only sail remaining set, the hulk was kept almost head to sea.

The sails ahead, spreading out in the water, served to break the force of the waves, making the ship ride more comfortably, although each heavy sea broke over the bows like a deluge and, running aft waist-deep clear to the taff-rail, poured out in great spouts through the shattered bulwarks.

The straining ship, wallowing like a mad buffalo in the sea, sent up the most life-like groans and screams of pain from her tortured timbers, as, buffeted back and forth from sea to sea, she rolled and pitched till our brains

began to reel. As I recall the resounding blows of the waves upon the vessel's sides and deck, the bellowing of the wind, the swash and crash of the tons of water in the hold, the cargo adrift, and sugar-bags tumbling around as pebbles roll up and down a beach, each one a hundred-pound battering-ram upon the white pine ceiling of the hold, the wild convulsions of the laboring hulk, the seams opening and closing and planks sawing back and forth against each other as if the wreck were breaking up, the pumps clogged with half-dissolved sugar and pieces of bamboo bags, while the water swept the decks so as to drive us into the scanty rigging of our jury mizzen-mast, where we lashed ourselves to keep from being blown away, expecting that each heavy plunge of the quivering bows would be the last,—as I recall all this, I wonder that our reason held, and can hardly understand how we calculated so logically as we did our chances of survival, discussed so coolly such projects as lashing a leaky oil barrel alongside the bowsprit to becalm the sea ahead, and even joked about the ship's being like Paddy's boot,—a hole in her fore-foot to let the water in, and a hole in her heel to let it out,—or like the *Mary Dunn* of Dover, with three decks and no bottom.

The morning of the ninth day dawned, or rather glimmered, upon a cheerless, cold, gray sky streaked with flying scud, and the air full of rain and spume flakes that stung our faces and hands like the pricking of needles, and almost blinded us if we attempted to look to windward. We had nothing to expect for some days but a living gale, which, veering gradually around the southern half of the compass from north-east to north-west, showed clearly that we were in the lower radius of a cyclone that must have destroyed everything in the path of its vortex, judging by the severity of what we experienced some two hundred miles away to the southward.

Toward the close of the forenoon, one of the men above me in the rigging scrambled down, and placing his face close to mine, shouted excitedly from the hollow of his hand, "Sail on the port quarter, sir!" On drawing ourselves higher up the rigging, we saw, through the flying spume-drift, a large vessel lying-to under storm canvas and apparently weathering the gale handsomely. With much difficulty and considerable danger of being washed overboard, we brought an ensign from the locker and secured it, union down, to the rigging above us, where it blew out straight and stiff as a board. Our hulk was by this time low enough in the water not to be visible at any great distance, and the entire absence of top-hamper made it extremely doubtful that we could be seen by the watch of the ship, who were in all probability crouched behind their weather cloth for protection from the gale. As the vessel drew nearer and her outline became more distinct, we made out that she was on the port tack and fore-reaching enough to carry her across our bows. Thus we were on her lee beam, and had a much better chance of being seen than if we had been to windward.

We clung there in the rigging and watched her graceful motions. She was careened enough to let us see her slant decks running with water, her hatches tightly battened down, the coils of running gear triced up clear of the deck, her black, taunt spars reeling overhead from the pressure on the little strips of white canvas, round and full as the breast of a swan, and in the mizzen rigging a square black tarpaulin with a few oil-skin coats visible behind it. She rolled heavily, but with that easy, graceful sweep that betokens a well-trimmed cargo, now revealing the whole outline of her decks and then shutting out the scene with her high, black bulwarks. Her cleanly cut and sweeping Yankee bows would be buried in a smother of foam clear to the knight-heads, and then rise dripping and quivering, revealing the glittering copper nearly to the fore-foot; and, as the sea rushed aft along the black and shining sides, her after-body rose slowly until her heel was flung out with a ponderous flourish, and then sank again with a fierce swash from under her rounded counter. As she was slowly forging by us not a quarter of a mile away, our hearts were gladdened by the sight of the American flag, and below it an answering pennant flying out from her monkey-gaff. In another instant her watch below tumbled out of the forecastle, and we could see them all busy ungriping their lee boat and running a line forward outside of all to the bows. Then we began to feel that we had done wrong in flying our signal of distress, for no boat, we thought, could live a moment in such an awful sea, and any attempt to take us off would only result in the drowning of the brave fellows who were coming to our relief, without bettering our condition a whit. They soon showed us that we were discounting Yankee skill and bravery at sea. We almost held our breath as we saw their whale-boat half-lowered, the crew in place with oars apeak, and then saw it dropped on the crest of a huge, rolling sea when the ship lurched heavily leeward. The boat's crew slued her quickly round head to wind as she was swept away from the ship, and let her drive down toward us with the gale, keeping her "bows on" with the oars, and checking her

stern-way to meet each combing breaker. It was magnificent to see her go down out of sight in the hollow of the sea, then come reeling up the steep ascent of green, pitch headlong through the foaming crest which burst over her and entirely concealed for a moment the six oil-jackets and south-westers, and then with a triumphant effort free herself and dash down into the trough again. The gale was fierce enough to drift her down to us at a rapid rate, and as we watched we were amazed that she was not swamped and capsized as each heavy sea broke over her, until at last she drove by close to our quarter. They caught the line we hove them and rode astern clear of the swash of the wallowing wreck.

Hastily diving below, I screwed down the water-tight lid of the chronometer case, and placed it, together with the sextants and the log-book, in an empty clothes-bag. While doing this, the water was swashing around some six inches deep over the cabin floor. The carpet was torn off, and in several places the planks were started, letting the compressed air in the hold rush up with a hiss that was smothered into a ludicrous sputter as the water ran over the openings. Our rescuers had certainly not come any too soon, for the hulk would not float an hour longer. Returning on deck, I bent a small line to the becket of the clothes-bag, and dropped it astern into the boat. The wounded men, who had been up to this time lashed securely in the rigging, were slung by a rope's end from the tip of the spanker-boom, and, watching for a comparatively smooth spell, the boat was hauled up and we lowered them into it. Then we tied bowlines around our waists, and, jumping one at a time from the taffrail, struck out for the boat, and were hauled in over its stern. Meanwhile the ship, after working slowly across our bows, had worn short round and, squaring her yards, sped by us like an arrow, and now lay rolling about, hove-to again to leeward, waiting for us to drift down to her.

The boat was what I had never seen before on board a merchant ship—an iron self-bailing life-boat, of the whale-boat model; and most gallantly she behaved, overloaded as she was, in that awful sea, which no ordinary ship's boat could have weathered for five minutes. You may imagine what a difficult matter it was to get aboard the ship and hoist in the boat. After about half an hour of hard work, we were on the deck of the good ship *Iceberg*, Captain Blaney, who received us with a hearty welcome, declining with a gruff good nature our protestations of gratitude and our admiration for the skillful seamanship that had carried his vessel and whale-boat safely through such dangerous maneuvers. As I turned to go below, a cry from the men caused me to look to windward, and I saw the *Wasatch* throw up her stern and go down head-foremost like a sounding whale. Our rescuers gave us what we then most wanted, a substantial meal, and generously supplied us with clothing until we reached Java Head, where, at our request, we were put ashore.

James J. Wait.

TOPICS OF THE TIME.

The Democrats and the Presidency.

ALTHOUGH the presidential election is more than a year distant, the politicians are actively preparing for it all over the United States. Candidates for both parties have sprung up in unusual numbers; and if we might believe all that is said in their favor by their enthusiastic friends, the amount of first-rate presidential material in the country is astonishingly large. We take little interest, however, in the fortunes of individual candidates when once the necessary qualifications of character and ability are insured; but we are somewhat concerned to know on what issues the presidential contest is to be fought. That there are questions of importance in our national politics about which there is wide difference of opinion among the people, is a familiar fact; but there seems to be a disposition in the leaders of both parties to keep these questions as much as possible out of sight. Civil service reform is little talked of by either party; the currency question is held in abeyance; the tariff question is avoided as much as possible by both parties; while the transportation problem seems not to have dawned as yet on the mind of the average politician.

But meanwhile the Democrats, being in opposition, must raise some issue or other in order to justify their demand for a change in the government; and so they have started the cry that the Republican party is hopelessly corrupt, and that the first step toward a better state of affairs is to "turn the rascals out." This cry was started almost simultaneously in various parts of the country, and the Democratic leaders apparently intend to make it the main issue next year. But if they do, they will, in our opinion, make a grave mistake. No one will deny that there are corrupt men among the leaders of the Republican party, or that there have been of late years scandalous cases of malfeasance in office, for which that party is mainly

responsible. But when we are asked to turn the Republicans out as a step toward reform, the question immediately arises, Whom have we to put in their place?

Such a party as the Republican party now is would not remain long in power if there were a party of unimpeachable integrity to put in its place. But, unfortunately for the Democrats, the integrity of their party is by no means unimpeachable, and there is strong reason to doubt whether they are a whit better than their opponents. To be sure, they have not done so much as the Republicans toward corrupting the national government, for the excellent reason that they have not had the power to do so; but in the States and cities where they have had control of affairs their management has been quite as corrupt as that of their opponents. Nay, in one respect it has been worse; for the shameless repudiation of public debts in many of the Southern States has been in the main their work, though there has been some disgraceful coquetting with the repudiators on the part of Republicans. Then we all know what scandalous abuses have marked their reign in the city of New York, where they have had uninterrupted control for a whole generation — scandals which are by no means a thing of the distant past. Nor has the party redeemed these acts by valuable services in the work of reform; on the contrary, it has in many cases opposed reforms which the Republicans carried into effect.

Now, the object of a change in the government is to make things better, and not to put one set of "rascals" in the place of another; and we see no reason for turning the Republicans out and putting the Democrats in, unless the latter give evidence that they will do better than their opponents. Up to this time, however, such evidence is not forthcoming; and there is one reason to fear that the contrary might be the case. The Democrats have now been out of power for nearly a quarter of a century, and they are evidently hungry for office. Is there not danger that, if they should attain to power, they would revive in all its fullness the old policy of "spoils"? and if they should do so, would not the country then be worse off than it is now? To jump out of the frying-pan into the fire is not usually supposed to be advantageous, yet many voters will fear that such may be our experience if we "turn out the Republican rascals" only to let in the "Democratic knaves."

In our opinion, the Democrats will make a serious mistake if they attempt to make the election hinge on this issue alone, to the neglect of the more important questions of legislation and public policy. The people will not readily be persuaded to put them into office merely to make a change in the *personnel* of the government. There is undoubtedly a good deal of dissatisfaction among the people with the Republican party; but it is due not merely to the malfeasance of certain Republican office-holders, but also to the failure of the party to enact thorough measures of reform. If, then, the Democrats would secure the presidency in the election next year, they ought to do something at the coming session of Congress to meet the popular demand for reform. They will have next winter the virtual control of legislation, and if they will use their opportunity to enact useful laws, such as the country now requires and the people demand, they will stand an excellent chance in the coming contest. But if they spend the winter's session in merely exposing and denouncing, for partisan purposes, the misdeeds of their opponents, the independent voters, who will really decide the election, will see little reason for preferring them to the party that is now in power.

Law-and-Order Leagues.

As population increases and civilization becomes more complex, it is evident that a large amount of volunteer work must be done in the administration of government. It will be necessary for good citizens not only to attend the primary meetings and to vote intelligently at the elections, but also to assist, by various methods, in the execution of the laws. This, indeed, seems at present to be the weak point in our political machinery. The inefficiency of the police and the prosecuting officers, and the fatal uncertainty of trial by jury, render our laws, in many cases, wholly inoperative. There are good laws, not a few, in every community, that are approved by the numerical majority of the voters and by the great mass of those who represent its property and its intelligence,— the class that ought to rule,— and yet are set at naught continually by the vicious and disorderly classes. The reasons are not remote. The disorderly classes are always bringing a powerful pressure to bear upon the officers of the law, to restrain them from enforcing its penal provisions; they control many votes, and they always make their political influence count for all it is worth. These classes constitute a positive, aggressive, implacable element in our politics; they know who are their friends, and they never fail to punish their enemies.

The intelligent, virtuous, and well-to-do citizens on the other side are not at all aggressive. Some are too busy, and some too fastidious, to take any active interest in the administration of the government. If they vote on election day for such candidates as the leaders of the caucus provide, they think they have discharged to the full their obligation as good citizens; if they go so far as to attend the primary meeting and register an ineffectual protest against the devices of the machinists, they count that a work of supererogation — a degree of patriotism to which only the elect ever attain. Of course, a great deal of promiscuous grumbling and deploring is done between elections by these prosperous and virtuous citizens; but very few of them ever attempt to influence the administration of government. The work of executing the laws belongs, they say, to the officers of the law.

Accordingly, we have on the side of disorder and lawlessness a positive and strenuous force, always pressing against the authorities — an influence that makes itself felt and feared every day in the year. On the side of law and order we have plenty of good sentiment, but no force that is organized or concentrated, and, practically, very little effective pressure is brought to bear upon the people who are responible for the execution of the laws. And who are these people who thus stand between this determined band of law-breakers and this numerous but negligent company of reputable citizens? It is not necessary to make any sweeping assertions about them; it is enough to say that the men who hold the offices are, as a rule, men who want office, who desire to keep

their places or to win promotion, who have a profound respect for any one who can influence votes, and who wish, therefore, to have as little controversy as possible with the rum-sellers and the gamblers and the keepers of vile houses. The conduct of the average town or city official, under such circumstances, can be easily predicted: he will yield to the more aggressive force; he will move in the direction of least resistance.

It begins to be evident that the law-abiding classes must oppose to the pressure of the law-breakers an influence in favor of the execution of the laws not less positive and strenuous. Doubtless, the first thing to be done is to secure, wherever that is possible, a higher grade of officers; but that is not enough. These officers, at best, will be human; and it is too much to expect that they will do their whole duty when the powers of iniquity are loud and instant, and the powers of righteousness are irresolute or indifferent. It is due to them that they should be constantly braced and invigorated by being brought in contact with the moral forces of the community. The malefactors will not fail to make them afraid to enforce the laws, will show them that it is for their interest to neglect their duty; good citizens must make them afraid *not* to enforce the laws, must show them that it is for their interest to *do* their duty. The problem of bringing a steady and constant pressure of moral influence to bear upon the men who are responsible for the execution of the laws is the problem to be solved.

There is no lack of right sentiment in our communities; all that is necessary is that it should be organized and directed, that it should find a voice. Public sentiment, like every other force, must be concentrated that it may be effective. There is enough indignation against lawlessness diffused through the community to form an irresistible motive power for the enforcement of law, if it could only be gathered up and could have adequate expression. For this purpose, Law-and-Order Leagues have sprung into existence of late in many communities, east and west, and the results already reached are extremely encouraging.

Some of these leagues take into their own hands the work of prosecuting offenders, employing attorneys and detectives for this purpose, and pushing cases through the courts. What has thus been done in New York, with the assistance or in spite of the police and the Excise Commissioners, is well known; and the leagues in Boston and in Chicago have been even more successful. Probably this method is the only one that can be successfully employed in the larger cities; but there is another method, much less expensive, that has been tried with good results in the smaller communities. This method contemplates the employment of no detectives, and the prosecution by the league of no offenders; it proposes to secure its results through the constituted authorities,—the police and the prosecuting attorneys,—and not independent of them. It assumes that the officers of the law are ready to enforce the law, and it stands by them to give them moral support, and to aid them, so far as possible, in furnishing them information. The Law-and-Order League, formed for this purpose, ought to include in its membership a large number of the best citizens of the community—merchants, manufacturers, teachers, lawyers, clergymen—the men who are recognized as leaders of business and of opinion, but who are not closely allied with any political machine. The preamble of its simple constitution should sharply restrict its operations to the enforcement of existing laws. The league should have frequent public meetings, in which the general facts with respect to the violation of law should be carefully and calmly laid before the public. The newspapers of the neighborhood should also be employed for the same purpose. The league should have a secretary, whose office should be its head-quarters, where information concerning illegal practices could be left by any citizen. It should also have an executive committee of a dozen or more energetic and public-spirited men, who could be depended on to meet statedly at the office of the secretary, and whose duty it should be to collect, through their observation and their conversation, facts relating to the infraction of the statutes, to collate them with those gathered and verified by the secretary, and then to present them, in an official communication, to the police authorities. It is not likely that the information thus presented would greatly enlighten the police; they would already be in possession of most of these facts; but the knowledge that a large body of intelligent and determined men were watching their operations, ready to applaud them when they performed their duty and to call them sharply to account when they neglected it, would have a wholesome influence upon them. Such a society, known to represent the sober and virtuous elements of the community, and to be composed of men who had no political ambitions, and who were far more interested in the maintenance of the law than in the success of either political party, would not be long in existence before its power would be felt in many quarters.

The sheriff has the power to call to his aid the *posse comitatus* in enforcing the law. The Law-and-Order League is a volunteer *posse comitatus*, that does not propose to supersede or embarrass the proper authorities, but to aid them in every possible way in bringing offenders to justice. The shameless violations of law that we witness in many places, and the feebleness of the powers whose duty it is to bring the violators to justice, indicate a large opportunity for public service in this direction. The duty of good citizens cannot all be performed on one or two days in the year; they must learn how to bring the forces of intelligence and virtue to bear directly and steadily upon the machinery of the local government all the year round.

The Lack of Earnestness in American Politics.

NOTWITHSTANDING the increased attention lately given to questions of political reform, and notwithstanding the local temperance agitations and the noisy, recurrent gossip concerning "candidates," one of the most striking facts in American life at the present time is the lack of moral earnestness in public affairs. If we were to judge from this fact, we might conclude that our government was now so well conducted that no further reform was needed, and that our rulers had nothing to do but luxuriate in idleness. But if we look below the surface of affairs, we find abuses enough in our political system, some old, some new, but all requiring to be taken in hand and dealt with vigorously. Hitherto, however, there has been so little

public interest in the subject that the chief obstacle that reformers have had to contend with has been found, not in the opposition of the open defenders of abuses, but in the apathy and indifference of the people themselves.

The particular reform that has been most discussed of late is that of the civil service, a very simple reform, and one which it might be thought the whole people would favor as soon as they understood it; yet it has taken twenty years to awaken popular interest in it. Again, there is much complaint among the poorer classes about the evils they suffer from the injustice of the rich and from the monopolies and other invasions of private rights that our laws permit. Yet when an attempt is made in a sensible way to check these abuses, by abolishing monopolies and restraining corporations and other combinations of capital within proper limits, scarcely a token of interest appears among the masses of the people.

This lack of earnestness in our public life is rendered more conspicuous by contrast with the zeal and activity now displayed in the politics of England. There, just across the ocean, we find a ministry of unusual ability, led by one of the world's great statesmen, carrying out a series of reforms of the most important and far-reaching character, sufficient almost to mark an epoch in the nation's history. And the reason why they have effected so much is because they are zealous in the work, and because they have behind them the deep moral earnestness of an energetic people.

Why there should be such a difference in the politics of the two countries, such activity in the one, such apathy in the other, is not at first sight apparent. Some perhaps would say, because our politicians are so much occupied with distributing the spoils and securing their own share of them that they have no energy left for more important work; and it must be admitted that they are earnest in this business, if in nothing else. But then, if the people themselves were in earnest, and determined on reform, they would infuse their own temper into their public men, as they did in the days of the antislavery conflict and the Civil war.

The spoils business, in fact, is one of the strongest proofs of the prevailing apathy; for the practice is not only injurious to the public welfare, but contemptible and mean, and a slight breath of popular earnestness would sweep it away forever. Again, the condition of parties among us is undoubtedly a hinderance to political improvement, since party lines do not correspond with the lines of opinion, and there is to-day no recognized party of progress in this country as there is in England. But party lines would quickly yield to a determined people, and new parties could be easily organized, if the old ones would not serve the popular will.

Now that we have become a wealthy nation, and multitudes of our people have attained a full competence, with the leisure and freedom from sordid cares that it gives, it is surely more than ever their duty to devote some part of their time and energy to the work of moral and political improvement. And if even a portion of our young men would enter upon such work with the same earnestness that their fathers have shown in the work of material progress, the complete reform of our government and the elevation of our public life would not be long delayed.

Professor Jevons on Education.

THE subject of education is so important for the future of the American people that everything of moment that is said about it ought to be attentively pondered by all who desire the welfare of the people and the elevation of the national life. The work of primary education, to be sure, is already as well advanced among us as in any other country in the world; but the higher education is still in an undeveloped state, and all matters relating to it are, therefore, entitled to the best thought we can give them. Accordingly, we would call our readers' attention to an essay on "Cram" by the late Professor Jevons, originally contributed to the pages of "Mind," and now republished in his volume on "Methods of Social Reform." In this paper the author undertakes a defense of the method of education popularly known as cramming, and probably makes as good an argument in its favor as can be made; but, nevertheless, we can by no means agree with his conclusions.

Professor Jevons lays down the principle that the ultimate object of education is "success in life," and he advocates the cramming process as the best means of attaining this end. He would make the process a thorough one, and subject the student to searching examination; and all this, so far as it goes, is well. He makes a distinction between what he calls "good cram" and "bad cram," but we can see nothing in this except a difference in the application of the method, and what we object to is the method itself. We do not deny that such a course of study and examination as Professor Jevons advocates may be useful for the acquisition of technical knowledge and for cultivating the technical faculties of the mind. Hence the applicability of the examination test in the case of Government clerks, whose work is almost entirely of a technical character. But the very fact that it is thus applicable in their case raises a presumption against it as a means of general education, the object of which is not the acquisition of technical skill, but the elevation of the mind and character. The main purpose of education is not to promote success in life, but to raise the standard of life itself; and this object can be attained only by those higher studies which call forth the powers of reason, moral feeling, and artistic taste. Even in professional education, our aim ought rather to be usefulness in life than mere success, and we have great distrust of all theories of education that put success in the first place.

Professor Jevons admits that the method he advocates fails in the field of mental and social philosophy; for he says he has had great difficulty in devising a system of written examinations on these topics, and that "it is difficult in these subjects to make the student think for himself." But, surely, a method of teaching that is not applicable to some of the highest subjects of human thought, and that fails to make the student think for himself, can hardly be called a successful method of education. There was once a man named Socrates who knew how to conduct examinations in philosophical subjects, and to make his pupils think for themselves, and we believe that his teaching had considerable influence on the world; but we never heard of his pupils' cramming themselves. The history of Greek philosophy, and, indeed, of Greek

civilization generally, is a standing refutation of all cramming theories of education.

We object to Professor Jevons's theory of education, therefore, and to the method of teaching he approves, because it puts the technical above the intellectual, and facts above philosophy. We believe that education should be of a kind in sympathy with the present age, and that it should by no means neglect to fit its recipient for the struggle of life; but we object to Professor Jevons's theory because it puts worldly success before the pursuit of beauty and truth; and we should be sorry to see such theories find acceptance with American educators.

A Word to the Readers of The Century.

THE present number of THE CENTURY closes the twenty-sixth volume and thirteenth year of the magazine. Presuming once more upon the interest the readers of a periodical like this are supposed to take in its fortunes,—which, in fact, we well know they do take therein,—we beg leave in a few lines to report progress, and to say a word about the future. It was the good fortune of THE CENTURY (then called SCRIBNER'S MONTHLY) to come into existence at the moment when a renascence was preparing in American art and in American literature. From the first, the magazine has striven to do something more than keep abreast of these movements; something more than merely to record them. Whether mistakenly or not, whether for good or for evil, the magazine has (it may be said without undue egotism) been an influence. It has striven also to take its proper share in the wholesome movement, still in its full vigor, and encouraged by many successes, for the purification of American public life and the better administration of government. From the beginning also, one of this magazine's principal functions has been to present all that is most purifying and most inspiring in the religion of our country, of our race, and of the world's higher civilization,—while at the same time insisting upon freedom and fair-play in discussion and continually opposing all dogmatic and sectarian narrowness.

On these lines the magazine has moved from the beginning, winning year by year an increased number of readers and of friends, and on these lines its course will continue. It enters upon its fourteenth annual "fall campaign," we are happy to say, with a circulation and an audience numbering thousands beyond those of the last or of any former year in its history.

For a summary of the contents of the past two volumes, and an announcement of some of the special features of those to come, we refer our readers to the advertising columns of the magazine.

OPEN LETTERS.

A New Interpreter of Greek Art.

THE surprising discoveries of the past few years in the Troad, in Cyprus, at Mycenæ, Olympia, and elsewhere about the eastern Mediterranean, have accustomed us to the greatest expectations of what may be recovered out of the ancient world of art. But what we did not look for, after so many years of learned research and archæological ingenuity, was the coming of a new interpreter of this art, with a clarified vision that almost merits the title of inspiration,—a genius whose insight enables him to make important discoveries in fields supposed to be already thoroughly known, and to cast new and brilliant light upon the remains of classic art and upon Hellenic life. The words genius and inspiration are large words to apply to anybody in these days, but I should not like to use any weaker ones in regard to Charles Waldstein and his archæological essays and discoveries. In this corner of THE CENTURY there is space for only a mention of the man and his promising work, and I avail myself of the informality of this hospitable corner to make that mention familiarly and merely introductory.

The first paper that fell into my hands by Mr. Waldstein was one reprinted from the "Journal of Hellenic Studies" (1880), on the Pythagoras of Rhegion and the Early Athlete Statues. This was an argument, to put it briefly, proving that certain ancient statues believed to be Apollos, and classified as such in the museums, were really athletes. The learning and ingenuity of the cogent argument were notable enough; but beyond this, the author shows minuteness and exactness of knowledge of all the bearings of his subject, a vigor and reserve of power in insight and perception that compel the wondering admiration of the reader. Here, it was evident, was a new critic, not using a vague art-terminology, but one profoundly imbued with the principles of art, and capable of the most lucid and revealing expression. It is no exaggeration to say that, since Lessing's paper on the Laocoön, no art criticism had seemed so pungent and original as this and other essays by the same hand. We can give no adequate notion of the quality of this new light in art criticism and interpretation, without quoting an entire essay; but I am tempted to give a passage or two from the essay named above. And I may preface it by the remark that Mr. Waldstein's criticism is not merely historically descriptive; it is creative, for the purpose of modern art. Rhythm in plastic art is not immediately connected with rhythm in poetry; in the first instance, it means simply "flow." Symmetry is an architectural idea expressing the lasting, the uniform, the inorganic; rhythm implies change, the organic, as sculpture deals with animal life. Archaic sculpture was too architectural; it expressed symmetry to the exclusion of rhythm. The innovation of Pythagoras was that he added this flowing, irregular element to art, and thereby contributed to the appearance of vitality. But he kept within the bounds of what is pleasing to the eye; and though he furthered rhythm, he did not do it to the exclusion of symmetry. This harmony between life and form is the most characteristic feature in Greek art. The writer specifies:

"Vitality is, in the first place, given to the statue by means of the *continuous flow* of the surface. Each smallest part of the surface in a good statue must have the resemblance of moving and vibrating like the skin of a real body, which never presents a geometrically straight line, but is a *continuous* succession of elevations or recessions, arsis and thesis—that is, it flows. Vitality must, as it were, stream into the clay through the fingers of the modeling artist. The difference in this respect between Greek works and Roman copies that were made to order like mechanical ware, will illustrate the difference between a statue possessed of this vitality of texture and one which is wanting in this first requisite. * * * Each part of the surface [in the statue under examination] is carefully and thoroughly executed, and the difference in texture between the hair, the skin, and the stem of the tree is clearly indicated. To attain this effect, besides the feeling of form which must be inherent in the artist, much and intense work is needed. Hasty modeling (unless it is meant to be a sketch) can never convey vitality. The same holds good in all arts. The organic quality, the continuity of composition in literary work, can only be attained when the subject has been thoroughly and for a long while revolved in the brain of the author, or has been modeled and remodeled during the process of fixing it on paper. But the texture of the surface varies in appearance in accordance with what is below it, which it covers. As it covers bone or muscle or softer material, so will its appearance be different. This difference the sculptor must indicate by means of modeling; he must look deeper than the mere superficial appearance to what anatomically lies below as the cause of the phenomenal difference. But in poor work, the muscles, joints, etc., are indicated by means of simple elevations that do not gradually rise and fall, are not intermediated—they seem *put together;* while in good work the transition is gradual, the lines are not torn asunder—all *flows together*, as in nature."

The author further subtly indicates the limits of the artistic powers of Pythagoras of Rhegion by saying that he could express, by means of his statues, physical pain, but not moral grief:

"There are still higher stages in the development of plastic rhythm to which Pythagoras did not attain; but these belong to a later period. They are the expression of *moral* character and individual mood in plastic rhythm."

This discovery, that many of the so-called Apollos are really athletes, is only one of many by this fresh and original observer. No one else has thrown more light than he upon the quality of the genius of Pheidias. Walking one day through the Louvre with one of the authorities of the Museum, Mr. Waldstein espied, on a high shelf among some fragments, a marble head which arrested his attention. The more he looked at it, the more he was convinced that it was a Pheidian work, and had all the character of the metopes of the Parthenon, now in the British Museum. His companion, remarking with a smile that he was always discovering Pheidias, took down the fragment and placed it in Waldstein's hands. A close inspection convinced him that it was the head of a Lapith from one of the Parthenon metopes. On inquiry, he learned that the head had been recently acquired from a dealer in Vienna, who obtained it from the Piræus, where it was said to have been found in the water. An exact cast of the head was made and taken to London, and in the Museum the metope was found to which it seemed to belong. Upon placing the cast upon the fractured neck, they fitted completely, each fractured projection of the one fitting into the depression of the other. This metope is now one of the most complete, as it is in many ways the finest.

Another curious discovery of Mr. Waldstein's, showing perhaps a more astonishing range of archæological knowledge and intuition, was the identification of a Hermes in Ephesian silver-work on a patera from Bernay in France, also described in a brochure reprinted from the "Journal of Hellenic Studies" (1882). A paper, two years previous, from the Transactions of the Royal Society of Literature, on "Praxiteles and the Hermes with the Dionysos-child from the Heraion in Olympia," exhibits perhaps more conspicuously the surprising critical genius of the author, the breadth of his critical sympathy and apprehension. I cannot dwell upon this delightful paper further than to note the contrast the writer draws between Praxiteles and Pheidias. Praxiteles had the sensuous temperament which frequently reacts toward melancholy. This sensuousness was far from meaning actual passion. In Praxiteles, we have potential passion, suggestions of strong impulses rather than impulses themselves.

"But such suggestiveness, hidden and veiled, is sad in itself, sadder in its aspect than even the violent impulse to destruction; and whenever the sensitive and amative nature is not vibrating, it is apt to be sad. Pheidias was not sad, but the time in which he lived was essentially different from that of Praxiteles."

The time in which the character of Pheidias was formed was one of decision, of united resistance of all the Greek states to the Persian foe. This energetic spirit excluded self-consciousness and self-reflection; it gave to the Greeks keen perception of broad types of the ideal. This condition was most favorable to the production of great sculptors; its naïveté and inventive impulse were most characteristic of the genius of Pheidias—a noble serenity. The age of Praxiteles was not so simple or decided, and his was a less simple personality. The nervous constitution of sanguine temperaments does not allow of any protracted sojourn on the heights of sublimity. There is no cuntinuity of impulse, no sameness of work.

"When they try to fix these impressions they frequently fail, for such moods cannot last. Coleridge's 'Kubla Khan' and Shelley's 'Epipsychidion' are fragmentary. The Lovely, the Humanly-Beautiful, is their domain, for they are lovable and much loving natures. Yet over this world of restlessness, of 'storm and pressure,' is spread a thin gauze of unpronounced sadness, like the thin mist that spreads over even the freshest landscape in the brightest morning of spring. Praxiteles, Shelley, Heine, De Musset, Chopin were such temperaments. What adds to the melancholy of such natures is the consciousness that they have lost simplicity; they know that they are sophisticated, and thus the simple and innocent, whenever they meet it, evokes in them a fond and desiring sadness. When a pure maiden inspires Heine, he can write the purest and sadly-sweetest verses; all the stains of his past joy have left him. * * *

"Praxiteles, the sculptor of what is lovable, was ordered to fashion a Hermes, the protector of athletic sports, in the temple at Olympia, the sacred realm of all physical exercise: a strong god in the vast temple of strength. And how did he solve the task? He gave a strong god, but in a moment of tender pensiveness, and accentuated, even more than his strength,

his amiable beauty. The man with his individual character shines forth through the artist.

"The Hermes, then, undoubtedly the work of Praxiteles, has enabled us to recognize the character of Praxitelean art, the character and genius of Praxiteles himself, and has thrown a new ray of light upon a period of Greek history. A work of art may elucidate an age as clearly as a chapter of written history. Who can know the history of the Italian Renaissance without studying Da Vinci, Raphael, and Michael Angelo?"

Upon inquiry as to who is this new light in scientific art criticism, I learned that he is a young man, with a very considerable European reputation for his extensive archæological knowledge and discoveries, at present holding the position of "Reader" on Greek art in Cambridge University, England, and that he is now establishing there a new archæological school (which is in addition to the Disney and Slade foundations). For the purposes chiefly of this school, a museum of casts has been created in connection with the Fitzwilliam Museum, mainly through the exertions of the distinguished Professor Sidney Colvin. Funds have also been raised for an archæological library, intended for the use of the same school,—the Fitzwilliam having already an excellent library of art. I learned also that in earlier years, before he devoted himself exclusively to art, his proficiency in philosophy had been such as to attract the admiration of the London circle to which George Eliot belonged. Aside from his art contributions in French, German, and English to various archæological journals, I have read an elaborate scheme by him for the reorganization of liberal education, and a curious paper, printed in the "Minerva" of Rome, on "Specialization, a Morbid Tendency of our Time."

It certainly will not detract from the interest of this sketch to THE CENTURY readers to know that Mr. Waldstein — perhaps I should give him his title of Dr. Charles Waldstein — is an American, born in New York. I will close what is already too long a letter with a short sketch of his life.

Charles Waldstein was born in Broadway, New York, March 30, 1856, of naturalized German parents. His father is an optician in the city. His early education was at such private schools as the city could afford. Later he attended the public schools and received private tuition at home. In 1867 he was taken to Europe with his family, and put to school at Stuttgart, where he remained three years, when he returned to New York, and prepared for the entrance examination of Columbia College. He entered the freshman class of 1871, and remained till the end of the sophomore year in 1873, when he again went abroad and entered the University of Heidelberg as a student of philosophy. From 1873 to 1875 he attended the lectures of the most famous masters in archæology, history, and economy, taking his degrees of M. A. and Ph. D. in the autumn of the latter year. The summer time of the next year he was in Leipsic, studying under Overbeck, etc.; in October he went to London, where he studied the collections and art works in the British Museum, the National Gallery, etc. He was asked to deliver a course of art lectures in the British Museum in the winter; the course was highly successful, and, as it turned out, was the turning-point in determining his career. He spent the greater part of the years 1878–9 in Italy, chiefly in Rome, and in Greece, and was present at the German excavations at Olympia. On his return to England he delivered courses of lectures, on invitation, in various places, chief among them Cambridge. His influence upon the students there in art studies made itself felt very soon; he was given his present position, and in 1882 the degree of M. A. *honoris causa* was conferred on him, in recognition of his services in the cause of art teaching and research. During this time he was frequently invited to deliver short courses of lectures on Greek art at various colleges and schools, and before public societies, such as King's College, Harrow, Eton, etc. In April last he delivered a course of discourses before the Royal Institute of Great Britain, one lecture on "The Influence of Athletic Games on Greek Art," and four on the "Art of Pheidias." The latter are the nucleus of a volume which is now in the University press at Cambridge, and is shortly to be published. Dr. Waldstein has made careful studies of the principal public and private museums and collections in Europe. In April he was appointed corresponding member of the Imperial German Institute of Archæology at Berlin, Rome, and Athens. He has the spirit of a thorough student, rejoicing in his work for itself, and seeking no adventitious aids to reputation.

Charles Dudley Warner.

Henry Irving's Stage Management.

THE careful manner in which, under Mr. Irving's management of the Lyceum Theater, the scenery and appointments are planned, with reference to the full development of the author's meaning, seems especially worthy of notice at a time when there is much controversy as to the relative value of the setting of a play. There are, at present, many persons who inveigh loudly against the development of scenic effect. As an instance of this, I may quote a passage from a well-written article in the June number of the "Magazine of Art." The writer of this article, Mr. Archer, says:

"This idea of proportioning the scene to the business 'then to be considered' is the last which occurs to a modern manager. He gives his scenic artist *carte blanche*, and insists upon each decoration reaching a fixed standard of magnificence. Juliet's bedchamber, where she is to battle with the grizzly horrors of the tomb, shall be as rich, if not as gaudy, as the banquet-hall, where she does nothing much more serious than walk a minuet."

Putting aside the amazing slip as to Juliet's doing nothing much more serious than walking a minuet in the very scene in which she declares her sudden passion for Romeo, the writer is, so far at least as the Lyceum is concerned, very wide of the mark. Yet in such a complaint as his there is a modicum of a special truth. This relates really to a danger rather than a fact, and is merely sufficient to warrant jealousy of a practice which, in the hands of persons of good resource but small artistic power, may cumber histrionic effort with irrelevant show, or bury it entirely beneath a load of superfluous finery. The abuse of a power is, however, no criterion of its use; and the development of the art of scenic effect as a correlative force in dramatic method must not be foregone or stayed because indiscreet zeal or efflorescent taste at times misleads. It is to the highest, not to the lowest aims and efforts

and effects, that we must look for the signs of a progress sufficiently strong and true to give promise of permanency. And we find this progress in the Lyceum stage during Mr. Irving's management of it. The late revivals of pieces played there some few years ago show clearly enough what progress has been made in this kind. Before 1878, in which year Mr. Irving became manager of the Lyceum, a good many plays were produced with great success. In all of these, the province of stage management came practically within the control of the actor, in so far as the acting was concerned. The effect of his own histrionic power and his influence on the stage is, by this time, an old story. My object now is not to enter at all upon the question of Mr. Irving's powers or qualities as an actor, but to give from personal knowledge some insight into his method of preparing a play for public representation, especially with reference to the setting of the play and the manner in which scenic effect and the resources of stage-craft are subjugated by the manager to their true place as matters of secondary though very great importance.

At the very beginning of his arranging a production, Mr. Irving makes sure, first of all, of the text and cast of his play as ready for acting. All entrances and exits, all movings to and fro, all changes of dress and shiftings of scene, as rendered necessary by the exigencies of the play, are prepared for. The time is marked, from first to last, with a marvelous accuracy, which could only be attained by a mingling of thought and experience. The truth of Mr. Irving's oft-expressed apothegm, that *on the stage everything is due to intention, nothing is the result of accident*, receives a living proof in the care given to all things both before and during rehearsal. When the scene-painters receive their first instructions, upon which they proceed to shape out their rough models, the first points which they are required to consider are the needs of the action. For instance, a door must be here, a window there. A house, a grotto, an altar, a tree, are important elements in the presentation of the piece. To these necessary requirements other details of the scene must be subordinated, so that ultimately, in a suitable and picturesque surrounding, calculated in every way to stimulate the imagination, the central points on which action turns may, at the due moment, appear in natural prominence. So it is with all the appliances and arrangements of the stage. The property master, the machinist, the gas engineer, the chorus master, have all to conform rigidly to their instructions, which are given by the manager solely with reference to the requirements of the play. It is at all times interesting, instructive, and even fascinating to see how the multitude of details, each elaborated separately according to accurate instructions, gradually grow together as prearranged in the master mind till a coherent and natural whole is achieved. The on-looker, at even a partial development of the method, cannot but see in it an embodiment of the poet's idea as that idea has taken root in the mind of the manager. At the back of all the personal thought and care and zeal which these things require, an exceptional following is necessary; and one can see at a glance how admirably Mr. Irving is served. He has not only himself chosen the various heads of his departments, but he has trained them to understand something of his own ideas. Thus there is mutual confidence between the manager and his subordinates. They are content to accept at once and to work out loyally their appointed tasks, confident that each point, howsoever minute or seemingly unimportant, has some definite meaning or purpose in the general theme; while he, having full knowledge that his orders once given will be strictly carried out, is able to proceed to other matters of importance, which develop by degrees into harmonious proportions and tangible existence. Now and again I have been struck with amazement at the enormous number of points to which the most careful attention has been given. Thus, on orders having been given for some change in a scene or the setting of it, I have noticed how even the slightest change involved a multitude of alterations. In truth, the labor of a Lyceum production is very great, for Mr. Irving does not hesitate to make changes, no matter how much trouble to the different departments they may involve. On the contrary, he tries to find fault in his own work with a critical facility as varied as it is earnest. I remember at the rehearsals of "The Corsican Brothers," in 1880, that two whole scenes, which had been produced with great care and labor, were condemned and others substituted — the "interior" in the first act and the glade-scene in the last. This involved a wholly new conception and execution of the scenes. Those originally appointed did not, on practical trial, lend themselves suitably to the action and sentiment of the play. Again, I saw the first scene of "Romeo and Juliet" condemned on trial without a murmur. (This scene preceded the banquet-hall scene, in which the drilling of a crowd five hundred strong had been the work of months.) It was in each case quite apparent that with the growth to actuality of the preconceived effects the horizon of the picturesque possibilities had broadened.

Walter Herries Pollock.

Some of the Younger English Poets.

E. W. GOSSE.

THE younger English poets at this moment best known in America — whether justly or not — are Mr. Philip Bourke Marston, Miss A. Mary F. Robinson, Mr. Andrew Lang, Mr. Edmund W. Gosse, Mr. Austin Dobson, not to mention Mr. Oscar Wilde and his unfortunate protégé, Mr. Ronald Rodd. The verses of most of these may be seen now and then in American magazines. The most popular of them here is Mr. Austin Dobson, partly because he has probably been longer before the public, partly on account of the humor and humanity of his verse. Mr. Marston has struck as deep a note as, and a more touching one than, the others; but he is perhaps the most unequal, and the body of his work most persistently resembles the modern masters of a certain school, under whose influence his style has been formed.

There is a slight resemblance in the verse of Messrs. Dobson, Lang, and Gosse; but as time goes on each is more strongly differentiated from the others. Mr. Dobson has fallen into line after Praed and Locker, as a writer of what is vaguely called *vers de société*, though the range of the younger poet is much too wide

for this limiting phrase. Mr. Lang's work is spoken of elsewhere. Mr. Gosse (besides the finely written prose he occasionally puts forth) continues to write verse, chiefly lyrical, showing a broad range of sympathies, and an unusual sensitiveness to form.

The best idea of his lyrical genius may be had from a selected edition of poems recently published in America, with the title of an earlier English collection of his verse, "On Viol and Flute" (Henry Holt, New York), to which volume I should like especially to call attention here.

In this collection it is interesting to find what appears to be some of the author's most spontaneous poetry taking the most intricate form. This fact should convey a lesson to those who cry out against form as a hinderance to poetical spontaneity,—though the literature of the world is, of course, full of such lessons. The "Sestina," on page 184, seems to me one of the most sincerely felt as it is one of the most charming of the pieces in this book, and it is written in a form of the highest artificiality — as every one knows who is familiar with the laws of the recently revived Provençal forms. So, also, Mr. Gosse's best sonnets are filled to the brim with meaning and with feeling.

Along with Mr. Gosse's easy mastery of form should be mentioned a perfect clearness of expression and a faculty of throwing off phrases of great verbal felicity; like these perfect lines in the beautiful poem of "The Sisters":

> "Ah, who has told thee that he comes at night?
> I hardly told my heart my heart's delight."

In some of his shorter pieces (as, for instance, "Greece and England") there is a lyrical lightness and motion that is most pleasing. The book, as a whole, reflects a mind of the truest culture,—one that has delight in the highest forms of plastic and literary art,—and is, moreover, careful, even minute, in its observation of natural phenomena. Beginning under the Rossetti influence, this poet has still kept remarkably clear of mannerism, and his work now shows no unpleasant trace of the school, if it ever did. The fault that may be found with him is a fault of the day, of nearly all modern art,—namely, literary self-consciousness,— ending in a verse that at times ceases to move on account of its faulty faultlessness. But Mr. Gosse's poetry I should expect to see mellow and deepen with years, like Longfellow's. Let me present here the "Sestina," of which I have spoken:

SESTINA.

TO F. H.

"'*Fra tutti il primo Arnaldo Daniello*
Gran maestro d'amor.'"—PETRARCH.

"In fair Provence, the land of lute and rose,
Arnaut, great master of the lore of love,
First wrought sestines to win his lady's heart;
For she was deaf when simpler staves he sang,
And for her sake he broke the bonds of rhyme,
And in this subtler measure hid his woe.

"'Harsh be my lines,' cried Arnaut, 'harsh the woe
My lady, that enthorn'd and cruel rose,
Inflicts on him that made her live in rhyme!'
But through the meter spake the voice of Love,
And like a wild-wood nightingale he sang
Who thought in crabbed lays to ease his heart.

"It is not told if her untoward heart
Was melted by her poet's lyric woe,
Or if in vain so amorously he sang:
Perchance through cloud of dark conceits he rose
To nobler heights of philosophic love,
And crowned his later years with sterner rhyme.

"This thing alone we know: the triple rhyme,
Of him who bared his vast and passionate heart
To all the crossing flames of hate and love,
Wears in the midst of all its storm of woe,—
As some loud morn of March may bear a rose,—
The impress of a song that Arnaut sang.

"'Smith of his mother-tongue,' the Frenchman sang
Of Lancelot and of Galahad, the rhyme
That beat so bloodlike at its core of rose,
It stirred the sweet Francesca's gentle heart
To take that kiss that brought her so much woe
And sealed in fire her martyrdom of love.

"And Dante, full of her immortal love,
Stayed his drear song, and softly, fondly sang
As though his voice broke with that weight of woe;
And to this day we think of Arnaut's rhyme
Whenever pity at the laboring heart
On fair Francesca's memory drops the rose.

"Ah! sovereign Love, forgive this weaker rhyme!
The men of old who sang were great at heart,
Yet have we too known woe, and worn thy rose."

If any verses written by one of the younger English poets of our day deserve the gentle treatment of oblivious time, this poem does,— where subject and method, thought and expression, are so harmoniously wedded, and where the human sentiment is so moving. To have written a not unworthy poem on so famed and exquisite a theme will be regarded, especially by those who are themselves of the poetic guild, as no small achievement.

X.

ANDREW LANG.

THE latest version of "the tale of Troy divine" ("Helen of Troy," by A. Lang. New York: Charles Scribner's Sons) seems to be the overflow of Mr. Lang's Homeric studies in the course of his translation of Homer into English prose, made in conjunction with Mr. S. H. Butcher. That was an admirable performance, and perhaps, on the whole, a greater success than any of the numerous renderings in verse which have appeared in our tongue, from Chapman's to Bryant's. The present venture in the poetic interpretation of one portion of the Homeric myth can hardly be regarded as successful. The upholstery is the upholstery of Homer, but the spirit is the spirit of Morris. The polished cars and pillared fore-courts, the vases of bronze and gold, the chairs of cedar-wood and ivory, are all there. The baths, feasts, and sacrifices are described correctly. The banqueters dismiss the desire of meat and drink, and the priests lay the fat of the victim fold on fold in the true Homeric fashion. But when he comes to the really epic parts of his task, it seems to me the poet loses his grip.

It was, perhaps, a feeling of his own inability to deal with character and passion effectively that led Mr. Lang to invent the extraordinary departure from the Homeric story, by which he represents Helen, in her flight from Lacedæmon, and again in her restoration to Menelaus, as a puppet in the hands of the gods,

without memory, free-will, or responsibility. He makes her fall into a trance, from which she awakes "forgetful of her old life, and ignorant of her shame, and blameless of those evil deeds that the goddess thrust upon her"; and in this conveniently "immoral" condition she elopes with Paris. And when the war is over and Ilios has fallen,

> "— Aphrodite made the past unknown
> To Helen, as of old, when in the dew
> Of that fair dawn the net was round her thrown:
> Nay, now no memory of Troy brake through
> The mist that veiled, from her sweet eyes and blue,
> The dreadful days and deeds all overpast," etc.

For this there is no warrant in Homer. It is true that in the Iliad, Priam says to Helen, in a single passage, that he does not blame her, for the gods have brought this woe upon Troy; but Helen herself, throughout that poem, is fully conscious of her actions, and is made repeatedly to express grief, shame, and homesickness. It is also true, in a general way, that the moral atmosphere of the Homeric poems is less intense than that which pervades the literature of Christendom, and that the agency of the gods is constantly present. It is for that reason that when the deeds of the heroes are submitted to the harsh light of modern ethical standards, as in Shakspere's "Troilus and Cressida," the disenchantment is so startling that many critics have looked upon that play as a deliberate satire.

But Mr. Lang has, I think, gone too far. Ancient authorities, Euripides, for example, limited the use of

> "That nepenthes which the wife of Thone
> In Egypt gave to Jove-born Helena"

to the occasion of her return to home and husband *after* the siege and fall of Troy. To treat the heroine, throughout the entire course of the adventure, as a plaything of Aphrodite seems to me a mistake in art. It breaks the continuity of the action; and, in place of securing a sense of passionate reality, it removes the story to a world of dream, where the ordinary motives of human conduct are absent. The figures in Mr. Lang's poem have no life, but appear to be going through a pantomime at a great distance, and in obedience to some unseen mechanism.

It goes without saying that, in point of execution, the poem is tasteful and scholarly. There is the same delicate touch which gratified the artistic sense in the author's "Ballads and Lyrics of Old France," and in his other poems and prose writings, such as "The Library." There is a great deal in the volume which is fine in workmanship and able to give genuine pleasure to a cultivated reader. It is in depth of conception and in power to move the feelings that Mr. Lang falls short. Perhaps he comes nearest to exhibiting something of these great qualities in the episode of the deaths of Paris and Ænone; but even here he declines to grapple with the dramatic capabilities of the situation, by adroitly evading anything that can be called an interview between the dying hero and his quondam love. And in general the poet passes rather lightly over those crises in the action on which the stress and strain of emotion fall most weightily in Homer, and lays his emphasis on narrative and description. In narrative his manner is smooth and flowing, the verse is musical, the choice of epithets careful, and the command of language easy; but there is an absence of the fire and spirit which characterize the best passages of born story-tellers in verse, like Byron and Scott. There is rather the somewhat cloying and monotonous evenness of Morris, of whom, as I have already hinted, Mr. Lang reminds us, and not unpleasantly reminds us.

B.

Tame Butterflies.

IN THE CENTURY for June, 1883, Mr. Gosse describes a monument in which the sculptor has carved a child holding out her hand for butterflies to perch on. He goes on to say that this was criticised as improbable, even by so exact an observer as Mr. Tennyson. It may therefore be of some interest to your readers to record the following facts from my personal experience:

One summer I watched the larvæ of the swallow-tailed butterfly through their different stages, and reserved two chrysalides to develop into the perfect insect. In due time one of these fairy-like creatures came out. I placed it in a small Indian cage made of fine threads of bamboo. A carpet of soft moss and a vase of flowers in the center made a pleasant home for my tiny "Psyche." I found that she greatly enjoyed a repast of honey; when some was placed on a leaf within her reach, she would uncoil her long proboscis and draw up the sweet food with great apparent enjoyment. She was so tame that it became my habit, once or twice a day, to take her on my finger; and while I walked in the garden she would take short flights hither and thither, but was always content to mount upon my hand again. She would come on my finger of her own accord, and, if the day was bright, would remain there as long as I had patience to carry her, with her wings outspread, basking in the sunbeams, which appeared to convey exquisite delight to the delicate little creature.

I never touched her beautiful wings. She never fluttered or showed any wish to escape, but lived three weeks of tranquil life in her tiny home; and then having, as I suppose, reached the limit of butterfly existence, she quietly ceased to live.

On the day of her death the other butterfly emerged, and lived for the same length of time. Both were equally tame, but the second showed more intelligence, for she discovered that by folding her wings together she could easily walk between the slender bars of the cage; and having done so, she would fly to a window and remain there, basking in the sun, folding and unfolding her wings with evident enjoyment, until I presented my finger, when she would immediately step upon it and be carried back to her cage.

LONDON, ENGLAND. *E. Brightwen.*

Two Southern Novelists.

I HAVE ventured to ask if you will allow, under the head of your Open Letters, this brief defense of two of my old favorites to appear. Mr. Morse (in the June CENTURY) pronounces John P. Kennedy's "Swallow Barn" to be "trash, with little truth or home growth about it." Has Mr. Morse done anything more than skim over the work in question? It can hardly be called

a novel, as it is distinctly modeled after the style of Irving, and, as a sketch of the scenes and manners of the Virginia of that day, is purely of home growth, and in its way exceedingly pleasant. Next, Mr. Morse decides, with unhesitating dogmatism, that John Esten Cooke has "no strength in characterization, and has found a wide rather than a discriminating audience." At the risk of being ignominiously classed in the category of the indiscriminating, I must again couch a lance in the defense of one with whose writings I am thoroughly familiar, and of many of which I am exceedingly fond. Again, I think that Mr. Morse's perusal of Mr. Cooke's works has been decidedly cursory, the more from the names of the works he cites as examples. In the "Virginia Comedians," "Henry St. John," "Fairfax," and "Leather Stocking and Silk," Mr. Cooke gives a picture of the colonial life of the Old Dominion which is not only valuable in itself as a description of a most interesting period, but which is true in all its minor details, and therefore should be interesting to even a *discriminating auditor*. In "Surry of Eagle's Nest," "Mohun," and "Hilt to Hilt," Mr. Cooke gives a vivid picture of Virginia in her war scenes, with pen-pictures of many of the distinguished actors, which, coming from the pen of an eye-witness, become of great value. It is hardly necessary for me to review Mr. Cooke's style, as that is a matter outside of the record; but his works, dwelling on a field which would otherwise have been left totally uncultivated, and being possessed of great truth and originality, surely deserve more than a hasty and, in my humble opinion, an unjust criticism. If to depict characters as they have been seen, with all their marked and salient peculiarities preserved, be not strength in characterization, then, as George Eliot and Dickens would fall under the same ax of condemnation, Mr. Cooke and his admirers may remain easily satisfied with the critic's judgment.

T. B. Dorsey.

Ellicott City, Md., June 26, 1883.

A Recent Decision on the License Question.

A Pennsylvania judge has recently put a stop to the curious method of evading the license law, extensively practiced in the petroleum regions of that State, and described in the July number of The Century, in the article entitled "Striking Oil." The beer-sellers have been openly retailing their wares without license under the sign of "Bottling Works," and claiming the right to do so by virtue of a statute of 1858, which enacted that "bottlers of ale, porter, or beer, not otherwise engaged in the sale of intoxicating liquors, nor in keeping any tavern, oyster house or cellar, restaurant or place of amusement or refreshment, shall be allowed to sell the same by the bottle; *provided*, that such liquor is not drank on the premises where sold, nor at any place provided by such seller for that purpose." Judge Elwell now decides that this law was repealed, in effect, by a statute of 1867 which provides that "If *any person*, after the passage of this act, shall sell spirituous and vinous liquors, domestic wines, malt or brewed liquors, without having obtained a license authorizing him so to do, such person shall, on conviction in the Court of Quarter Sessions, be fined," etc.

This decision is of interest to all advocates of legislation to restrict the evils of the liquor traffic; but the remarkable feature of the whole matter is that people who were daily witnesses of the abuse of selling beer without license should not have known of the existence and repealing power of the later law until the practice had gone on for nearly two years. Does not this fact show the necessity for temperance societies which shall make it their business to see that existing legislation curbing the liquor dealers is enforced, as well as to agitate for new and more stringent laws? Just now the popular feeling, especially in the West, is in favor of a high license system. I believe this movement to be a wise one; but where successful, it will not be effective unless there are voluntary local organizations to see that the new laws are obeyed, and that there is no selling of intoxicants without license. The chief weakness of license laws lies in the indifference to their enforcement of the so-called temperance men and women who believe in absolute prohibition. If the experiment of a high license law, enforced by the vigilance and energy of all the temperance societies, could be tried in any one State, I believe the result would be a more salutary and satisfactory limitation of the amount of crime and poverty caused by the liquor traffic than has been attained by any system of legislation heretofore adopted in the United States.

E. V. Smalley.

Chief-Justice Taney in Relation to the Dred Scott Case.

I.

In the July number of The Century, "A Radical Abolitionist" on Boteler's "Recollections of the John Brown Raid" puts a false interpretation on the language used by Chief-Justice Taney in the Dred Scott case. Had the writer taken the trouble to read the preceding and following paragraphs of the famous decision, he never would have written, "Through the mouth of Chief-Justice Taney, who simply uttered the decrees of the slave-holding oligarchy, they had made the Supreme Court declare that four million Americans, of African descent, had practically 'no rights which a white man was bound to respect.'"

The preceding paragraph of the decision is as follows:

"It is difficult at this day to realize the state of public opinion in relation to that unfortunate race which prevailed in the civilized and enlightened portions of the world at the time of the Declaration of Independence and when the Constitution of the United States was framed and adopted. But the public history of every European nation displays it in a manner too plain to be mistaken."

This is one fact. We have another fact in the paragraph that follows:

"They had for more than a century before been regarded as beings of an inferior order and altogether unfit to associate with the white race either in social or political relations, and so far inferior that they had no rights which the white man was bound to respect." (*Vide* Dred Scott *versus* John F. A. Sanford, page 407. D. Appleton & Co., New York, 1857.)

The Chief-Justice merely asserted a fact, and did not decide that the negro "had no rights that a white man was bound to respect." Judge Taney never held

such an opinion and it is an insult to his memory to make such an assertion.

Allow me to state some facts relative to Judge Taney's feelings toward the colored race. Some thirty years before his death he freed his slaves. This proves that he was no lover of slavery. On one occasion, speaking of the colored people, with much emphasis, he said: "Thank God that at least in one place all men are equal, in the church of God. I do not consider it any degradation to kneel side by side with a negro in the house of our Heavenly Father." On another occasion, speaking of the Dred Scott decision, he remarked, that "no matter what might be his feelings in regard to this question of slavery, his oath bound him to interpret the law under the Constitution." This was his higher law — the oath he had taken when he accepted the position of Chief-Justice of the United States Supreme Court. A purer, a more conscientious man never wore the ermine; a more faithful servant the government of the United States never had. It was his fidelity to duty that cost him his life, as I personally know. I knew him intimately for several years. He spoke with sadness of our late troubles, wishing from his heart that some statesman would rise up and prevent the fratricidal contest.

J. A. Walter.

WASHINGTON, D. C.

II.

THERE are many circumstances which clearly show that Mr. Taney's sympathy with the advocates of the freedom of the negro was unbounded. The slaves whom he inherited from his father not only received their freedom, but were watched and aided in many ways after all legal connection between them and their former master had ceased.

Those who quote with so much flourish the well-known phrase in his decision on the Dred Scott case, "They (the negroes) had no rights which the white man was bound to respect," fail to note that it is here cited as the opinion of our forefathers. Mr. Taney proceeds to show that the natural degradation of the negro was an unquestioned conviction in the minds of legislators, even in those States whose influence would presumably be turned against slavery, long after the adoption of the Constitution. Endeavoring to view the question of negro rights from this position, he seeks to interpret the Constitution not as we might construe it, but as its framers and their contemporaries would have done had this question been presented for their decision. His words throughout this famous document testify to his respect for precedent and for the letter of the Constitution. This feeling, indeed, might be regarded as an element of his character. It was shown in his earlier practice before the bar in Frederick and Baltimore, notably in his defense of General Wilkinson and Father Gruber: in the first case breasting popular displeasure as the defender of a man who, it was claimed, though without legal justification, had disregarded the sacred rights secured to the citizens by the *habeas corpus;* and in the second case not fearing to oppose the will of powerful judges and politicians who desired the condemnation of a minister of the gospel for preaching to the negroes upon the equality of all mankind.

The influence of Mr. Taney's family, which was of English origin and severely aristocratic, together with the well-defined views of the Roman Catholic Church, of which he was a member, were sufficient to instill a high regard for precedent and the letter of the law, whether civil or religious. Neither was he free from a keen appreciation of prerogative. All these elements, united in a man by nature determined and resolute, will readily explain his position in the Dred Scott case, and serve to vindicate him from the taint of partisanship, from which judges, more than any other class of public men, should be free.

Nowhere is the language of this decision a justification of the principle of slavery, but it reveals in Mr. Taney many evidences of signal tender-heartedness and genuine sympathy for the condition of the black man.

Courtenay De Kalb.

SYRACUSE, N. Y.

The John Brown Raid.

MRS. S. H. BROWN, sister of William H. Leeman (said to be the youngest of those who fell under John Brown at Harper's Ferry), writes to us concerning the statement of Mr. Alexander R. Boteler, in our July number, that Leeman was discovered trying to "escape" across the river (p. 407). She denies this, and quotes as follows from a letter from Brown, which she says has never before been in print:

"CHARLESTOWN, JEFFERSON CO., VA.
"Monday, Nov. 28, 1859.

"While we were surrounded by enemies, and fighting for our lives, I asked who would volunteer to carry word to Owen Brown or Cook. William answered at once that he would go. His last words to me were that he would deliver my message or die in the attempt. I am told that he went out through the culvert to the river, when half-way across was seen, pursued, and killed."

BRIC-À-BRAC.

In the Conservatory.

"Quis multa gracilis te puer in rosâ." — HORAT. CARM. I. 5.

AH! fair coquette, you're at it yet,
I see — it's still the same old story.
That night how shall I e'er forget —
My night in the conservatory!
Tell me, what later victim there
Enamored at your feet reposes,
Exchanging vows and locks of hair,
And making love among the roses?

I grant you looked divine to-night;
Your dress might set a poet dreaming:
A modest robe of muslin white,
One rosebud in your dark hair gleaming,
You seemed a simple village flower;
But he whose life its wreck shall owe you,
How will he curse the cruel hour
When first he knew and failed to know you!

Now, recking naught of guilt or guile
While basking in your beauty's splendor,
He suns his heart in that false smile,
Nor dreams 'twill ever be less tender;
Blind mariner in unknown seas,
Where shipwreck waits the wariest master,
He knows not that the siren breeze
But lulls to lure him to disaster.

Thrice hapless they who find you fair!
So shines the wrecker's heartless beacon;
Happy, like me, who've snapped your snare,
And whom your wiles no more can weaken.
'Scaped hardly from that treacherous sea,
How swiftly love is turned to loathing!
Neptune we thank on bended knee,
And change our passion with our clothing.

Walter Carey.

"Boy's-Love."

STEPPING down the grassy lane,
Timorously as a dove,
Came an artless little damsel,
Looking out ahead for love.
(All the wild rose-hedge was budded—apple-boughs hung white above.)

"*Whosoe'er I first do meet*
With the Boy's-Love in my shoe,
He's the one I'm sure to wed,
Sure to wed and love him true."
She'd a fair face, sweetly peeping from a little hood of blue.

She had never had a lover,
But she'd dreamed of one alway,
And would find him by the Boy's-Love
Hidden in her shoe to-day;
For it is a test worth trying, all the wise old grandams say.

Should she meet the tanner's boy,
Should she meet the miller's son,
She was so in love with loving,
She would love them either one,
Nor doubt he was the one she'd dreamed of ever since she first begun.

So, she met a rosy stripling,
And they passed without a word;
But her heart would beat so loudly,
She was almost sure he heard,
And her snowy kerchief trembled like the plumage of a bird.

Innocently sideways glancing,
From her little gingham hood,
Through her soul she felt the fragrance
Of that sprig of southernwood,
And she thought the lad so pretty, and believed him wise and good.

Then she lay awake, a-thinking
Of the lad, the whole night through;
But *he* soundly slept till daybreak,
Just as he was used to do,
And never dreamed he'd met a damsel with some Boy's-Love in her shoe.

Mary E. Wilkins.

Chrysander's Quest.

THE young knight Chrysander sat pensively in the tapestry chamber at Poplinium, surrounded by six beautiful maidens. A cloud was on his brow, a trouble in his heart; for he found no meaning in the many, many words which flowed musically from those rosy lips. And he departed in pain; but came again upon the morrow, with a lofty purpose and a bold resolve.

"Sweet ladies," he said, "deign to impart your secret lore to a humble scholar. Naught is known to me of all these mysteries whereof ye discourse, neither do I understand the words of your speech. Teach me, therefore, I pray you, that I too may speak this strangely beautiful language."

Then they taught him until the sun sank in the west, and until the twilight faded; and yet was he but little wiser than before. And again he departed in pain; and through the weary hours of the night he pondered upon all that he had heard.

On the morrow he betook him once more to the maidens, and cried, "O damsels, your toil is but in vain! The mystic language is yet sealed to me, and its subtleties baffle my best wit. So soon as I have learned fitly to discriminate between a box-pleated gore and a double-biased panier puff, behold, even then I straightway forget the true difference between slashing and shirring, nor am I able, for all my striving, to tell what it is to run up frilled tatting with a basted hemstitch, or to pink the fluting of peplum points. Woe is me! I cannot learn this lore!"

But the fair maidens cheered Chrysander, bidding him take heart and give due diligence to his task, and all should be well.

Even so it came to pass. The heedful knight waxed wiser and yet more wise, until he became like unto the maidens, thinking even as they thought, and speaking as they spake. In good time he forsook his rude oaths, "By Bacchus!" and "Holy Saint Jingo!" and "Great Cæsar's ghost!" and learned to say "By Bombazine!" and "Rip up my bastings!" and to vow by holy Honiton and sacred Sarcenet. And as the bird of the desert returns daily to the cool spring where it is wont to slake its thirst, so did the knight Chrysander daily revisit the refreshing fountains of occult knowledge.

At length he bethought him in what manner he might requite those damsels, his teachers, who had thus enriched him with the treasures of their wisdom. And he made for them many pleasant lays and ditties. Likewise, he took counsel with his heart, and framed the Seven Goodly Proverbs, that are known by every maid, not only in Poplinium, but also throughout all the land of Polonaisia. And these are the Seven Goodly Proverbs:

1. A basted bias gathers no pleats.
2. Never look a pinked tuck in the seams.
3. One shirr in the mull is worth three in the scrim.
4. A basque is known by the stitches it keeps.
5. You may lead a woman to the machine, but you cannot make her hem.
6. Better is a slashed gore with bangles, than a gusset of tulle and honiton therewith.
7. Frilled tatting fulls deep.

To this day, men may read the Seven Goodly Proverbs, worked in letters of gold, in the tapestry chamber at Poplinium; but of all the brave rhymes writ by Chrysander, only these remain:

"Let the double-shirred Peplums from Gussets refrain,
And beware ere they take up the Darts of Gros-Grain!
For, though Paniers should basque in the Pleats of Nainsook,
And though Ruches and Plastrons should join in rebuke,
You may baste, you may bias the Gore if you will,
Yet the Yoke of the Tucker will hang round the Frill!"

J. Bouckman.

An Incomplete Revelation.

WHILE Quaker folks were Quakers still, some fifty years ago,
When coats were drab and gowns were plain and speech was staid and slow,
Before Dame Fashion dared suggest a single friz or curl,
There dwelt, 'mid Penfield's peaceful shades, an old-time Quaker girl.

Ruth Wilson's garb was of her sect. Devoid of furbelows,
She spoke rebuke to vanity, from bonnet to her toes;
Sweet red bird was she, all disguised in feathers of the dove,
With dainty foot and perfect form and eyes that dreamt of love.

Sylvanus Moore, a bachelor of forty years or so,
A quaintly pious, weazened soul, with beard and hair of tow,
And queer thin legs and shuffling walk and drawling, nasal tone,
Was prompted by the Spirit to make this maid his own.

He knew it was the Spirit, for he felt it in his breast
As oft before in meeting time, and, sure of his request,
Procured the permit in due form. On Fourth-day of that week
He let Ruth know the message true that he was moved to speak.

"Ruth, it has been revealed to me that thee and I shall wed,
I have spoken to the meeting and the members all have said
That our union seems a righteous one, which they will not gainsay,
So if convenient to thy views, I'll wed thee next Third-day."

The cool possession of herself by friend Sylvanus Moore
Aroused her hot resentment, which by effort she forbore,—
(She knew he was a goodly man, of simple, child-like mind,)
And checked the word "Impertinence!" and answered him in kind:

"Sylvanus Moore, do thee go home and wait until I see
The fact that I must be thy wife revealéd unto *me*."
And thus she left him there alone, at will to ruminate,
Sore puzzled at the mysteries of Love, Free Will, and Fate.

Richard A. Jackson.

The Future of the Classics.

[WRITTEN after reading telegraphic reports of the Phi Beta Kappa address of Charles Francis Adams, Jr., and retained, with apologies, after receiving fuller reports (and the orator's subsequent explanations), for the sake of the labor bestowed on the Versification by the author, who is pleased to be assured that his poetical Prophecy is Fallacious.]

No longer, O scholars, shall Plautus
Be taught us.
No more shall professors be partial
To Martial.
No ninny
Will stop playing "shinney"
For Pliny.
Not even the veriest Mexican Greaser
Will stop to read Cæsar.
No true son of Erin will leave his potato
To list to the love-lore of Ovid or Plato.
Old Homer,
That hapless old roamer,
Will ne'er find a rest 'neath collegiate dome or
Anywhere else. As to Seneca,
Any cur
Safely may snub him, or urge ill
Effects from the reading of Virgil.
Cornelius Nepos
Wont keep us
Much longer from pleasure's light errands—
Nor Terence.
The irreverent now may all scoff in ease
At the shade of poor old Aristophanes.
And moderns it now doth behoove in all
Ways to despise poor old Juvenal;
And to chivvy
Livy.
The class-room hereafter will miss a row
Of eager young students of Cicero.
The 'longshoreman—yes, and the dock-rat, he's
Down upon Socrates.
And what'll
Induce us to read Aristotle?
We shall fail in
Our duty to Galen.
No tutor henceforward shall rack us
To construe old Horatius Flaccus.
We have but a wretched opinion
Of Mr. Justinian.
In our classical pabulum mix we no wee sop
Of Æsop.
Our balance of intellect asks for no ballast
From Sallust.
With feminine scorn no fair Vassar-bred lass at us
Shall smile if we own that we cannot read Tacitus.
No admirer shall ever now wreath with begonias
The bust of Suetonius.
And so, if you follow me,
We'll have to cut Ptolemy.
Besides, it would just be considered facetious
To look at Lucretius.
And you can
Not go in Society if you read Lucan.
And we cannot have any fun
Out of Xenophon.
